The use of the revised OMB delineations and the updated RUCA codes would mean the recognition of new urban and rural boundaries based on the population migration that occurred over a 10-year period, between 2010 and 2020. As discussed previously in this section, we are proposing to use the updated 2020 RUCA codes to identify rural census tracts within MSAs, such that the census tracts falling at or above RUCA level 4.0 would continue to be designated as rural areas. To determine which ZIP codes are included in each such rural census tract, we are proposing to use the ZIP code approximation file developed by HRSA. This file includes the 2020 RUCA code designation for each ZIP code and can be found at: *https://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes* If ZIP codes are added over time to the USPS ZIP code file (and thus are not included in the 2020 ZIP code approximation file provided to us by HRSA) or if ZIP codes are revised over time, we would determine the appropriate urban/rural designation for such ZIP code based on any updates provided on the HRSA and OMB websites located at: *https://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes.aspx* and *https://www.whitehouse.gov/wp-content/uploads/2023/07/OMB-Bulletin-23-01.pdf*.

Based on the April 2026 United States Postal Service (USPS) ZIP code file that we are using in this proposed rule to assess the impacts of the revised geographic designations; there are a total of 42,956 ZIP codes in the U.S. Table B–H1 sets forth an analysis of the number of ZIP codes that changed urban/rural status in each U.S. State and territory using the April 2026 USPS ZIP code file, the revised OMB delineations (OMB Bulletin No. 23–01), and the updated 2020 RUCA codes. Based on this data, the geographic designations for approximately 95.87 percent of ZIP codes would be unchanged by OMB's revised delineations and the updated RUCA codes. As reflected in Table B–H1, more ZIP codes would change from urban to rural (1,172, or 2.73 percent) than rural to urban (602, or 1.40 percent). In general, it is expected that ambulance providers and suppliers in 1,172 ZIP codes within 47 States and Puerto Rico may experience payment increases if we adopt the revised OMB delineations and the updated RUCA codes, as these areas would be redesignated from urban to rural. The State of Maryland would have the most ZIP codes changing from urban to rural with a total of 49, or 7.78 percent. Ambulance providers and suppliers in 602 ZIP codes within 43 States may experience payment decreases if we adopt the revised OMB delineations and the updated RUCA codes, as these areas would be redesignated from rural to urban. The State of South Carolina would have the most ZIP codes changing from rural to urban (20, or 3.68 percent). Our findings are illustrated in Table B–H1.

TABLE B-H1: ZIP CODES ANALYSIS BASED ON OMB'S REVISED DELINEATIONS AND UPDATED RUCA CODES

State/ Territory*	Total ZIP Codes	Total ZIP Codes Changed Rural to Urban	Percentage of Total ZIP Codes	Total ZIP Codes Changed Urban to Rural	Percentage of Total ZIP Codes	Total ZIP Codes Not Changed	Percentage of Total ZIP Codes Not Changed

*ZIP code analysis includes U.S. States and Territories (FM—Federated States of Micronesia, GU—Guam, MH—Marshall Islands, MP—Northern Mariana Islands, PW—Palau, AS—American Samoa; VI—Virgin Islands; PR—Puerto Rico). Missouri is divided into east and west regions due to work distribution of the Medicare Administrative Contractors (MACs): EM—East Missouri, WM—West Missouri. Johnson and Wyandotte counties in Kansas were changed as of January 2010 to East Kansas (EK), and the rest of the state is West Kansas (WK).

For more detail on the impact of our proposals, in addition to Table B–H1, the following files are available through the internet on the Ambulances Services Center website at: *https://www.cms.gov/medicare/coverage/ambulances-services-center*; ZIP Codes By State Changed From Urban To Rural: ZIP Codes By State Changed From Rural To Urban: List of ZIP Codes With RUCA Code Designations: and Complete List of ZIP Codes.

We invite public comments on our proposals to make use of the revised OMB delineations as set forth in OMB's July 21, 2023 bulletin (No. 23–01) and the most recent modifications of the RUCA codes as discussed previously for CY 2027 for purposes of payment under the AFS.

X. Request for Information (RFI) on Duplicate Laboratory Testing, Imaging, and Result Sharing and Interoperability

1. Overview

Diagnostic imaging and laboratory testing are critical to determining a patient's course of treatment. Imaging data and test results are often siloed within the acquiring systems' electronic health record and inaccessible outside of those systems. Treating health care providers often do not even know of the existence of these siloed results. The inaccessibility of laboratory and imaging data due to siloing results in incomplete or delayed care management and duplicative testing, with concomitant increased costs (and in the case of duplicative diagnostic imaging, unnecessary radiation exposure).

2. Purpose of the RFI

We are issuing this RFI to gather input from interested parties—including clinicians, laboratories, imaging health care providers, health systems, payers, health IT developers, and other interested parties—to inform potential actions aimed at addressing the interoperability and duplicate testing concerns described earlier in this section.

3. Potential Mechanisms for Addressing Duplicative Payment

Given the concerns discussed previously in this section resulting from duplicate diagnostic laboratory and image testing, we are exploring various mechanisms for addressing duplicative payment:

- Clarifications to billing instructions to laboratories and imaging centers on

parameters of duplicate laboratory or imaging tests;

- Local Medicare Administrative Contractor (MAC) edits that would result in non-payment or reductions in payment as applicable for duplicate laboratory or imaging tests;
- Use of payment integrity levers to recoup payments from health care providers and suppliers who performed duplicate laboratory or imaging tests; and
- Application of frequency limitations to certain tests where clinically appropriate.

We note that frequency limitations are already in use in certain contexts. For example, a Local Coverage Decision (LCD) from a MAC limits testing for Vitamin D levels (L33996—Vitamin D Assay Testing), providing that once a beneficiary has been shown to be Vitamin D deficient, further testing is medically necessary only to ensure adequate replacement has been accomplished, with annual testing thereafter being appropriate depending on the indication and other mitigating factors. We believe there are likely other diagnostic laboratory tests that should similarly be subject to frequency limitations.

We also recognize that in some cases more frequent testing is clinically justified and we are therefore seeking input not only on which laboratory and imaging tests should be subject to frequency limitations, but also on what exceptions should be permitted to ensure beneficiary access is not inappropriately restricted.

We seek input on how such enforcement actions can be implemented without restricting beneficiary access to necessary care, and specifically how practitioners can communicate clinical justification for repeat testing in specific circumstances—for example, in cases of trauma, stroke, or evolving emergencies where repeat imaging may be clinically appropriate.

- Should CMS consider possible changes to payment policies when diagnostic tests are billed duplicatively; that is, additional imaging or diagnostic laboratory tests for the same condition? For example, is there a time period which an image or laboratory test should automatically be considered ''duplicate'' and therefore subject to payment consequences? To which kinds of tests or subsets of tests should such policies apply? We welcome responses from both the clinical community as well as payors who have likely addressed or considered these or similar issues related to the payments they make.

4. Laboratory and Imaging Interoperability

Several agencies within HHS have indicated an interest in gaining public input on interoperability for various health programs. Section 4003 of the 21st Century Cures Act (Pub. L. 114–255) amended section 3000 of the PHSA to add a new paragraph (10) to include a statutory definition of ''interoperability.'' Interoperability is defined to mean, with respect to health information technology, such health information technology that— (A) enables the secure exchange of electronic health information with, and use of electronic health information from, other health information technology without special effort on the part of the user; (B) allows for complete access, exchange, and use of all electronically accessible health information for authorized use under applicable State or Federal law; and (C) does not constitute information blocking as defined in section 3022(a) of the Public Health Service Act.

We view duplicate imaging and laboratory testing as one of several use cases in which the lack of clinical interoperability causes non-trivial beneficiary harm and program integrity concerns. In recognition of that perspective, the broader department, and the Office of the National Coordinator for Health Information Technology (ONC) in particular, adopts standards that facilitate easier exchange of diagnostic clinical information and includes criteria in the ONC Health IT Certification Program that address the certification of health IT to exchange this information. In the January 30, 2026 **Federal Register** (91 FR 4054), ONC published an RFI titled, ''Request for Information: Diagnostic Imaging Interoperability Standards and Certification''.

The regulatory background section of the January 2026 RFI (91 FR 4055) outlined the following prior efforts:

- Federal efforts to incorporate diagnostic imaging requirements into certification criteria for electronic health record (EHRs) and other health IT systems span more than a decade, marked by a recurring cycle of proposals, reversals, and unresolved interoperability challenges.
- In 2012, the Secretary published the proposed rule titled, ''Health Information Technology: Standards, Implementation Specifications, and Certification Criteria for Electronic Health Record Technology, 2014 Edition; Revisions to the Permanent Certification Program for Health Information Technology'' (77 FR 13832) (hereinafter '' 2014 Edition Proposed Rule''), which proposed an imaging certification criterion (§ 170.314(a)(12)) without requiring the Digital Imaging and Communications in Medicine (DICOM) standard, while simultaneously requesting public comments on its use (77 FR 13838). The proposed rule also proposed to require EHR technology certified under the View, Download, and Transmit (VDT) certification criterion (§ 170.314(e)(1)) to be capable of enabling images formatted according to the DICOM-formatted images (77 FR 13839 and 13840). However, when the 2014 Edition Final Rule was published later that year (77 FR 54163), the DICOM standard was not adopted, and the image download and transmission requirement was removed from the VDT certification criterion—largely due to complexity and implementation burden raised by commenters (77 FR 54183). Instead, the 2014 Edition Final Rule adopted an ''image results'' certification criterion that required Health IT Modules certified to that criterion to indicate the availability of patient images and narrative interpretations, accessible either through a direct link within the EHR or a context-sensitive link to an external application (77 FR 54172 and 54173).

Between 2014 and 2024, ONC continued efforts to modernize the VDT imaging related criteria. Public feedback consistently underscored challenges related to standards maturity, uneven implementation across settings, and fragmentation in available technologies. Imaging exchange remains uniquely complex: in addition to narrative reports, large image files, associated metadata, and viewing capabilities must be exchanged in a manner that is performant, secure, and consistent across systems. Information blocking, economic and workflow burdens, and inconsistent conformance to existing standards all continue to affect access to diagnostic imaging across organizational boundaries.

- Responses to other recent RFIs (for example, ''Request for Information; Health Technology Ecosystem'' which appeared in the May 16, 2025 **Federal Register** (90 FR 21034) (hereinafter ''Health Technology Ecosystem RFI'') indicate that the imaging exchange environment remains fragmented and unreliable, with ongoing dependence on CDs and DVDs and limited availability of modern, API-enabled tools that would allow patients and health care providers to access and share images seamlessly. Interested parties have also highlighted privacy and security considerations that must be accounted

for as exchange capabilities evolve. Public feedback highlights support for building on existing standards rather than creating entirely new exchange paradigms.

- Similar patterns are evident in laboratory interoperability, where challenges frequently stem from differing ordering workflows, variations in result reporting practices, local coding conventions, and inconsistent implementation of standards. These issues mirror broader interoperability challenges and reinforce the need for coordinated, standards-based approaches across diagnostic domains.

Other key information received in response to the Health Technology Ecosystem RFI:

- The current system of fragmented patient portals is unworkable.
- A unified, ''one-stop shop'' for health records is the universal goal.
- API access must go beyond the USCDI data set to the full electronic health information (EHI).
- Existing data access tools are insufficient.

Given what we discussed earlier in this section, we believe there are opportunities to establish or improve interoperability between laboratories and physicians, hospitals, and other care delivery organizations. Specifically, participation in a national interoperability network for exchanging diagnostic imaging and laboratory results in a standardized format remains top of mind for the Department. Such participation would allow physicians, hospitals, laboratories, and other care delivery organizations to more easily access relevant clinical data to prevent the duplicate imaging and testing discussed previously in this section. We are aware that such participation is insufficient. The networks must resolve fundamental technical issues like authentication (for example, are you who you say you are?); authorization (for example, are you allowed to access the data?); and patient matching (for example, what records are associated with the individual in question?). Without a reliable way to match records across systems, even well-connected networks would return incomplete or incorrect results.

We have also considered building on the existing Electronic Notifications Condition of Participation (CoP) at 42 CFR 482.4(d) to require hospitals to participate in a national interoperability network. We believe that the relationship to patient health and safety is clear: timely and accurate information leads to coordinated, safer care and treatment decisions for patients. While we believe a CoP, for Medicare and Medicaid participating hospitals, would be an appropriate mechanism to drive interoperability, we also recognize that unlike other provider types the only statutorily available penalty for noncompliance with the hospital CoPs is termination from the Medicare program, as provided under section 1866(b)(2)(A) and (B) of the Act. We believe this would be overly burdensome. However, we will continue to monitor hospital advances in interoperability and may consider future rulemaking or look to other programs like the Medicare Promoting Interoperability Program or the Hospital Inpatient Quality Reporting program (IQR) or both.

Building upon the RFIs noted previously, we would like to further explore opportunities related to interoperability, specifically for diagnostic laboratory tests and imaging services. The following are questions for which we seek input.

- Because image exchange can involve substantial technical and operational costs, should HHS or CMS consider incentives to support adoption and implementation, and if so, what form should those incentives take?
- Given variability in conformance to existing laboratory and imaging exchange standards, would interested parties find value in expanded conformance testing tools, certification approaches, or implementation guidance?
- How should CMS account for cases in which repeat imaging occurs because prior imaging results were not available for timely, standards-based reuse? Should CMS consider payment, quality, or participation policies that create accountability for the initial imaging provider, furnishing entity, or facility when failure to make results reusable contributes to avoidable repeat imaging? Are there penalties or disincentives for non-compliance we should consider?
- For laboratory interoperability specifically, what barriers continue to impede exchange despite the availability of established standards, and what policy levers could help address those barriers? Should we consider incentives to support laboratory adoption and implementation of health data standards?

Should CMS establish a minimum data standard for result shareability, for example, a United States Core Data for Interoperability (USCDI+) supplement for imaging and laboratory results, requiring all participating entities to deliver both a structured Fast Healthcare Interoperability Resources (FHIR) R4 Diagnostic Report resource and a human-readable Portable Document Format/Archive (PDF/A) rendition to the ordering health care provider's designated endpoint as a condition of Medicare payment? How should CMS address health care providers who have not yet implemented FHIR-native workflows, especially in rural areas?

IV. Updates to the Quality Payment Program

A. CY 2027 Modifications to the Quality Payment Program Reporting and Data Submission

1. Executive Summary

a. Overview

This section of this proposed rule outlines changes to the Quality Payment Program starting January 1, 2027, except as otherwise noted for specific provisions. We continue to move the Quality Payment Program forward, including focusing more on alignment between the Merit-based Incentive Payment System (MIPS) and Advanced Alternative Payment Models (APM) tracks of participation, alignment with broader CMS initiatives, and new options for clinicians to participate in more meaningful ways. We aim to achieve continuous improvement in the quality of health care services provided to Medicare beneficiaries and other patients through MIPS and Advanced APMs for the CY 2027 performance period/2029 payment year.

Authorized by the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, April 16, 2015), the Quality Payment Program is a value-based payment program, by which clinicians are rewarded for providing high-value, high-quality care to their patients in a cost-efficient manner. There are two ways for clinicians who provide services under the Medicare program to participate in the Quality Payment Program: MIPS and Advanced APMs. The statutory requirements for the Quality Payment Program are set forth in section 1848(q) and (r) of the Act for MIPS and section 1833(z) of the Act for Advanced APMs.

For the MIPS participation track, MIPS eligible clinicians (defined at § 414.1305) [371] are subject to a MIPS payment adjustment (positive, neutral, or negative) based on their performance in four performance categories: cost, quality, improvement activities, and Promoting Interoperability. We assess

[371] We note that the term MIPS eligible clinician is defined at § 414.1305 as including a group of at least one MIPS eligible clinician billing under a single tax identification number. We refer readers to our policies governing group reporting and scoring under MIPS as set forth at § 414.1310(e).

each MIPS eligible clinician's total performance according to established performance standards for the applicable measures and activities specified in each of these four performance categories during a performance period to compute a final composite performance score (a ''final score'' as defined at § 414.1305). In calculating the final score, we must apply different weights for the four performance categories, subject to certain exceptions, as set forth in section 1848(q)(5) of the Act and at § 414.1380. Unless we assign a different scoring weight under these exceptions, for the CY 2027 performance period/2029 MIPS payment year, the scoring weights are as follows: 30 percent for the quality performance category; 30 percent for the cost performance category; 25 percent for the Promoting Interoperability performance category; and 15 percent for the improvement activities performance category.

Once calculated, each MIPS eligible clinician's final score is compared to the performance threshold established in prior rulemaking for that performance period to calculate the MIPS payment adjustment factor as specified in section 1848(q)(6) of the Act, such that the MIPS eligible clinician will receive in the applicable MIPS payment year: (1) a positive adjustment, if their final score exceeds the performance threshold; (2) a neutral adjustment, if their final score meets the performance threshold; or (3) a negative adjustment, if their final score is below the performance threshold. In calculating the MIPS payment adjustment factor for a MIPS eligible clinician, we account for scaling factor and budget neutrality requirements, as further specified in section 1848(q)(6) of the Act. We then apply the MIPS payment adjustment factor to amounts otherwise paid under Medicare Part B for covered professional services for the MIPS eligible clinician for the applicable MIPS payment year and payments for covered professional services are increased, decreased, or not adjusted based on the MIPS eligible clinician's final score relative to the performance threshold.

Section 1848(q) of the Act sets forth other requirements applicable to MIPS, including opportunities for feedback and targeted review and public reporting of MIPS eligible clinicians' performance. Section 1848(r) of the Act sets forth more specific requirements for development of measures for the cost performance category under MIPS.

For the Advanced APM track, if an eligible clinician participates in an Advanced APM and achieves Qualifying APM Participant (QP) or Partial QP status, they are excluded from the MIPS reporting requirements and payment adjustment (though eligible clinicians who are Partial QPs may elect to participate in MIPS and be subject to the MIPS reporting requirements and payment adjustment). In alignment with the application of QPP eligibility determinations, we are proposing to apply QP and Partial QP status to the TIN/NPI under which a clinician achieves QP or Partial QP status. Under current law, eligible clinicians who are QPs for the 2024 performance year/2026 payment year and beyond will receive an increased physician fee schedule update of 0.75 percent qualifying APM conversion factor. We note that, historically, QPs received a lump sum APM Incentive Payment in the corresponding payment year, calculated as a specified percentage of the QP's paid claims for covered professional services from the base year. Only legislation enacted by Congress can make changes to either the enhanced QP conversion factor updates or the APM Incentive Payment.

We plan to continue developing policies for the Quality Payment Program that more effectively reward high-quality of care for patients and increase opportunities for Advanced APM participation. We continue to implement MIPS Value Pathways (MVPs) to allow for a more cohesive participation experience by connecting activities and measures from the four MIPS performance categories that are relevant to a specialty, medical condition, or a particular population.

As we move into the 10th year of the Quality Payment Program, we will be implementing the updates set forth in this section of this proposed rule, encouraging continued improvement in clinicians' performance with each performance year and driving improved quality of health care through payment policy.

b. Summary of Major Proposals

(1) Transforming the Quality Payment Program

The Making America Healthy Again (MAHA) initiative (*https://www.hhs.gov/maha/index.html*) represents a shift from the focus on chronic disease management and moves toward prevention and restoring foundational wellness. This initiative aims to address the root causes of poor health outcomes by reducing chronic disease rates, improving nutrition, promoting preventative care, and increasing transparency in health systems. This vision is supported by aligning policies in MIPS and APMs within the Quality Payment Program with the foundational pillars of MAHA. We are expanding the MVP portfolio to include Diabetic Disease and Hypertension MVPs that address the prevention of chronic illnesses and aim to reduce the incidence and impact of long-term conditions. In alignment with the goal of promoting preventive care and fostering a more proactive and holistic approach to health management, we are proposing new improvement activities under the ''Advancing Health and Wellness'' subcategory within the improvement activities performance category. The proposed improvement activities integrate concepts that address nutrition, implement lifestyle approaches to disease management, and support patient wellness to ensure a healthier future.

Through the policies described in this proposed rule, we intend to transform and simplify MIPS, promote the use of connected measures and activities, continue rewarding clinicians for providing high value care, and use data-driven information to help all clinicians improve care and engage patients. In accordance with the stated intent, we are proposing the traditional MIPS reporting option would be sunset and that MVPs will be the only reporting option for MIPS beginning with the CY 2029 performance period/2031 MIPS payment year. Traditional MIPS would continue to be an available reporting option until the CY 2029 performance period/2031 MIPS payment year, when sunsetting occurs.

(a) Transforming MIPS: MVP Strategy

MVPs will improve value, reduce burden, and inform patient choice in selecting clinicians. To support our goal of phasing out traditional MIPS and transitioning eligible clinicians to MVP reporting, we are proposing policies supporting MVP only reporting for MIPS. The MVP reporting option offers aligned measures and activities across quality, cost, improvement activities, and Promoting Interoperability performance categories, focusing on specific specialties, conditions, or patient populations to make reporting more meaningful. Specifically, we propose that beginning in the CY 2029 performance period/2031 MIPS payment year, eligible clinicians participating in MIPS, and not reporting the APM Performance Pathway (APP), would be required to report the measures and activities in a selected MVP for MIPS. We also propose including virtual groups in MVP reporting to ensure all eligible clinicians can report MVPs.

(b) MIPS Value Pathways Development and Maintenance

To continue moving the healthcare community toward value-based, high-quality, safe, and cost-efficient care, we are proposing three new MVPs around the following topics: Diabetic Disease, Hypertension, and Hospitalist.

We are also proposing MVP maintenance updates to our MVP inventory that are aligned with the MVP development criteria and take into consideration feedback from interested parties we have received through the maintenance process. Additionally, we updated all the MVPs to include MIPS core measures. Finally, we are renaming the Rehabilitative Support for Musculoskeletal Care MVP to Rehabilitative Support MVP to better represent the measures and activities included in the MVP.

(c) APM Performance Pathway

We are proposing to align quality measures in the APM Performance Pathway (APP), original quality measure set and the APP Plus quality measure set to reflect our proposed changes to measures specified for the quality performance category as discussed in section IV.A.4.b.2 of this proposed rule.

(d) Fast Healthcare Interoperability Resources (FHIR) Request for Information

We are advancing quality measurement by transitioning existing quality measures and reporting processes to Fast Healthcare Interoperability Resources® (FHIR®)-based digital reporting options. In this proposed rule, we seek input on the anticipated transition timeline, key milestones, and implementation considerations for FHIR-based quality reporting in the Quality Payment Program and other CMS quality reporting programs.

(e) MIPS Quality Performance Category

For the CY 2027 performance period/2029 MIPS payment year, we are proposing to establish a measure set inventory of 180 MIPS quality measures, of which 177 are available in traditional MIPS and three are available only for utilization in MVPs. Proposed changes to the measure set inventory include 20 measure removals, 10 measure additions for CY 2027, one measure addition for CY 2028, and 43 substantive changes to existing measures.

The proposed measure removals focus on low bar process measures, measures reaching extremely topped-out status or the end of the topped-out measure lifecycle, measures that are duplicative of new or current measures, measures with limited adoption and therefore no benchmark, measures lacking robustness, and measures the steward would no longer maintain. The proposed measure additions focus on measuring patient-reported outcomes and chronic disease management. Proposed substantive changes to existing measures would ensure the measures included in MIPS continue to be meaningful and drive improvements in quality of care.

Beginning with the CY 2027 performance period/2029 MIPS payment year, we are proposing to implement the MIPS core measure designation in traditional MIPS and MVPs. We are also proposing to remove the high priority designation from MIPS quality measures and the MVP inventory. Additionally, we are proposing to no longer use the high priority designation as one of the retention criteria for MIPS quality measures and the MVP inventory.

Furthermore, beginning with the CY 2027 performance period/2029 MIPS payment year, we propose removing the current quality measure data submission requirement of one outcome (or one high priority measure if an outcome measure is not available) for traditional MIPS and MVP reporting and replacing it with the requirement that eligible clinicians must report at least one MIPS core measure (or, if an applicable MIPS core measure is not available, report one other MIPS non-core measure). We are also proposing that if a MIPS eligible clinician does not have an available and applicable MIPS core measure, they must attest during the data submission period that a MIPS core measure is not available and applicable for them to report. The clinician would then be required to choose another measure to report instead of the MIPS core measure.

Also, we are proposing that clinicians in small practices would be exempt from the proposed MIPS core measure requirement and would not need to submit an attestation if a MIPS core measure is not available and applicable to them.

Lastly, we are proposing to expand the definition of the collection type to include Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs); establish the data submission criteria for Medicare eCQMs; and establish the data completeness criteria for Medicare eCQMs.

(f) MIPS Cost Performance Category

We are proposing to update the operational list of care episodes and patient condition groups and codes to reflect coding changes identified through our annual maintenance process for MIPS cost measures.

(g) MIPS Improvement Activities Performance Category

We are proposing the following updates to the MIPS Improvement Activity Inventory beginning with the CY 2027 performance period/2029 MIPS payment year. First, we are proposing to add six new improvement activities into two subcategories: (1) Care Coordination and (2) Advancing Health and Wellness, our newest subcategory. Second, we propose modifying five existing improvement activities currently specified for the performance category. Third, we propose to remove eleven improvement activities currently specified for the performance category.

(h) MIPS Promoting Interoperability Performance Category

We are proposing the following policies:

- Starting with the CY 2026 performance period/2028 MIPS payment year, we are proposing to remove the ONC Direct Review attestation and the ONC-Authorized Certification Bodies (ACB) Surveillance attestation.
- Starting with the CY 2027 performance period/2029 MIPS payment year, we are proposing to:

++ Modify the definition of Certified Electronic Health Record Technology (CEHRT) to align with the applicable Office of the National Coordinator for Health Information Technology's (ONC) proposals to remove certain certification criteria from the ONC Health IT Certification Program as outlined in the Health Data, Technology, and Interoperability: Office of the Assistant Secretary for Technology Policy (ASTP)/ONC Deregulatory Actions to Unleash Prosperity (HTI–5) proposed rule;

++ Modify the Electronic Prior Authorization measure by updating the measure description, and for the CY 2027 performance period, changing the measure from being a required measure to being an optional measure; and

++ Remove the Security Risk Analysis measure.

- Starting with the CY 2028 performance period/2030 MIPS payment year, we are proposing to:

++ Modify the Electronic Prior Authorization measure by updating the measure description to account for additional requirements pertaining to the measure, and changing the measure to being a required measure; and

++ Add a new measure, Electronic Prior Authorization for Prescription

Drugs, as a required measure under the Health Information Exchange objective.

(i) MIPS Scoring

We are proposing scoring policies consistent with the proposed MIPS core measure requirement for MIPS eligible clinicians beginning in the CY 2027 performance period/2029 MIPS payment year. Specifically, we propose to assign zero measure achievement points for one quality measure for clinicians reporting data under traditional MIPS and MVP reporting, if they do not submit a MIPS core measure and do not attest during data submission that they do not have an available and applicable MIPS core measure.

We are seeking feedback on the proposed list of topped out measures impacted by limited measure choice in specialty measure sets and MVPs to be subject to the defined topped out measure benchmark for the CY 2027 performance period/2029 MIPS payment year. We propose to modify the publishing location of topped out measures impacted by limited measure choice and scored according to the defined topped out benchmark. We also propose to apply the defined topped out benchmark for MIPS core measures that are topped out for 2 or more consecutive years. Additionally, we seek feedback in a request for information (RFI) on the future direction of MVP scoring policies.

Lastly, we are proposing the following modifications: The benchmarking methodology for the Medicare CQMs collection type by extending the use of flat benchmarks; establishment of a flat benchmarking methodology for the proposed Medicare eCQMs collection type; and modification of the Electronic Prior Authorization measure from a required measure to an optional measure worth 10 bonus points under the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year.

(j) Third Party Intermediaries

In this proposed rule, we seek to update our requirements for third-party intermediaries related to the conditions for approval of Qualified Clinical Data Registries (QCDRs) and qualified registries, remove the additional requirements for health IT vendors, and revise our remedial action and termination policies. At a high level, we are proposing the following:

- Clarify that the additional requirements for health IT vendors no longer apply beginning with the CY 2025 performance period/2027 MIPS payment year, as health IT vendors are no longer permitted to submit MIPS data as a third-party intermediary starting in that year;
- Make minor revisions to the audit requirements;
- Modify our policy so that third-party intermediaries that do not submit data for 1 year would be terminated;
- Revise existing policies to specify a QCDR or a qualified registry must be able to submit to CMS data for at least six quality measures including at least one MIPS core measure to align with the proposed removal of high priority designation from MIPS quality measures and the MIPS core measure reporting requirements in section IV.A.4.d.(1)(c) of this proposed rule; and

(k) Calculating MIPS Final Score

In this proposed rule, we propose that beginning with the CY 2027 performance period/2029 MIPS payment year we will use whatever data is most current and reliable to determine if an individual MIPS eligible clinician is located in an area that has been identified as being affected by an extreme and uncontrollable circumstance (EUC). We also propose to adjust the deadline by which clinicians would be able to submit reweighting requests for the quality, improvement activities, and Promoting Interoperability performance categories due to scenarios where a third-party intermediary did not submit data on their behalf in accordance with the applicable data submission deadlines. Specifically, we propose that beginning with the CY 2025 performance period/2027 MIPS payment year, MIPS eligible clinicians would be able to submit reweighting requests on or before December 31st of the year preceding the relevant MIPS payment year.

(l) Public Reporting

The public reporting section of this proposed rule contains a policy proposal and RFI for improvements to the CMS Compare Tools hosted by the U.S. Department of Health and Human Services (HHS) available on clinician profile pages at *https://www.medicare.gov/care-compare/* and in the Medicare Provider Data Catalog available at *https://data.cms.gov/provider-data/topics/doctors-clinicians*.

We propose to remove the requirement preventing public reporting of any performance data reported through an MVP on new improvement activity or Promoting Interoperability (PI) measure, objective, or activity during the first year in which it is included in such MVP. Under the removal of this requirement, performance information for new improvement activities and PI measures would be publicly reported on CMS Compare Tools during the first year in which the measures and activities are included in the program, regardless of reporting option.

We are also soliciting feedback on improvements to the current star rating assignment methodology for quality measure scores collected under the administrative claims collection type. With more information, we can determine whether an alternative methodology for star rating assignments is more appropriate for administrative claims quality measures prior to the public reporting of these scores on clinicians' profile pages on the Medicare.gov Compare Tool.

(2) Advanced APM Proposals

We are proposing to modify the application of the QP and partial QP status at § 414.1425 to ensure that only TINs participating in Advanced APMs receive additional incentive payments, both the APM Incentive Payment and the qualifying APM conversion factor.

We are proposing to clarify language at § 414.1425(c)(5) pertaining to when QP status is lost as a result of an APM Entity terminating participation from an Advanced APM.

We are proposing that for certain Alternative Payment Models where a participation list is not practicable that they would not provide a participation list for as a MIPS APM or APM participation for QPP purposes.

We are proposing to modify the conditions by which we award credit for Improvement Activities specified at § 414.1355 to ensure that participants receive credit.

We are proposing to modify the thresholds established at § 414.1430 in accordance with the Consolidated Appropriations Act, 2026.

2. Definitions

At § 414.1305, we are proposing to revise definitions of the following terms:

- APM Incentive Payment
- Collection type
- High priority measure
- MVP Participant
- Participation List

These terms and definitions are discussed in detail in the relevant sections of this proposed rule.

3. Transforming MIPS: MIPS Value Pathway (MVP) Strategy

We play a leading role in transitioning the Federal health care system from Original Medicare payment toward value-based payment, incentivizing higher quality of care over higher

quantity of care. MIPS aims to drive value through the collection, assessment, and public reporting of data that informs and rewards the delivery of high-value care. We continue to focus on transforming health care delivery, driving higher value care, and increasing alignment with other CMS programs and initiatives to reduce burden. We intend to continue our efforts to align the Quality Payment Program with the broader aims of CMS to ensure patients receive the care they want and deserve by promoting prevention, wellness, and chronic disease management. We are guided by the CMS National Quality Strategy [372] which focuses on achieving the best outcomes and safest care across the full care journey through innovation and collaboration. We are implementing meaningful improvements designed to strengthen healthcare delivery and advance patient outcomes. Through these efforts, we strive to create a healthcare system that not only responds to chronic disease but works proactively to prevent it.

In the CY 2022 PFS proposed rule and CY 2025 PFS final rule, we stated our intent to transform MIPS and obtain more meaningful, comparable performance data, and drive higher value care through MVPs (86 FR 39356 and 89 FR 98346) and that we intended to propose a full transition to MVP reporting along with the Alternative Payment Model (APM) Performance Pathway (APP) reporting to support movement towards value-based payment (86 FR 65394 through 65396, 87 FR 70034, and 89 FR 98346). As noted in the CY 2025 PFS proposed rule (89 FR 62012), robust MVP availability and clinician coverage would be a precursor to sunsetting traditional MIPS. Through this proposed rule and future rulemaking, we acknowledge that we will need to develop policies to support MVP reporting for all MIPS eligible clinicians by the CY 2029 performance period/2031 MIPS payment year. We will continue engaging with specialty societies to identify gaps and opportunities, and leveraging additional policy options, as needed.

In this section, we are proposing to phase out traditional MIPS reporting for MIPS eligible clinicians not participating in the APP and are proposing to sunset traditional MIPS reporting beginning with the CY 2029 performance period/2031 MIPS payment year. The MVP reporting option offers aligned measures and activities across quality, cost, improvement activities, and Promoting Interoperability performance categories. MVPs focus on specific specialties, conditions, or patient populations to make reporting more meaningful. With increased MIPS eligible clinicians reporting MVPs, MVP comparative performance data may become valuable to patients and caregivers in evaluating clinician performance and making choices about their care. We are proposing that MIPS eligible clinicians participating in MIPS and not the APP, would be required to report the measures and activities in the selected MVP beginning in the CY 2029 performance period/2031 MIPS payment year. We also propose to include virtual groups in MVP reporting to ensure all MIPS eligible clinicians can report MVPs.

a. Overview

In the CY 2022 PFS final rule, we finalized the MVP reporting option for MIPS eligible clinicians beginning in the CY 2023 performance period/2025 MIPS payment year to serve as an additional reporting option (86 FR 65391 through 65394). Currently there are three reporting options: MVPs, traditional MIPS, and the APP. We noted that we created the MVP reporting pathway to improve value, reduce burden, and inform patient choice in selecting clinicians. We also stated the MVP framework will move MIPS forward on the path to value by offering a reporting option that connects measures and activities across MIPS performance categories, better informing and empowering patients to make decisions about their healthcare, and by helping clinicians to achieve better outcomes using robust and accessible healthcare data and interoperability (86 FR 65392).

We intend to propose to transform MIPS through a full transition to MVP reporting to allow reporting of both MVPs and the APP to support movement towards value-based payment. If the proposal to phase out traditional MIPS reporting for MIPS eligible clinicians not participating in the APP is finalized, there would be two reporting options in the Quality Payment Program: MVPs and the APP. The transition from clinicians selecting from a large inventory of measures and activities in traditional MIPS to reporting more clinically relevant measures and activities in MVPs represents a necessary progression in MIPS if we are to achieve our intended goals of connecting measures and activities across MIPS and providing meaningful data to inform and empower patients to make decisions about their healthcare. We introduced the MVP reporting pathway in the CY 2020 PFS final rule (84 FR 62946). In the CY 2021 PFS final rule, we established MVP Guiding Principles (85 FR 84845 through 84849). In the CY 2022 PFS final rule, we finalized that MVP scoring policies would align with traditional MIPS unless exceptions were noted (86 FR 65419 through 65422). In the CY 2022 PFS proposed rule, we requested feedback on the potential sunset of traditional MIPS as a reporting option beginning with the CY 2028 performance period/2030 MIPS payment year (86 FR 65396). In the CY 2023 PFS final rule, we indicated our intention that MVPs would be the only pathway for participation in MIPS in the future (87 FR 70035). We have made continued and substantial progress in developing an MVP inventory offering clinicians the ability to report an MVP with clinically relevant measures. As discussed in section IV.A.4.a.(1) of this proposed rule, we previously finalized 27 MVPs and are proposing three additional MVPs for the CY 2027 performance period/2029 MIPS payment year. If the three newly proposed MVPs are finalized, our MVP inventory would increase to 30, potentially resulting in coverage of approximately 98 percent of specialties for MIPS eligible clinicians based upon self-reported specialty designations data and MVP topic. Please see section IV.A.4.a.(1) of this proposed rule for more information on MVP development. Phasing out traditional MIPS reporting and full implementation of MVPs for MIPS eligible clinicians not participating in the APP will move MIPS away from a fragmented reporting approach toward a more meaningful, specialty-aligned framework. Further, MVPs will continue to advance the overall goals of the Quality Payment Program of aligning quality and payment, fostering accountability, and improving care and outcomes for people served by Medicare.

b. Background on Full MVP Implementation

The MVP framework was introduced in the CY 2020 PFS final rule (84 FR 62946 through 62948). In the CY 2022 PFS proposed rule, we noted our intent to sunset traditional MIPS in a future performance period and solicited public comments on: 1) the length of time MVP reporting should be voluntary; 2) the timing for when we should fully implement MVPs; and 3) sunsetting the traditional MIPS reporting option (86 FR 39356). Responding interested parties

[372] *https://www.cms.gov/medicare/quality/meaningful-measures-initiative/cms-quality-strategy.*

supported MVP goals and a transparent, gradual transition to MVPs with voluntary MVP reporting, with adequate time to prepare for reporting an MVP (86 FR 65391 through 65396). In the CY 2022 PFS final rule, we finalized that voluntary reporting of MVPs would start in the CY 2023 performance period/2025 MIPS payment year. Additionally, we stated that we considered input from interested parties who encouraged implementation of MVPs through a gradual process that allows MVP participants and third-party intermediaries time to adapt to changes in policy, requirements, and programming updates that would need to occur in technology systems (86 FR 65394 to 65396).

In the CY 2025 PFS proposed rule, we issued a Request for Information (RFI) on the development of a timeline for the full transition to MVPs. We sought feedback on clinician readiness for MVP reporting and MIPS policies needed to sunset traditional MIPS to allow for full MVP implementation in the CY 2029 performance period/2031 MIPS payment year (89 FR 62011 and 62012). We noted full implementation of MVPs represents an evolution in MIPS towards value-based payment using meaningful sets of measures and activities reported by clinicians, including specialists. We stated MVPs would reduce the complexity of reporting burden associated with MIPS inventory of measures and activities through a targeted set of measures and activities that relate to specialties or conditions, aligning quality and cost measures, improvement activities, and a foundational layer of Promoting Interoperability measures and population health measures. We also noted that full implementation of MVPs would allow for closer comparisons of the performance of clinicians within the same specialty submitting an MVP and would provide improved data for patients.

In response to the RFIs that sought feedback on full MVP implementation, interested parties provided many comments regarding activities and policies that may support full MVP adoption. One key concern they noted was the limited ability of clinicians to choose the quality measures to report within an MVP. We recognize that full MVP implementation may limit the choice of measures and activities compared to those currently afforded by policies in traditional MIPS. However, MVPs include a set of clinically relevant measures and activities that provide an opportunity for MIPS performance data to better reflect clinicians' scope of care.

With the full implementation of MVPs, clinicians not reporting the APP would be able to select an MVP relevant to their scope of care and further choose the quality measures and improvement activities within the selected MVP that reflect the care provided. Widescale adoption of MVPs, using a standardized connected set of measures and activities for a specialty or medical condition, may generate important and meaningful information for patients to be able to compare the performance of clinicians on the same or similar sets of measures. Additionally, we refer readers to section IV.A.4.d.(1)(c)(i) of this proposed rule for details on the proposed MIPS core measure requirement for traditional MIPS and MVP reporting. The proposed MIPS core measure requirement would further clarify how MVPs would emphasize and increase reporting on select quality measures that are most important to clinicians and patients and reflect the care that is central to an applicable specialty, medical condition, or episode of care. Interested parties indicated that full implementation of MVPs requires the ability of all specialties to participate. In the CY 2026 PFS final rule, we finalized six new MVPs and updated 21 previously finalized MVPs. MVPs were developed and added to create a comprehensive inventory based on MVP clinical issues and targeted specialties/subspecialties (90 FR 49847). We refer readers to section IV.A.4.a.(1) of this proposed rule regarding the three new proposed MVPs for the CY 2027 performance period/2029 MIPS payment year.

In response to the RFIs that sought feedback on full MVP implementation (89 FR 62011 through 62016), some interested parties voiced concerns that full implementation of MVPs and subgroup policies would result in increased reporting burden. The commenters also expressed concern about the subgroup reporting requirement for multispecialty groups reporting an MVP beginning in the CY 2026 performance period/2028 MIPS payment year. As further discussed in this paragraph, we have modified our MVP and subgroup reporting policies to address some of these concerns. Our current MVP and subgroup reporting policies are aligned with the goal for full MVP implementation and would encourage increased participation from specialists. As we have greater MVP adoption and subgroup reporting, we anticipate specialist reporting through MVPs would increase the amount of performance data available to patients when selecting a clinician (89 FR 62012). In the CY 2022 PFS final rule (86 FR 65397), we finalized the subgroup reporting option for clinicians participating in MVP reporting. We noted that the intent of the subgroup reporting policies is to move away from large multispecialty groups reporting on the same set of measures, which may not be relevant or meaningful to all specialists that participate within a multispecialty group. In addition, subgroup reporting addresses feedback from interested parties over the prior years that large multispecialty groups tend to submit data that is not necessarily representative of all the clinicians that make up that group. To address concerns from interested parties on the MVP subgroup reporting burden, we finalized policies in the CY 2026 PFS final rule (90 FR 49842 through 49846) allowing a group practice to self-attest and identify the need to divide into subgroups based on the scope of care provided by clinicians in their group. We will continue to monitor subgroup participation in MVP reporting to determine potential policy changes in the future as we transition to full MVP implementation for MIPS eligible clinicians not participating in the APP.

Historically, we have received feedback from MIPS eligible clinicians in small group practices, defined at § 414.1305 as a TIN consisting of 15 or fewer eligible clinicians during the MIPS determination period, about the lack of adequate resources to successfully meet MIPS reporting requirements. To provide flexibility and to prevent additional burden for small groups we finalized a policy to maintain the MVP group reporting option for small practices, without the need for small practices to form subgroups (90 FR 49842 to 49843). We also note that MVP policies continue to offer the same scoring flexibilities for small group practices available to small group practices reporting traditional MIPS finalized at § 414.1380(b)(1) (86 FR 65419 through 65422). We refer readers to sections IV.A.4.d.(1)(c)(iii)(C) and IV.B.1.b.(2) of this proposed rule for details on the proposed exemption of small practices from the MIPS core measure reporting requirements and proposed scoring flexibilities for small practices.

Additionally, we will continue to monitor the subgroup reporting burden of larger group practices to determine if additional flexibilities are needed in the future for multispecialty groups that are not small practices to participate as subgroups. We believe the potential increase in the reporting burden for larger groups to divide into subgroups is outweighed by the benefit of additional

information clinicians and patients will receive through increased specialist reporting data (86 FR 65393 and 65394).

Finally, interested parties were interested in how scoring rules may work with full MVP implementation for clinicians with limited measure choices. MVP scoring policies, which rely on traditional MIPS scoring policies finalized at § 414.1380(b)(1), were established in the CY 2023 PFS final rule. More recently, in response to the RFI (89 FR 62011 through 62016) interested party feedback voiced concerns about quality measures within MVPs that cannot be scored for reasons beyond the clinician's control, such as measures without benchmarks, and the potential for some topped out measures to have a scoring cap. As noted previously, the existing scoring policies established in traditional MIPS specific to small group practices and the scoring policies related to measures without benchmarks, measures that do not meet case minimum, and measures that do not meet data completeness requirements also apply to MVP scoring (86 FR 65419 through 65420). We acknowledge concerns from clinicians with limited choice of measures and, in the CY 2026 PFS final rule, we finalized expansion of our approach for identifying measures impacted by limited choice and subject to topped-out measure benchmarks would extend to MVPs (90 FR 49903 through 49908). Additionally, we refer readers to section IV.B.1.b.(3) of this proposed rule for proposals on the scoring of topped out measures included in MVPs, to address concerns that interested parties raised with respect to those clinicians with limited measure choice and scoring caps for topped out measures. We will continue to evaluate the performance of clinicians impacted by limited measure choice as the program evolves and may refine the topped out scoring policies as needed in the future. Commenters responding to the RFI also requested that we develop scoring policies to ensure scoring between MVPs is equitable. We agree that ensuring scoring between MVPs is equitable is an important goal of MVP reporting. Therefore, we have solicited feedback on the future direction of MVP scoring in an RFI in section IV.B.1.e. of this proposed rule.

c. Proposal To Update Timeline for Full MVP Implementation

As discussed previously in section IV.A.3.a. of this proposed rule, MVP reporting became available for clinicians beginning in the CY 2023 performance period/2025 MIPS payment year (86 FR 65394 to 65396). In previous PFS rules, we have stated our intention to fully transition to MVPs and to sunset traditional MIPS (85 FR 50279 and 50284, 86 FR 65394 through 65396). We are concerned that continuing to maintain the traditional MIPS reporting option may impede MVP adoption for eligible clinicians. Additionally, it may cause slow adoption which may delay the intended benefits of MVPs, including simplification of MIPS and improving comparable clinician performance data that helps to drive value and inform clinician selection by patients. In addition, the availability of two MIPS reporting options, MVPs and traditional MIPS, creates challenges for developing and refining MVP policies over time due to limited MVP reporting resulting from continued clinician reliance on the traditional MIPS reporting option. However, in establishing the sunset date we are also cognizant of the need to provide ample time for clinicians to prepare for full MVP reporting. Therefore, we propose to phase out traditional MIPS reporting for MIPS eligible clinicians not participating in the APP beginning in the CY 2029 performance year/2031 MIPS payment year. Transitioning to MVP implementation alongside the option to participate through the APP would support efforts to transform MIPS for clinicians and patients who rely on program performance information. We note that traditional MIPS reporting will be available to clinicians through the CY 2028 performance period/2030 MIPS payment year. This proposed timeline will have provided a period of 6 years for voluntary MVP reporting, allowing clinicians time to engage in the development of the MVP inventory, update their systems and work processes to prepare for MVP reporting, and gain experience with MVP reporting. Clinicians would continue to be able to report through either traditional MIPS or via MVPs through the CY 2028 performance year/2030 MIPS payment year.

We currently believe that the CY 2029 performance year/2031 MIPS payment year would be an appropriate timeline for full implementation of MVPs. Since the current and proposed inventory of MVPs listed in section Appendix 2 of this proposed rule offers the opportunity for approximately 98 percent of MIPS eligible clinicians based on self-reported specialty designations and MVP topic to report through an MVP, we anticipate that nearly all MIPS eligible clinicians will be able to choose an applicable MVP. As discussed in section IV.A.4.a.(1) of this proposed rule, we continue developing new MVPs that are relevant and meaningful for MIPS eligible clinicians. We intend to explore a range of strategies for transitioning to full MVP reporting, including, but not limited to, proposing additional MVPs. We recognize that clinicians may currently lack applicable measures and may not have an applicable MVP or may be unable to report a sufficient number of measures in an MVP. However, for subspecialists without many applicable and available measures in the MIPS measure inventory, we are on track to developing reporting options or exploring alternatives to reporting MVPs by CY 2029. For example, we could consider developing a process for clinicians to indicate at the time of MVP registration that no available MVP in the MVP inventory includes applicable and available measures and activities. Alternatively, we could consider expanding measure denominators as applicable to strengthen specialty coverage for clinicians with limited applicable measures. We could also consider policies that allow us to review available and applicable measures for clinicians in the selected MVP to reduce the denominator of the quality performance category to score the quality performance category with fewer than four measures. Delaying the timeline for full implementation of MVPs would not result in a significantly greater availability of MVPs for the remaining specialists who currently lack applicable measures, since the MVPs are built on the measures and activities available in the current traditional MIPS measure inventory. With the majority of specialists having available MVPs, policies for clinicians with few quality measures, and 6 years of availability of MVPs we believe we should move forward with full implementation of MVPs.

Beginning in the CY 2029 performance period/2031 MIPS payment year, we propose that all MIPS eligible clinicians, with the exception of clinicians reporting through the APP, would report through an MVP. Specifically, we propose to add under § 414.1365(a)(2) that beginning in the CY 2029 performance period/2031 MIPS payment year, except for clinicians reporting under the APM performance pathway pursuant to § 414.1367, all MIPS eligible clinicians must report through an MVP.

We request public comment on this proposal.

d. Proposal to Include Virtual Groups in MVP Reporting

Section 1848(q)(5)(I) of the Act establishes the use of voluntary virtual

groups for certain assessment purposes. The statute requires the establishment and implementation of a process that allows an individual MIPS eligible clinician or a group consisting of not more than 10 MIPS eligible clinicians to elect to form a virtual group with at least one other such individual MIPS eligible clinician for a performance period. As determined in statute, individual MIPS eligible clinicians and groups forming virtual groups are required to make such election prior to the start of the applicable performance period under MIPS and cannot change their election during the performance period.

In the CY 2022 PFS final rule (86 FR 65394), we finalized a delay in the availability of MVP reporting for virtual groups. We noted that there are several considerations, such as implementation burden for interested parties and us, value of MVP reporting for these clinicians versus burden, scoring policies, and other issues that must be addressed prior to allowing clinicians in virtual groups to participate in MVP reporting. Therefore, we did not include virtual groups in the previously finalized definition of an MVP participant at § 414.1305 (86 FR 65392 through 65394). However, to comply with the statute, full implementation of MVPs must include a pathway for virtual groups to participate. For this reason, we propose to allow virtual groups to participate in MVP reporting beginning in the CY 2029 performance period/2031 MIPS payment year, aligning with the proposed timeline for full MVP implementation in section IV.A.3.c. of this proposed rule. This approach would allow time for us to further refine participation criteria and address potential barriers for virtual groups to participate in MVP reporting.

To include virtual groups in MVP reporting, we propose to revise the definition of an MVP participant at § 414.1305 to provide that, beginning in the CY 2029 performance period/2031 MIPS payment year, MVP participant means an individual MIPS eligible clinician, single specialty group, multispecialty group that meets the requirements of a small practice, virtual group, subgroup, or APM Entity that is assessed on an MVP in accordance with § 414.1365 for all MIPS performance categories. As we update the definition of an MVP participant to include virtual groups, we are interested in feedback from virtual groups about any concerns they have regarding MVP reporting.

We considered including virtual groups in MVP reporting beginning in the CY 2028 performance period/2030 MIPS payment year. We recognize that we would need to evaluate additional related policies before including virtual groups in MVP reporting. Under the current policy at § 414.1365(b), MVP participants must register during the performance period. We recognize that the inclusion of virtual groups in MVP reporting would therefore require these groups to register for MVP reporting, which would be an addition to the existing registration requirement to form a virtual group prior to the performance period. We are exploring options to mitigate the need for virtual groups to register a second time for MVP reporting. Additionally, we note that even with the proposed inclusion of virtual groups in MVP reporting, clinicians in virtual groups would be unable to participate as subgroups because the definition of a subgroup at § 414.1305 is limited to clinicians within a single TIN and therefore excludes virtual groups, which, by definition, are composed of clinicians across two or more TINs. Under § 414.1305, a subgroup is a subset of a group that includes at least one MIPS eligible clinician and is identified by the group TIN, a subgroup identifier, and each eligible clinician's NPI.

We request public comment on this proposal.

4. QPP Reporting and Data Submission

a. CY 2027 MVP Development and Maintenance

(1) Development of New MIPS Value Pathways (MVPs)

The development of MVPs is informed by the framework established in prior rulemaking (85 FR 84849 through 84856). In the CY 2023 PFS final rule (87 FR 70035 through 70037), we expanded the MVP development process to provide interested parties more opportunities to submit feedback on new candidate MVPs prior to the notice and comment rulemaking process. Consistent with these policies, we posted three MVP candidates for interested parties to review and provide feedback for consideration in this proposed rule. We refer readers to the Quality Payment Program website to review public feedback for each 2027 MVP candidate (*https://qpp.cms.gov/mips/candidate-feedback*).

In alignment with the MVP development process (85 FR 84849 through 84856; 87 FR 70035 through 70037) and feedback received from interested parties, we are proposing to adopt three new MVPs:

- Diabetic Disease;
- Hospitalist; and
- Hypertension.

We aim to continue developing new MVPs that are relevant and meaningful for MIPS eligible clinicians. The Diabetic Disease and Hypertension MVPs are specifically designed to address the prevention of chronic illnesses by including measures and activities aimed at reducing the incidence and impact of long-term conditions. Disease-specific MVPs allow for more targeted interventions, improved measurement accuracy, and support clinicians in delivering evidence-based care for high-risk populations. We refer readers to Appendix 3: MVP Inventory, in this proposed rule for a detailed description of each proposed new MVP.

We continue to encourage interested parties to utilize our established pre-rulemaking processes to develop and submit candidate quality and cost measures relevant to their specialty. Furthermore, we continue to develop MVPs based on needs and priorities, as described in the MVP Needs and Priorities document (*https://qpp-cm-prod-content.s3.amazonaws.com/uploads/1803/MIPS%20Value%20Pathways%20(MVPs)%20Development%20Resources.zip*).

(2) MVP Maintenance Updates to Previously Finalized MVPs

Beginning with the CY 2022 PFS final rule (86 FR 65998 through 66031) and continuing through the CY 2026 PFS final rule (90 FR 50376 through 50405), we have expanded the MVP inventory to include the following 27 MVPs:

- Adopting Best Practices and Promoting Patient Safety within Emergency Medicine;
- Advancing Cancer Care;
- Advancing Care for Heart Disease;
- Advancing Rheumatology Patient Care;
- Complete Ophthalmologic Care;
- Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes;
- Dermatological Care;
- Diagnostic Radiology;
- Focusing on Women's Health;
- Gastroenterology Care;
- Improving Care for Lower Extremity Joint Repair;
- Interventional Radiology;
- Neuropsychology;
- Optimizing Chronic Disease Management;
- Optimal Care for Kidney Health;
- Pathology;
- Patient Safety and Support of Positive Experiences with Anesthesia;
- Podiatry; and
- Prevention and Treatment of Infectious Disorders Including

Hepatitis C and Human Immunodeficiency Virus (HIV);
- Pulmonology Care;
- Quality Care for Patients with Neurological Conditions MVP;
- Quality Care for the Treatment of Ear, Nose, and Throat Disorders;
- Quality Care in Mental Health and Substance Use Disorder; and
- Rehabilitative Support for Musculoskeletal Care;
- Surgical Care;
- Value in Primary Care; and
- Vascular Surgery.

In this proposed rule, we are proposing modifications to 23 previously finalized MVPs with the addition and removal of measures and improvement activities based on the MVP development criteria (85 FR 84849 through 84854). Through these modifications, we can expand upon clinical concepts, advance health and wellness, address maintenance requests from interested parties, and remove measures and activities that would either be replaced by more robust measures or activities or are being proposed for removal from their respective MIPS inventory. We are also proposing to rename the Rehabilitative Support for Musculoskeletal Care MVP to Rehabilitative Support MVP to better reflect the measures and activities it includes.

Additionally, we are proposing modifications to all 27 previously finalized MVPs in alignment with the proposed implementation of MIPS core measures. In section IV.A.4.d.(1) of this proposed rule, we propose modifications to the current MVP quality reporting requirements at § 414.1365 to replace the current requirement for an outcome/high priority measure with one MIPS core measure included in the MVP. We revised the format of the MVP tables in Appendix 3: MVP Inventory of this proposed rule to include MIPS core measures for each previously finalized MVP. We also added a MIPS core measure table to the newly proposed MVPs. We refer readers to sections IV.A.4.d.(1) and IV.B.1.b. of this proposed rule where we discuss the proposed policies for MIPS core measures.

We refer readers to Appendix 3: MVP Inventory of this proposed rule for the proposed modifications and detailed descriptions to the previously finalized MVPs and the newly proposed MVPs.

We request public comment on these proposals.

b. APM Performance Pathway (APP)

(1) Overview

In the CY 2021 PFS final rule (85 FR 84859 through 84866), we finalized the APM Performance Pathway (APP) at § 414.1367 beginning with the CY 2021 performance period/CY 2023 MIPS payment year. The APP was designed as a reporting and scoring pathway available only to MIPS eligible clinicians identified on the Participation List or Affiliated Practitioner List of an APM Entity participating in a MIPS APM as defined in § 414.1305 (MIPS APM participants) (§ 414.1367(a)). The APP provides a predictable and consistent MIPS reporting option to reduce reporting burden for, and encourage continued APM participation by, these clinicians. We also established in the APP for Shared Savings Program ACOs providing that, beginning with the Shared Savings Program performance year 2021 (CY 2021 performance period/CY 2023 MIPS payment year), ACOs were required to report quality data for purposes of the Shared Savings Program via the APP (42 CFR 425.512(a)(3); 85 FR 84722).

In that same rule, we finalized a quality measure set (85 FR 84860 and 84861) for purposes of quality performance category scoring for the APP. For those MIPS eligible clinicians, groups, or APM Entities for whom a given measure is unavailable due to the size of the available patient population or who are otherwise unable to meet the minimum case threshold for a measure, we established that such measure would be removed from the quality performance category score for such MIPS eligible clinician, group, or APM Entity (85 FR 84861).

In the CY 2025 PFS final rule (89 FR 98562), we finalized a second, optional quality measure set within the APP, called the APP Plus quality measure set, to align with the Universal Foundation measure set. The measure set for CY 2026 performance year includes the current APP quality measures and two additional quality measures from the Adult Universal Foundation measure set. As discussed in the CY 2025 PFS final rule, we intended to incrementally add the remaining three Adult Universal Foundation measures by the CY 2028 performance period/2030 MIPS payment year. We also finalized a 1-year delay to the CY 2026 performance year/CY 2027 MIPS payment year in the incorporation of the Clinician and Clinician Group Risk-standardized Hospital Admission Rates for Patients with Multiple Chronic Conditions (Quality ID: 484) measure.

Further, for MIPS eligible clinicians, groups, and APM Entities reporting through the APP, we established in the CY 2021 PFS final rule (85 FR 84907) that we would not apply the quality measure scoring cap at § 414.1380(b)(1)(iv) in the event that a measure in the APP quality measure set is determined to be topped out. Because the APP quality measure set is fixed, we noted that it would not be appropriate to limit the maximum quality performance category score available to APP reporters. Should an APP quality measure be determined to be topped out, we would at that time consider amending the APP quality measure set through future rulemaking, if appropriate.

In the CY 2024 PFS final rule (88 FR 79329), we established the Medicare Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQMs) collection type in the APP quality measure set and finalized that the Medicare CQMs collection type would be available to only ACOs participating in the Shared Savings Program.

In the CY 2026 PFS final rule (90 FR 49849 through 49856) we updated quality measures in the original quality measure set and the APP Plus quality measure set, to reflect measures updates specified for the quality performance category.

(2) Updates to Quality Measures in the APP and APP Plus Quality Measure Set

In the CY 2021 PFS final rule, we adopted the original APP quality measure set (85 FR 84860 and 84861). In the CY 2025 PFS final rule, we finalized a phased approach to establish the APP Plus quality measure set over 4 years (89 FR 62024), including by incorporating into the APP Plus quality measure set the measures from the original APP quality measure set.

In the CY 2025 PFS final rule, we finalized a phased approach to establish the APP Plus quality measure set over 4 years (89 FR 62024). As finalized, the APP Plus quality measure set consisted of all the measures that were within the APP quality measure set (five Adult Universal Foundation measures and a separate quality measure) plus one additional measure from the Adult Universal Foundation measure set, with the intention of incrementally incorporating the remaining measures from the Adult Universal Foundation measure set by the CY 2028 performance year/CY 2030 MIPS payment year. We finalized this incremental approach in part to allow for both the eCQM and, for Shared

Savings Program ACOs, Medicare CQMs collection types to be developed and become available.

Because the APP is a feature within MIPS and therefore the quality measures used within the APP and APP Plus quality measure sets are all MIPS measures, any proposed updates we apply to MIPS measures also are incorporated into the APP and APP Plus quality measure sets, and proposed here accordingly. As discussed in Table Group D, in Appendix 1, of this proposed rule, we are proposing to adopt measure specification changes to the following measures that are part of the APP and APP Plus quality measure sets:

- *Diabetes:* Glycemic Status Assessment Greater Than 9% (Quality ID: 001) (eCQMs collection type)
- *Preventive Care and Screening*: Screening for Depression and Follow-up Plan (Quality ID: 134)
- Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups (Quality ID: 479)

In addition, we are proposing the removal of the following measures that, under the policies finalized in the CY 2025 PFS final rule (89 FR 98369 through 98371) are scheduled to be added to the APP Plus quality measure set for the CY 2027 performance period and for the CY 2028 performance period or the performance period that is 1 year after the eCQM specification becomes available, whichever is later, respectively:

- Initiation and Engagement of Alcohol and Other Drug Dependence Treatment measures (Quality ID: 305)
- Adult Immunization Status (Quality ID: 493)

We are proposing the removal of these two measures from the APP Plus quality measure set due to operational issues impacting the development of the collection types that were finalized in the CY 2025 PFS final rule for these two measures. Our proposal would address concerns expressed by ACOs with increasing the number of measures in the APP Plus quality measure set each year. ACOs have suggested maintaining a stable measure set as they transition to digital quality measurement. In the CY 2026 PFS dQM RFI, many commenters recommended that we maintain the APP Plus quality measure set as finalized without adding new measures to preserve resources for the transition to digital quality measurement and to consider challenges ACOs face in data aggregations for eCQM/MIPS CQM/Medicare CQM reporting (90 FR 49856).

These changes have been reflected in Tables C–BC2. Table C–BC2 also reflects the proposed creation of the new Medicare eCQMs collection type for Shared Savings Program ACOs reporting the APP Plus Quality measure set for performance year 2027 and subsequent performance years, as discussed in section XXX and Table Group D and DD, in Appendix 1, of this proposed rule.

BILLING CODE 4169–69–P

TABLE C-BC1: APM PERFORMANCE PATHWAY QUALITY MEASURE SET BEGINNING WITH THE CY 2026 PERFORMANCE PERIOD/2028 MIPS PAYMENT YEAR AND SUBSEQUENT PERFORMANCE PERIODS/MIPS PAYMENT YEARS

#	Measure Title	Collection Type	Submitter Type	Measure Type
001	Diabetes: Glycemic Status Assessment Greater Than 9%	eCQM/MIPS CQM/Part B Claims (all APP reporters)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Intermediate Outcome
134	Preventive Care and Screening: Screening for Depression and Follow-up Plan	eCQM/MIPS CQM/Part B Claims (all APP reporters)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Process
236	Controlling High Blood Pressure	eCQM/MIPS CQM/Part B Claims (all APP reporters)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Intermediate Outcome
321	CAHPS for MIPS	CAHPS for MIPS Survey	Third Party Intermediary	Patient Engagement/ Experience
479	Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups	Administrative Claims	N/A	Outcome
484	Clinician and Clinician Group Risk-standardized Hospital Admission Rates for Patients with Multiple Chronic Conditions	Administrative Claims	N/A	Outcome

TABLE C-BC2: APP PLUS QUALITY MEASURE SET FOR THE CY 2027 PERFORMANCE PERIOD/CY 2029 MIPS PAYMENT YEAR AND SUBSEQUENT PERFORMANCE PERIODS/MIPS PAYMENT YEARS

QUALITY #	MEASURE TITLE	COLLECTION TYPE	SUBMITTER TYPE	MEASURE TYPE
001	Diabetes: Glycemic Status Assessment Greater Than 9%	eCQM/MIPS CQM/Part B Claims (all APP reporters) Medicare CQM/Medicare eCQM (SSP ACOs only)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Intermediate Outcome
112	Breast Cancer Screening	eCQM/MIPS CQM/Part B Claims (all APP reporters) Medicare CQM/Medicare eCQM (SSP ACOs only)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Process
113	Colorectal Cancer Screening	eCQM/MIPS CQM/Part B Claims (all APP reporters) Medicare CQM /Medicare eCQM (SSP ACOs only)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Process
134	Preventive Care and Screening: Screening for Depression and Follow-up Plan	eCQM/MIPS CQM/Part B Claims (all APP reporters) Medicare CQM/Medicare eCQM (SSP ACOs only)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Process
236	Controlling High Blood Pressure	eCQM/MIPS CQM/Part B Claims (all APP reporters) Medicare CQM/Medicare eCQM (SSP ACOs only)	MIPS Eligible Clinician Representative of a Practice APM Entity Third Party Intermediary	Intermediate Outcome
321	CAHPS for MIPS	CAHPS for MIPS Survey	Third Party Intermediary	Patient Engagement/Experience
479	Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups	Administrative Claims	N/A	Outcome
484	Clinician and Clinician Group Risk-standardized Hospital Admission Rates for Patients with Multiple Chronic Conditions	Administrative Claims	N/A	Outcome

BILLING CODE 4169–69–C

c. Fast Healthcare Interoperability Resources®-Based Digital Quality Measurement in the Quality Payment Program and Other CMS Quality Programs—Request for Information

(1) Background

We are advancing quality measurement by transitioning existing quality measures and reporting processes to Fast Healthcare Interoperability Resources® (FHIR®)-based digital approaches. Digital quality measures [1] (dQMs) use standardized, interoperable digital data from multiple sources, including electronic health records (EHRs), to enable more comprehensive and timely assessment of care while reducing reporting burden. We continue to collaborate with Federal partners to advance health information technology and digital quality measurement policy, interoperability standards, and quality measurement infrastructure to support the transition to FHIR-based digital quality reporting. The establishment of the United States Core Data for Interoperability (USCDI)+ Quality Version 1 (V1), which identifies a common set of quality-related data elements to support more consistent and reusable data for quality measurement across programs, was released in 2026.[2] FHIR-based implementation guides and tools are also being developed to enable end-to-end FHIR-based digital quality measurement.[3] The 2026 US Quality Core Implementation Guide version 0.5.0 provides guidance for implementing USCDI+ Quality in FHIR to support consistent, interoperable

[1] Read more about the dQM transition in the Electronic Clinical Quality Improvement (eCQI) Resource Center here: *https://ecqi.healthit.gov/dqm/about-dqms.*

[2] Additional information on USCDI+ Quality Version 1, including the list of quality data elements and related implementation materials, is available at *https://uscdiplus.healthit.gov/uscdiplus?id=uscdi_record&table=x_g_sshh_uscdi_domain&sys_id=7ddf78228745b95098e5edb90cbb3525&view=sp#:~:text=of%20quality%20measures.-,Quality%20V1,-The%20USCDI%2B%20Quality.* The January 2026 announcement of the release of USCDI+ Quality Version 1 is available at *https://uscdiplus.healthit.gov/uscdiplus/en/announcing-the-release-of-uscdi-quality-version-1-january-2026?id=kb_article&table=kb_knowledge&sys_id=9ee9383c87f6fe108edc42e50cbb350b.*

[3] For example, see the eCQI Resource Center description of the FHIR Quality Measure Implementation Guide at *https://ecqi.healthit.gov/tool/hl7-quality-measure-ig.*

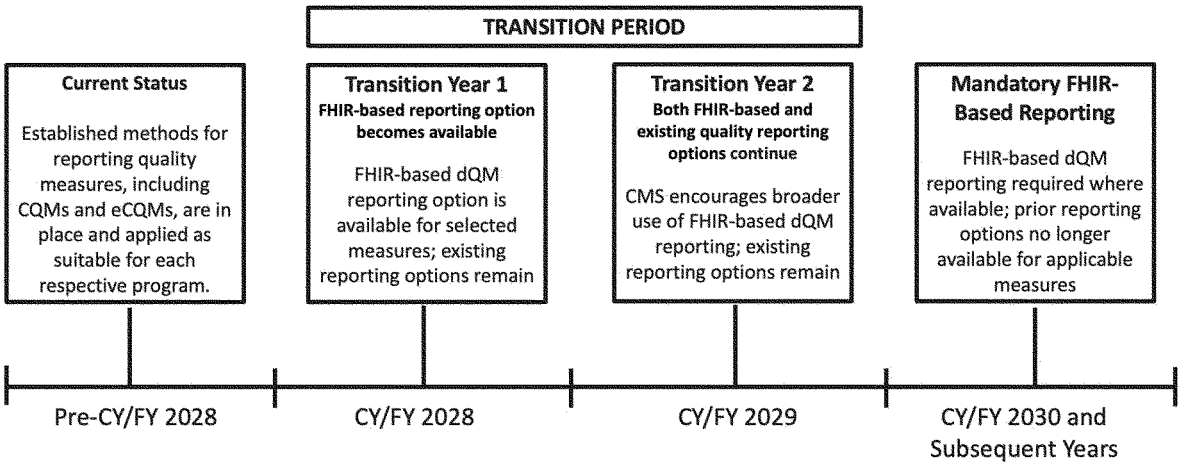
representation and exchange of quality data for quality measurement and reporting programs.[4] The Data Exchange for Quality Measures (DEQM) FHIR implementation guide provides guidance on how FHIR-based quality data can be reported and exchanged between providers, intermediaries, and payers.[5] Also available is the Measure Authoring Development Integrated Environment (MADiE), a software tool that enables creation and testing of eCQMs and FHIR-based dQMs within a single application, supporting modernized CMS quality measurement and reporting workflows.[6] Finally, the FHIR dQM specifications are also available.[7] Collectively, these developments are intended to provide a foundation for FHIR-based digital quality measurement and reporting. To further these goals, we seek public comment on the timeline for transitioning to FHIR-based quality measurement.

(2) Transition to FHIR-Based Quality Measurement in the Quality Payment Program and Other CMS Clinician and Hospital Quality Programs

The Quality Payment Program and other CMS clinician and hospital quality programs use clinical quality measures (CQMs) and electronic clinical quality measures (eCQMs), with current eCQM reporting supported through Quality Reporting Document Architecture (QRDA) files. We previously sought input on dQMs, including eCQMs, and FHIR-based quality measurement and reporting in multiple Medicare payment rules[8] and now seek input on a transition timeline, key milestones, and implementation considerations for FHIR-based quality reporting in the Quality Payment Program and other CMS clinician and hospital quality programs.

Subject to future notice and comment rulemaking, we are developing a phased transition to FHIR-based digital quality reporting for applicable measures that balances modernization goals with practical implementation considerations. Under this approach, for example, in the Quality Payment Program, we would introduce a 2-year transition period beginning with the CY 2028 performance period/2030 MIPS payment year during which existing quality collection types for CQMs and eCQMs, including eCQM reporting via QRDA files, would continue to be available while FHIR-based dQM options are introduced for selected measures, including both new and existing measures. Following this transition period, FHIR-based reporting would be required for those applicable measures that were available as FHIR-based dQM collection types during the transition period, beginning with the CY 2030 performance period/2032 MIPS payment year. An example of this timeline is illustrated in Figure C–C1.

Figure C-C1: TIMELINE FOR TRANSITION TO FHIR-BASED QUALITY REPORTING IN CMS QUALITY REPORTING PROGRAMS*



*We note that more specific adoption timelines may vary by measure and program based on feasibility, implementation complexity, and readiness of interested parties. Existing quality collection types for CQMs and eCQMs may include the following, as applicable by program: MIPS CQMs, Medicare CQMs, eCQM reporting via QRDA files, and proposed Medicare eCQMs. An additional timeline, titled "Transition Timeline for FHIR-based Digital Quality Measurement and Reporting," is also available on the QPP Resource Library at for more context.

We anticipate that the transition would begin with a limited set of measures for which FHIR-based digital specifications are available initially and would expand over time as technical infrastructure and implementation

[4] See the eCQI Resource Center description of the US Quality Core Implementation Guide (*https://ecqi.healthit.gov/qi-core/about*) and version 0.5.0 of the 2026 US Quality Core Implementation Guide (*http://fhir.org/guides/onc/us-quality-core/ImplementationGuide/fhir.onc.us-quality-core*).

[5] Additional information about the DEQM implementation guide is available at the eCQI Resource Center description: *https://ecqi.healthit.gov/tool/deqm-ig.*

[6] Additional information on MADiE is available at *https://www.emeasuretool.cms.gov/.*

[7] See *CMS https://ecqi.healthit.gov/sites/default/files/CMSdQMStrategicRoadmap_032822.pdfdigital* quality measurement specifications at .

[8] We have previously issued RFIs on digital quality measurement and FHIR-based reporting in multiple Medicare payment rules, including several Physician Fee Schedule (PFS) rules, such as CY 2022 PFS final rule (86 FR 65377 through 65382), CY 2023 PFS proposed rule (87 FR 46259 through 46262), and CY 2026 PFS final rule (90 FR 49855 through 49856). Additional requests for comment include the Health Technology Ecosystem RFI (90 FR 21034) and the Public Comment Period for Draft CMS FHIR® Digital Quality Measures (dQMs) request for comment available at*https://ecqi.healthit.gov/now-open-public-comment-period-draft-cms-fhir%C2%AE-digital-quality-measures-dqms.*

experience grow. Specific timelines for adopting FHIR-based digital quality reporting may need to vary by measure and program based on feasibility, implementation complexity, and program-specific requirements or reporting structures. We recognize that clear expectations and sufficient lead time are essential for successful implementation. Program-specific considerations for the Medicare Shared Savings Program (Shared Savings Program) are discussed in section IV.A.4.c.(3). In addition, we note that CMS Innovation Center models may have separate requirements and timelines related to FHIR-based digital quality measurement and reporting. We recognize resource constraints, and reporting burden may differ significantly for solo practitioners, small practices and provider facilities, and other practices and provider facilities in rural or underserved areas, and that these differences may warrant additional flexibilities or support.

TABLE C-C1: IMPLEMENTATION TIMELINE AND MILESTONES FOR TRANSITION TO FHIR-BASED DIGITAL QUALITY MEASUREMENT

Phase	Timeframe	Implementation Focus
Transition Period with FHIR-Based Reporting Options (Year 1)	CY and FY 2028*	Initial availability of FHIR-based digital quality measure (dQM) reporting option for selected measures, while existing quality reporting options for clinical quality measures (CQMs) and electronic clinical quality measures (eCQMs)** remain available for applicable measures and programs.
Transition Period with FHIR-Based Reporting Options (Year 2)	CY and FY 2029*	Continued availability of FHIR-based dQM reporting options for selected measures alongside existing quality reporting options for CQMs and eCQMs**, with CMS encouraging broader use of FHIR-based reporting.
Mandatory FHIR-Based Reporting	CY and FY 2030 and subsequent years*	FHIR-based dQM reporting required for measures that have been transitioned to FHIR-based digital quality specifications, with prior CQM and eCQM reporting options no longer available for those transitioned measures. Existing CQM and eCQM reporting options** would continue to be available for measures that have not yet transitioned to FHIR-based dQM reporting, as applicable under program-specific policies.

*Timeframes shown may correspond to performance periods, program years, reporting periods, or other CMS quality program-specific timeframes, as applicable. For example, CMS quality programs operate under both timings including CY and FY.

**Existing quality collection types for CQMs and eCQMs may include the following, as applicable by program: MIPS CQMs, Medicare CQMs, eCQM reporting via Quality Reporting Document Architecture (QRDA) files, and proposed Medicare eCQMs.

We invite public comment on the phased timeline, which we anticipate will start with a transition period with FHIR-based reporting options available alongside existing quality reporting options for the CY/FY 2028 and CY/FY 2029 performance periods, respectively. This transition period would then be followed by required FHIR-based reporting for applicable measures beginning with the CY 2030 performance period/2032 MIPS payment year.

- *Transition Approach and Design:* What factors should be considered in determining the structure of the 2-year transition period, during which FHIR-based reporting options and existing electronic quality reporting options for CQMs and eCQMs would be available concurrently? What are the scoring implications that CMS must consider during the transition period, when multiple reporting options are available? How should CMS approach data submission criteria, completeness, and other regulatory elements around quality measurement during the transition period?
- *Factors Affecting Readiness for FHIR-Based Reporting:* How does readiness for adopting FHIR-based quality measurement and reporting vary across different practice types, organizational settings, and supporting health IT entities (for example, EHR vendors, Qualified Clinical Data Registries (QCDRs), qualified registries, and other intermediaries)? What are the primary barriers and facilitators to adoption (for example, access to technology, workforce capacity, resources)? Specifically, what can be done to support technology readiness, testing needs, and measure availability? What strategies, technical assistance, policies, and scoring approaches would be most effective in helping reporting entities transition to FHIR-based reporting? In particular, how do these factors differ for solo practitioners, small practices and provider facilities, and other practices and provider facilities in rural or underserved areas, and what specific types of technical assistance, shared services, or policy flexibilities would be most helpful for these practices to successfully participate in FHIR-based quality reporting? We invite comment on existing clinician capabilities to begin the transition to FHIR-based quality reporting, challenges in using these approaches, and insights from early implementation that may inform future FHIR-based quality reporting activities.
- *General Solicitation of Comments:* We welcome comments on any additional issues, opportunities, or considerations related to the transition to FHIR-based digital quality measurement for the Quality Payment

Program and other CMS clinician and hospital quality programs for topics not specifically addressed earlier in this section.

(3) Additional Considerations for Shared Savings Program Transition to FHIR-Based Quality Measurement

As finalized in the CY 2025 PFS final rule, Shared Savings Program ACOs are required to report the Alternative Payment Model (APM) Performance Pathway (APP) Plus quality measure set beginning with the 2025 performance year (89 FR 98105).

We are seeking input from interested parties, ahead of future policy decisions, on a phased transition to FHIR-based digital quality reporting for applicable measures [9] under which we would introduce a 2-year transition period beginning with the 2028 performance period. During the transition period, existing quality reporting options [10] for Shared Savings Program ACOs would continue to be available while FHIR-based dQM options are introduced for selected measures. For the Shared Savings Program, the transition to FHIR-based dQMs builds upon the existing eCQM reporting infrastructure used for the APP Plus quality measure set (including APP/APP Plus measure alignment and current electronic reporting approaches) while introducing FHIR-based specifications for dQMs and related software tools, such as the Measure Authoring Development Integrated Environment (MADiE), so that Shared Savings Program ACOs would have a feasible pathway to adopt FHIR-based quality measurement. Following this transition period, FHIR-based reporting would be required for those applicable measures that were available as FHIR-based dQM reporting options during the transition period, beginning with the 2030 performance period. For example, Shared Savings Program ACOs would need to be prepared, by the 2030 performance period, to report each applicable APP Plus measure via FHIR-based digital quality reporting where a FHIR-based dQM specification exists for that measure. For APP Plus measures that do not have FHIR-based dQM specifications following the transition period, Shared Savings Program ACOs would continue to use applicable existing reporting mechanisms (for example, MIPS CQMs, Medicare CQMs, eCQM reporting via QRDA files, and proposed Medicare eCQMs) until FHIR-based dQM options are developed and adopted through future rulemaking. We recognize that clear expectations and sufficient lead time are essential for successful implementation, so we are clearly stating our planned timeline to avoid confusion among participants, in particular Shared Savings Program ACOs which, due to their organizational complexity, may require a longer lead time than MIPS reporting clinical groups.

As noted in section III.G.4.b.(2) of this proposed rule, we are also pursuing proposals in the Shared Savings Program to encourage the use of other pathways for using FHIR-enabled capabilities in certified health IT to support quality measurement reporting by ACOs and demonstrate use of CEHRT. This approach would offer another avenue for ACOs to gain experience with supporting quality measurement reporting using FHIR in anticipation of the transition to dQMs.

We invite public feedback on the phased timeline which starts with a 2-year transition period followed by required FHIR-based reporting for applicable measures.

- *Request for Information:* In addition to the questions included in section IV.A.4.of this proposed rule, we request public input on the technical assistance needed by organizations and on whether support and informational needs may differ for entities with more complex reporting environments, such as multi-taxpayer identification number (multi-TIN) ACOs, APM Entities, or providers operating across multiple EHR systems.

d. MIPS Performance Category Measures and Activities

(1) Quality Performance Category

(a) Background

Section 1848(q)(1)(A)(i) and (ii) of the Act requires the Secretary to develop a methodology for assessing the total performance of each MIPS eligible clinician according to certain specified performance standards and, using such methodology, to provide for a final score for each MIPS eligible clinician. Section 1848(q)(2)(A)(i) of the Act provides that the Secretary must use the quality performance category in determining each MIPS eligible clinician's final score, and section 1848(q)(2)(B)(i) of the Act describes the measures that must be specified under the quality performance category.

We refer readers to §§ 414.1330 through 414.1340 and the CY 2017 and CY 2018 Quality Payment Program final rules (81 FR 77097 through 77162 and 82 FR 53626 through 53641, respectively), and the CY 2019 through CY 2026 PFS final rules (83 FR 59754 through 59765, 84 FR 63949 through 62959, 85 FR 84866 through 84877, 86 FR 65431 through 65445, 87 FR 70047 through 70055, 88 FR 79329 through 79338, and 89 FR 98381 through 98390, and 90 FR 49856 through 49859, respectively) for a description of previously established policies and the statutory basis for policies regarding the quality performance category. In this proposed rule, we are proposing to:

- Amend the definition of the term ''collection type'' to include the Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs).
- Implement the MIPS core measure designations for quality measures in traditional MIPS and MVPs.
- Remove the high priority designation from MIPS quality measures.
- Remove the high priority designation from quality measure retention consideration.
- Replace the requirement to report a high priority measure with the requirement to report a MIPS core measure; and require an attestation process for cases in which a MIPS core measure is not available and applicable.
- Exempt clinicians in small practices from the MIPS core measure requirement and the attestation process.
- Amend the quality performance category data submission criteria at § 414.1335 and § 414.1365 to require MIPS core measure reporting with an attestation process.
- Amend the data submission criteria for the Medicare CQMs collection type.
- Establish the data submission criteria for the Medicare eCQMs collection type.
- Amend the data completeness criteria for the Medicare CQMs collection type.
- Establish data completeness criteria for the Medicare eCQMs collection type.
- Modify the MIPS quality measure set as described in Appendix 1 of this proposed rule, including the addition of new measures, updates to specialty sets, removal of existing measures, and substantive changes to existing measures.

(b) Proposal To Update Definition of Collection Type

With the proposed establishment of a new collection type, the Medicare Electronic Clinical Quality Measures for

[9] For Shared Savings Program ACOs, applicable measures include the five current eCQMs and proposed Medicare eCQMs in the APP Plus quality measure set.

[10] Existing quality reporting options for Shared Savings Program ACOS would include MIPS CQMs, Medicare CQMs, eCQM reporting via Quality Reporting Document Architecture (QRDA) files, and proposed Medicare eCQMs.

Accountable Care Organizations (ACOs) Participating in the Medicare Shared Savings Program (Medicare eCQMs) specific to the APM Performance Pathway (APP) as described in section XXX of this proposed rule, we are proposing to amend the definition of the term ''collection type'' to include Medicare eCQMs to account for the new collection type available only to Medicare Shared Savings Program ACOs meeting the reporting requirements of the APP. Specifically, starting with the CY 2027 performance period/2029 MIPS payment year, we are proposing to amend the definition of the term ''collection type'' in § 414.1305 to mean a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: Electronic clinical quality measures (eCQMs); MIPS clinical quality measures (MIPS CQMs); Qualified Clinical Data Registry (QCDR) measures; Medicare Part B claims measures; CMS Web Interface measures (except as provided in paragraph (1) of this definition, for the CY 2017 through CY 2022 performance periods/2019 through 2024 MIPS payment years); the CAHPS for MIPS survey measure; administrative claims measures; Medicare Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQMs); and Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs).

We request public comment on this proposal.

(c) Proposals To Modify Quality Data Submission Criteria

(i) Proposal To Designate MIPS Core Measures

In the CY 2026 PFS proposed rule (90 FR 32702), we published a Core Elements Request for Information (RFI) soliciting feedback on how to encourage MVP reporting on key quality measures, or ''core'' measures, that reflect the essential components of care. One goal of MIPS reporting, particularly with the transition to MVPs, is to provide patients with comparative clinician performance data so they can make the most informed decisions about their care. The number of MIPS quality measures available for clinicians to choose from in traditional MIPS reduces the standardization of performance data. While MVPs reduce the number of quality measures for clinicians to choose from, MVPs still provide a degree of measure choice that may not produce sufficient comparative performance data on standardized measures to support patient choice of care. In the Core Elements RFI in the CY 2026 PFS proposed rule (90 FR 37021 and 37022), we sought feedback on a potential reporting requirement in which clinicians reporting an MVP would be required to select and report one quality measure from a subset of ''core'' quality measures in each MVP, which would count as one of the four quality measures required in MVP reporting. MVP reporting requirements for the other performance categories would be unchanged. MIPS core measures would be limited to measures that are most reflective of the care that is unique to each MVP's specialty or medical condition. In response to the Core Elements RFI in the CY 2026 PFS proposed rule (90 FR 32702), commenters shared concerns that MIPS core measures may not be applicable to their scope of care and that a MIPS core measure reporting requirement could add complexity to MVP reporting. We have taken this commenter feedback into consideration in our proposal of the MIPS core measures policy and in our proposed modifications to the quality performance category data submission criteria for traditional MIPS and MVPs.

One of the goals of implementing MIPS core measures is to provide patients with comparative clinician performance data. This would enable patients to make better assessments of the quality of care provided by requiring clinicians within a given specialty to report on a narrower group of measures. This would also emphasize and increase reporting on select quality measures that we believe are the most reflective of the care central to an applicable specialty, medical condition, or episode of care. In developing the MIPS core measure policy, we evaluated several alternative approaches. First, when considering how to procure more robust comparative performance data, we considered mandating clinicians reporting an MVP be required to report the same MIPS quality measure. This approach was not consistent with section 1848(q)(2)(D)(i) of the Act, nor did it achieve intended policy goals of generating more comparative clinician performance data on key quality measures, since what matters most for high-quality care in one specialty may differ from another. Additionally, cross-cutting quality measures, while applicable to the majority of MIPS eligible clinicians, may not be applicable to all, especially bearing in mind subgroup reporting. Expanding upon this idea, we also examined the possibility of a uniform subset of quality measures that would be consistent across all MVPs, and from which clinicians would be required to report one to two quality measures. While having the same subset of measures provides better coverage of the variety of scopes of care provided by MIPS eligible clinicians, we remain concerned that a uniform subset of quality measures would not sufficiently account for the variety of MIPS eligible clinicians' scopes of care while meaningfully assessing quality performance.

In focusing on the goal of providing patients and clinicians with ''comparative performance data,'' particularly among clinicians practicing within the same clinical specialty or providing care to patients with a specific medical condition, we considered whether to use existing population health measures or to develop new administrative claims-based measures. While these approaches would allow for automatic capture of data, there are still constraints in applicability across MIPS eligible clinicians in addition to resources and feasibility. Given these findings, we determined that the most prudent way to capture meaningful comparative data and provide patients with better insight into the quality of care provided was to create a curated set of core quality measures for each MVP. The proposed list of MIPS core measures was selected because we determined these measures were most reflective of the care central to a clinical specialty or medical condition and would be the measures that the MIPS eligible clinician would be required to report from within that MVP.

For each MVP, we propose to select the MIPS core measures from the list of MIPS quality measures already assigned to the MVP because the quality measures within each MVP are the measures that are clinically relevant to the MVP's specialty or medical condition, and the proposed MIPS core measures are intended to be most reflective of the care that is central to the MVP's specialty or medical condition. The selection process focused on existing MIPS quality measures and quality measures proposed for the CY 2027 performance period/2029 MIPS payment year.

From this list, we then propose to select a minimum of three MIPS core measures per MVP. We may designate more than three MIPS core measures within an MVP if we determine more than three measures must be selected to reflect the care central to the subspecialties within that MVP.

Selection of the MIPS core measures would be based on the following factors:

- Whether the measure is an outcome-based measure;
- Measure collection type availability and the clinician's ability to meet reporting requirements to the extent practicable. Qualified Clinical Data Registry (QCDR) measures were not considered for MIPS core measure selection to ensure MIPS core measures are broadly available and accessible for all eligible clinicians;
- Measure adoption and current and historic performance rates for each measure, to be in alignment with section 1848(q)(3) of the Act which states that the Secretary shall consider historical performance standards and opportunity for continued improvement in establishing performance standards; and
- Whether the measure is most reflective of the care that is central to the clinical focus of the selected MVP, represents best practices essential to the MVP's specialty or medical condition, or addresses important areas for improving care.

We propose that the MIPS core measure designation would apply to quality measures in both traditional MIPS and MVPs. Establishing a set of unified key quality measures across both reporting pathways promotes alignment, reduced reporting complexity for clinicians reporting both traditional MIPS and MVPs and is operationally feasible. While the proposed MIPS core measures were selected from MVPs, the proposed MIPS core measure inventory would include over 70 quality measures. We believe these measures represent key aspects of care across a variety of specialties and medical conditions. The proposed MIPS core measures inventory also overlaps with the MIPS quality measures currently designated as high priority measures. Given the proposed removal of high priority designation for MIPS quality measures, the MIPS core measure inventory would not only support reporting within MVPs but would also be applicable to clinicians reporting via traditional MIPS. Additionally, it would provide sufficient data for benchmarking for the MIPS core measures once we phase out traditional MIPS reporting and transition to full implementation of MVP reporting, as proposed in section IV.A.3.c. of this proposed rule.

As detailed in section IV.A.4.d.(1)(c)(iii)(B) of this proposed rule, we are proposing that clinicians reporting through the traditional MIPS reporting option would select from the complete inventory of available MIPS core measures for the performance period. Whereas clinicians reporting through the MVP reporting option would select the applicable MIPS core measures from the core measures identified within their chosen MVP. As discussed in section IV.A.4.a.(2) of this proposed rule, we propose to revise the format of the MVP tables in Appendix 3: MVP Inventory of this proposed rule to include MIPS core measures for each previously finalized MVP. We also added a MIPS core measure table to the newly proposed MVPs. Further, we propose, beginning with the CY 2027 performance period/2029 MIPS payment year, to establish a MIPS core measure designation applicable to selected quality measures contained in the MIPS quality measure inventory and the MVP inventory found in the Appendices of this proposed rule.

We request public comment on these proposals.

(ii) Proposal To Remove High Priority Measure Designation and High Priority Quality Measure Retention Consideration

In the CY 2019 PFS final rule (83 FR 59761), we finalized that beginning with the CY 2019 performance period/2021 MIPS payment year, the term ''high priority measure'' is defined at § 414.1305 as an outcome (including intermediate-outcome and patient-reported outcome), appropriate use, patient safety, efficiency, patient experience, care coordination, or opioid-related quality measure. In the CY 2023 PFS final rule (87 FR 70047 through 70049), we finalized an amended definition of the term ''high priority measure'' to include quality measurement pertaining to health equity. In the CY 2026 PFS final rule (90 FR 49857), we finalized at § 414.1305 an amended definition of the term ''high priority measure'' to mean an outcome (including intermediate-outcome and patient-reported outcome), appropriate use, patient safety, efficiency, patient experience, care coordination, or opioid-related quality measure, beginning with the CY 2026 performance period/2028 MIPS payment year.

In the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77785) and subsequent Quality Payment Program and PFS rules (82 FR 53965 through 54174, 83 FR 60097 through 60285, 84 FR 63205 through 63513, 85 FR 85045 through 85368, 86 FR 65686 through 65968, 87 FR 70250 through 70633, 88 FR 79556 through 79964, 89 FR 98599 through 98957, and 90 FR 50036 through 50353), we designated certain quality measures as high priority in the MIPS quality measure inventory found in the Appendices of the rules for the applicable performance period to allow MIPS eligible clinicians to easily identify which measures meet the definition of a high priority measure at § 414.1305 and satisfy the reporting requirement. Additionally, in the CY 2022 PFS final rule (86 FR 65998 through 66031) and subsequent PFS rules we designated high priority quality measures in the MVP inventory found in the Appendices. The Explore Measures and Activities Tool on the QPP website (*https://qpp.cms.gov/reporting-requirements/measures-activities/explore*) also indicates which quality measures are designated as high priority in traditional MIPS and MVP reporting.

Given the proposed implementation of the MIPS core measure designation in section IV.A.4.d.(1)(c)(i) of this proposed rule, which identifies a subset of measures that reflect the essential components of care specific to a given specialty, medical condition, or episode of care, we are proposing to remove the high priority designation from MIPS quality measure inventory and the MVP inventory. The proposed MIPS core measures intend to increase reporting on select quality measures that are most reflective of the care central to a particular specialty, medical condition or episode of care, while providing patients with more comparative clinician performance data. We considered maintaining the high priority designation since many of the proposed MIPS core measures are high priority measures. However, the high priority designation does not appropriately capture a measure's relevance to a specific clinical specialty, medical condition or episode of care. We identify and designate quality measures that reflect agency-wide priorities as high priority in our programs through myriad ways such as using the MIPS high priority definition, developing the Universal Foundation, and implementing the Core Quality Measures Collaborative (CQMC). However, the proposed MIPS core measure designations specifically represent key quality measures that reflect the measure's relevance to a specific clinical specialty, medical condition or episode of care for clinicians and patients for each MVP and essential best practices to the MVP's clinical topic. The significant overlap in the proposed MIPS core measures with the MIPS high priority measures means we would still largely capture agency-wide priorities but with a greater emphasis on supporting intended MIPS policy goals of providing robust quality

measure data relevant to the scope of care for a specialty or medical condition. Additionally, maintaining the high priority measure designation could add complexity and confusion for clinicians given the overlap of the existing high priority measures and the proposed MIPS core measures. While we acknowledge the overlap in intended goals for high priority measures and MIPS core measures, we anticipate that the proposed MIPS core measures, with a selection emphasis on outcome-based measures, would provide a more targeted set of measures, focused on more meaningful improvement in the quality of care related to each MVP specialty or medical condition. Therefore, to implement the proposed MIPS core measure designation as described in section IV.A.4.d.(1)(c)(i) of this proposed rule, we are proposing to remove the high priority designation from the MIPS quality measure and the MVP inventory in Appendices 1 and 3 of this proposed rule.

Additionally, in the CY 2019 PFS final rule (83 FR 59765) at § 414.1330(c)(2), we revised the approach to remove quality measures to include considerations for retaining MIPS quality measures that otherwise meet the criteria for removal, including ''whether the MIPS quality measure is designated as high priority or not.'' To align with the proposed removal of high priority designation from MIPS quality measures, we would no longer include the use of a high priority measure designation as one of the considerations for retaining a MIPS quality measure. Therefore, we propose to update the existing quality measure retention consideration at § 414.1330(c)(2)(iv) to state that we would consider whether the quality measure is designated as high priority or not through the CY 2026 performance period/2028 MIPS payment year.

We request public comment on these proposals.

(iii) Proposal To Implement Data Submission Requirement for MIPS Core Measures

(A) Background

In the CY 2017 Quality Payment Program final rule (81 FR 77114), we finalized at § 414.1335(a)(1) that for the performance period, a MIPS eligible clinician will report at least six measures including at least one outcome measure. If an applicable outcome measure is not available, a MIPS eligible clinician will be required to report a high priority measure instead. Additionally, in the CY 2022 PFS final rule (86 FR 65412), we finalized at § 414.1365(c)(1), that except as provided in paragraph § 414.1365(c)(1)(i), an MVP participant must select and report, if applicable, 4 quality measures, including 1 outcome measure (or, if an outcome measure is not available, 1 high priority measure), included in the MVP, excluding the population health measure required under paragraph (c)(4)(ii). We were concerned that small practices do not have the same resources to meet the quality reporting requirement of four measures if the MVP does not include four Medicare Part B claims measures. Therefore, we finalized at § 414.1365(c)(1)(i) that paragraph § 414.1365(c)(1) does not apply to a small practice that reports on an MVP that includes fewer than four Medicare Part B claims measures, provided that the small practice reports each such measure that is applicable.

(B) Proposal for MIPS Core Measure Data Submission Requirements With Self-Attestation

In conjunction with the proposed removal of the high priority designation for MIPS quality measures, and the proposed new designation of MIPS core measures beginning with the CY 2027 performance period/2029 MIPS payment year, we are proposing to remove the current quality measure data submission requirement of one outcome measure (or, if an outcome measure is not available, one high priority measure) for traditional MIPS and MVPs and replace the requirement with a MIPS core measure data submission requirement to emphasize the reporting on the proposed MIPS core measures. The requirement to report an outcome measure (or, if an outcome measure is not available, one high priority measure) would no longer be necessary, as the goals of that policy would be met by the proposed MIPS core measure reporting requirement, since the proposed MIPS core measure selection process considers outcome-based measures and measures that are integral in driving positive patient outcomes. Specifically, we are proposing that MIPS eligible clinicians reporting via traditional MIPS must submit data on at least six measures, including at least one MIPS core measure. Clinicians reporting a specialty measure set in traditional MIPS must report at least six measures and choose an applicable MIPS core measure, if available, within that specialty measure set. If the set contains fewer than six measures or fewer than six measures within the set apply, they must report on each measure that is applicable. Additionally, to be consistent with the existing reporting requirements for clinicians reporting a specialty measure set, as finalized in the CY 2017 Quality Payment Program final rule (81 FR 77114), if a specialty measure set does not contain a MIPS core measure, clinicians must still report on at least six measures within the specialty set. If the specialty set does not contain a MIPS core measure and contains fewer than six measures, or fewer than six measures within the set apply, they must report on each measure that is applicable within the specialty measure set. An MVP participant must select and report, if applicable, four quality measures, including at least one MIPS core measure. We note that clinicians submitting data for the quality performance category in traditional MIPS reporting would choose an applicable MIPS core measure from the full inventory of available MIPS core measures for the performance period. Clinicians reporting an MVP would choose the applicable MIPS core measures from those available in the selected MVP. Each MVP would include a minimum of three MIPS core measures for a clinician to select from. MVPs that encompass multiple specialties or subspecialties may include more than three MIPS core measures to ensure comprehensive coverage for the variety of clinicians reporting that MVP.

Since the proposed MIPS core measures were identified to reflect the care most central to a clinician specialty, medical condition, or episode of care within each MVP for clinicians and patients, we anticipate that clinicians could report the proposed MIPS core measures in the selected MVP. We acknowledge that due to the variety of clinician practices, specialties, and subspecialties reporting each MVP, there may be instances in which a clinician does not have an available and applicable MIPS core measure due to the limited inventory of the proposed MIPS core measures. If an individual eligible clinician, group, subgroup, or APM Entity does not have an available and applicable MIPS core measure that meets the numerator and denominator criteria as specified in the MIPS quality measure inventory for the applicable performance period, either in traditional MIPS or MVP reporting, we propose to establish a MIPS core measure self-attestation process. Under this process, the clinician would be required in good faith to attest during the data submission period that there was not an available and applicable MIPS core measure for them to report. The clinician would then be required to choose another measure to report in place of the MIPS core measure. A

clinician reporting via traditional MIPS could report any other applicable quality measure in the MIPS quality measure inventory. In MVP reporting, a clinician could report any other quality measure in the selected MVP. There may be instances in which a clinician attested to not having an applicable and available MIPS core measure, but new information or changing circumstances later made it so that the clinician does have an applicable and available MIPS core measure to report. To account for these cases, we would allow a clinician to attest that they do not have an applicable and available MIPS core measure and then submit a MIPS core measure. We refer readers to section IV.B.1.b.(1) for our proposals for scoring MIPS core measures. While we considered requiring clinicians without an available and applicable MIPS core measure to report an outcome or high priority measure, we determined that such a requirement would increase complexity for clinicians and would be unnecessary given that MVPs are already a collection of the key quality measures for a specialty, medical condition, or episode of care. We would not penalize a MIPS eligible clinician who provides a self-attestation to not having a MIPS core measure to report. We note that we may monitor attestations received for the MIPS core measure requirement and may, in future years, conduct random reviews to verify that there were no available and applicable MIPS core measures for reporting. We refer readers to section IV.B.1.b.(1) of this proposed rule for details on the proposed scoring policies for MIPS core measures.

For traditional MIPS reporting, we propose at § 414.1335(a)(1)(i) that beginning in the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians, except as provided in paragraphs (a)(1)(ii) and (a)(1)(iii) of this section, submits data on at least six quality measures, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure. If fewer than six measures apply, then the MIPS eligible clinician, group, virtual group, or APM Entity must report on each measure that is applicable.

Additionally, we propose at § 414.1335(a)(1)(ii) that beginning in the CY 2027 performance period/2029 MIPS payment year, except as provided in paragraph (a)(1)(iii) of this section, a MIPS eligible clinician that reports on a specialty or subspecialty measure set, as designated in the MIPS final list of quality measures established by CMS through rulemaking, must submit data on at least six measures within that set, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure within that set. If the set contains fewer than six measures or if fewer than six measures within the set apply to the MIPS eligible clinician, report on each measure that is applicable.

For MVP reporting, we propose at § 414.1365(c)(1) that, beginning in the CY 2027 performance period/2029 MIPS payment year, except as provided in paragraphs (c)(1)(i) and (c)(1)(ii) of this section, an MVP participant must select and report, if applicable, four quality measures, including one MIPS core measure available in the MVP, excluding the population health measure required under paragraph (c)(4)(ii). If there is not an available and applicable MIPS core measure, an MVP participant must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure within the MVP.

We request public comment on these proposals.

(C) Proposal To Exempt Small Practices From MIPS Core Measure Reporting Requirement

We recognize that clinicians in small practices often face challenges in successfully participating in MIPS and MVP reporting due to limited financial, administrative, and health IT resources, when compared to medium and large practices. Historically, we have received feedback from small practices expressing concerns that meeting the MIPS reporting requirements can be challenging due to the limited resources of small practices, and we have implemented policies in MIPS to support clinicians in small practices to address these concerns. For example, in the CY 2022 PFS final rule (86 FR 65412), we finalized at § 414.1365(c)(1)(i) that the requirement to report four quality measures in an MVP does not apply to small practice clinicians reporting under the Medicare Part B claims collection type when the selected MVP contains fewer than four Medicare Part B claims-based quality measures. In addition, in MVPs, small practices reporting via Medicare Part B claims measures are currently exempt from the outcome/high priority reporting requirement if the MVP does not contain at least four Medicare Part B claims measures.

We considered several policy options for small practices with respect to reporting MIPS core measures. Initially, we considered whether to align the reporting requirements for small practices with the proposed MIPS core measure reporting requirements for clinicians in medium and large practices participating in traditional MIPS and MVP reporting. However, we anticipate that clinicians in small practices may continue to experience challenges with meeting the proposed MIPS core measure reporting requirement due to limited resources, difficulty reaching the case minimum requirement, and the limited inventory of proposed MIPS core measures, particularly the limited inventory of proposed MIPS core measures available via the Medicare Part B claims collection type, which is only available to small practices. While we also considered exempting small practices from the proposed MIPS core measure reporting requirement only if the selected MVP does not contain at least one MIPS core measure available via the Medicare Part B claims collection type, we remained concerned that such a policy would further limit measure choice for clinicians in small practices and could lead to confusion and unfairness if some MVPs contained Medicare Part B claims MIPS core measures and other MVPs did not. In recognition of these ongoing challenges, and to streamline reporting requirements for small practices while continuing to support clinicians in small practices, we want to provide flexibilities for clinicians in small practices to successfully report the MIPS quality performance category. Therefore, in both traditional MIPS and MVP reporting, we propose that small practices, as defined under § 414.1305, be exempt from the MIPS core measure data submission requirement. Under this proposal, clinicians in small practices would continue to report six quality measures for traditional MIPS or four quality measures as currently required for MVPs. It is important to note that while small practices are not required to report a MIPS core measure, they may choose to do so on a voluntary basis.

Specifically, we propose at § 414.1335(a)(1)(iii) that beginning with the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians in small practices are not required to submit at least one MIPS core measure or attest to not having an available and applicable MIPS core measure. MIPS eligible clinicians in

small practices must submit data on at least six measures, if applicable. Additionally, we propose at § 414.1365(c)(1)(ii) that beginning with the CY 2027 performance period/2029 MIPS payment year, an MVP participant that meets the requirements of a small practice is not required to submit at least one MIPS core measure or attest to not having an available and applicable MIPS core measure. Except as provided in paragraph (c)(1)(i) of this section, an MVP participant that meets the requirements of a small practice must select and report, if applicable, at least four quality measures included in the MVP, excluding the population health measure required under paragraph (c)(4)(ii) of this section.

We request public comment on these proposals.

(iv) Proposal To Modify Data Submission Criteria for Medicare CQMs

In this proposed rule, we are proposing an amendment to the data submission criteria for the Medicare CQMs collection type in § 414.1335(a)(4) by including the availability of Medicare CQMs within the APP Plus measure set, as applicable. Specifically, in § 414.1335(a)(4)(i), we are proposing that the data submission criteria pertaining to Medicare CQMs would be met by a MIPS eligible clinician, group, and APM Entity reporting on the Medicare CQMs (reporting quality data on beneficiaries eligible for Medicare CQMs as defined at § 425.20) within the APP measure set or APP Plus measure set (as applicable) and administering the CAHPS for MIPS Survey as required under the APP.

We are including the availability of Medicare CQMs under the APP Plus measure set to provide various options that would assist Medicare Shared Savings Program ACOs with reporting quality data and transition to the adoption of digital quality measures (dQMs). We encourage Medicare Shared Savings Program ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on their unique composition and technical infrastructure.

We request public comment on this proposal.

(v) Proposal To Implement Data Submission Criteria for Medicare eCQMs

In this proposed rule, we are proposing to establish the data submission criteria for the Medicare eCQMs collection type (as proposed under the APP in section III.G.3.d.(3) of this proposed rule) in § 414.1335(a)(5). Specifically, in § 414.1335(a)(5)(i), we are proposing that the data submission criteria pertaining to Medicare eCQMs would be met by a MIPS eligible clinician, group, and APM Entity reporting on the Medicare eCQMs (reporting quality data on beneficiaries eligible for Medicare eCQMs as defined at § 425.20) within the APP Plus measure set (as applicable) and administering the CAHPS for MIPS Survey as required under the APP.

Medicare eCQMs would serve to address concerns discussed in section III.G.3.d.(1) of this proposed rule by defining a population of beneficiaries that exists within the all payer/all patient eCQM specifications and tethering that population to a Medicare Shared Savings Program ACO's assigned beneficiary population. Medicare Shared Savings Program ACOs have noted challenges with quality data reporting as their list of eligible beneficiaries has often contained beneficiaries for whom the Medicare Shared Savings Program ACO is unable to identify a primary care relationship. Specifically, Medicare eCQMs would address the concern raised by Medicare Shared Savings Program ACOs with a higher proportion of specialty practices and/or multiple EHRs, the broader all payer/all patient eligible population would capture beneficiaries with no primary care relationship to the Medicare Shared Savings Program ACO. Medicare eCQMs would provide an additional optional collection type for reporting quality data and assist with the transition and adoption of dQMs. Also, we anticipate in future years when FHIR-based reporting becomes mandatory that Medicare Shared Savings Program ACOs would be able to continue to use the FHIR-based digital specifications to report only on their assigned beneficiary population. We encourage Medicare Shared Savings Program ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on their unique composition and technical infrastructure.

We request public comment on this proposal.

(d) Proposal To Modify Data Completeness Criteria

(i) Proposal To Modify Data Completeness Criteria for Medicare CQMs

As described in section III.G.3.c. of this proposed rule, we are extending the availability of the Medicare CQMs collection type and anticipating the sunsetting of the Medicare CQMs collection type starting with the CY 2030 performance period/2032 MIPS payment year when FHIR-based reporting becomes mandatory. We are proposing an amendment to the data completeness criteria for the Medicare CQMs collection type in § 414.1340(d)(1) by modifying the duration of availability for the Medicare CQMs collection type as a means for meeting data completeness criteria requirements, which would eliminate the specific duration of availability (from the CY 2024 performance period/2026 MIPS payment year to the CY 2028 performance period/2030 MIPS payment year) and extend the duration of the availability of the Medicare CQMs collection type. Such modification would extend the availability of the Medicare CQMs collection type for meeting the data completeness criteria threshold requirements under the APP until CMS identifies the sunsetting of the Medicare CQMs collection type in future rulemaking.

Specifically, in § 414.1340(d), respectively, we are proposing the following modification to the data completeness criteria threshold pertaining to the Medicare CQMs collection type:

At paragraph (d)(1), starting with the CY 2024 performance period/2026 MIPS payment year, an APM Entity, specifically a Medicare Shared Savings Program ACO that meets the reporting requirements under the APP, submitting quality measure data on Medicare CQMs must submit data on at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare CQM, as proposed to be defined at § 425.20, who meet the measure's denominator criteria.

We request public comment on this proposal.

(ii) Proposal To Implement Data Completeness Criteria for Medicare eCQMs

As we propose to establish a new collection type, Medicare eCQMs specific to the APP as described in section III.G.3.d.(3) of this proposed rule, we are also proposing to establish the data completeness criteria threshold for the Medicare eCQMs collection type. Specifically, in § 414.1340(e), respectively, we are proposing the following data completeness criteria threshold pertaining to the Medicare eCQMs collection type:

At paragraph (e)(1), starting with the CY 2027 performance period/2029 MIPS payment year, an APM Entity, specifically a Medicare Shared Savings Program ACO that meets the reporting requirements under the APP, submitting quality measure data on Medicare

eCQMs must submit data on at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare eCQM, as proposed to be defined at § 425.20, who meet the measure's denominator criteria.

Also, for the data completeness criteria pertaining to the quality performance category, we are proposing a technical amendment to recognize the former paragraph (e) as new paragraph (f) due to the proposal to establish the data completeness criteria for the new collection type, Medicare eCQM, in § 414.1340(e) as discussed in the following XXX section of this proposed rule.

We request public comment on this proposal.

(e) Addition of New Quality Measures

(i) Pre-Rulemaking Process

Prior to introducing a new MIPS quality measure in a proposed rule, we receive public input on measures through the pre-rulemaking process (referred to as the Pre-Rulemaking Measure Review (PRMR)) established in accordance with section 1890A of the Act. Although section 1848(q)(2)(D)(viii) of the Act provides that the pre-rulemaking process under section 1890A of the Act is not required to apply to the selection of MIPS quality measures, we have found that the pre-rulemaking process provides a comprehensive review of measures from multi-stakeholder workgroups and have accordingly elected for such measures to be reviewed utilizing the PRMR process (87 FR 70048). Under the established PRMR process (additional information regarding the PRMR process is available at *https://p4qm.org/PRMR*), CMS has contracted with a Consensus-Based Entity (CBE), which is responsible for convening a multi-stakeholder panel comprised of clinicians, patients, measure experts, and health information technology specialists to provide input on measures CMS is considering for use in Medicare.

The PRMR process begins with CMS's publication of measures under consideration for use in Medicare (the Measures Under Consideration (MUC) List). Each measure on the MUC List is reviewed by one of several committees convened by the CBE for the purpose of providing multi-stakeholder input to the Secretary. The PRMR process includes opportunities for public comments through a 21-day public comment period, as well as public listening sessions. The CBE posts the compiled comments and listening session inputs received during the public comment period and the listening sessions within 5 days of the close of the public comment period. More details regarding the PRMR process may be found in the PQM Guidebook of Policies and Procedures for Pre-Rulemaking Measure Review and Measure Set Review (available at *https://p4qm.org/sites/default/files/2025-07/OP2-PRMR-MSR-Final-Multi-Stakeholder-Group-Guidebook-of-Policies-and-Procedures-508_1.pdf*).

Per the PQM Guidebook, the final vote of the multistakeholder committee convened by the CBE may result in the following disposition of a measure: The committee recommends that this measure be added to the CMS program or the committee does not recommend that this measure be added to the CMS program. A ''does not recommend'' voting result signals continued disagreement among the committee despite being presented with perspectives from public comments and committee member feedback and discussion and highlights the multi-faceted assessments of quality measures. There may be cases in which the CBE does not recommend a measure to move forward to the rulemaking process and eventual implementation but we go forth with proposing a measure. We note that section 1848(q)(2)(D)(iii)(v)(III) of the Act does not preclude the Secretary from proposing and implementing measures that are not endorsed by a CBE as long as the measure is evidence-based.

Quality measures considered for potential implementation in MIPS starting with CY 2027 performance period/2029 MIPS payment year were informed, in part, by the measures included on the 2025 MUC List (available at *https://mmshub.cms.gov/sites/default/files/2025-MUC-List.xlsx*). We refer readers to Table Group A of Appendix 1: MIPS Quality Measures of this proposed rule for detailed descriptions of the new MIPS quality measures proposed. We note that we are advancing quality measurement by transitioning existing quality measures and reporting processes to Fast Healthcare Interoperability Resources® (FHIR®)-based digital approaches. We refer readers to section IV.A.4.c. of this proposed rule, where we seek input on the anticipated transition timeline, key milestones, and implementation considerations for FHIR-based quality reporting.

(ii) Removal of Quality Measures

In the CY 2025 PFS final rule, we codified previously established criteria for the removal of MIPS quality measures from the MIPS quality measure inventory at § 414.1330. In the CY 2017 Quality Payment Program final rule (81 FR 77136 through 77137), we established the following criteria for measure removal to include: If the Secretary determines that the MIPS quality measure is no longer meaningful, such as MIPS quality measures that are topped out; and, if a measure steward is no longer able to maintain the quality measure. In the CY 2019 PFS final rule (83 FR 59763), we expanded the criteria for measure removal to include MIPS quality measures that reached an extremely topped-out status (for example, a measure with an average mean performance within the 98th to 100th percentile range). The MIPS quality measure may be proposed for removal in the next rulemaking cycle, regardless of whether or not it is in the midst of the topped-out measure lifecycle, due to the extremely high and unvarying performance where meaningful distinctions and improvement in performance can no longer be made, after taking into account any other relevant factors.

Also, in the CY 2019 PFS final rule (83 FR 59764), we established other criteria for measure removal, specifically MIPS quality measures that are: duplicative; not maintained or updated to reflect current clinical guidelines, which are not reflective of a clinician's scope of practice; and low-bar, standard of care process measures. As described in the CY 2019 PFS final rule (83 FR 59765), we established an approach to incrementally remove process measures where prior to removal, consideration will be given to, but will not be limited to, the following:

- Whether the removal of the process measure impacts the number of measures available for a specific specialty.
- Whether the MIPS quality measure addresses a priority area highlighted in the Measure Development Plan: *https://www.cms.gov/medicare/quality/value-based-programs/quality-payment-program/measure-development.*
- Whether the MIPS quality measure promotes positive outcomes in patients.
- Considerations and evaluation of the measure's performance data.
- Whether the MIPS quality measure is designated as high priority or not.
- Whether the MIPS quality measure has reached extremely topped-out status within the 98th to 100th percentile range, due to the extremely high and unvarying performance where meaningful distinctions and improvement in performance can no longer be made.

In the CY 2020 PFS final rule (84 FR 62958 through 62959), we expanded the

criteria for measure removal to include MIPS quality measures that do not meet case minimum and reporting volumes required for benchmarking after being in the program for 2 consecutive CY performance periods and are not available for MIPS quality reporting by or on behalf of all MIPS eligible clinicians. For MIPS quality measures that do not meet case minimum and reporting volumes required for benchmarking after being in the program for 2 consecutive CY performance periods, we noted that we will factor in other considerations (such as, but not limited to, the robustness of the measure; whether it addresses a measurement gap; if the measure is a patient-reported outcome; and consideration of the MIPS quality measure in developing MVPs) prior to determining whether to remove the MIPS quality measure. We refer readers to section IV.A.4.d.(1)(c)(ii) of this proposed rule for our proposals regarding removing references to the high priority measure designation from MIPS quality measures and MIPS quality measure retention consideration.

(iii) Inventory of Quality Measures

Section 1848(q)(2)(D)(i) of the Act requires the Secretary, through notice and comment rulemaking, to establish an annual final list of quality measures from which MIPS eligible clinicians may choose for the purpose of assessment under MIPS. Section 1848(q)(2)(D)(i)(II) of the Act requires that the Secretary annually update the list by removing measures from the list, as appropriate; adding new measures to the list, as appropriate; and determining whether measures that have undergone substantive changes should be included on the updated list.

Previously finalized MIPS quality measures can be found in the CY 2017 and CY 2018 Quality Payment Program final rules (81 FR 77558 through 77816 and 82 FR 53966 through 54174, respectively), and the CY 2019 through CY 2026 PFS final rules (83 FR 60097 through 60285, 84 FR 63205 through 63513, 85 FR 85045 through 85369, 86 FR 65687 through 65968, 87 FR 70250 through 70633, 88 FR 79556 through 79964, 89 FR 98599 through 98957, and 90 FR 50036 through 50353, respectively). We are proposing changes to the MIPS quality measure inventory, as outlined in Appendix 1 of this proposed rule, including the following: the addition of new measures; updates to specialty sets (that is, creation of new specialty sets; addition and/or removal of measures; and substantive changes to existing measures within specialty sets, as appropriate); removal of existing measures; and substantive changes to existing measures. For the CY 2027 performance period/2029 MIPS payment year, we are proposing an inventory of 180 MIPS quality measures.

The new MIPS quality measures that we are proposing to include in MIPS for the CY 2027 performance period/2029 MIPS payment year and future years can be found in Table Group A of Appendix 1 of this proposed rule. For the CY 2027 performance period/2029 MIPS payment year, we are proposing 10 new MIPS quality measures, which include measures focused on patient-reported outcomes and chronic disease management.

On January 14, 2026, we solicited recommendations for potential new specialty measure sets or revisions to existing specialty measure sets for the CY 2027 performance period/2029 MIPS payment year.[376] The recommendations we received were based on the MIPS quality measures finalized in the CY 2026 PFS final rule and the 2025 MUC List. The recommendations include the addition or removal of current MIPS quality measures from existing specialty sets, and/or the creation of new specialty sets. All specialty set recommendations submitted for consideration were assessed and vetted, and as a result, the recommendations that we agree with are proposed in this proposed rule.

We are proposing modifications to existing specialty sets as described in Table Group B of Appendix 1 of this proposed rule. Modifications to specialty sets include the addition of new measures and/or existing measures within the MIPS quality measure inventory, removal of measures, and/or substantive changes to previously finalized measures. Specialty and subspecialty sets are not inclusive of every specialty or subspecialty. We develop and maintain specialty measure sets to assist MIPS eligible clinicians with selecting quality measures that are most relevant to their scope of practice.

In addition to establishing new individual MIPS quality measures and modifying existing specialty sets as described in Tables Group A and Group B of Appendix 1 of this proposed rule, we refer readers to Table Group C of Appendix 1 of this proposed rule for a list of MIPS quality measures proposed for removal and detailed discussion of our rationale for each measure. Of the 20 MIPS quality measures proposed for removal, two MIPS quality measures are extremely topped out, four MIPS quality measures have reached the end of the topped-out lifecycle, three MIPS quality measures are no longer being maintained by the measure steward, eight MIPS quality measures are duplicative of new or current measures, one MIPS quality measure has limited adoption and therefore no benchmark, one MIPS quality measure is a low bar process measure, and one MIPS quality measure lacks robustness. The proposal to remove the MIPS quality measures described in Table Group C of Appendix 1 of this proposed rule would lead to a more parsimonious inventory of meaningful, robust measures in the program.

Further, in Appendix 1 of this proposed rule, we are proposing substantive changes to 43 MIPS quality measures, which can be found in Table Group D and Table Group DD of Appendices of this proposed rule. Of the proposed substantive changes to the 43 MIPS quality measures, two MIPS quality measures are only available for use in relevant MVPs, which can be found in Table Group DD of Appendix 1 of this proposed rule. We have previously established criteria that would apply when we are considering making substantive changes to a quality measure (81 FR 77137 and 86 FR 65441 through 65442). On an annual basis, we review the established MIPS quality measure inventory to consider updates to the measures. Possible updates to measures may be minor or substantive. The proposed inventory of 180 MIPS quality measures for the CY 2027 performance period/2029 MIPS payment year includes 177 MIPS quality measure available for utilization in traditional MIPS and MVPs, and 3 MIPS quality measures available only for utilization in MVPs (as finalized in the CY 2024 PFS final rule (88 FR 79897 through 77902)).

In summary, in the CY 2027 PFS proposed rule, we are proposing to modify the quality performance category measure inventory to include a set of 180 MIPS quality measures for the CY 2027 performance period/2029 MIPS payment year, which includes the following:

- Implementation of 10 new MIPS quality measures including measures focused on patient-reported outcomes and chronic disease management;
- Removal of 20 MIPS quality measures: Two MIPS quality measures that are extremely topped out, four MIPS quality measures that have reached the end of the topped-out

[376] Message to the Quality Payment Program listserv on January 14, 2026, entitled ''The Centers for Medicare & Medicaid Services (CMS) is Soliciting Interested Party Recommendations for Potential Consideration of New Specialty Measure Sets and/or Revisions to the Existing Specialty Measure Sets for the 2027 Performance Year of the Merit-based Incentive Payment System (MIPS).''

measure lifecycle, three MIPS quality measures that are no longer being maintained by the measure steward, eight MIPS quality measures that are duplicative of new or current measures, one MIPS quality measure that has limited adoption and therefore no benchmark, one MIPS quality measure that is a low bar process measure, and one MIPS quality measure lacking robustness, and;

- Substantive changes to 43 current MIPS quality measures.

We refer readers to Table Groups A through DD of Appendix 1 of this proposed rule for a summary of the new measures proposed, the measures proposed for removal, and the substantive changes proposed as well as specialty set changes proposed.

We request public comment on these proposals.

(2) Cost Performance Category

(a) Background

Section 1848(q)(2)(A)(ii) of the Act includes resource use as a performance category under MIPS. We refer to this performance category as the cost performance category. As required by sections 1848(q)(2) and (5) of the Act, the four performance categories of MIPS are used in determining the MIPS final score for each MIPS eligible clinician. In general, MIPS eligible clinicians are evaluated under all four of the MIPS performance categories, including the cost performance category.

Section 1848(q)(2)(B)(ii) of the Act provides that, for the cost performance category, the measurement of resource use (that is, cost) for such period must be in accordance with section 1848(p)(3) of the Act, using the methodology under section 1848(r) of the Act as appropriate, and, as feasible and applicable, accounting for the cost of drugs under Medicare Part D. Section 1848(p)(3) of the Act provides that costs shall be evaluated, to the extent practicable, based on a composite of appropriate measures of costs established by the Secretary that eliminate the effect of geographic adjustments in payment rates, and take into account risk factors (such as socioeconomic and demographic characteristics, ethnicity, and health status of individuals) and other factors determined appropriate by the Secretary. Section 1848(r) of the Act specifies a series of steps and activities for the Secretary to undertake to involve physicians, practitioners, and other interested parties in enhancing the infrastructure for cost measurement, including for purposes of MIPS and Advanced APMs under section 1833(z) of the Act. Specifically, section 1848(r)(2)(H) of the Act provides that, not later than November 1 of each year (beginning with 2018), the Secretary shall, through rulemaking, make revisions to the operational lists of care episode and patient condition codes as the Secretary determines may be appropriate.

We are proposing the following update to the cost performance category beginning with the CY 2027 performance period/2029 MIPS payment year:

- Update the operational list of care episode and patient condition groups and codes to reflect changes to service and diagnosis codes that define care episodes and patient condition groups, as identified through the annual maintenance of episode-based measures.

For a description of the statutory authority for and existing policies pertaining to the cost performance category, we refer readers to §§ 414.1350 and 414.1380(b)(2) and the CY 2017 Quality Payment Program final rule (81 FR 77162 through 77177), CY 2018 Quality Payment Program final rule (82 FR 53641 through 53648), CY 2019 PFS final rule (83 FR 59765 through 59776), CY 2020 PFS final rule (84 FR 62959 through 62979), CY 2021 PFS final rule (85 FR 84877 through 84881), CY 2022 PFS final rule (86 FR 65445 through 65461), CY 2023 PFS final rule (87 FR 70055 through 70057), CY 2024 PFS final rule (88 FR 79339 through 79349), CY 2025 PFS final rule (89 FR 98390 through 98408), and CY 2026 PFS final rule (90 FR 49859 through 49864).

More details on the proposal in this section, which we invite comments on, are provided in section IV.A.4.d.(2)(b) through section IV.A.4.d.(2)(d) of this proposed rule.

(b) Selection of Cost Measures

In accordance with our statutory authority as described in section IV.A.4.d.(2)(a) of this proposed rule and our regulation at § 414.1350(a), we specify cost measures for a performance period to assess the performance of MIPS eligible clinicians on the cost performance category.

We consider adoption of cost measures to capture new clinical areas, which furthers our goals to transition from traditional MIPS to MVPs and expands the Medicare spending that is captured by the cost performance category assessment. MVPs require the inclusion of at least one cost measure, so adoption of cost measures for new clinical areas allows us to create new MVPs for clinical areas that do not yet have MVPs or to increase the amount of applicable cost measures in existing MVPs. Additionally, adopting cost measures that assess new clinical areas moves us closer towards the statutory goal of covering 50 percent of costs under Medicare Parts A and B, as specified under section 1848(r)(2)(D)(i)(I) of the Act.

In the CY 2022 PFS final rule (86 FR 65455 through 65459), we established common standards for potential episode-based measures to ensure consistency across episode-based measures being considered for potential use in MIPS. Specifically, the CY 2022 PFS final rule requires that any episode-based measure for the cost performance category include the following: (1) episode definition based on trigger codes that determine the patient cohort; (2) attribution; (3) service assignment; (4) exclusions; and (5) risk adjustment.

Additionally, in the CY 2025 PFS final rule (89 FR 98405), we codified criteria that must be met for a cost measure to be removed from the MIPS cost measure inventory at § 414.1350. Under the criteria, we may remove a cost measure from MIPS based on one or more of the following factors; provided, however, that we may retain a cost measure that meets one or more of the following factors if we determine the benefit of retaining the measure outweighs the benefit of removing it.

- It is not feasible to implement the measure specifications.
- A measure steward is no longer able to maintain the cost measure.
- The implementation costs or negative unintended consequences associated with a cost measure outweigh the benefit of its continued use in the MIPS cost performance category.
- The measure specifications do not reflect current clinical practice or guidelines.
- The availability of a more applicable measure, including a measure that applies across settings, applies across populations, or is more proximal in time to desired patient outcomes for the particular topic.

We are not proposing to adopt any new measures for the CY 2027 performance period/2029 MIPS payment year. We are also not proposing to remove any measures for the CY 2027 performance period/2029 MIPS payment year.

(c) Inventory of Cost Measures

As discussed previously, we specify cost measures for a performance period to assess the performance of MIPS eligible clinicians on the cost performance category. There are currently 35 cost measures in the cost performance category for the CY 2026 performance period/2028 MIPS

payment year, comprising 33 episode-based measures covering a range of conditions and procedures and 2 population-based measures. Previously finalized MIPS cost measures can be found in the CY 2018 Quality Payment Program final rule (82 FR 53641 through 53648), CY 2019 PFS final rule (83 FR 59765 through 59776), CY 2020 PFS final rule (84 FR 62959 through 62979), CY 2021 PFS final rule (85 FR 84877 through 84881), CY 2022 PFS final rule (86 FR 65445 through 65461), CY 2023 PFS final rule (87 FR 70055 through 70057), CY 2024 PFS final rule (88 FR 79339 through 79349), and CY 2025 PFS final rule (89 FR 98390 through 98408). We refer readers to the CY 2026 PFS proposed rule (90 FR 32718 through 32719) for more context on how we establish the inventory of cost measures, including the pre-rulemaking requirements.

We are neither proposing any new MIPS cost measures nor proposing to remove any MIPS cost measures for the CY 2027 performance period/2029 MIPS payment year. We are also not proposing substantive changes to any existing MIPS cost measures for the CY 2027 performance period/2029 MIPS payment year.

(d) Proposal To Update the Operational List of Care Episode and Patient Condition Groups and Codes

Generally, to calculate MIPS eligible clinicians' performance on cost measures, we use codes from claims data to identify and apply the applicable cost measure's specifications, which govern the attribution, scope, and calculation of the cost measure. We are proposing to revise the operational list of care episode and patient condition groups and codes to reflect coding changes that are identified during the annual measure maintenance of implemented cost measures. This section of this proposed rule provides context on the statutory requirements for care episode and patient condition groups and proposes changes to the operational list.

Section 1848(r) of the Act specifies a series of steps and activities for the Secretary to undertake to involve physicians, practitioners, and other interested parties in enhancing the infrastructure for cost measurement, including for purposes of MIPS and Advanced APMs under section 1833(z) of the Act. Section 1848(r)(2) of the Act requires the development of care episode and patient condition groups, and classification codes for such groups, and provides for care episode and patient condition groups to account for a target of an estimated one-half of expenditures under Medicare Parts A and B (with this target increasing over time as appropriate). Sections 1848(r)(2)(E) through (G) of the Act require the Secretary to post on the CMS website a draft list of care episode and patient condition groups and codes for solicitation of input from interested parties, and subsequently, post an operational list of such groups and codes. Section 1848(r)(2)(H) of the Act requires that not later than November 1 of each year (beginning with 2018), the Secretary shall, through rulemaking, revise the operational list of care episode and patient condition codes as the Secretary determines may be appropriate, and that these revisions may be based on experience, new information developed under section 1848(n)(9)(A) of the Act, and input from physician specialty societies and other interested parties.

For more information about past revisions to the operational list that we made as we developed, proposed, and finalized episode-based measures, we refer readers to the CY 2023 PFS final rule (87 FR 70056 and 70057), CY 2024 PFS final rule (88 FR 79348), and CY 2025 PFS final rule (89 FR 98404). Prior operational lists are available at the QPP Cost Measure Information page at *https://www.cms.gov/medicare/quality/value-based-programs/cost-measures/about.*

In accordance with section 1848(r)(2)(H) of the Act, we are proposing to revise the operational list beginning with the CY 2027 performance period/2029 MIPS payment year to reflect changes to codes used to identify existing care episode and patient condition groups, based on new information gathered during annual maintenance of MIPS cost measures. We conduct annual maintenance for measures implemented in MIPS to ensure that the codes used for the measure specifications remain up to date. For example, we may update the service or diagnosis codes associated with a cost measure's specifications to retain the intent of the measure when these codes are changed in, added to, or deleted from the applicable code sets. During our annual maintenance review process for MIPS cost measures, we work with the measure developer to identify non-substantive changes to service and diagnosis codes that should be reflected in the operational list of care episode and patient condition groups so that, to the extent feasible, there is alignment between the operational list and measure specifications. More information on the annual maintenance process is available at the CMS Measures Management System (MMS) page at *https://mmshub.cms.gov/measure-lifecycle/measure-use/maintenance/annual-update.*

Our proposed revisions to the operational list are available for review on our QPP Cost Measure Information page at *https://www.cms.gov/medicare/quality/value-based-programs/cost-measures/about.* We seek interested party feedback on the service and diagnosis codes used in MIPS care episode and patient condition groups to inform any non-substantive changes to the operational list in tandem with CMS's annual maintenance efforts for the CY 2027 performance period/2029 MIPS payment year.

We request public comment on this proposal.

(3) Improvement Activities Performance Category

(a) Background

Section 1848(q)(2)(A)(iii) of the Act includes clinical practice improvement activities as a performance category under MIPS. We refer to this performance category as the improvement activities performance category. As required by section 1848(q)(2) and (5) of the Act, the four performance categories of MIPS are used in determining the MIPS final score for each MIPS eligible clinician. In general, MIPS eligible clinicians are evaluated under all four of the MIPS performance categories, including the improvement activities performance category.

Section 1848(q)(2)(C)(v)(III) defines the term ''clinical practice improvement activities'' as activities that relevant eligible professional organizations and other relevant stakeholders identify as improving clinical practice or care delivery and that the Secretary determines, when effectively executed, is likely to result in improved outcomes.

Section 1848(q)(2)(B)(iii) of the Act provides that, for the improvement activities category, the Secretary shall specify subcategories of clinical practice improvement activities, including at least six subcategories as specified in section 1848(q)(2)(B)(iii)(I) through (VI) of the Act. These statutorily enumerated subcategories are: (1) expanded practice access (such as same day appointments for urgent needs and afterhours access to clinician advice); (2) population management (such as monitoring health conditions of individuals to provide timely health care interventions or participation in a qualified clinical data registry); (3) care coordination (such as timely communication of test results, timely exchange of clinical information to patients and other providers, and use

of remote monitoring or telehealth); (4) beneficiary engagement (such as the establishment of care plans for individuals with complex care needs, beneficiary self-management assessment and training, and using shared decision-making mechanisms); (5) patient safety and practice assessment (such as through use of clinical or surgical checklists and practice assessments related to maintaining certification); and (6) participation in an alternative payment model, as defined in section 1833(z)(3)(C) of the Act (section 1848(q)(2)(B)(iii)(I) through (VI) of the Act).

For previous discussions on the general background of the improvement activities performance category, we refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77177 and 77178), the CY 2018 Quality Payment Program final rule (82 FR 53648 through 53661), the CY 2019 Physician Fee Schedule (PFS) final rule (83 FR 59776 and 59777), the CY 2020 PFS final rule (84 FR 62980 through 62990), CY 2021 PFS final rule (85 FR 84881 through 84886), the CY 2022 PFS final rule (86 FR 65462 through 65466), the CY 2023 PFS final rule (87 FR 70057 through 70061), the CY 2024 PFS final rule (88 FR 79350 and 88 FR 79351), CY 2025 PFS final rule (89 FR 98408 through 98413), and CY 2026 PFS final rule (90 FR 49846 through 49868). We also refer readers to § 414.1305 for the relevant definitions of improvement activities and attestation, § 414.1320 for standards establishing the performance period, § 414.1325 for the data submission requirements, § 414.1355 for standards related to the improvement activity performance category generally, § 414.1360 for data submission criteria for the improvement activity performance category, and § 414.1380(b)(3) for improvement activities performance category scoring.

We are proposing various updates to the Improvement Activities Inventory (the Inventory) beginning with the CY 2027 performance period/2029 MIPS payment year, as described further in section IV.A.4.d.(3)(b)(ii) of this proposed rule. First, we propose adding six new improvement activities in two performance categories: (1) Care Coordination and (2) Advancing Health and Wellness, our newest subcategory. Second, we propose modifying five existing improvement activities currently specified for the performance category. Third, we propose removing 11 improvement activities currently specified for the performance category.

(b) Improvement Activities Inventory

(i) Annual Call for Activities

Background

In the CY 2017 Quality Payment Program final rule (81 FR 77190), for the first year of MIPS, we implemented the initial Inventory consisting of approximately 95 activities (81 FR 77817 through 77831). We took several steps to ensure the Inventory was inclusive of activities aligned with statutory and program requirements. As part of this process, we conducted numerous interviews with high performing organizations of all sizes and conducted an environmental scan to identify existing models, activities, or measures that met all or part of the improvement activities performance category.

Beginning with the CY 2018 performance period/2020 MIPS payment year (82 FR 53656 through 53659), we introduced an informal process for interested parties to submit new improvement activities or modifications for our consideration and potential inclusion in the comprehensive Inventory. In the CY 2018 Quality Payment Program final rule (82 FR 53656 through 53659), beginning with the CY 2019 performance period/2021 MIPS payment year, we finalized a formal Annual Call for Activities process for the addition of possible new activities and for possible modifications to current activities in the Inventory. This process requires interested parties to submit a nomination form similar to the one we used for the CY 2018 performance period/2020 MIPS payment year (82 FR 53656 through 53659). In order to submit a request for a new activity or a modification to an existing activity, the interested party must submit a nomination form (OMB control # 0938–1314) available at *https://qpp.cms.gov/resources/resource-library* during the Annual Call for Activities.

(ii) Proposals To Update the Improvement Activities Inventory

In the CY 2018 Quality Payment Program final rule (82 FR 53660), we finalized that we would establish improvement activities through notice-and-comment rulemaking. For our previously finalized Improvement Activities Inventories, we refer readers to Table H in the CY 2017 Quality Payment Program final rule (81 FR 77817) Appendix, Tables F and G in the CY 2018 Quality Payment Program final rule (82 FR 54175 through 54229) Appendix, Tables A and B in the CY 2019 PFS final rule (83 FR 60286 through 60303) Appendix 2, Tables A, B, and C in the CY 2020 PFS final rule (84 FR 63514 through 63538) Appendix 2, Tables A, B, and C in the CY 2021 PFS final rule (85 FR 85370 through 85377) Appendix 2, Tables A, B, and C in the CY 2022 PFS final rule (86 FR 65969 through 65997) Appendix 2, Tables A, B, and C in the CY 2023 PFS final rule (87 FR 70633 through 70650) Appendix 2, Tables A, B, and C in the CY 2024 PFS final rule (88 FR 79965 and 88 FR 79977) Appendix 2, Tables A, B, and C in the CY 2025 PFS final rule (89 FR 98958 through 98971) Appendix 2, and Tables A, B, and C in the CY 2026 PFS final rule (90 FR 50354 through 50369) Appendix 2. We also refer readers to the Quality Payment Program website at *https://qpp.cms.gov/* and the Explore Measures and Activities tool at *https://qpp.cms.gov/reporting-requirements/measures-activities/explore?tab=improvement Activities&py=2026* for a complete list of the current improvement activities.

(iii) Proposals To Adopt New Improvement Activities

We propose adding six new improvement activities beginning with the CY 2027 performance period/2029 MIPS payment year. We propose that IA_CC_XX (Use of Data to Improve Practice Workflows) and IA_CC_XX (Understand and Improve Diagnostic Performance) be included in the Care Coordination subcategory. We propose that IA_AHW_XX (Systematic Screening and Intervention for Nutrition and other Health-Impacting, Non-Clinical Issues), IA_AHW_XX (Advance Care Planning Conversations to Support Patient Wellness and Care Preferences), IA_AHW_XX (Clinician Use of Artificial Intelligence (AI) to Improve Patient Care), and IA_AHW_XX (Lifestyle Approaches to Diabetes Remediation) would be included in the Advancing Health and Wellness subcategory.

The first new improvement activity, IA_CC_XX, titled ''Use of Data to Improve Practice Workflows'', would allow MIPS-eligible clinicians to improve integration of evidence-based guidelines into care by developing and refining clinical pathways and workflows. If gaps are identified through data, clinicians would update and implement changes, monitor adoption and outcomes, and reassess performance regularly.

The second new improvement activity, IA_CC_XX, titled ''Understand and Improve Diagnostic Performance'', supports clinicians in improving patient safety by reducing diagnostic safety events and miscommunication through standardized processes for tracking

discrepancies, near-misses, and data accuracy. If issues are identified, teams would conduct root-cause analyses, implement corrective actions such as workflow changes or training, and monitor performance regularly to ensure improvement.

The third new improvement activity, IA_AHW_XX, titled ''Systematic Screening and Intervention for Nutrition and other Health-Impacting, Non-Clinical Issues'', would allow MIPS-eligible clinicians to implement standardized screening tools for nutrition, housing, transportation, and financial strain within clinical workflows. If needs are identified, clinicians would initiate referrals to appropriate community resources, track follow-up and resolution, and reassess screening processes and outcomes regularly to improve effectiveness.The fourth new improvement activity, IA_AHW_XX, titled ''Advance Care Planning Conversations to Support Patient Wellness and Care Preferences'', would allow MIPS-eligible clinicians to engage patients and caregivers in advance care planning and end-of-life discussions using structured communication tools while documenting goals of care, symptom management, and patient priorities. If care preferences or needs change, clinicians would update care preferences, coordinate across specialties, and reassess regularly to ensure alignment with the patient's goals and clinical status.

The fifth new activity, IA_AHW_XX, titled ''Clinician Use of Artificial Intelligence (AI) to Improve Patient Care'', would allow MIPS-eligible clinicians to implement and participate in organizational initiatives that improve patient care through the responsible and transparent use of artificial intelligence (AI) in clinical and operational workflows. Clinicians would establish policies for evaluating and monitoring AI tools or participate in developing and refining AI-enabled resources, such as predictive analytics, clinical decision support, and risk-stratification models, to improve patient outcomes, care-team efficiency, and population health management. Examples may include using AI tools to summarize medical literature for clinical decision-making, assist with documentation (*e.g.,* AI-generated notes with clinician review), support population health management by identifying care gaps, determine patient eligibility for clinical trials, or generate draft responses to patient questions for clinician review.

The sixth new activity, IA_AHW_XX, titled ''Lifestyle Approaches to Diabetes Remediation'', engages clinicians in delivering structured, evidence-based lifestyle interventions for diabetes management, addressing nutrition, physical activity, sleep, stress, and behavior change through programs such as; Lifestyle Empowerment Approach for Diabetes Remission (LEADR) or the Diabetes Self-Management Education and Support (DSMES). Clinicians provide education and coaching, track patient progress, and adjust interventions as needed to improve health outcomes.

See Table F–B1 in Appendix 2 for more information regarding each of these proposed new improvement activities.

We are seeking public comments on our proposals to add each of these activities to the Inventory beginning with the CY 2027 performance period/2029 MIPS payment year.

(iv) Proposals To Modify Existing Improvement Activities

We are proposing to modify five existing improvement activities beginning with the CY 2027 performance period/2029 MIPS payment year. First, IA_BMH_4 ''Depression screening'', IA_CC_8 ''Implementation of documentation improvements for practice/process improvements'', IA_CC_9 ''Implementation of practices/processes for developing regular individual care plans'', and IA_PM_4 ''Glycemic management services'' will be combined with elements of similar improvement activities in the Inventory to make their descriptions more robust. IA_BMH_4, will be combined with elements from IA_BMH_5 ''Major depressive disorder (MDD) prevention and treatment interventions''. The proposed description modification involves clinicians using a coordinated, team-based approach to screen for depression, assess suicide risk, and provide evidence-based follow-up care, with ongoing monitoring and documentation to support safe, effective management of patients.

IA_CC_8, will be combined with elements from IA_CC_10 ''Care transition documentation practice improvements'', IA_CC_11 ''Care transition standard operational improvements'', and IA_CC_12 ''Care coordination agreements that promote improvements in patient tracking across settings''. The proposed description modification promotes proactive, patient-centered care coordination across all settings by improving communication, tracking referrals and transitions, and documenting actions to ensure continuity, reduce fragmentation, and support better outcomes.

IA_CC_9 will be combined with elements from IA_BE_15 ''Engagement of Patients, Family, and Caregivers in Developing a Plan of Care''. The proposed description modification highlights creating and regularly updating individualized care plans for at-risk patients in collaboration with the patient and their family or caregivers. It emphasizes aligning care with the patient's goals, priorities, and desired outcomes while ensuring clear communication and shared understanding.

IA_PM_4, will be combined with elements from IA_PM_19 ''Glycemic Screening Services'' and IA_PM_20 ''Glycemic Referring Services''. The proposed description modification requires clinicians to attest to screening for abnormal blood glucose, referring eligible patients to prevention programs, and setting individualized glycemic goals that are regularly reassessed. Documentation must meet 60 percent in the first year and 75 percent thereafter, including patients treated for at least 90 days.

Second, IA_PSPA_16 ''Use decision support—ideally platform-agnostic, interoperable clinical decision support (CDS) tools, including AI-enabled predictive decision-support interventions—and standardized treatment protocols to manage workflow on the care team to meet patient needs,'' would be modified to explicitly incorporate AI-enabled decision support and strengthen oversight requirements, including monitoring, root cause analysis, and mitigation of AI-related risks. The proposed description modification specifies that MIPS-eligible clinicians use interoperable, AI-enabled clinical decision support tools to guide care-team workflows and support evidence-based, patient-centered care, while also implementing safeguards for safe use, ongoing monitoring, and evaluation of tool performance and patient safety.

See Table F–B2 in Appendix 2 for more information regarding each of these proposed modifications to existing improvement activities.

We are seeking public comments on our proposals to modify each of these activities currently specified for the Inventory beginning with the CY 2027 performance period/2029 MIPS payment year.

(v) Proposals To Remove Existing Improvement Activities

Additionally, we are proposing to remove eleven previously finalized improvement activities beginning with

the CY 2027 performance period/2029 MIPS payment year: IA_BMH_5 ''MDD prevention and treatment interventions'', IA_CC_10 ''Care transition documentation practice improvements'', IA_CC_11 ''Care transition standard operational improvements'', IA_CC_12 ''Care coordination agreements that promote improvements in patient tracking across settings'', IA_PSPA_2 ''Participation in MOC Part IV'', IA_CC_16 ''Primary Care Physician and Behavioral Health Bilateral Electronic Exchange of Information for Shared Patients'', IA_BE_15 ''Engagement of Patients, Family, and Caregivers in Developing a Plan of Care'', IA_PM_19 ''Glycemic Screening Services'', IA_PM_20 ''Glycemic Referring Services'', IA_EPA_4 ''Additional improvements in access as a result of QIN/QIO TA'', and IA_PM_2 ''Anticoagulant management improvements''. We are proposing removal of these specific improvement activities in accordance with our activity removal policy set forth at § 414.1355(d). Specifically, we propose to remove each of these eleven improvement activities under Removal Factor(s) 1 or 7, which provides that we may remove an improvement activity if we determine it is duplicative of another activity (§ 414.1355(d)(1)) or the activity is obsolete (§ 414.1355(d)(7)).

Our proposal to remove IA_BMH_5, IA_CC_10, IA_CC_11, IA_CC_12, IA_BE_15, IA_PM_19, and IA_PM_20 would align with Removal Factor 1, as these activities are similar to other improvement activities in the Inventory and can be considered duplicative. Additionally, our proposal to remove IA_PSPA_2, IA_CC_16, IA_EPA_4, and IA_PM_2 would align with Removal Factor 7, as the activities are no longer relevant or useful in current clinical practice or policy and can be considered obsolete. See Table F–B3 in Appendix 2 for more information regarding our proposals to remove each of these existing improvement activities.

We are seeking public comments on our proposals to remove each of these activities from the improvement activities performance category beginning with the CY 2027 performance period/2029 MIPS payment year.

(4) MIPS Promoting Interoperability Performance Category

(a) Background

Section 1848(q)(2)(A)(iv) of the Act includes the meaningful use of certified electronic health record (EHR) technology (CEHRT) as a performance category under MIPS. We refer to this performance category as the MIPS Promoting Interoperability performance category (formerly the advancing care information performance category).

Section 1848(q)(2)(B)(iv) of the Act provides that the requirements established under section 1848(o)(2) of the Act for determining whether a MIPS eligible clinician is a meaningful EHR user also applies to our assessment of a MIPS eligible clinician's performance on measures and activities with respect to the MIPS Promoting Interoperability performance category. Section 1848(o)(2)(D) of the Act generally provides that the requirements for being a meaningful EHR user under section 1848(o)(2) continue to apply for purposes of MIPS.

Under section 1848(o)(2)(A) of the Act, a MIPS eligible clinician must meet three requirements related to the meaningful use of CEHRT during a performance period for a MIPS payment year. Specifically, under section 1848(o)(2)(A) of the Act, the MIPS eligible clinician must: (1) Demonstrate to the satisfaction of the Secretary the use of CEHRT in a meaningful manner, which shall include the use of electronic prescribing as determined to be appropriate by the Secretary; (2) Demonstrate to the satisfaction of the Secretary that their CEHRT is connected in a manner that provides, in accordance with law and standards applicable to the exchange of information, for electronic exchange of health information to improve the quality of care, such as promoting care coordination, and demonstrates (through a process specified by the Secretary), that they have not knowingly and willfully taken action (such as to disable functionality) to limit or restrict the compatibility or interoperability of the CEHRT; and (3) Use CEHRT to submit information on clinical quality measures and such other measures as selected by the Secretary.

For previously established policies regarding the MIPS Promoting Interoperability performance category, we refer readers to §§ 414.1305 (includes definitions pertaining to the MIPS Promoting Interoperability performance category), 414.1375 (MIPS Promoting Interoperability performance category provisions), and 414.1380(b)(4) (includes scoring provisions pertaining to the MIPS Promoting Interoperability performance category); and the CY 2017 Quality Payment Program final rule (81 FR 77199 through 77245), CY 2018 Quality Payment Program final rule (82 FR 53663 through 53688), CY 2019 PFS final rule (83 FR 59785 through 59820), CY 2020 PFS final rule (84 FR 62991 through 63006), CY 2021 PFS final rule (85 FR 84886 through 84895), CY 2022 PFS final rule (86 FR 65466 through 65490), CY 2023 PFS final rule (87 FR 70060 through 70087), CY 2024 PFS final rule (88 FR 79308 through 79312 and 79351 through 79365), the 21st Century Cures Act: Establishment of Disincentives for Health Care Providers That Have Committed Information Blocking final rule (89 FR 54662 through 54718), CY 2025 PFS final rule (89 FR 98414 through 98427), and CY 2026 PFS final rule (90 FR 49868 through 49902).

In this proposed rule, we are proposing to—

- Update the definition of CEHRT to align with ONC Health IT Certification Program proposed updates relevant to the MIPS Promoting Interoperability performance category;
- Remove the ONC Direct Review and ONC-Authorized Certification Bodies (ACB) Surveillance attestations;
- Remove the Security Risk Analysis measure;
- Add an Electronic Prior Authorization for Prescription Drugs measure; and
- Update the previously adopted Electronic Prior Authorization measure.

(b) Proposal To Modify the Definition of Certified Electronic Health Record Technology in the MIPS Promoting Interoperability Performance Category

(i) Background

In accordance with § 414.1375(b)(1), to earn a performance category score for the MIPS Promoting Interoperability performance category, a MIPS eligible clinician must be a meaningful EHR user for MIPS and use CEHRT during the performance period, as both terms are defined in § 414.1305. In the CY 2025 PFS final rule, we discussed previously finalized modifications related to the CEHRT definition for the Quality Payment Program, including for the MIPS Promoting Interoperability performance category at § 414.1305 (89 FR 98414 and 98415). Currently, we define CEHRT, for purposes of MIPS, as EHR technology (which could include multiple technologies) certified under the Office of National Coordinator for Health Information Technology's (ONC) Health Information Technology (IT) Certification Program that meets the Base EHR definition at 45 CFR 170.102 and certified as meeting additional ONC health IT certification criteria as adopted and updated in 45 CFR 170.315 as enumerated in paragraph (2)(i) of the CEHRT definition at § 414.1305, including as necessary to report on applicable measures specified for the MIPS Promoting Interoperability

performance category. In section IV.A.4.d.(4)(g)(iv) of this proposed rule, Table C–G 8 outlines the measures for the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year and the associated ONC health IT certification criteria set forth at 45 CFR 170.315 impacting the definition of CEHRT, as applicable as of the publication date of this proposed rule.

In the Health Data, Technology, and Interoperability: ASTP/ONC Deregulatory Actions to Unleash Prosperity proposed rule (90 FR 60970) (HTI–5 proposed rule) published in the **Federal Register** on December 29, 2025, ONC [377] proposed a wide-ranging set of updates to the ONC Health IT Certification Program. The HTI–5 proposed rule focuses on deregulatory actions in 45 CFR part 170 (Health Information Technology Standards, Implementation Specifications, and Certification Criteria and Certification Programs for Health Information Technology) and 45 CFR part 171 (Information Blocking). The HTI–5 proposed rule seeks to reduce burden, offer flexibility to developers and providers, and support innovation through the removal and revision of certain certification criteria and regulatory provisions. The following summarizes proposals in the HTI–5 proposed rule that are relevant to MIPS eligible clinicians.

In the HTI–5 proposed rule, ONC identified 34 certification criteria for removal and 7 certification criteria for revision. ONC stated that removing or revising these criteria would reduce burden and costs for health IT developers and clinicians, partly due to the decreased necessity to maintain ongoing conformance with certification requirements (90 FR 60973).

Table C–G 1 of this proposed rule summarizes the potential impacts the proposed removal and revisions of the ONC health IT certification criteria may have on MIPS eligible clinicians reporting the MIPS Promoting Interoperability performance category. Table C–G 1 of this proposed rule describes how the criteria subject to HTI–5 proposals are incorporated into the definition of CEHRT in § 414.1305. In addition to the ONC health IT certification criteria included in the definition of CEHRT in § 414.1305, the definition includes EHR technology certified under the ONC Health IT Certification Program that meets the Base EHR definition at 45 CFR 170.102 and technology certified to the health IT criteria necessary to report on applicable measures specified for the MIPS Promoting Interoperability performance category.

BILLING CODE 4169–69–P

[377] ASTP/ONC is now referred to as ONC, pursuant to a notice published in the **Federal Register** on April 1, 2026 (91 FR 16204). Although at the time of specific references noted herein, ONC was either referenced as ASTP/ONC or as ONC; for clarity, all references in this proposed rule are noted as ONC.

TABLE C-G 1 HTI-5 PROPOSED RULE PROPOSALS TO REMOVE AND REVISE ONC HEALTH IT CERTIFICATION CRITERIA THAT IMPACT THE CEHRT DEFINITION FOR THE MIPS PROMOTING INTEROPERABILITY PERFORMANCE CATEGORY

ONC Health IT Certification Criteria as Defined in the Following Sections of Title 45 CFR 170.315	Remove/Revise	Timing	Relevance to the CEHRT Definition for the MIPS Promoting Interoperability Performance Category
Patient Demographics and Observations - (a)(5)	Revise	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Implantable Device List - (a)(14)	Remove	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Decision Support Interventions - (b)(11)	Revise	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Direct Project - (h)(1)	Remove	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Direct Project, Edge Protocol, and XDR/XDM - (h)(2)	Remove	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Family Health History - (a)(12)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Patient Health Information Capture - (e)(3)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Automated Numerator Recording - (g)(1)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Automated Measure Calculation – (g)(2)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Clinical Quality Measures – Report – (c)(3)(i)	Revise	Effective January 1, 2027.	Specified in CEHRT definition.
Clinical Quality Measures – Report – (c)(3)(ii)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Clinical Quality Measures – Filter – (c)(4)	Remove	Effective January 1, 2027	Specified in CEHRT definition
Transitions of Care - (b)(1)	Revise	Effective January 1, 2027.	Specified criterion for the Support Electronic Referral Loops by Sending Health Information, Support Electronic Referral Loops by Receiving and Reconciling Health Information, Health Information Exchange Bi-Directional Exchange, and Enabling Exchange Under TEFCA measures.
Clinical Information Reconciliation and Incorporation - (b)(2)	Remove	Effective January 1, 2027.	Specified criterion for the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure.
View, Download, and Transmit to 3rd Party - (e)(1)	Revise	Effective date of HTI-5 final rule.	Specified criterion for the Provide Patients Electronic Access to Their Health Information measure.
Transmission to cancer registries – (f)(4)	Remove	Effective January 1, 2027	Specified criterion for the Public Health Registry Reporting measure.
Transmission to public health agencies – Electronic Case Reporting - (f)(5)	Revise	Effective date of HTI-5 final rule.	Specified criterion for the Electronic Case Reporting measure.
Transmission to public health agencies – Health Care Surveys - (f)(7)	Remove	Effective January 1, 2027.	Specified criterion for the Public Health Registry Reporting measure.
Application access — patient selection - (g)(7)	Remove	Effective January 1, 2027.	Specified criterion for the Provide Patients Electronic Access to Their Health Information and Health Information Exchange Bi-Directional Exchange measures.
Application Access – All Data Request - (g)(9)	Remove	Effective January 1, 2027.	Specified criterion for the Provide Patients Electronic Access to Their Health Information and Health Information Exchange Bi-Directional Exchange measures.

BILLING CODE 4169–69–C

Proposed changes in the HTI–5 proposed rule would affect ONC health IT certification criteria included in the definition of CEHRT in 42 CFR 414.1305, which applies to the MIPS Promoting Interoperability performance category in several ways. First, several ONC proposals either revise or remove certain ONC Health IT Certification Program certification criteria included within the Base EHR definition at 45 CFR 170.102, which is incorporated into the definition of CEHRT at § 414.1305. Removal of these criteria from the ONC Health IT Certification Program and the Base EHR definition would therefore remove the requirement that a MIPS eligible clinician must use CEHRT that includes health IT certified to the removed criteria Specifically, ONC proposed to remove the following ONC health IT certification criteria from the Base EHR definition at:, 45 CFR 170.315(a)(14)—''implantable device list'' (90 FR 60983), 45 CFR 170.315(h)(1)—''transport methods and

other protocols—direct project'' (90 FR 60998), and 45 CFR 170.315(h)(2)—''transport methods and other protocols—Direct Project, Edge Protocol, and XDR/XDM'' (90 FR 60999). ONC also proposed to revise the following criteria referenced in the Base EHR definition: 45 CFR 170.315(b)(1)—''transitions of care'' (90 FR 60984), 45 CFR 170.315(a)(5)—''patient demographics and observations'' (90 FR 60981 through 60982) and 45 CFR 170.315(b)(11)—''decision support interventions'' (90 FR 60986 through 60987).

Also, ONC proposed to remove the following five ONC health IT certification criteria specified in the text of the definition of CEHRT at § 414.1305. Specifically, ONC proposed to remove: 45 CFR 170.315(a)(12)—''family health history,'' 45 CFR 170.315(e)(3)—''patient health information capture,'' 45 CFR 170.315(g)(1)—''automated numerator recording,'' 45 CFR 170.315(g)(2)—''automated measure calculation,'' and 45 CFR 170.315(c)(4)—''clinical quality measures—filter'' (90 FR 60982, 60991, 60994, 60995, and 60988, respectively). Also, ONC proposed to revise 45 CFR 170.315(c)(3)—''clinical quality measures—report'' (90 FR 60988). Such ONC health IT certification criteria are discussed further in section IV.A.4.d.(4)(b)(ii) of this proposed rule.

In addition, ONC proposed to remove and/or revise other ONC health IT certification criteria that directly support certain MIPS Promoting Interoperability performance category measures. For example, ONC proposed to revise the ''transitions of care'' criterion in 45 CFR 170.315(b)(1), which supports the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures and remove the ''clinical information reconciliation and incorporation'' criterion in 45 CFR 170.315(b)(2), which supports the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure (90 FR 60984). In addition, of the four ONC health IT certification criteria that are identified as supporting the Provide Patients Electronic Access to Their Health Information measure: 45 CFR 170.315(e)(1), 45 CFR 170.315(g)(7), 45 CFR 170.315(g)(9), and 45 CFR 170.315(g)(10), three are impacted by the proposals in the HTI–5 proposed rule. ONC proposed to revise 45 CFR 170.315(e)(1) (90 FR 60990 through 60991) and remove 45 CFR 170.315(g)(7) and 45 CFR 170.315(g)(9) (90 FR 60998). MIPS eligible clinicians would only need to implement the remaining heath IT certification criteria identified for the Provide Patients Electronic Access to Their Health Information measure (the revised 45 CFR 170.315(e)(1) and unaltered 45 CFR 170.315(g)(10)), if ONC finalizes such proposals. Similarly, for the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures, MIPS eligible clinicians would only need to implement the remaining ONC health IT certification criteria if applicable ONC health IT certification criteria proposed for removal are finalized as proposed in the HTI–5 proposed rule. In section IV.A.4.d.(4)(g)(iv) of this proposed rule, Table C–G 8 contains a complete list of the MIPS Promoting Interoperability performance category measures, and the applicable ONC health IT certification criteria, including the impact to individual ONC health IT certification criteria if the proposals in the HTI–5 proposed rule are finalized.

Regarding the Public Health Registry Reporting measure, ONC has proposed to remove both ONC health IT certification criteria that support the measure: 45 CFR 170.315(f)(4)—''transmission to cancer registries'' and 45 CFR 170.315(f)(7)—''transmission to public health agencies—health care surveys'' (90 FR 60992 and 60994). If the proposed removal of the ONC health IT certification criteria is finalized as proposed in the HTI–5 proposed rule, there would be no specific ONC health IT certification criteria identified for this measure. Consistent with existing policy, a MIPS eligible clinician would still be able to use any available data exchange standard specified in 45 CFR part 170 subpart B to meet the measure. For example, the transmission could be in the form of a Consolidated Clinical Document Architecture (C–CDA) as adopted in 45 CFR 170.205(a)(4), or Quality Reporting Document Architecture (QRDA) as adopted in 45 CFR 170.205(h)(2).

Regarding the Electronic Case Reporting measure, ONC proposed to revise the following health IT criterion that supports the measure: at 45 CFR 170.315(f)(5)—''transmission to public health agencies—electronic case reporting'' (90 FR 60992 through 60993). This proposal would update the ONC health IT certification criterion to focus on functional, rather than standards-based requirements. While ONC's proposal, if finalized, would revise the requirements for health IT products certified to this health IT criterion, MIPS eligible clinicians would continue to need to use health IT certified to this criterion to report the Electronic Case Reporting measure.

Also, we note that ONC proposed to remove certain ONC health IT certification criteria such as 45 CFR 170.315(g)(3)—''safety-enhanced design,'' 45 CFR 170.315(g)(4)—''quality management system,'' (90 FR 60995 through 60997), and a series of criteria related to privacy and security functionality in 45 CFR 170.315(d)(1)–(13) (90 FR 60989 and 60990), most of which are included in the Health IT Module certification requirements at 45 CFR 170.550. Such ONC health IT certification criteria represent capabilities commonly found in certified health IT products used by MIPS eligible clinicians. Furthermore, we note that the proposed removal of such health IT criteria from the ONC Health IT Certification Program would not affect a MIPS eligible clinician's obligation to ensure the privacy and safety of patient electronic health information under the Health Insurance Portability and Accountability Act of 1996 and other applicable laws. We refer readers to Table C–G 8 in section IV.A.4.d.(4)(g)(iv) of this proposed rule for a complete list of ONC health IT certification criteria that support each MIPS Promoting Interoperability performance category measure, including ONC health IT certification criteria ONC proposed to remove and/or revise. In most cases, the ONC health IT certification criteria that support measure reporting would remain part of the ONC Health IT Certification Program. For additional information regarding ONC's proposals in the HTI–5 proposed rule, we refer readers to the HTI–5 proposed rule (90 FR 60970).

(ii) Proposal To Modify the Definition of Certified Electronic Health Record Technology in the MIPS Promoting Interoperability Performance Category

Beginning with the CY 2019 performance period and subsequent performance periods, the definition of CEHRT for the MIPS Promoting Interoperability performance category in § 414.1305 requires the use of EHR technology certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to specific ONC health IT certification criteria as adopted and updated in 45 CFR 170.315. In paragraph (2)(i) of the definition of CEHRT, the definition further specifies that EHR technology must be certified to criteria for ''family health history'' (45 CFR 170.315(a)(12)) and ''patient health information

capture'' (45 CFR 170.315(e)(3)). In paragraph (2)(ii) of the definition of CEHRT, the definition specifies that EHR technology must be certified to ONC health IT certification criteria that are necessary to report on applicable objectives and measures specified for the MIPS Promoting Interoperability performance category. Paragraph (2)(ii)(A) of the definition of CEHRT includes the applicable measure calculation certification criteria at 45 CFR 170.315(g)(1) or (2) for all ONC health IT certification criteria that support an objective with a percentage-based measure. Paragraph (2)(ii)(B) includes clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3)(i) and (ii) and optionally (c)(4).

We are proposing to amend the definition of CEHRT (specified as ''Certified electronic health record technology (CEHRT)'') in § 414.1305, by modifying paragraphs (2)(i), (2)(ii)(A), and (2)(ii)(B) to align with the applicable ONC proposals to remove and revise certain ONC health IT certification criteria as proposed in the HTI–5 proposed rule. Specifically, we are proposing to remove references to the following ONC health IT certification criteria for the CY 2027 performance period/2029 MIPS payment year:

- ''family health history''—45 CFR 170.315(a)(12);
- ''patient health information capture''—45 CFR 170.315(e)(3);
- ''automated numerator recording''—45 CFR 170.315(g)(1);
- ''automated measure calculation''—45 CFR 170.315(g)(2); and
- ''clinical quality measures—filter''—45 CFR 170.315(c)(4).

If the ONC proposals to remove such ONC health IT certification criteria are finalized as proposed, the ONC health IT certification criteria at 45 CFR 170.315(a)(12), 45 CFR 170.315(e)(3), 45 CFR 170.315(g)(1), and 45 CFR 170.315(g)(2) would no longer be required and ONC health IT certification criteria at 45 CFR 170.315(c)(4) would no longer be included as an optional criterion to meet the definition of CEHRT, effective January 1, 2027. As part of this proposed modification to the definition of CEHRT, we would also specify a limited timeframe, from CY 2019 through CY 2026, for the following ONC health IT certification criteria to be included in the CEHRT definition; ''family health history'' (45 CFR 170.315(a)(12)), ''patient health information capture'' (45 CFR 170.315(e)(3)), ''automated numerator recording'' (45 CFR 170.315(g)(1)), ''automated measure calculation'' (45 CFR 170.315(g)(2), and ''clinical quality measures'' (45 CFR 170.315(c)(4)). Additionally, as part of the proposed modification to the definition of CEHRT, we would modify the reference to the ''clinical quality measures—report'' (45 CFR 170.315(c)(3)) ONC health IT certification criterion from ''(c)(3)(i) and (ii)'' to (c)(3), which would align with the proposed revisions in the HTI–5 proposed rule to modify (c)(3) to include the provision of (c)(3)(i), and remove subparagraphs (c)(3)(i) and (c)(3)(ii). Lastly, we are proposing to amend the definition of CEHRT in § 414.1305 by modifying paragraphs 2(i), (2)(i)(A), and (2)(i)(B).

While the proposal is consistent with the proposals in the HTI–5 proposed rule (90 FR 60970), we note that our proposal is not contingent upon the final actions that ONC will make regarding their proposals to remove and revise ONC health IT certification criteria as proposed in the HTI–5 proposed rule.

We believe that the longstanding presence of the ONC health IT certification criteria for ''family health history'' at 45 CFR 170.315(a)(12) and ''patient health information capture'' at 45 CFR 170.315(e)(3) in the ONC Health IT Certification Program (adopted in 2015 at 80 FR 62602 and 80 FR 62624 respectively) and their incorporation into the MIPS Promoting Interoperability performance category requirements means functionality reflected in such ONC health IT certification criteria is likely to be fully embedded in certified health IT and is widely available for use by MIPS eligible clinicians. Further, ONC anticipates that health IT developers will continue to retain such capabilities in their Health IT Modules despite the absence of ONC health IT certification criteria for such functionalities (90 FR 60982 and 60991). Such ONC health IT certification criteria are not identified as supporting any specific measures within the MIPS Promoting Interoperability performance category and as a result, we do not anticipate any modifications to the measure specifications due to the removal of these criteria from the definition.

If the ONC health IT certification criteria needed for measure calculation (''automated numerator recording'' and ''automated measure calculation'' ONC health IT certification criteria in 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2)) is finalized for removal, then EHR technology used by MIPS eligible clinicians would not need to be certified to such two ONC health IT certification criteria in order to meet the requirement for MIPS eligible clinicians to use CEHRT; however, we anticipate that health IT developers seeking to support customers participating in the MIPS Promoting Interoperability performance category will continue to support the functionality of these criteria by reporting of numerators and denominators for certain MIPS Promoting Interoperability performance category measures, including the e-Prescribing measure and Provide Patients Electronic Access to Their Health Information measure. Removing the requirements for ONC health IT certification criteria at 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2) from the definition of CEHRT in § 414.1305 would reduce administrative burden for health IT developers associated with testing and certifying to such functionality without impacting reporting requirements for the MIPS Promoting Interoperability performance category.

Additionally, for the optional ONC health IT certification criterion pertaining to ''clinical quality measures—filter'' in 45 CFR 170.315(c)(4), we do not believe that this criterion is a meaningful addition to the CEHRT definition for health care providers. The optional designation for this ONC health IT certification criterion has led to limited uptake while health care providers and health IT developers have indicated that this functionality is available in EHRs without relying on a regulatory requirement. Also, ONC has stated that it anticipates that health IT systems will continue to retain the clinical quality measure filtering functionality despite the absence of the ONC health IT certification criterion for such functionality (90 FR 60988).

In summary, we are proposing to amend the definition of CEHRT, specified as ''Certified electronic health record technology (CEHRT)'' in § 414.1305, by modifying paragraphs (2)(i), (2)(i)(A), and (2)(i)(B). Specifically—

- In paragraph (2)(i), we are proposing to remove for CY 2027 and subsequent years, the certification criteria for ''family health history'' (as adopted and updated at 45 CFR 170.315(a)(12)) and ''patient health information capture'' (as adopted and updated at 45 CFR 170.315(e)(3));
- In paragraph (2)(ii)(A), we are proposing to remove for CY 2027 and subsequent years, the ONC health IT certification criteria for ''automated numerator recording'' (as adopted and updated at 45 CFR 170.315(g)(1)) and ''automated measure calculation'' (as

adopted and updated at 45 CFR 170.315(g)(2)); and

• In paragraph (2)(ii)(B), we are proposing to remove for CY 2027 and subsequent years, the ONC health IT certification criterion for ''clinical quality measures—filter'' (as adopted and updated at 45 CFR 170.315(c)(4)).

The revised text would read as follows:

''Certified electronic health record technology (CEHRT) [. . .]

(2) For 2019 and subsequent years, EHR technology (which could include multiple technologies) certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition, or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to the ONC health IT certification criteria, as adopted and updated in 45 CFR 170.315—

(i) For CY 2019 through CY 2026, at 45 CFR 170.315(a)(12) (family health history) and 45 CFR 170.315(e)(3) (patient health information capture); and

(ii) Necessary to report on applicable objectives and measures specified for MIPS including the following:

(A) For CY 2019 through CY 2026, the applicable measure calculation certification criterion at 45 CFR 170.315(g)(1) or (2) for all certification criteria that support a meaningful use objective with a percentage-based measure.

(B) Clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3), and for CY 2019 through CY 2026, optionally (c)(4), and can be electronically accepted by CMS.''

The proposed modifications would be effective January 1, 2027, which aligns with the effective date of ONC's proposal to remove such ONC health IT certification criteria from the Code of Federal Regulations as proposed in the HTI–5 proposed rule. If our proposed modifications are finalized, a MIPS eligible clinician's EHR technology would no longer be required to meet the ONC health IT certification criteria at 45 CFR 170.315(a)(12), (e)(3), (g)(1), or (g)(2), the ONC health IT certification criteria at 45 CFR 170.315(c)(4) would no longer be included as optional in paragraph (2)(ii)(B), and paragraph (2)(ii)(B) would reference the entirety of the certification criterion at 45 CFR 170.315(c)(3) in the definition of CEHRT at 42 CFR 414.1305. All other remaining ONC health IT certification criteria included in the definition of CEHRT would continue to be a requirement for a MIPS eligible clinician's EHR technology. We note that there is a similar proposal to remove certain ONC health IT certification criteria from the definition of CEHRT for the Medicare Promoting Interoperability Program for eligible hospitals and critical access hospitals (CAHs) in the ''Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals (IPPS) and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year (FY) 2027 Rates; Requirements for Quality Programs; and Other Policy Changes'' (FY 2027 IPPS/LTCH PPS) proposed rule (91 FR 19620 through 19621).

We request public comment on this proposal.

(c) Proposal To Remove ONC Direct Review and ONC-Authorized Certification Bodies (ACB) Surveillance Attestations

(i) Background

In the CY 2017 Quality Payment Program final rule, we finalized policies to support MIPS eligible clinicians in ONC health IT surveillance and direct review activities through requiring two attestations, specifically, the ONC Direct Review attestation and the ONC-Authorized Certification Bodies (ACB) Surveillance attestation (81 FR 77019 through 77027). The purpose of ONC surveillance and direct review is to provide greater assurance that health IT meets certification requirements not only in a controlled testing environment, but also when used by health care providers in actual production environments (80 FR 62707). When such attestations were finalized as requirements for the MIPS Promoting Interoperability performance category (formerly the advancing care information performance category) in the CY 2017 Quality Payment Program final rule, we intended for the attestations to complement and strengthen recent updates to ONC's ability to perform surveillance and direct review activities.

Specifically, in October 2015, ONC finalized the 2015 Edition Health Information Technology (Health IT) Certification Criteria, 2015 Edition Base Electronic Health Record (EHR) Definition, and ONC Health IT Certification Program Modifications final rule, which added requirements for ONC–ACBs to conduct more frequent and more rigorous surveillance of certified technology and capabilities in the field (80 FR 62707). Additionally, in October 2016, ONC published the ONC Health IT Certification Program: Enhanced Oversight and Accountability final rule, which established regulatory processes to facilitate ONC's direct review and evaluation of the performance of certified health IT in certain circumstances (81 FR 72406). In the CY 2017 Quality Payment Program final rule, we determined that surveillance and direct review activities provided greater assurance to health care providers that their certified EHR technology would perform in a manner that meets their expectations, but that such surveillance and direct review would not be effective unless health care providers cooperated with such activities, including by granting access to and assisting ONC–ACBs and ONC to observe the performance of production systems (81 FR 77020).

In § 414.1375(b)(3)(i)(A), we require an attestation that acknowledges the requirement to cooperate in good faith with ONC direct review of his or her health IT certified under the ONC Health IT Certification Program if a request to assist in ONC direct review is received. A MIPS eligible clinician must attest that he or she, if requested, cooperated in good faith with ONC direct review of his or her health IT certified under the ONC Health IT Certification Program as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the MIPS eligible clinician in the field. Also, we specified at § 414.1375(b)(3)(i)(B) an optional attestation that acknowledges the option to cooperate in good faith with ONC–ACB surveillance of his or her health IT certified under the ONC Health IT Certification Program if a request to assist in ONC–ACB surveillance is received. A MIPS eligible clinician may attest that he or she, if requested, cooperated in good faith with ONC–ACB surveillance of his or her health IT certified under the ONC Health IT Certification Program as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the MIPS eligible clinician in the field.

The ONC Direct Review attestation is a required element of the MIPS Promoting Interoperability performance category. Submitting a ''Yes'' response is the only means to fulfill the requirement of the attestation. If a MIPS eligible clinician submits a ''No'' response or does not submit any

attestation for the ONC Direct Review attestation, the MIPS eligible clinician will receive a score of zero for the MIPS Promoting Interoperability performance category. The ONC–ACB Surveillance attestation is optional. A MIPS eligible clinician can submit a ''Yes'' or ''No'' response or not submit any attestation for the ONC–ACB Surveillance attestation. No scenario for the ONC–ACB Surveillance attestation would impact a MIPS eligible clinician's score for the MIPS Promoting Interoperability performance category. Scoring implications for the proposal to remove the ONC Direct Review and ONC–ACB Surveillance attestations are discussed in section IV.A.4.d.(4)(g)(ii)(A) of this proposed rule.

(ii) Proposal To Remove the ONC Direct Review and ONC–ACB Surveillance Attestations Beginning With the CY 2026 Performance Period/2028 MIPS Payment Year

We are proposing to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation in § 414.1375(b)(3)(i)(A) and (B), respectively, beginning with the CY 2026 performance period/2028 MIPS payment year to reduce administrative burden. For the CY 2026 performance period, MIPS eligible clinicians would not be reporting on such attestations until the applicable submission period, which starts on January 1, 2027. Because these two attestations are reported during the applicable submission period, we have determined that it would be feasible for CMS to implement and operationalize these modifications to the MIPS Promoting Interoperability performance category requirements prior to the start of the submission period associated with the CY 2026 performance period. We continue to recognize the importance of ONC direct review and ONC–ACB surveillance activities and consider such mechanisms important for mitigating issues with health IT products that may pose serious risks to public health or safety, and we continue to collaborate with ONC to support the ONC Health IT Certification Program. As stated in the CY 2017 Quality Payment Program final rule (81 FR 77020), efforts to strengthen surveillance and direct review of certified health IT are critical to the success of HHS programs and initiatives that require the use of certified health IT to improve health care quality and the efficient delivery of care. We do not anticipate that the commitment from ONC and the ONC–ACBs toward such goals will change.

While ONC–ACB surveillance and ONC direct review activities remain important to being a user of certified health IT, we no longer consider the administrative step of attesting to cooperating and/or participating in such activities to be necessary. Since 2016 (1 year prior to the enactment of MACRA, in which the MIPS Promoting Interoperability performance category replaced the Medicare EHR Incentive Program for eligible professionals), the ONC–ACB surveillance and ONC direct review activities and processes have become known to MIPS eligible clinicians and as a result, the value of participation has become evident without dependence on an ongoing need to conduct annual attestations. Therefore, the administrative burden associated with such attestations outweighs their value compared to when they were originally adopted.

The proposal to remove the ONC Direct Review attestation and ONC–ACB Surveillance attestation aligns with the goals of reducing administrative burden while simultaneously focusing on high-value, outcome-oriented measures. Specifically, the removal of such attestations from the MIPS Promoting Interoperability performance category requirements provides an opportunity to reduce the number of discrete manual steps and reporting fields required for successful adherence to reporting requirements without diminishing the integrity or central goals of the MIPS Promoting Interoperability performance category. Although we are proposing to remove such attestations, we strongly encourage MIPS eligible clinicians to continue participating in the surveillance and direct review processes when assistance is requested by ONC or an ONC–ACB. CMS will continue to support surveillance and direct review activities as appropriate.

We are proposing to amend § 414.1375(b)(3)(i) by modifying the requirements to include a specific allotted timeframe (CY 2017 performance period/2019 MIPS payment year through CY 2025 performance period/2027 MIPS payment year) for requiring the reporting of attestations pertaining to the ONC Direct Review attestation and ONC–ACB Surveillance attestation. Specifically, we are proposing to amend § 414.1375(b)(3)(i) as follows: ''Supporting providers with the performance of CEHRT (SPPC). To engage in activities related to supporting providers with the performance of CEHRT beginning with the 2019 MIPS payment year through the 2027 MIPS payment year, the MIPS eligible clinician—. . .'' We are proposing to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation beginning with the CY 2026 performance period/2028 MIPS payment year to reduce burden. If the proposal to remove the ONC Direct Review attestation and ONC–ACB Surveillance attestation is finalized as proposed, for the CY 2026 performance period/2028 MIPS payment year, MIPS eligible clinicians would not, in the case of the ONC Direct Review attestation, be required to report on such attestation, and in the case of the ONC–ACB Surveillance attestation, have the option of reporting on such attestation during the applicable submission period (January 1, 2027 through March 1, 2027). The proposed removal of such attestations would not affect a MIPS eligible clinician's score for the MIPS Promoting Interoperability performance category for the CY 2026 performance period/2028 MIPS payment year, respectively. We note that the proposals to remove the ONC Direct Review attestation and optional ONC–ACB Surveillance attestation align with the same proposals for the Medicare Promoting Interoperability Program as proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19621).

We refer readers to Tables C–G 2, C–G 3, and C–G 6 in sections IV.A.4.d.(4)(g)(i) and IV.A.4.d.(4)(g)(ii)(D) of this proposed rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category for the CY 2026 performance period/2028 MIPS payment year, if the proposal to remove the ONC Direct Review attestation and ONC–ACB Surveillance attestation is finalized as proposed. We note that if the proposal is finalized as proposed, the CY 2025 performance period/2027 MIPS payment year would be the last performance period/MIPS payment year in which the ONC Direct Review attestation and ONC–ACB Surveillance attestation would be included under the MIPS Promoting Interoperability performance category.

We request public comment on these proposals.

(d) Proposal To Remove Security Risk Analysis Measure

(i) Background

The HIPAA Security Rule [378] (45 CFR part 160 and subparts A and C of part

[378] On January 6, 2025, the U.S. Department of Health and Human Services published the HIPAA Security Rule to Strengthen the Cybersecurity of Electronic Protected Health Information proposed

164) contains, among other things, the administrative safeguards that covered entities and business associates (45 CFR 164.308) must implement, such as the standard and implementation specifications for security management processes. Among such safeguards are implementation specifications that require covered entities and business associates to conduct an accurate and thorough assessment of the potential risks and vulnerabilities to the confidentiality, integrity, and availability of electronic protected health information (ePHI) held by the covered entity or business associate (45 CFR 164.308(a)(1)(ii)(A)). Safeguards also include implementing security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with the general requirements of the HIPAA Security Rule at 45 CFR 164.306(a).

Ensuring the privacy and security of ePHI is essential for demonstrating meaningful use of CEHRT (90 FR 49871). Since 2010, we adopted and maintained the Security Risk Analysis measure based on the HIPAA Security Rule risk analysis requirement in 45 CFR 164.308(a)(1)(ii)(A) for the Medicare EHR Incentive Program for Eligible Professionals,[379] the predecessor to the MIPS Promoting Interoperability performance category.[380] In the CY 2017 Quality Payment Program final rule (81 FR 77219 through 77220), we adopted the Protect Patient Health Information objective for the MIPS Promoting Interoperability performance category and included the Security Risk Analysis measure within this objective. We subsequently modified this measure in the CY 2019 PFS final rule (83 FR 59790) and the CY 2026 PFS final rule (90 FR 49871 through 49874).

As described in the CY 2026 PFS final rule, the MIPS Promoting Interoperability Security Risk Analysis measure requires MIPS eligible clinicians to attest ''Yes'' to having conducted security risk management and attest ''Yes'' to having conducted or reviewed a security risk analysis as required by the HIPAA Security Rule (90 FR 49870 through 49874). The scoring implications associated with the proposal to remove the Security Risk Analysis measure are discussed in section IV.A.4.d.(4)(g)(ii)(B) of this proposed rule.

(ii) Proposal To Remove the Security Risk Analysis Measure Beginning With the CY 2027 Performance Period/2029 MIPS Payment Year

We are proposing to remove the Security Risk Analysis measure beginning with the CY 2027 performance period/2029 MIPS payment year to reduce reporting burden. The HIPAA Security Rule (45 CFR part 160 and subparts A and C of part 164) contains, among other requirements, the administrative safeguards that covered entities and business associates (45 CFR 164.308) must implement, such as the standard and implementation specifications for security risk analysis and risk management processes. The administrative safeguards also require implementation of security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with the general requirements of the HIPAA Security Rule at 45 CFR 164.306.

Given that MIPS eligible clinicians are covered entities under the HIPAA Security Rule and the requirements of the Security Risk Analysis measure derive from the HIPAA Security Rule requirements, removal of the Security Risk Analysis measure will not weaken any cybersecurity requirements for MIPS eligible clinicians. When the Security Risk Analysis measure was adopted in the CY 2017 Quality Payment Program final rule, we determined that requiring an attestation regarding HIPAA Security Rule requirements promoted awareness of these requirements among MIPS eligible clinicians (81 FR 77219 through 77220).

However, we have considered the ongoing applicability of the measure given its longstanding presence in the MIPS Promoting Interoperability performance category and the established awareness of HIPAA Security Rule requirements among MIPS eligible clinicians. In assessing whether it remains appropriate to maintain the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category, we considered the extent to which the measure continues to advance its goals relative to the costs associated with its continued use. We believe these costs include not only the burden associated with reporting the requisite attestations, but also the costs associated with administering and maintaining the measure within the program. These costs may include but are not limited to the following: clinician burden associated with information collection and submission; clinician burden associated with complying with overlapping programmatic and regulatory requirements, including the HIPAA Security Rule; and CMS resources associated with oversight, maintenance, education, and operational support for the measure. In the case of the Security Risk Analysis measure, because the underlying security risk analysis and risk management activities are already required under the HIPAA Security Rule, we believe it may be unnecessarily costly and of limited incremental benefit to retain this measure where its continued inclusion no longer meaningfully advances the objectives of the MIPS Promoting Interoperability performance category beyond the separate regulatory requirements that already apply. For these reasons, we believe removal of the Security Risk Analysis measure at this time would balance the goals of reducing unnecessary administrative burden, maintaining a parsimonious and meaningful measure set, and preserving the focus of the MIPS Promoting Interoperability performance category on high-value measures that more directly support program objectives.

This proposal aligns with our goals of reducing administrative burden while simultaneously focusing on high-value, outcome-oriented measures. Specifically, the removal of the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category provides an opportunity to reduce the number of discrete manual steps and reporting fields required for successful adherence to reporting requirements without diminishing the integrity or central goals of the MIPS Promoting Interoperability performance category. Although we are proposing to remove the Security Risk Analysis measure, we remind MIPS eligible clinicians to continue to conduct security risk analysis and security risk management to safeguard ePHI as required under the HIPAA Security Rule. We anticipate that MIPS eligible clinicians will continue to conduct security risk analysis and security risk management activities to comply with the requirements pertaining to the security of data created and maintained

rule (90 FR 898). The proposed rule has not been finalized as of the publication of this proposed rule.

[379] Medicare and Medicaid Programs: Electronic Health Record Incentive Program final rule (75 FR 44368 and 44369); established at 42 CFR 495.6(d)(15)(ii).

[380] Section 101(b) of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) sunset the Medicare EHR Incentive Program for Eligible Professionals, set forth at section 1848(o) of the Act. As discussed previously, section 1848(o)(2) of the Act has been incorporated into the MIPS Promoting Interoperability performance category's requirements via section 1848(q)(2)(B)(iv) of the Act. *See* CY 2017 Quality Payment Program final rule (81 FR 77018 and 77019) for more information regarding the sunsetting of the Medicare EHR Incentive Program for Eligible Professionals.

by CEHRT in accordance with the HIPAA Security Rule.

Retirement of the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category beginning with the CY 2027 performance period/2029 MIPS payment year would reduce burden by removing the attestation requirement and supporting a more parsimonious and outcomes-oriented measure set. Specifically, we propose in § 414.1375(b)(2)(ii)(A) to specify a limited timeframe, through the 2028 MIPS payment year for which a MIPS eligible clinician would be required to report that they completed the actions included in the Security Risk Analysis measure during the year in which the performance period occurs.

We refer readers to Tables C–G 2, C–G 4, C–G 6 and C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this proposed rule for more information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category starting with the CY 2027 performance period/2029 MIPS payment year, which is contingent upon the finalization of the proposal to remove the Security Risk Analysis measure.

We request public comment on this proposal.

(e) Proposal To Adopt a New Electronic Prior Authorization for Prescription Drugs Measure Beginning With the CY 2028 Performance Period/2030 MIPS Payment Year

(i) Background

Under section 1848(o)(2)(A) of the Act, the MIPS Promoting Interoperability performance category assesses whether MIPS eligible clinicians use CEHRT in a meaningful manner. By statute, such demonstration includes the use of electronic prescribing as determined to be appropriate by the Secretary. The MIPS Promoting Interoperability performance category has therefore included measures related to electronic prescribing since its inception (75 FR 44337; and 81 FR 77229 through 77237). Separately from the MIPS Promoting Interoperability performance category, we have also advanced the adoption of electronic prescribing through authority under section 1860D–4(e) of the Act, which requires that prescriptions for covered Medicare Part D drugs transmitted electronically comply with a uniform transaction standard specified by CMS. Under the same authority under section 1860D–4(e) of the Act, we also generally require that Schedule II, III, IV, and V controlled substances under Medicare Part D and Medicare Advantage prescription drug plans be prescribed electronically in accordance with an electronic prescription drug program. That required standard includes transactions for the electronic prior authorization of Part D-covered drugs prescribed to Part D-eligible individuals (85 FR 86827 through 86832 and 89 FR 51242 through 51247).

Historically, the ONC Health IT Certification Program and the Part D Program have maintained complementary policies of aligning ONC health IT certification criteria and associated standards related to electronic prescribing, medication history, and electronic prior authorization for prescriptions (89 FR 51257). In successive rules supporting the ONC Health IT Certification Program, ONC has adopted the National Council for Prescription Drugs Program (NCPDP) SCRIPT standard as the required exchange standard for the electronic prescribing certification criterion at 45 CFR 170.315(b)(3). In the ''Medicare Program; Medicare Prescription Drug Benefit Program; Health Information Technology Standards and Implementation Specifications'' final rule (89 FR 51242 through 51247), the Part D Program finalized at § 423.160(b)(1) the requirement that Part D sponsors, prescribers and dispensers, when electronically transmitting prescriptions and prescription-related information for covered Part D drugs for Part D eligible individuals, must comply with the standard in 45 CFR 170.205(b). Taken in conjunction with the standards and expiration date adopted by ONC in the same rule (89 FR 51258 through 51259), § 423.160(b)(1) will require Part D sponsors, prescribers and dispensers to use NCPDP SCRIPT standard version 2023011, which ONC adopted at 45 CFR 170.205(b)(2), beginning January 1, 2028, and expire NCPDP SCRIPT standard version 2017071, which ONC previously adopted at 45 CFR 170.205(b)(1) as of January 1, 2028. The NCPDP SCRIPT standard version 2023011 includes enhancements to support electronic prescribing and transmission of prescription-related and electronic prior authorization information.

On April 14, 2026, the ''Medicare and Medicaid Programs; Patient Protection and Affordable Care Act; Interoperability Standards and Prior Authorization for Drugs for Medicare Advantage Organizations, Medicaid Managed Care Plans, State Medicaid Agencies, Children's Health Insurance Program (CHIP) Agencies and CHIP Managed Care Entities, and Issuers of Qualified Health Plans on the Federally-Facilitated Exchanges'' (2026 CMS Interoperability Standards and Prior Authorization for Drugs) proposed rule was published and introduced proposals that require Medicare Advantage organizations, state Medicaid and CHIP FFS programs, Medicaid managed care plans, CHIP managed care entities, and Qualified Health Plans offered on the Federally-facilitated Exchanges (collectively ''impacted payers'') to support certain exchange standards for the electronic prior authorization of prescription drugs (91 FR 19890). We proposed that, beginning on October 1, 2027, impacted payers be required to support electronic prior authorization for all drugs that require prior authorization. Two separate sets of standards were proposed for payers to facilitate electronic prior authorization for drugs: three NCPDP standards (NCPDP SCRIPT Standard©, NCPDP Formulary and Benefit (F&B) Standard©, and NCPDP Real-Time Prescription Benefit (RTPB) Standard©) for prescription drugs covered under a pharmacy benefit; and six Fast Healthcare Interoperability Resources® (FHIR®) standards including the HL7 FHIR Da Vinci—Coverage Requirements Discovery (CRD) Implementation Guide (IG), the HL7 FHIR Da Vinci—Documentation Templates and Rules (DTR) IG, the HL7 FHIR Da Vinci—Prior Authorization Support (PAS) IG) for prescription drugs covered under a medical benefit.

Concurrent with other CMS efforts to promote standards adoption in electronic prior authorization, the MIPS Promoting Interoperability performance category has placed increasing emphasis on prior authorization through its adoption of the Electronic Prior Authorization measure (89 FR 8909) as established in the ''Medicare and Medicaid Programs; Patient Protection and Affordable Care Act; Advancing Interoperability and Improving Prior Authorization Processes for Medicare Advantage Organizations, Medicaid Managed Care Plans, State Medicaid Agencies, Children's Health Insurance Program (CHIP) Agencies and CHIP Managed Care Entities, Issuers of Qualified Health Plans on the Federally-Facilitated Exchanges, Merit-Based Incentive Payment System (MIPS) Eligible Clinicians, and Eligible Hospitals and Critical Access Hospitals in the Medicare Promoting Interoperability Program'' (2024 CMS Interoperability and Prior Authorization) final rule. The Electronic Prior Authorization measure assesses

MIPS eligible clinicians on the use of a Prior Authorization application programming interface (API) to request prior authorization for medical items and services. However, the measure does not assess the use of electronic prior authorization for prescription drugs, in part because the Prior Authorization API requirements finalized in the 2024 CMS Interoperability and Prior Authorization final rule excluded prescription drugs (89 FR 8918).

(ii) Proposal To Adopt Electronic Prior Authorization for Prescription Drugs Measure

Across the healthcare industry, a majority of prior authorizations for prescription drugs covered under a pharmacy benefit remain a separate manual process outside of the EHR workflow, not connected to e-prescribing, and could cause major points of friction and delay in the prescribing and prior authorization workflow. In 2023, approximately 38 percent of prescription drug prior authorizations were fully electronic and 15 percent were fully manual, indicating continuing capacity for improvement in the domain.[381] This current level of adoption of electronic prior authorization for prescription drugs contributes to a reliance on payer portals and manual processes, including processes based on phone, or fax, which are entirely outside the EHR and that may delay patients' access to needed medications, increase administrative complexity for clinicians and staff, and undermine the efficiency and clinical value of electronic prescribing. As more payers support standardized electronic prior authorization, we have determined that measuring the use of prior authorization for prescription drugs would be a valuable addition to our assessment of meaningful use of CEHRT under the MIPS Promoting Interoperability performance category. Standards-based electronic prior authorization should improve timeliness and transparency of medication access by facilitating document-gathering and tracking of prior authorization status within clinician EHR workflows to support care coordination and help close the prescriber-to-dispenser loop. Thus, we believe that incorporating electronic prior authorization for prescription drugs is an appropriate aspect of demonstrating meaningful use of CEHRT by MIPS eligible clinicians.

Action in this area is further supported by longstanding efforts to promote standards adoption for prescription-related transactions under the Part D Program and the ONC Health IT Certification Program. As previously noted, CMS and ONC have maintained complementary policies aligning electronic prescribing and prescription-related standards at 42 CFR 423.160(b)(1) for Part D transactions and 45 CFR 170.315(b)(3) for the ONC Health IT Certification Program. Health IT developers also have experience with the underlying transaction standards because of their use in Part D transactions. Therefore, we believe that MIPS eligible clinicians and their health IT vendors have a foundation to implement the functionality for a new measure we are proposing in this proposed rule, the Electronic Prior Authorization for Prescription Drugs measure.

We are proposing to adopt a new measure, Electronic Prior Authorization for Prescription Drugs, for the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year. We intend for the new Electronic Prior Authorization for Prescription Drugs measure to be included in the Health Information Exchange objective for the MIPS Promoting Interoperability performance category to emphasize the role of prior authorization in promoting care coordination and collocate the new measure in the same objective as the previously adopted Electronic Prior Authorization measure. The new Electronic Prior Authorization for Prescription Drugs measure aims to assess a MIPS eligible clinician's utilization of standards-based electronic prior authorization. We are proposing the specifications of the Electronic Prior Authorization for Prescription Drugs measure to be as follows:

- *Measure Description:* For at least one prescription drug ordered by the MIPS eligible clinician during the performance period for which prior authorization is required, the prior authorization is requested electronically using CEHRT.
- *Reporting Requirements:* ''Yes''/''No'' response.
- *Exclusion:* Any MIPS eligible clinician who—

++ Does not prescribe drugs that require prior authorization during the applicable performance period;

++ Only prescribes drugs requiring prior authorization where the payer does not support the specified electronic prior authorization standard during the applicable performance period; or

++ Prescribes fewer than 100 permissible prescription drugs during the performance period.

We note that the last exclusion matches an exclusion in the Electronic Prescribing measure. For this exclusion, ''permissible prescriptions'' means all drugs that meet the current definition of a prescription as ordered by a MIPS eligible clinician to dispense a drug that would not be dispensed without such order. ''Permissible prescriptions'' may include electronic prescriptions of controlled substances where creation of an electronic prescription for the medication is feasible using CEHRT and where allowable by state and local law. Additionally, for purposes of this exclusion, permissible prescriptions include any prescription, not only those requiring prior authorization. To successfully report this measure, MIPS eligible clinicians must submit a ''Yes'' response, in which they are affirmatively attesting to having requested prior authorization electronically using CEHRT for at least one prescription drug ordered by the MIPS eligible clinician during the performance period or (if applicable) claim an exclusion. We expect that once a MIPS eligible clinician has the capability of requesting prior authorization electronically, that MIPS eligible clinician would do so more frequently, though we are not proposing to measure frequency of use at this time with this initial version of the measure. The new measure would apply to prescription drugs covered under a pharmacy benefit, as functionally defined by whether prior authorization can be requested for the drug can be authorized using the NCPDP SCRIPT standard.

The proposal to use CEHRT for this measure would require use of health IT certified to the ONC health IT certification criteria at 45 CFR 170.315(b)(3)—''Electronic prescribing'' and at 45 CFR 170.315(b)(4)—''Real-time prescription benefit'' to support any electronic prior authorization requests used to satisfy this measure. Use of both ''electronic prescribing'' and ''real-time prescription benefit'' certification criteria ensures that MIPS eligible clinicians use standards-based capabilities within their health IT systems to successfully complete the measure. Beginning January 1, 2028, the specified standards within the certification criteria in 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4) would be the same versions of the NCPDP SCRIPT Standard and NCPDP

[381] For more information, see: *https://www.caqh.org/hubfs/Issue%20Briefs/CAQH_Insights_NCPDP_SCRIPT_Issue_Brief.pdf.*

RTPB Standard, respectively, required for Medicare Part D sponsors and proposed to be required for other impacted payers in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 19925 through 19927). For purposes of the proposed new Electronic Prior Authorization for Prescription Drugs measure, ''requested electronically'' means initiating and submitting an electronic prior authorization request from within CEHRT using health IT certified under 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4). Using health IT certified to the ''real-time prescription benefit'' criterion in 45 CFR 170.315(b)(4) allows a MIPS eligible clinician to ascertain the patient-specific out-of-pocket cost of a prescription drug, the cost of suitable alternatives, compare prescription costs at different pharmacies, and learn whether prior authorization for a specific prescription drug is required.

The 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule also proposed that impacted payers support the NCPDP F&B standard (91 FR 19926). We are not including this standard as part of required CEHRT for this measure at this juncture. However, we believe that the NCPDP F&B standard complements the NCPDP SCRIPT and RTPB standards certification criteria for Health IT Modules in 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4), respectively, and we encourage MIPS eligible clinicians to use the F&B standard functions within their EHRs as part of an electronic prior authorization workflow as well.

We note that adoption of the new Electronic Prior Authorization for Prescription Drugs measure is not contingent upon the finalization of the proposals in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule. We note the proposed new Electronic Prior Authorization for Prescription Drugs measure includes an exclusion for cases in which no applicable payer supports the specified electronic prior authorization standard.

Electronic prior authorization requests for prescription drugs covered under a pharmacy benefit, which would leverage the NCPDP SCRIPT Standard and NCPDP RTPB Standard, are often for those prescription drugs dispensed at a retail pharmacy. We recognize that other prescription drugs may be covered under a medical benefit and are usually administered or dispensed by a medical provider in a health care setting. Those drugs covered under a medical benefit generally use FHIR-based electronic prior authorization processes, such as those supported by the Da Vinci CRD, DTR, and PAS implementation guides finalized under ONC health IT certification criteria, and therefore are not in scope for the proposed new Electronic Prior Authorization for Prescription Drugs measure. A MIPS eligible clinician that only needs prior authorization for prescription drugs covered under a medical benefit and not a pharmacy benefit would be eligible to claim an exclusion for not ordering an applicable prescription drug during the performance period.

For purposes of the new Electronic Prior Authorization for Prescription Drugs measure, ''one prescription drug ordered by the MIPS eligible clinician'' includes a new prescription and, where applicable, a prescription renewal or refill request that generates a prior authorization requirement at the time of prescribing. A prescription drug ''for which prior authorization is required'' is one for which the applicable payer rules indicate a prior authorization requirement at the point of prescribing for the patient and plan. We believe the NCPDP F&B Standard would help inform MIPS eligible clinicians when a prior authorization is required or not, even if not a mandate of the Electronic Prior Authorization for Prescription Drugs measure. We recognize that coverage for certain prescription drugs may fall under either the pharmacy or medical benefit and we will continue to consider future policies to reduce workflow fragmentation across prior authorization approaches. In section IV.A.4.d.(4)(f)(vii) of this proposed rule, we request public comment on the potential to expand the scope of the Electronic Prior Authorization to include prescription drugs covered under a medical benefit.

We are proposing that the Electronic Prior Authorization for Prescription Drugs measure would require an attestation of ''Yes'' or ''No'' response from a MIPS eligible clinician. Starting with the CY 2028 performance period/2030 MIPS payment year and subsequent years for MIPS eligible clinicians, a MIPS eligible clinician would be required to submit a ''Yes'' response for the measure or claim an applicable exclusion in order to earn a score for the MIPS Promoting Interoperability performance category. If a MIPS eligible clinician submits a ''No'' response, fails to submit any attestation, or does not claim an applicable exclusion for the Electronic Prior Authorization for Prescription Drugs measure, the MIPS eligible clinician would receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score), and would not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for an applicable performance period. We refer readers to Tables C–G 2, C–G 5, C–G 6, and C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this proposed rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category, which is contingent upon the finalization of the proposal to adopt the new Electronic Prior Authorization for Prescription Drugs measure.

We propose that this measure would initially require an attestation of a ''Yes'' or ''No'' response to allow MIPS eligible clinicians to gain familiarity with electronic prior authorization for prescription drugs and measure reporting. We anticipate a future conversion of the Electronic Prior Authorization for Prescription Drugs measure to numerator/denominator reporting once standardized data capture and reporting have further progressed. We would monitor the measure's feasibility and consider updates, including volume-based thresholds or rate-based scoring, to ensure the measure reflects meaningful use at scale.

We request public comment on these proposals.

(f) Proposal To Modify the Electronic Prior Authorization Measure

(i) Background

In the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we adopted the Electronic Prior Authorization measure under the Health Information Exchange objective in the MIPS Promoting Interoperability performance category. We finalized that MIPS eligible clinicians would be required to attest to the Electronic Prior Authorization measure beginning with the CY 2027 performance period/2029 MIPS payment year (89 FR 8910); and subsequently, once the measure would become effective as a required measure in the MIPS Promoting Interoperability performance category, MIPS eligible clinicians would be required to satisfactorily report on the measure (and meet the other reporting requirements) in order to earn a score for the MIPS Promoting Interoperability performance category. For purposes of the Electronic Prior Authorization measure, a prior authorization request would need to be made using a Prior Authorization API using data from CEHRT to submit a

''Yes'' response for the measure, unless a MIPS eligible clinician claims an applicable exclusion. We finalized the following measure description for the Electronic Prior Authorization measure (89 FR 8916):

For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the prior authorization is requested electronically from a Prior Authorization API using data from CEHRT.

Exclusions: Any MIPS eligible clinician who:

(1) Does not order any medical items or services (excluding drugs) requiring prior authorization during the applicable performance period; or

(2) Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's Prior Authorization API requirements during the applicable performance period.

In addition to becoming a required measure beginning with the CY 2027 performance period/2029 MIPS payment year, we finalized that the Electronic Prior Authorization measure would not be scored (that is, not assigned points for successful completion) for the CY 2027 performance period/2029 MIPS payment year. For the MIPS Promoting Interoperability performance category, satisfactory performance on the Electronic Prior Authorization measure can be demonstrated only by submitting a ''Yes'' response to affirmatively attest to the measure or by claiming an applicable exclusion. MIPS eligible clinicians who submit a ''No'' response, fail to submit any attestation response, or do not claim an applicable exclusion for the Electronic Prior Authorization measure will receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score), and will not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for the applicable performance period (89 FR 8911).

The 2024 CMS Interoperability and Prior Authorization final rule also finalized that Medicare Advantage plans, state Medicaid Fee-for-service (FFS) programs, state Children's Health Insurance Program (CHIP) FFS programs, Medicaid managed care plans, CHIP managed care entities, and Qualified Health Plans (QHP) issuers on the Federally-Facilitated Exchange (collectively referred to as ''impacted payers'') must implement and maintain a Prior Authorization API beginning in CY 2027. The compliance date is January 1, 2027, for MA organizations and state Medicaid and CHIP FFS programs; by the first rating period beginning on or after January 1, 2027 for Medicaid managed care plans and CHIP managed care entities; and for plan years beginning on or after January 1, 2027, for individual market QHP issuers on the FFEs (89 FR 8759 through 8760). In that rule, we recommended, rather than required, specific FHIR Implementation Guides (IGs) to support the APIs (89 FR 8937).

In the Health Data, Technology, and Interoperability: Electronic Prescribing, Real-Time Prescription Benefit and Electronic Prior Authorization final rule (HTI–4 final rule), which was published as part of the FY 2026 IPPS/LTCH PPS final rule (90 FR 37164 through 37182), ONC finalized three ONC health IT certification criteria for electronic prior authorization:

- ''Provider prior authorization API—coverage requirements discovery'' in 45 CFR 170.315(g)(31);
- ''Provider prior authorization API—documentation templates and rules'' in 45 CFR 170.315(g)(32); and
- ''Provider prior authorization API—prior authorization support'' in 45 CFR 170.315(g)(33).

These certification criteria are based on three IGs developed by the HL7 Da Vinci project which ONC adopted in the HTI–4 final rule [382] at 45 CFR 170.215(j)(1), (2), and (3)—

- HL7® FHIR® Da Vinci—Coverage Requirements Discovery (CRD) IG;
- HL7 FHIR Da Vinci—Documentation Templates and Rules (DTR) IG; and
- HL7 FHIR Da Vinci—Prior Authorization Support (PAS) IG.

Together, these ONC health IT certification criteria can enable electronic prior authorization for healthcare providers. We refer readers to the HTI–4 final rule (90 FR 37162 through 37175) for more information regarding ONC's finalized certification criteria at 45 CFR 170.315(g)(31) through (33) and section XI.B.4.b. of the HTI–4 final rule (90 FR 36541 through 36542) for a summary of all ONC finalized policies.

In the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule, we proposed to require impacted payers to implement and maintain Prior Authorization APIs that conform to the CRD, DTR, and PAS IGs adopted by ONC on behalf of the Secretary at 45 CFR 170.215(j)(1), (2), and (3). We proposed compliance dates for impacted payers to conform to the proposed standards and IGs beginning October 1, 2027 (however, impacted payers must still implement Prior Authorization APIs beginning in CY 2027). Finally, in section II.J.6 of the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 20002), ONC proposed to adopt updated versions of the CRD, DTR, and PAS IGs. If finalized, these proposed updated versions will enable payers and health IT developers to implement Prior Authorization APIs and Health IT Modules conforming to the finalized ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) to utilize the latest versions of these specifications.

The 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule includes proposals for impacted payers to implement and maintain Prior Authorization APIs using the CRD, DTR, and PAS IGs. Those proposals, along with the provisions ONC finalized in the HTI–4 final rule to adopt the CRD, DTR, and PAS IGs and establish electronic prior authorization certification criteria for health IT developers, collectively support the Electronic Prior Authorization measure for MIPS eligible clinicians and advance interoperability by applying consistent standards across HHS programs. We refer readers to the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule and the HTI–4 final rule (90 FR 37169) for more information regarding the three ONC health IT certification criteria to support electronic prior authorization at 45 CFR 170.315(g)(31), (32), and (33).

(ii) Proposal To Modify the Electronic Prior Authorization Measure for the CY 2027 Performance Period/2029 MIPS Payment Year

We are proposing to amend the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year by modifying the measure description.

Specifically, the new measure description would be: For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.

For the proposed modification to the measure description, we are amending the phrase from ''using data from CEHRT'' to ''using CEHRT'' to clarify that MIPS eligible clinicians must use certified Health IT modules where

[382] In the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule, ONC has proposed updated versions of such Implementation Guides (91 FR 19910 and 19911).

necessary to support the electronic prior authorization processes specified in this measure. When we adopted the Electronic Prior Authorization measure, we did not identify specific ONC health IT certification criteria required to complete the actions specified in the measure (89 FR 8910 through 8915). We stated that gathering structured data from CEHRT would be achievable without additional certification criteria (89 FR 8925) that had not been proposed or finalized at the time of the 2024 CMS Interoperability and Prior Authorization final rule. The proposed update to the measure description to require that a prior authorization be requested electronically ''using CEHRT'' is consistent with the availability of certified Health IT Modules that must be used to complete the action specified in the Electronic Prior Authorization measure. At this juncture, we are not proposing to modify the exclusion criteria that were finalized when we adopted the Electronic Prior Authorization measure (89 FR 8916). The proposal to amend the Electronic Prior Authorization measure by modifying the measure description for the CY 2027 performance period/2029 MIPS payment year aligns with the same proposal for the Medicare Promoting Interoperability Program as proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19621).

We request public comment on this proposal.

(iii) Proposal To Modify the Electronic Prior Authorization Measure Beginning With the CY 2028 Performance Period/2030 MIPS Payment Year

We are proposing to amend the Electronic Prior Authorization measure description beginning with the CY 2028 performance period/2030 MIPS payment year to include a complete set of actions necessary to support robust prior authorization and require use of Health IT modules certified to the ONC health IT certification criteria at 45 CFR 170.315(g)(31),[383] (32),[384] and (33) [385] as part of the measure requirements. We are proposing to update the measure in order to take a step-wise approach to the certified health IT capabilities necessary to complete the measure and ensure that MIPS eligible clinicians continue to progress towards adoption of capabilities necessary to fully support electronic prior authorization.

Specifically, we are proposing to modify the measure description as follows beginning with the CY 2028 performance period/2030 MIPS payment year: For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the MIPS eligible clinician uses CEHRT to electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a provider Prior Authorization API.

We are proposing to modify the measure description to explicitly delineate the requirement to use ONC health IT certification criteria for the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year. We propose to modify the measure description to specify the following actions required for meeting the requirement of the measure: ''electronically request and receive coverage requirements,'' ''request and populate prior authorization documentation using templates and rules,'' ''submit the prior authorization request,'' and ''receive the payer response'' (does not require the approval of the prior authorization request by the payer, but does require that the MIPS eligible clinician receive a prior authorization decision or determination response from the payer) to reflect the specific capabilities supported by Health IT Modules certified to the ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33). We note that we would interpret this requirement to mean that each of these specific actions should occur within the same prior authorization request.

We request public comment on this proposal.

(iv) ONC Health IT Certification Criteria To Support the Electronic Prior Authorization Measure

If the proposal to require that an electronic prior authorization must be requested using CEHRT to satisfy the Electronic Prior Authorization measure is finalized, we would require MIPS eligible clinicians to use Health IT Modules certified to the ONC health IT certification criteria in 45 CFR 170.315(g)(31), (32), and/or (33) as finalized in the HTI–4 final rule. Specifically, for the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians would be required to use CEHRT for electronic prior authorization requests that includes the utilization of one, or more than one, Health IT Modules certified to the ONC health IT certification criteria in 45 CFR 170.315(g)(31), (32), or (33) to meet the requirements of the Electronic Prior Authorization measure. Beginning with the CY 2028 performance period/2030 MIPS payment year, MIPS eligible clinicians would be required to use CEHRT for electronic prior authorization requests that includes the utilization of all three Health IT Modules certified to the ONC health IT certification criteria in 45 CFR 170.315(g)(31), (32), and (33) to meet the requirements of the Electronic Prior Authorization measure. Using certified health IT to support these electronic prior authorization transactions ensures that MIPS eligible clinicians have standards-based capabilities within their health IT systems to interact with Prior Authorization APIs impacted payers are required to implement and maintain.

Specifically, the three criteria at 45 CFR 170.315(g)(31), (32), and (33) are based on the HL7 Da Vinci CRD, DTR, and PAS IGs, and address different parts of the electronic prior authorization workflow. The ''provider prior authorization API—coverage requirements discovery'' in 45 CFR 170.315(g)(31) enables a healthcare provider to request information from payers about coverage requirements. Where further information is needed to support a prior authorization request, the ''provider prior authorization API—documentation templates and rules'' criterion in 45 CFR 170.315(g)(32) provides a mechanism for providers to assemble the documentation needed to support a prior authorization request according to a payer's requirements. Finally, the ''provider prior authorization API—prior authorization support'' in 45 CFR 170.315(g)(33) enables submission of prior authorization requests from health IT systems as well as to check the status of a previously submitted request. By finalizing each component of the workflow as a separate ONC health IT certification criterion, ONC sought to support a more dynamic health IT marketplace in which a health IT developer could develop Health IT Modules demonstrating conformance to all three IGs or focus on a specific element or elements (90 FR 37169).

For the CY 2027 performance period/2029 MIPS payment year, we are proposing modifications to the Electronic Prior Authorization measure

[383] *https://www.ecfr.gov/current/title-45/subtitle-A/subchapter-D/part-170/subpart-C/section-170.315#p-170.315(g)(31).*

[384] *https://www.ecfr.gov/current/title-45/subtitle-A/subchapter-D/part-170/subpart-C/section-170.315#p-170.315(g)(32).*

[385] *https://www.ecfr.gov/current/title-45/subtitle-A/subchapter-D/part-170/subpart-C/section-170.315#p-170.315(g)(33).*

in section IV.A.4.d.(4)(f)(ii) of this proposed rule such that a MIPS eligible clinician could submit a ''Yes'' response, in which they are affirmatively attesting to the measure, if a ''prior authorization is requested electronically through a Prior Authorization API using CEHRT.'' Different prior authorization scenarios that allow a MIPS eligible clinician to successfully attest to the measure, as proposed for CY 2027 performance period/2029 MIPS payment year, may require the functionality of one, or more than one, Health IT Modules certified to the criteria in 45 CFR 170.315(g)(31), (32), and (33). For instance, a MIPS eligible clinician could successfully report on the measure for the CY 2027 performance period/2029 MIPS payment year using CEHRT that includes a Health IT Module that is only certified to the ''provider prior authorization API—coverage requirements discovery'' criterion in 45 CFR 170.315(g)(31), but not to the ONC health IT certification criteria at 45 CFR 170.315(g)(32) or (33).

Consider an example in which a patient is a Medicare Advantage (MA) enrollee who has stable coronary artery disease and new exertional dyspnea (feeling shortness of breath during physical exertion). The patient's cardiologist wants to order an outpatient transthoracic echocardiogram (TTE) to assess left ventricular function and valvular disease. When the cardiologist places an order for a TTE in the EHR, a Health IT Module certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) automatically sends a real-time query to the patient's MA plan endpoint to determine whether prior authorization is required for the requested service (the TTE) and, if so, what documentation is needed. The MA plan returns a CRD response (via CDS Hooks ''card'') indicating that prior authorization is necessary and has been approved under the beneficiary's plan benefits and network status, including information such as the prior authorization number and assumed billing codes.

In this first example, the prior authorization request is satisfied using only the capabilities represented with the ''provider prior authorization API—coverage requirements discovery'' (45 CFR 170.315(g)(31)). The MIPS eligible clinician submitted a query for prior authorization, the payer responded that prior authorization was required, the prior authorization was approved, and the MIPS eligible clinician received a response indicating this approval from the payer through the payer's Prior Authorization API. In this case, the receipt of an approval indicates that the MIPS eligible clinician effectively submitted a request for prior authorization, consistent with the requirements of the Electronic Prior Authorization measure. Conversely, if the MIPS eligible clinician receives a response that no prior authorization is required, that query would not fulfill the requirements of the measure. Also, we considered whether the allowance of using CEHRT to conduct a check to determine if an item or service requires prior authorization should be able to satisfy the measure when the MIPS eligible clinician successfully submits a prior authorization coverage requirements determination query, regardless of whether the payer's response indicates that prior authorization is required. We request comment on whether such additional flexibility would benefit MIPS eligible clinicians.

Based on feedback we have received from implementers about their likely approach to phasing in electronic prior authorization capabilities, we expect that the use of health IT certified to the ''provider prior authorization API—coverage requirements discovery'' (45 CFR 170.315(g)(31)), as described in the example above, may be a common approach for the CY 2027 performance period/2029 MIPS payment year. However, we note that under the approach to use certified Health IT Modules for the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year as described in this proposed rule, there could be additional scenarios that would qualify for the measure in which a MIPS eligible clinician uses only the certified Health IT Module in 45 CFR 170.315(g)(32) or (g)(33) as part of the workflow for submitting a prior authorization request.

For the following second example, the case illustrates a prior authorization workflow that would meet the requirements of the Electronic Prior Authorization measure as proposed for the CY 2027 performance period/2029 MIPS payment year and also meet the more stringent requirements for the measure proposed beginning with the CY 2028 performance period/2030 MIPS payment year, as described in section IV.A.4.d.(4)(f)(iii) of this proposed rule, when all three certified Health IT Modules in 45 CFR 170.315(g)(31), (32) and (33) would be required. The initial prior authorization query from a MIPS eligible clinician to a payer could result in a response indicating the need for additional information before a determination as to whether prior authorization is approved or denied can be provided, based on the coverage requirements identified. Additional certified Health IT Modules supporting additional elements of the electronic prior authorization workflow would then need to be used to submit the prior authorization request after collecting the necessary documentation.

Consider an example in which the patient is an MA enrollee who has been diagnosed with metastatic colorectal cancer. The patient's oncologist has ordered a PET–CT scan and immunotherapy infusion. The oncologist places the order for a PET–CT scan and immunotherapy infusion in the EHR, which is certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) and automatically queries the patient's MA plan's FHIR API. The EHR receives a response via CDS Hooks card indicating that prior authorization is required for both services and describes coverage criteria and documentation needs. Because the EHR is also certified to 45 CFR 170.315(g)(32), the certified health IT enables the oncologist to complete prior authorization following the DTR IG. An embedded Substitutable Medical Applications and Reusable Technologies (SMART) on FHIR app fetches the payer's specific documentation template and rules for oncology prior authorizations. For the PET–CT, the payer's documentation rules ask for the cancer staging information and previous imaging results; the immunotherapy, the payer's documentation rules require the patient's biomarker (for example, PD–L1 expression) status, prior treatment history, and recent lab results. Much of this information can be auto-populated because the embedded DTR app uses Clinical Quality Language (CQL) logic and FHIR queries to pull the patient's latest CT scan report and lab results from her medical record, and it confirms her cancer diagnosis and stage from the problem list. The oncologist answers a few additional questions (such as confirming the patient has no contraindications and that a required biomarker test was positive). By the end of this step, the EHR has compiled all necessary supporting documentation for the prior authorization, ensuring the request will be complete.

Next, the oncologist's office submits the prior authorization request electronically using the capabilities under the ''provider prior authorization API-prior authorization support'' criterion (45 CFR 170.315(g)(33)) to bundle the request and documentation and send it to the MA plan's prior

authorization endpoint. This bundle is transmitted via a FHIR RESTful interaction to the payer, as defined by the PAS IG. The EHR's certified Health IT Module ensures the request conforms to the required FHIR structure and sends it securely. Because all required information was provided up front and matched the plan's coverage criteria, the MA plan's system could potentially automatically adjudicate and approve the requests in near real-time. If that happened, the oncologist could now schedule the patient's therapy without delay, confident that the services are covered.

Both examples result in a prior authorization request that would meet the proposed modification to Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year because in each case, the MIPS eligible clinician requests prior authorization electronically using CEHRT. However, each example utilized different combinations of Health IT Modules certified to electronic prior authorization certification criteria in 45 CFR 170.315(g)(31), (32), and (33). In the first example, the MIPS eligible clinician used a single Health IT Module certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) to complete actions necessary to successfully attest ''Yes'' to the Electronic Prior Authorization measure. In the second example, the MIPS eligible clinician used Health IT Modules certified to all three of the electronic prior authorization certification criteria to complete all actions for the MIPS eligible clinician to successfully attest ''Yes'' to the Electronic Prior Authorization measure as proposed for CY 2027 performance period/2029 MIPS payment year.

Consistent with the hypothetical examples, we note that a MIPS eligible clinician would be able to successfully attest ''Yes'' to the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year using only those certified Health IT Modules necessary to meet the requirements of the measure. MIPS eligible clinicians would not be required to adopt additional electronic prior authorization certified Health IT Modules if they are not needed for the purposes of successfully reporting the Electronic Prior Authorization measure. We expect that the ability to utilize different combinations of certified Health IT Modules to meet the measure for the CY 2027 performance period/2029 MIPS payment year would afford MIPS eligible clinicians and health IT developers flexibility in how they deploy, adopt, and use different aspects of certified health IT functionality for electronic prior authorization.

Beginning with the CY 2028 performance period/2030 MIPS payment year, we are proposing to modify the measure language to state that a MIPS eligible clinician must use CEHRT to ''electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a provider prior authorization API.'' In order for a MIPS eligible clinician to attest ''Yes'' to the Electronic Prior Authorization measure, all three certified health IT modules at 45 CFR 170.315(g)(31), (32), and (33) would be required, consistent with the actions associated with the proposed modifications to the measure, which require capabilities corresponding to each of the certified Health IT Modules. Only the second example described above, in which a prior authorization request is submitted after obtaining additional documentation necessary for the request and utilizing health IT certified to the complete set of ONC health IT certification criteria for electronic prior authorization, would be relevant if the proposal for the CY 2028 performance period/2030 MIPS payment year is finalized.

We request public comment on the proposal to use certified health IT to support the Electronic Prior Authorization measure.

(v) Proposal To Modify the Electronic Prior Authorization Measure to an Optional Measure for the CY 2027 Performance Period/2029 MIPS Payment Year

We are proposing to amend our previously finalized requirement that MIPS eligible clinicians must report the Electronic Prior Authorization measure to be considered a meaningful EHR user for the CY 2027 performance period/2029 MIPS payment year (89 FR 8919).

Subsequent to the Electronic Prior Authorization measure being established, we proposed in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule to require that impacted payers implement and maintain Prior Authorization APIs that use HL7 FHIR and conform to the HL7 FHIR Da Vinci CRD, DTR, and PAS implementation guides, as adopted by ONC, with compliance generally beginning October 1, 2027 (91 FR 19910 through 19911). We expect additional implementation complexity for MIPS eligible clinicians, who are downstream from impacted payers and health IT developers who will be required to implement these API standards version requirements in CY 2027 if the CMS Interoperability Standards and Prior Authorization for Drugs proposed rule is finalized as proposed (91 FR 19910 through 19911). As a result, we believe that MIPS eligible clinicians may need additional time and flexibility before requiring the Electronic Prior Authorization measure to account for these changes to the underlying transaction standards occurring in CY 2027. First, we recognize that MIPS eligible clinicians and health IT developers will need additional time for procurement, integration, and testing to operationalize standards-based electronic prior authorization capabilities that support the Electronic Prior Authorization measure. Second, interested parties have indicated that achieving widespread implementation and routine use of these capabilities in CY 2027 may be challenging, particularly for small, rural, and otherwise under-resourced MIPS eligible clinicians. Third, there may be additional implementation complexity for MIPS eligible clinicians because the CMS Interoperability Standards and Prior Authorization for Drugs proposed rule includes proposals to update the versions of underlying transaction standards within the relevant ONC health IT certification criteria. For these reasons, we propose that a year of optional reporting will both incentivize adoption of Health IT Modules certified to ONC criteria for electronic prior authorization through bonus points and offer flexibility to those MIPS eligible clinicians that could benefit from additional time to test, implement, and deploy the CEHRT functionality that is required to support the Electronic Prior Authorization measure. We note that we do not believe that finalization of this proposal is contingent on finalization of proposals in the CMS Interoperability Standards and Prior Authorization for Drugs proposed rule because health care providers, payers, and health IT developers have already begun to adopt and test standards-based electronic prior authorization capabilities, and we expect standards adoption, conformance testing, and validation for the relevant Health IT Modules to continue.[386]

Therefore, in section IV.A.4.d.(4)(f)(v) of this proposed rule, we are proposing

[386] For example, CMS has announced early adopters advancing electronic prior authorization solutions; see *https://www.cms.gov/newsroom/press-releases/cms-announces-early-adopters-advance-solutions-electronic-prior-authorization-accelerating-momentum.*

to modify the Electronic Prior Authorization measure, with the proposed measure updates, to be an optional measure. The measure would be eligible for 10 bonus points for MIPS eligible clinicians who submit a ''Yes'' response for the measure indicating that they have requested a prior authorization electronically using CEHRT from a payer's Prior Authorization API for at least one medical item or service (excluding drugs) ordered within the CY 2027 performance period. To account for the Electronic Prior Authorization measure being an optional measure for the CY 2027 performance period/2029 MIPS payment year with an allocation of 10 bonus points, we are proposing to modify the scoring methodology for optional measures under the MIPS Promoting Interoperability performance category as described in section IV.B.1.d. of this proposed rule. If the proposal to modify the Electronic Prior Authorization measure from a required measure to an optional measure is finalized as proposed, a MIPS eligible clinician who submits a ''No'' response would not have an affected score for the MIPS Promoting Interoperability performance category, and their response would not impact the MIPS eligible clinician being considered a meaningful EHR user for the CY 2027 performance period/2029 MIPS payment year.

Such proposed modification would change the policy adopted for the Electronic Prior Authorization measure as finalized in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8911). The optional reporting of the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year may be particularly beneficial for MIPS eligible clinicians in small, rural, or otherwise under-resourced clinical practice settings navigating new measure requirements while minimizing and balancing operational and reporting burden and demand. If the proposal to amend the Electronic Prior Authorization measure by modifying the measure from a required measure to an optional measure is finalized as proposed, exclusions would not be available for the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year because there will be no negative consequences for MIPS eligible clinicians who do not report on the optional measure. Given the allocated timeframe for MIPS eligible clinicians to become familiar with the Electronic Prior Authorization measure since the CY 2024 performance period as provided in the 2024 CMS Interoperability and Prior Authorization final rule, we believe that proposing to amend the Electronic Prior Authorization measure by modifying it from being a required measure to being as an optional bonus measure solely for the CY 2027 performance period/2029 MIPS payment year would provide MIPS eligible clinicians sufficient time to adopt and begin utilizing the certified health IT necessary to successfully report the Electronic Prior Authorization measure.

We refer readers to Tables C–G 2, C–G 4, C–G 6, and C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this proposed rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year, which is contingent upon the finalization of the proposal to amend the Electronic Prior Authorization by modifying the measure from being a required measure to being an optional measure. We note that the proposal to amend the Electronic Prior Authorization by modifying the measure from being a required measure to an optional measure for the CY 2027 performance period/2029 MIPS payment year aligns with the same proposal for the Medicare Promoting Interoperability Program as proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19625).

We request public comment on this proposal.

(vi) Proposal To Require the Electronic Prior Authorization Measure Beginning With the CY 2028 Performance Period/2030 MIPS Payment Year

When the Electronic Prior Authorization measure was adopted in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we finalized that for a MIPS eligible clinician to satisfactorily meet the requirements of the measure, they would be required to affirmatively attest or claim an applicable exclusion for the Electronic Prior Authorization measure beginning with the CY 2027 performance period/2029 MIPS payment year (89 FR 8910). If a MIPS eligible clinician submits a ''No'' response, fails to submit any attestation, or does not claim an applicable exclusion for the Electronic Prior Authorization measure, the MIPS eligible clinician would receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score) and would not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for the applicable performance period (89 FR 8911).

We are proposing to amend the Electronic Prior Authorization measure by modifying the measure to require MIPS eligible clinicians to report the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year. Specifically, beginning with the CY 2028 performance period/2030 MIPS payment year, we are proposing that a MIPS eligible clinician must use CEHRT to electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a Prior Authorization API for at least one medical item or service (excluding drugs) ordered within the applicable performance period. A MIPS eligible clinician would submit a ''Yes'' response, or alternatively claim an applicable exclusion, to satisfy the requirements of the Electronic Prior Authorization measure. In each case, the Electronic Prior Authorization measure would not affect the total score for the MIPS Promoting Interoperability performance category. If a MIPS eligible clinician submits a ''No'' response, fails to submit any attestation, or does not claim an applicable exclusion for the Electronic Prior Authorization measure, the MIPS eligible clinician would receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score) and would not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for the applicable performance period (89 FR 8911). This proposal reflects the measure reporting requirements that were first adopted for the Electronic Prior Authorization measure as described in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8911), but it would modify the measure to being a required measure for the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year instead of beginning with the CY 2027 performance period/2029 MIPS payment year as originally finalized.

The measure exclusions originally adopted in the 2024 CMS

Interoperability and Prior Authorization final rule (89 FR 8916 through 8923) would be available to MIPS eligible clinicians for the CY 2028 performance period/2030 MIPS payment year and subsequent years. The available exclusions would be for any MIPS eligible clinician who: (1) Does not order any medical items or services (excluding drugs) requiring prior authorization during the applicable performance period; or (2) Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's Prior Authorization API requirements during the applicable performance period. A MIPS eligible clinician would also be able to claim the first exclusion if none of its prior authorization requests required the functionality described in the certification criteria at 45 CFR 170.315(g)(31), (32) and (33) for electronic prior authorization. For instance, if no prior authorization request submitted by a MIPS eligible clinician during the performance period required gathering and submitting additional documentation to support the request, which is supported by health IT certified to the criteria in 45 CFR 170.315(g)(32) and 45 CFR 170.315(g)(33), then no prior authorization request that MIPS eligible clinician performed would fulfill the measure and the MIPS eligible clinician would be able to claim an exclusion. More broadly, if the MIPS eligible clinician is unable to use CEHRT to effectively exchange information and submit a prior authorization request with any payer from which they are seeking an authorization, we believe that would be sufficient for a MIPS eligible clinician to claim that the payer does not have a functioning Prior Authorization API for the purpose of the reporting and exclusion eligibility.

We note that CMS's specified payer Prior Authorization API requirements are proposed to include conformance to the three IGs underlying the ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33). Therefore, if those Prior Authorization API requirements are finalized as proposed, a MIPS eligible clinician could claim the second exclusion if all their requests are with payers that do not support all three FHIR IGs. If we do not finalize the Prior Authorization API requirements for payers as proposed in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule, we would still intend for this exclusion under the Electronic Prior Authorization measure to apply to Prior Authorization APIs that do not use all three IGs underlying the ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33).

We refer readers to Tables C–G 2, C–G 5, C–G 6 and C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this proposed rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year, which is contingent upon the finalization of the proposal to amend the Electronic Prior Authorization by modifying the measure to be a required measure.

We request public comment on this proposal.

(vii) Request for Information on Future Potential Performance-Based Measures of Electronic Prior Authorization

While the current measure requirement of achieving ''at least one'' electronic prior authorization is appropriate for the initial inclusion of the Electronic Prior Authorization measures for both medical items and services and for prescription drugs in the MIPS Promoting Interoperability performance category, we do not expect this minimal requirement to effectively increase electronic prior authorization usage over time. Therefore, we are seeking comments on potential future updates we could make to this measure to incentivize MIPS eligible clinicians to use CEHRT for electronic prior authorization for a more substantial set of the electronic prior authorization requests that they submit over the course of a performance period and corresponding MIPS payment year. Consistent with statutory requirements in section 1886(n)(3)(A)(ii) of the Act, we envision that expanding the scope of the measures in future rulemaking would lead to increased interoperable exchange of data that would not only decrease administrative burden, but could improve the quality of health by reducing the time needed for a patient to get access to necessary medical services and items as well as prescription drugs covered under the medical benefit. Reducing delays in the exchange of data and as a result providing patients care more efficiently, drives better care coordination which is a key objective of meaningful use. Additionally, because electronic prior authorization requires data sharing, this advances interoperability, which is a primary focus of meaningful use. We also intend to drive adoption of health IT capabilities supporting the complete electronic prior authorization workflow over time, by requiring MIPS eligible clinicians to address a wider array of prior authorization requests that require more complex interactions with payers. The public input we receive will contribute to future considerations for potentially updating the Electronic Prior Authorization measures in a manner that helps achieve HHS's goals of promoting meaningful use of certified EHR technology, electronic exchange of health information, and submission of clinical quality measures.

We seek public comment on potential future updates to this measure. We seek public comment on barriers and challenges that MIPS eligible clinicians in small, rural, or otherwise under-resourced practice settings might face when reporting performance-based electronic prior authorization measures. Also, we request comment on what alternative approaches should be considered to support use of electronic prior authorization. We seek public comment on how we can further strengthen the Electronic Prior Authorization measures in a manner that incentivizes progress while avoiding undue administrative complexity and implementation challenges for MIPS eligible clinicians.

(g) Proposal To Modify Requirements and Scoring Policies for the MIPS Promoting Interoperability Performance Category

(i) Proposal To Modify Objectives and Measures

In this proposed rule, we are proposing updates that would occur in different performance periods. For reference, Table C–G 2 sets forth the objectives and measures for the Promoting Interoperability performance category that would be required for the CY 2027 performance period/2029 MIPS payment year, the CY 2028 performance period/2030 MIPS payment year, and subsequent years if our proposals are finalized as proposed. Table C–G 2 reflects proposed modifications to previously established objectives and measures, including the proposals:

- For the CY 2026 performance period/2028 MIPS payment year: Remove the ONC Direct Review and ONC–ACB Surveillance attestations.
- For the CY 2027 performance period/2029 MIPS payment year: Remove the Security Risk Analysis measure and make the existing Electronic Prior Authorization measure an optional measure.
- For the CY 2028 performance period/2030 MIPS payment year: Make the existing Electronic Prior

Authorization measure required and unscored and create a new Electronic Prior Authorization for Prescription Drugs measure.

BILLING CODE 4169–69–P

TABLE C-G 2: PROPOSED OBJECTIVES AND MEASURES FOR THE MIPS PROMOTING INTEROPERABILITY PERFORMANCE CATEGORY FOR THE CY 2026 PERFORMANCE PERIOD/2028 MIPS PAYMENT YEAR, CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR, THE CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR, AND SUBSEQUENT YEARS

Objective	Measure	Numerator	Denominator	Exclusion
Electronic Prescribing: Generate and transmit permissible prescriptions electronically	e-Prescribing – At least one permissible prescription written by the MIPS eligible clinician is transmitted electronically using CEHRT.	Number of prescriptions in the denominator generated and transmitted electronically using CEHRT.	Number of prescriptions written for drugs requiring a prescription to be dispensed other than controlled substances during the performance period; or number of prescriptions written for drugs requiring a prescription to be dispensed during the performance period.	Any MIPS eligible clinician who writes fewer than 100 permissible prescriptions during the performance period.
Electronic Prescribing	Query of PDMP – For at least one Schedule II opioid or Schedule III or IV drug electronically prescribed using CEHRT during the performance period, the MIPS eligible clinician uses data from CEHRT to conduct a query of a PDMP for prescription drug history.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	Any MIPS eligible clinician who: 1. Is unable to electronically prescribe Schedule II opioids and Schedule III and IV drugs in accordance with applicable law during the performance period; OR 2. Does not electronically prescribe any Schedule II opioids or Schedule III or IV drugs during the performance period.
Health Information Exchange: The MIPS eligible clinician provides a summary of care record when transitioning care or referring their patient to another setting of care, receives or retrieves a summary of care record upon the receipt of a transition of care or referral or upon the first patient encounter with a new patient, and reconciles summary of care information from other healthcare providers into their EHR using the functions of CEHRT	Support Electronic Referral Loops by Sending Health Information – For at least one transition of care or referral, the MIPS eligible clinician that transitions care of a patient or refers their patient to another setting of care or healthcare provider: 1. Creates a summary of care using CEHRT; AND 2. Electronically exchanges the summary of care record.	Number of transitions of care and referrals in the denominator where the summary of care record was created using CEHRT and exchanged electronically.	Number of transitions of care and referrals during the performance period for which the MIPS eligible clinician was the transferring or referring clinician.	Any MIPS eligible clinician who transfers a patient to another setting or refers a patient fewer than 100 times during the performance period.
Health Information	Support Electronic	Number of	Number of electronic	Any MIPS eligible clinician

Objective	Measure	Numerator	Denominator	Exclusion
Exchange (HIE)	Referral Loops by Receiving and Reconciling Health Information – For at least one electronic summary of care record received for patient encounters during the performance period for which a MIPS eligible clinician was the receiving party of a transition of care or referral, or for patient encounters during the performance period in which the MIPS eligible clinician has never before encountered the patient, the MIPS eligible clinician conducts clinical information reconciliation for medication, mediation allergy, and current problem list.	electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: 1. Medication – Review of the patient's medication, including the name, dosage, frequency, and route of each medication; 2. Medication allergy – Review of the patient's known medication allergies; and 3. Current Problem List – Review of the patient's current and active diagnoses.	summary of care records received using CEHRT for patient encounters during the performance period for which a MIPS eligible clinician was the receiving party of a transition of care or referral, and for patient encounters during the performance period in which the MIPS eligible clinician has never before encountered the patient.	who receives transitions of care or referrals or has patient encounters in which the MIPS eligible clinician has never before encountered the patient fewer than 100 times during the performance period.
Health Information Exchange (HIE)	Health Information Exchange Bi-Directional Exchange – Statement 1: I participate in an HIE to enable secure, bi-directional exchange to occur for every patient encounter, transition of care or referral and record stored or maintained in the EHR during the performance period in accordance with applicable law and policy. Statement 2: The HIE that I participate in is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs and not engaging in exclusionary behavior	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A

Objective	Measure	Numerator	Denominator	Exclusion
	when determining exchange partners. Statement 3: I use the functions of CEHRT to support bi-directional exchange with an HIE.			
Health Information Exchange	Enabling Exchange Under TEFCA – MIPS eligible clinicians attest to the following. Statement 1: I participate as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC website) in good standing (that is, not suspended) and enabling secure, bi-directional exchange of information to occur, in production, for every patient encounter, transition of care or referral, and record stored or maintained in the EHR during the performance period, in accordance with applicable law and policy. Statement 2: I use the functions of CEHRT to support bi-directional exchange of patient information, in production, under this Framework Agreement.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A
Health Information Exchange	Electronic Prior Authorization for Prescription Drugs (CY 2028 and subsequent performance periods) – For at least one prescription written by the MIPS eligible clinician during the	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	Any MIPS eligible clinician who: 1. Does not write a prescription that requires prior authorization during the applicable performance period; or 2. only writes prescriptions requiring prior authorization where the payer does not support the specified electronic prior

Objective	Measure	Numerator	Denominator	Exclusion
	performance period for which prior authorization is required, the prior authorization is requested electronically using CEHRT.*			authorization standard during the applicable performance period; or 3 writes fewer than 100 permissible prescriptions during the performance period.*
Health Information Exchange	Electronic Prior Authorization (CY 2027 performance period *only*) – For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.**	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None**
Health Information Exchange	Electronic Prior Authorization (CY 2028 and subsequent performance periods) – For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the MIPS eligible clinician uses CEHRT to electronically discover applicable coverage requirements, complete required documentation, submit the prior authorization request, and receive the payer response through a Prior Authorization API.*	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	Any MIPS eligible clinician who: 1. Does not order any medical items or services (excluding drugs) requiring prior authorization during the applicable performance period; OR 2. Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's specified Prior Authorization API requirements.*
Provider to Patient Exchange: The MIPS eligible clinician provides patients (or patient-authorized representative) with timely electronic access to their health information.	Provide Patients Electronic Access to Their Health Information – For at least one unique patient seen by the MIPS eligible clinician: 1. The patient (or the patient-authorized	Number of patients (or patient authorized representatives) in the denominator who are provided timely access to health information to view online, download, and	Number of unique patients seen by the MIPS eligible clinician during the performance period.	N/A

Objective	Measure	Numerator	Denominator	Exclusion
	representative) is provided timely access to view online, download, and transmit his or her health information; AND 2. The MIPS eligible clinician ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the Application Programming Interface (API) in the MIPS eligible clinician's CEHRT.	transmit to a third party and to access using an application of their choice that is configured to meet the technical specifications of the API in the MIPS eligible clinician's CEHRT.		
Public Health and Clinical Data Exchange: The MIPS eligible clinician is in active engagement with a public health agency or clinical data registry to submit electronic public health data in a meaningful way using CEHRT, except where prohibited, and in accordance with applicable law and practice.	Immunization Registry Reporting – The MIPS eligible clinician is in active engagement with a public health agency to submit immunization data and receive immunization forecasts and histories from the public health immunization registry/immunization information system (IIS).	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	The MIPS eligible clinician: 1. Does not administer any immunizations to any of the populations for which data is collected by its jurisdiction's immunization registry or immunization information system during the performance period; OR 2. Operates in a jurisdiction for which no immunization registry or immunization information system is capable of accepting the specific standards required to meet the CEHRT definition at the start of the performance period; OR 3. Operates in a jurisdiction where no immunization registry or immunization information system has declared readiness to receive immunization data as of 6 months prior to the start of the performance period.
Public Health and Clinical Data Exchange	Electronic Case Reporting – The MIPS eligible clinician is in active engagement with a PHA to electronically submit	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	The MIPS eligible clinician: 1. Does not treat or diagnose any reportable diseases for which data is collected by their jurisdiction's reportable disease system

Objective	Measure	Numerator	Denominator	Exclusion
	case reporting of reportable conditions.			during the performance period; OR 2. Operates in a jurisdiction for which no PHA is capable of receiving electronic case reporting data in the specific standards required to meet the CEHRT definition at the start of the performance period; OR 3. Operates in a jurisdiction where no PHA has declared readiness to receive electronic case reporting data as of 6 months prior to the start of the performance period.
Public Health and Clinical Data Exchange	Public Health Registry Reporting (Optional) – The MIPS eligible clinician is in active engagement with a PHA to submit data to public health registries.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None
Public Health and Clinical Data Exchange	Clinical Data Registry Reporting (Optional) – The MIPS eligible clinician is in active engagement to submit data to a clinical data registry.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None
Public Health and Clinical Data Exchange	Syndromic Surveillance Reporting (Optional) – The MIPS eligible clinician is in active engagement with a PHA to submit syndromic surveillance data from an urgent care setting.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None
Public Health and Clinical Data Exchange	Public Health Reporting Using TEFCA (Optional)* – The MIPS eligible clinician: 1. Is participating as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC's website); 2.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None

Objective	Measure	Numerator	Denominator	Exclusion
	Is not suspended from participating in TEFCA exchange; 3. Submits health information using TEFCA to a PHA consistent with one or more of the measures under the Public Health and Clinical Data Exchange objective; 4. Is in active engagement Option 2 (validated data production) with a PHA to transfer health information for one or more of the measures under the Public Health and Clinical Data Exchange objective; AND 5. Uses the functions of CEHRT to exchange with the PHA.			
Protect Patient Health Information: Protect electronic protected health information (ePHI) created or maintained by CEHRT through the implementation of appropriate technical, administrative, and physical safeguards. Protect Patient Health Information	High Priority Practices SAFER Guide – Beginning with the CY 2024 performance period/2026 MIPS payment year, submit an affirmative attestation regarding the MIPS eligible clinician's completion of the annual self-assessment under the High Priority Practices SAFER Guide measure using the 2025 High Priority Practices SAFER Guide during the year in which the performance period occurs.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None

* Signifies a proposal in this proposed rule that would apply to the CY 2028 performance period and subsequent years.
** Signifies a proposal in this proposed rule that would apply to the CY 2027 performance period.

BILLING CODE 4169–69–C

(ii) Proposal To Modify Scoring Methodology

For reference, Tables C–G 3, C–G 4 and C–G 5 set forth the scoring methodology for the MIPS Promoting Interoperability performance category for CY 2026 performance period/2028 MIPS payment year, the CY 2027 performance period/2029 MIPS payment year, and the CY 2028 performance period/2030 MIPS payment year and subsequent years. In sections IV.A.4.d.(4)(c)(ii), IV.A.4.d.(4)(d)(ii), IV.A.4.d.(4)(e)(ii), IV.A.4.d.(4)(f)(ii), IV.A.4.d.(4)(f)(iii), IV.A.4.d.(4)(f)(iv), IV.A.4.d.(4)(f)(v), and IV.A.4.d.(4)(f)(vi) of this proposed rule, we discuss the proposed removal of certain measures, addition of certain measures, and modifications/updates to

certain measures for the MIPS Promoting Interoperability performance category. We refer readers to section IV.B.1.d. of this proposed rule for the discussion regarding the proposal that modifies the scoring methodology to account for the Electronic Prior Authorization measure being changed to an optional measure with an allocation of 10 bonus points for the CY 2027 performance period/2029 MIPS payment year. There are no implications to the scoring methodology for the proposal to update the definition of CEHRT in section IV.A.4.d.(4)(b)(ii) of this proposed rule. This section includes a discussion of scoring implications for the proposed changes in this proposed rule for the MIPS Promoting Interoperability performance category—

- Removal of the ONC Direct Review and ONC–ACB Surveillance attestations;
- Removal of the Security Risk Analysis measure;
- Addition of an Electronic Prior Authorization for Prescription Drugs measure; and
- Updates to the Electronic Prior Authorization measure.

(A) Proposal To Modify Scoring for the ONC Direct Review and ONC–ACB Surveillance Attestations

The proposal to remove the ONC Direct Review and ONC–ACB Surveillance attestations beginning with the CY 2026 performance period/2028 MIPS payment year as discussed in section IV.A.4.d.(4)(c)(ii) of this proposed rule will be reflected in the scoring of the MIPS Promoting Interoperability performance category in the following manner. Currently, to earn a score for the MIPS Promoting Interoperability performance category for inclusion in the MIPS final score, a MIPS eligible clinician must be a meaningful EHR user for MIPS and submit a ''Yes'' response attesting to engaging in activities supporting providers with performance of CEHRT, including acknowledging the requirement to cooperate in good faith with ONC Direct Review. The ONC–ACB Surveillance attestation is optional, and MIPS eligible clinicians can attest ''Yes'', ''No'' or not submit an attestation (81 FR 77019 to 77028).

Starting in the CY 2026 performance period/2028 MIPS payment year, we are proposing to remove scoring policies related to the ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation since we are proposing in section IV.A.4.d.(4)(c)(ii) of this proposed rule to remove the attestations. The ONC Direct Review attestation will no longer be required to earn a score for the MIPS Promoting Interoperability performance category for inclusion in the final score. Since we did not provide measure points for either the attestation of ONC Direct Review and ONC–ACB Surveillance, removal of the attestation requirements and scoring policies starting with the CY 2026 performance period/2028 MIPS payment year will not result in a need to redistribute measure points in the MIPS Promoting Interoperability performance category.

We refer readers to Table C–G 3 in section IV.A.4.d.(4)(g)(ii)(D) of this proposed rule for more information on the scoring methodology for the MIPS Promoting Interoperability performance category for the CY 2026 performance period/2028 MIPS payment year.

We request public comment on this proposal.

(B) Proposal To Modify Scoring for the Security Risk Analysis Measure

We are proposing to remove the Security Risk Analysis measure beginning with the CY 2027 performance period/2029 MIPS payment year as discussed in section IV.A.4.d.(4)(d)(ii) of this proposed rule. Thus, we are proposing to remove the scoring policies corresponding to the Security Risk Analysis measure. The measure is not scored individually and the attestation of a ''Yes'' response does not contribute to the MIPS eligible clinician's MIPS Promoting Interoperability performance category score for the Protect Patient Health Information objective and measures. An attestation of a ''No'' demonstrates that the MIPS eligible clinician did not complete the actions included in the measure as required by § 414.1375(b)(2)(ii)(A) and did not satisfy the definition of a meaningful EHR user at § 414.1305. Therefore, if the MIPS eligible clinician submits a ''No'' response for this measure, they would not earn a score for the MIPS Promoting Interoperability performance category, resulting in a score of zero, in accordance with § 414.1375(b)(2) (90 FR 49870 and 49871). The proposed removal of the Security Risk Analysis measure, which does not contribute to the MIPS eligible clinician's MIPS Promoting Interoperability performance category score, will not result in the need to redistribute measure points in the MIPS Promoting Interoperability performance category. We refer readers to Table C–G 4 in section IV.A.4.d.(4)(g)(ii)(D) of this proposed rule for more information on the scoring methodology for the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year, which would no longer include the Security Risk Analysis measure, which is proposed for removal.

We request public comment on this proposal.

(C) Proposal To Modify Scoring for the New Electronic Prior Authorization for Prescription Drugs Measure

We are proposing to adopt a new attestation-based Electronic Prior Authorization for Prescription Drugs measure beginning with the CY 2028 performance period/2030 MIPS payment year as discussed in section IV.A.4.d.(4)(e)(ii) of this proposed rule. We are proposing that the Electronic Prior Authorization for Prescription Drugs measure would not be scored for the CY 2028 performance period/2030 MIPS payment year and subsequent years for MIPS eligible clinicians. A MIPS eligible clinician would be required to attest ''Yes'' to the measure or claim an exclusion, but the measure would not affect the total score for the MIPS Promoting Interoperability performance category. MIPS eligible clinicians that report a ''No'' attestation, fail to submit the measure, or fail to claim an applicable exclusion would receive a score of zero for the MIPS Promoting Interoperability performance category (currently weighted at 25 percent of the MIPS final score), and would not be considered a meaningful EHR user for MIPS for that performance year.

We request public comment on this proposal.

(D) Proposal To Modify Scoring for the Electronic Prior Authorization Measure

When we adopted the Electronic Prior Authorization measure in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we finalized that MIPS eligible clinicians would report the measure as an unscored attestation for the CY 2027 performance period specifically (89 FR 8910), but we did not specify its scoring methodology for subsequent years because we determined that it would be more appropriate to determine the measure's scoring structure closer in time to its effective date.

In sections IV.A.4.d.(4)(f)(v) and IV.B.1.d. of this proposed rule, we are proposing to modify the Electronic Prior Authorization measure by making the measure optional and eligible for 10 bonus points for MIPS eligible clinicians who submit a ''Yes'' response attesting to meeting the requirements of the measure for the CY 2027 performance period/2029 MIPS

payment year. We are proposing to make the measure eligible for 10 bonus points for MIPS eligible clinicians that submit a ''Yes'' response attesting to meeting the requirements of measure. Allocating 10 bonus points is an appropriate and effective incentive to promote the adoption and use of certified technology for requesting electronic prior authorizations among MIPS eligible clinicians. To account for the allocation of bonus points specific to the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year, we are proposing to amend § 414.1380(b)(4)(ii)(C) by adding a new provision at § 414.1380(b)(4)(ii)(C)(4). We refer readers to section IV.B.1. of this proposed rule for the proposal to establish the allocation of 10 bonus points in § 414.1380(b)(4)(ii)(C)(4), respectively, for MIPS eligible clinicians who affirmatively attested to meeting the requirements of the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year.

Also, as described in section IV.A.4.d.(4)(f)(v) of this proposed rule, we are proposing to require the measure for the CY 2028 performance period/2030 MIPS payment year and subsequent years. Similar to its original scoring methodology as adopted in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we are proposing that the Electronic Prior Authorization measure would remain unscored for the CY 2028 performance period and subsequent years. This scoring methodology would allow time for MIPS eligible clinicians to adjust to the new electronic prior authorization workflow using Prior Authorization APIs without undue focus on scoring implications in the MIPS Promoting Interoperability performance category. We anticipate the Electronic Prior Authorization measure will retain its importance as an aspect of health information exchange.

We request public comment on these proposals.

BILLING CODE 4169–69–P

TABLE C-G 3: PROPOSED SCORING METHODOLOGY FOR THE CY 2026 PERFORMANCE PERIOD/2028 MIPS PAYMENT YEAR

Objective	Measure	Maximum Points	Required/Optional
Electronic Prescribing	e-Prescribing	10 points	Required
	Query of PDMP	10 points	Required
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	15 points	Required (MIPS eligible clinician's choice of one of the three reporting options)
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	15 points	
	-OR-		
	Health Information Exchange Bi-Directional Exchange	30 points	
	-OR-		
	Enabling Exchange Under TEFCA	30 points	
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	25 points	Required
Public Health and Clinical Data Exchange	Report the following two measures: • Immunization Registry Reporting • Electronic Case Reporting	25 points	Required
	Report one of the following measures: • Public Health Registry Reporting • Clinical Data Registry Reporting • Syndromic Surveillance Reporting • Public Health Reporting Using TEFCA	5 points (*bonus*)	Optional
Protect Patient Health Information	Security Risk Analysis	Not scored*	Required
	High Priority Practices SAFER Guide	Not scored*	Required
No Associated Objective: Attestation Requirements**	Actions to Limit or Restrict the Compatibility of CEHRT	Not scored*	Required

* Measures and attestations that are required but not scored do not have associated points, but failure to fulfill such requirements will result in a zero score for the MIPS Promoting Interoperability performance category.

**Attestation Requirements: The proposed removal of the ONC-Direct Review attestation and the ONC-ACB Surveillance attestation is applicable starting with the CY 2026 performance period/2028 MIPS payment year as discussed in section IV.A.4.d.(4)(c)(ii) of this proposed rule.

TABLE C-G 4: PROPOSED SCORING METHODOLOGY FOR THE CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR

Objective	Measure	Maximum Points	Required/Optional
Electronic Prescribing	e-Prescribing	10 points	Required
	Query of PDMP	10 points	Required
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	15 points	Required (MIPS eligible clinician's choice of one of the three reporting options)
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	15 points	
	-OR-		
	Health Information Exchange Bi-Directional Exchange	30 points	
	-OR-		
	Enabling Exchange Under TEFCA	30 points	
	Electronic Prior Authorization*	10 points (*bonus*)	Optional
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	25 points	Required
Public Health and Clinical Data Exchange	Report the following two measures: • Immunization Registry Reporting • Electronic Case Reporting	25 points	Required
	Report one of the following measures: • Public Health Registry Reporting • Clinical Data Registry Reporting • Syndromic Surveillance Reporting • Public Health Reporting Using TEFCA	5 points (*bonus*)	Optional
Protect Patient Health Information**	High Priority Practices SAFER Guide	Not scored***	Required
No Associated Objective: Attestation Requirements****	Actions to Limit or Restrict the Compatibility of CEHRT	Not scored***	Required

* In sections IV.A.4.d.(4)(f)(v) and IV.A.4.d(4)(f)(vi) of this proposed rule, we are proposing to make the Electronic Prior Authorization measure an optional measure for the CY 2027 performance period and required, but unscored, starting with the CY 2028 performance period.

** The proposed removal of the Security Risk Analysis measure is applicable starting with the CY 2027 performance period/2029 MIPS payment year as described in section IV.A.4.d.(4)(d)(ii) of this proposed rule.

*** Measures and attestations that are required, but not scored do not have associated points, but failure to fulfill such requirements will result in a zero score for the MIPS Promoting Interoperability performance category.

**** Attestation Requirements: The proposed removal of the ONC-Direct Review attestation and the ONC-ACB Surveillance attestation is applicable starting with the CY 2026 performance period/2028 MIPS payment year as discussed in section IV.A.4.d.(4)(c)(ii) of this proposed rule.

TABLE C-G 5: PROPOSED SCORING METHODOLOGY FOR THE CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR AND SUBSEQUENT YEARS

Objective	Measure	Maximum Points	Required/Optional
Electronic Prescribing	e-Prescribing	10 points	Required
	Query of PDMP	10 points	Required
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	15 points	Required (MIPS eligible clinician's choice of one of the three reporting options)
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	15 points	
	-OR-		
	Health Information Exchange Bi-Directional Exchange	30 points

* Measures and attestations that are required but not scored do not have associated points, but failure to fulfill such requirements will result in a zero score for the MIPS Promoting Interoperability performance category.

BILLING CODE 4169–69–C

(iii) Exclusion Redistribution

Many required measures would have exclusions associated with them as set forth in Table C–G 7. If a MIPS eligible clinician determines an exclusion for a particular measure applies to them, they may claim it when they submit their data. The maximum available points, as shown in Table C–G 7, do not include the points that would be redistributed if a MIPS eligible clinician claims an exclusion for a specific measure. Table C–G 7 sets forth how points would be redistributed among the objectives and measures specified for the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year in the event a MIPS eligible clinician claims an exclusion for a given measure.

BILLING CODE 4169–69–P

TABLE C-G 7: PROPOSED EXCLUSION REDISTRIBUTION FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR

Objective	Measure	Redistribution if exclusion is claimed
Electronic Prescribing	e-Prescribing	10 points to HIE objective
	Query of PDMP	10 points to e-Prescribing measure
Health Information Exchange (HIE)	Support Electronic Referral Loops by Sending Health Information	15 points to Provide Patients Electronic Access to Their Health Information measure
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	15 points to the Support Electronic Referral Loops by Sending Health Information measure
	-OR-	
	Health Information Exchange Bi-Directional Exchange	No exclusion
	-OR-	
	Enabling Exchange Under TEFCA	No exclusion
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	No exclusion
Public Health and Clinical Data Exchange	Report the following two measures: • Electronic Case Reporting • Immunization Registry Reporting	If an exclusion is claimed for both measures, 25 points are redistributed to the Provide Patients Electronic Access to Their Health Information measure

(iv) ONC Health IT Certification Criteria

Table C–G 8 sets forth the objectives and measures for the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year and the associated ONC health IT certification criteria set forth at 45 CFR 170.315, as is currently applicable. Table C–G 8 also summarizes any changes to the relevant ONC Health IT certification criteria if the HTI–5 proposals are finalized as proposed. We refer readers to section IV.A.4.d.(4)(b)(ii) of this proposed rule for discussion of and amendments to the definition of CEHRT at § 414.1305.

TABLE C-G 8: MIPS PROMOTING INTEROPERABILITY PERFORMANCE CATEGORY OBJECTIVES AND MEASURES AND ONC HEALTH IT CERTIFICATION CRITERIA

Objective	Measure	Certification Criteria (CY 2027 Performance Period/2029 MIPS Payment Year) in Title 45 of the CFR	ONC Health IT Certification Criteria Changes if HTI-5 Proposals are Finalized as Proposed
Electronic Prescribing	e-Prescribing	§ 170.315(b)(3) Electronic prescribing	No change
	Query of PDMP	§ 170.315(b)(3) Electronic prescribing	No change
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	§ 170.315(b)(1) Transitions of care	Revised

	Clinical Data Registry Reporting (Optional)	No ONC health IT certification criteria at this time.	No change
	Public Health Reporting Using TEFCA (Optional)	Examples of certified health IT capabilities to support the actions of this measure may include but are not limited to technology certified to the following criteria:	
		§ 170.315(f)(5) Transmission to public health agencies — electronic case reporting	Revised
Protect Patient Health Information	Security Risk Analysis	The requirements are a part of CEHRT specific to each certification criterion.	
	High Priority Practices SAFER Guide	No ONC health IT certification criteria at this time.	No change

* In sections IV.A.4.d.(4)(f)(v) and IV.A.4.d.(4)(f)(vi) of this proposed rule, we are proposing to make the Electronic Prior Authorization measure an optional bonus measure for the CY 2027 performance period and required, but unscored, starting with the CY 2028 performance period. ** In section IV.A.4.d.(4)(e)(ii) of this proposed rule, we are proposing to adopt a new Electronic Prior Authorization for Prescription Drugs measure for the CY 2028 performance period, which is unscored.

BILLING CODE 4169–69–C

B. MIPS Final Score Methodology

1. Performance Category Scores

a. Background

Sections 1848(q)(1)(A)(i) and (ii) and (5)(A) of the Act provide, in relevant part, that the Secretary shall develop a methodology for assessing the total performance of each MIPS eligible clinician according to certain specified performance standards and, using such methodology, provide for a final score for each MIPS eligible clinician. Section 1848(q)(2)(A)(i) of the Act requires us to use the quality performance category in determining each MIPS eligible clinician's final score, and section 1848(q)(2)(B)(i) of the Act describes the measures and activities that must be specified under the quality performance category. The statute does not specify the number of quality measures on which a MIPS eligible clinician must report, nor does it specify the amount or type of information that a MIPS eligible clinician must report on each quality measure.

In this section, we propose scoring policies that are consistent with the proposed MIPS core measure reporting requirement in section IV.A.4.d.(1)(c)(iii) of this proposed rule. Additionally, we propose policies building on the current scoring policies for topped out quality measures. Moreover, we propose policies to modify the benchmarks for Medicare

CQMs and apply flat benchmarks to Medicare eCQMs that are consistent with the proposed Medicare eCQM collection type in section III.G.3.d.(3) of this proposed rule. In this section, we also propose policy to update scoring for the Electronic Prior Authorization measure in the Promoting Interoperability performance category. Lastly, we also include a request for information (RFI) on the future direction of MVP scoring policies. Specifically, we propose to:

- Establish a policy for scoring MIPS core measures;
- Apply the defined topped out benchmark for certain topped out measures for clinicians impacted by limited measure choice;
- Apply the defined topped out benchmark for topped out MIPS core measures;
- Modify the publishing location of topped out measures impacted by limited measure choice and scored according to the defined topped out benchmark;
- Modify the flat benchmarking methodology for the Medicare CQMs collection type;
- Establish a flat benchmarking methodology for the Medicare eCQMs collection type; and
- Modify the Electronic Prior Authorization measure from a required measure to an optional measure under the Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year.

Additionally, we discuss the impact of the proposed MIPS core measure scoring for small practices and explain that we would apply the historical benchmark if a measure is no longer topped out. We note that the proposed policies for scoring the quality performance category would apply to both traditional MIPS and MVP scoring.

b. Scoring the Quality Performance Category for the Following Collection Types: Medicare Part B Claims Measures, eCQMs, MIPS CQMs, QCDR Measures, the CAHPS for MIPS Survey Measures and Administrative Claims Measures

We refer readers to the CY 2017, CY 2018, and CY 2019 Quality Payment Program final rules, the CY 2020, CY 2021, CY 2022, CY 2023, CY 2024, CY 2025, and CY 2026 PFS final rules (81 FR 77276 through 77308, 82 FR 53716 through 53748, 83 FR 59841 through 59855, 84 FR 63011 through 63018, 85 FR 84898 through 84913, 86 FR 65490 through 65509, 87 FR 70088 through 70091, 88 FR 79368 and 79369, 89 FR 98427 through 98439, and 90 FR 49903 through 49914), and § 414.1380(b)(1) for our current policies regarding, among other things, quality measure benchmarks, calculating total measure achievement points, calculating the quality performance category score, including achievement and improvement points, the small practice bonus, and scoring flexibilities. In the CY 2026 PFS final rule (90 FR 49903 through 49914), we finalized policies for scoring topped out measures impacted by limited measure choice and the scoring methodology for administrative claims-based quality measures at § 414.1380(b)(1)(i) and (b)(1)(ii)(D).

(1) Proposal for Scoring of MIPS Core Measures

Section 1848(q)(5)(B)(i) of the Act requires the Secretary to treat any MIPS eligible clinician who fails to report on a required measure or activity as achieving the lowest potential score applicable to the measure or activity. In the CY 2017 Quality Payment Program final rule (81 FR 77291), we finalized at § 414.1380(b)(1) that MIPS eligible clinicians receive zero measure achievement points for each measure required under § 414.1335, on which no data is submitted in accordance with § 414.1325. In the CY 2022 PFS final rule (86 FR 65421), we finalized that scoring the required quality measures in an MVP is consistent with traditional MIPS scoring policies described under § 414.1380(b)(1).

In section IV.A.4.d.(1)(c)(iii)(B) of this proposed rule, we propose that MIPS eligible clinicians would need to report a MIPS core measure, as one of their six required quality measures in traditional MIPS or one of their four required quality measures in MVP reporting. The proposed MIPS core measure requirement would replace the existing outcome or high priority measure requirement for clinicians participating in traditional MIPS and MVP reporting. In the same section, we propose an attestation requirement, during data submission, for clinicians who do not have an available and applicable MIPS core measure. Additionally, we propose in that section that the MIPS core measure reporting requirement would not apply to clinicians in small practices. We refer readers to section IV.A.4.d.(1)(c)(iii) of this proposed rule for details on the proposed MIPS core measure reporting requirement, the attestation process, and exemption of small practices from the MIPS core measure reporting requirement. We refer readers to Appendix 1: MIPS Quality Measures of this proposed rule for details on the MIPS core measures inventory for the CY 2027 performance period/2029 MIPS payment year.

Beginning in the CY 2027 performance period/2029 MIPS payment year, for scoring the quality performance category for clinicians that are not part of small practices, we would include the proposed MIPS core measure as one of the six required quality measures for clinicians participating in traditional MIPS or one of the four required quality measures for clinicians participating in MVP reporting. As discussed in section IV.A.4.d.(1)(c)(iii)(B) of this proposed rule, clinicians who attest to not having an applicable and available MIPS core measure would still need to report enough measures to meet the required number of six quality measures in traditional MIPS or four quality measures in MVP reporting. We would use the highest scoring six or four quality measures, respectively, to determine the quality performance category score. As discussed in section IV.A.4.d.(1)(c)(iii)(B), there may be instances in which a clinician attested to not having an applicable and available MIPS core measure, but new information or changing circumstances later made it so that the clinician does have an applicable and available MIPS core measure to report. To account for these cases, if an attestation is submitted during data submission and a MIPS core measure is also reported, we would score the MIPS core measure as one of the six required quality measures in traditional MIPS reporting or one of the four required quality measures in MVP reporting. If a MIPS eligible clinician submits data for more than one MIPS core measure, we would use the highest scoring MIPS core measure as one of the six or four quality measures, and the remaining scored measures will consist of either the five highest scoring quality measures or the three highest scoring measures, as applicable, in traditional MIPS and MVP reporting.

As discussed in section IV.A.4.d.(1)(c)(iii)(B) of this proposed rule, we propose to remove the current quality measure data submission requirement of one outcome measure (or, if an outcome measure is not available, one high priority measure) for traditional MIPS and MVP reporting and replace the requirement with a MIPS core measure data submission requirement. As discussed in section IV.A.4.d.(1)(c)(i) of this proposed rule, one of the factors considered for the proposed MIPS core measure selection includes an emphasis on whether the measure is an outcome-based measure. We refer readers to section IV.A.4.d.(1)(c)(i) of this proposed rule

for additional details on the proposal to designate MIPS core measures. Therefore, we propose to assign zero measure achievement points for one quality measure if clinicians reporting traditional MIPS or MVP do not submit a MIPS core measure and do not attest during data submission that they do not have an available and applicable MIPS core measure. This proposal is consistent with the existing rule under § 414.1380(b)(1)(i). Under the existing policy under § 414.1380(b)(1)(i), MIPS eligible clinicians who submit data in accordance with § 414.1325 on a greater number of measures than required under § 414.1335 are scored only on the measures with the greatest number of measure achievement points. Therefore, we are not proposing any changes to the regulatory text for this proposal.

We request public comment on this proposal.

(2) Small Practice Scoring Exemption Clarification for MIPS Core Measures

Historically, we have heard from clinicians in small practices that they face unique challenges to successfully participate in MIPS. To further support clinicians in small practices, who often have limited resources to successfully participate in MIPS, we implemented policies to provide them with more flexibilities. For example, as described under § 414.1380(b)(1)(v)(C), beginning with the CY 2019 performance period/2021 MIPS payment year, MIPS eligible clinicians in small practices receive 6 measure bonus points if they submit data to MIPS on at least 1 quality measure. To continue the existing flexibilities and further support clinicians in small practices, we propose in section IV.A.4.d.(1)(c)(iii)(C) of this proposed rule that small practice clinicians participating in both traditional MIPS and MVP reporting would be exempt from the MIPS core measure reporting requirement. Under this proposal, clinicians in small practices are not required to submit MIPS core measures and would not need to attest during data submission if they do not have an available and applicable MIPS core measure. The existing regulation text under § 414.1380(b)(1)(i) states that MIPS eligible clinicians receive zero measure achievement points for each measure required under § 414.1335 for which no data is submitted in accordance with § 414.1325. Consistent with the existing regulation at § 414.1380(b)(1)(i) and given the proposal to exempt small practices from the MIPS core measure requirement in section IV.A.4.d.(1)(c)(iii)(C) of this proposed rule, we would not assign zero measure achievement points for one MIPS core measure if clinicians in small practices do not submit data for such measure in traditional MIPS and MVP reporting. If a small practice chooses to submit data on a MIPS core measure, we would include the core measure in the quality performance category score only if the MIPS core measure is one of the six highest scoring measures in traditional MIPS or one of the four highest scoring measures in MVP reporting, in accordance with the existing regulation under § 414.1380(b)(1)(i). We refer readers to Appendix 1: MIPS Quality Measures of this proposed rule for details on the proposed MIPS core measures inventory for the CY 2027 performance period/2029 MIPS payment year.

(3) Scoring Topped Out Measures

(a) Background on Scoring Topped Out Measures

We refer readers to the CY 2017, CY 2018, and CY 2019 Quality Payment Program final rules (81 FR 77282 through 77287, 82 FR 53721 through 53727), the CY 2023, CY 2025, and CY 2026 PFS final rules (83 FR 59761 through 59765, 88 FR 70090 and 70091, 89 FR 98428 through 98435, and 90 FR 49902 through 49908), and § 414.1380(b)(1)(iv) for established topped out measure scoring policies.

Topped out measures are measures for which measure performance is considered so high and unvarying that meaningful distinctions and improvements in performance can no longer be made (81 FR 77136). Section 1848(q)(3)(B) of the Act requires that in establishing performance standards with respect to measures and activities, we consider, among other things, the opportunity for continued improvement. Topped out measures do not provide an opportunity for continued improvement, nor do payment adjustments based on topped out measures incentivize clinicians to improve their care. As a result, we finalized policies in the CY 2018 Quality Payment Program final rule (82 FR 53723 through 53727) to identify and cap the scoring potential of topped out measures. Additionally, we established policies for the removal of topped out measures, such as establishing the topped out measure lifecycle, to continue to drive quality improvement in areas where such improvement is possible and necessary. The topped out measure lifecycle is described in the CY 2018 Quality Payment Program final rule (82 FR 53721 through 53727). We established at § 414.1380(b)(1)(iv)(B) that we will cap scoring for topped out measures at seven measure achievement points in the second consecutive year that the measure benchmark is identified as topped out. If a measure has been identified as topped out for three consecutive years after being originally identified through the benchmarks, such measure may then be proposed for removal through notice-and-comment rulemaking (83 FR 59761). This timeline, however, is not fixed. We noted our concern that removal of topped out measures may leave clinicians with fewer than six applicable measures to report and that such removal in those instances will impact some specialties more than others (82 FR 53721). We stated that consideration for ensuring available applicable measures would be made when considering measure removals (83 FR 59763).

In the CY 2018 Quality Payment Program final rule (82 FR 53727), we established the topped out scoring cap to encourage MIPS eligible clinicians to submit measures that are not topped out. However, we created an exemption to this policy in the CY 2025 PFS final rule (89 FR 98428 through 98435) for certain topped out measures that are frequently used by certain specialties impacted by limited measure choice (89 FR 98428 through 98435). To address scoring scenarios in which limited measure choice compels clinicians to report topped out measures with scoring caps, we finalized in the CY 2025 PFS final rule (89 FR 98428 through 98435) at § 414.1380(b)(1)(iv)(C) that beginning with the CY 2025 performance period/2027 MIPS payment year, topped out measures frequently used by certain specialties reporting specialty measure sets that are impacted by limited measure choice, as specified in accordance with § 414.1380(b)(1)(ii)(E), are not subject to the 7-point scoring cap. In the CY 2025 PFS final rule, we finalized at § 414.1380(b)(1)(ii)(E) that beginning with the CY 2025 performance period/2027 MIPS payment year, we will annually publish a list in the **Federal Register** of topped out measures determined to be impacted by limited measure choice. Measures included in the list are scored from 1 to 10 measure achievement points according to defined topped out measure benchmarks calculated from performance data in the baseline period, in which a performance rate of 97 percent corresponds to 10 percent of the performance threshold for the corresponding performance year.

In the CY 2026 PFS final rule (90 FR 49904 through 49908), we modified our approach for identifying the list of measures impacted by limited measure

choice and subject to defined topped out measure benchmarks. We finalized that each specialty measure set and MVP is reviewed by collection type to identify if the prevalence of topped out measures within such a set of measures hinders a clinician's ability to successfully participate in the MIPS quality performance category. To make such a determination, we finalized a policy stating that we will analyze the ability of clinicians reporting the specialty measure sets and MVPs to reasonably achieve 75 percent of available quality achievement points based upon the measures available to them and program requirements. Specifically, at the collection type level, each measure is assigned points based upon the current benchmarking data: new measures receive 7 or 5 points based on year in the program, measures with benchmarks are given points based upon the highest decile achievable with a less than perfect score (less than 100 percent or greater than 0 percent for inverse measures), and measures with no available historic benchmark are given 0 points. All measure set points are added together to get an output of scoring potential; the Medicare Part B claims collection type measure sets have an additional 6 points added to the output to account for the small practice bonus. The sum of quality achievement points for each specialty measure set and MVP are then compared to the analysis threshold of 75 percent of available quality achievement points, based on the number of available measures. Any specialty measure sets or MVPs that are unable to meet or exceed the analysis threshold are flagged as ''at-risk.''

Additional factors that we take into consideration include whether the topped out measure is considered a cross-cutting measure or is a broadly applicable measure, which we consider to be a measure included in three or more specialty sets or MVPs. We also consider whether the specialty measure set or MVP contains more than ten measures, by collection type (90 FR 49904 through 49908).

(b) Proposal of Measures Impacted by Limited Measure Choice To Be Subject to Defined Topped Out Benchmark for the CY 2027 Performance Period/2029 MIPS Payment Year

Table C–H1 of this proposed rule contains the list of measures that meet the criteria for topped out measures impacted by limited measure choice in specialty measure sets and MVPs as finalized in the CY 2026 PFS final rule (90 FR 49904 through 49908), and for which we are proposing to apply the defined topped out measure benchmark for the CY 2027 performance period/2029 MIPS payment year.

BILLING CODE 4169–69–P

TABLE C-H1: PROPOSED TOPPED OUT MEASURES IMPACTED BY LIMITED MEASURE CHOICE AND SUBJECT TO DEFINED TOPPED OUT MEASURE BENCHMARKS FOR THE CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR

Measure ID	Collection Type	Measure Title
127	MIPS CQM	Diabetes Mellitus: Diabetic Foot and Ankle Care, Ulcer Prevention - Evaluation of Footwear
144	MIPS CQM	Oncology: Medical and Radiation - Plan of Care for Pain
145	Medicare Part B Claims, MIPS CQM	Radiology: Exposure Dose Indices Reported for Procedures Using Fluoroscopy
249	Medicare Part B Claims, MIPS CQM	Barrett's Esophagus
250	Medicare Part B Claims, MIPS CQM	Radical Prostatectomy Pathology Reporting
351	MIPS CQM	Total Knee or Hip Replacement: Venous Thromboembolic and Cardiovascular Risk Evaluation
360	MIPS CQM	Optimizing Patient Exposure to Ionizing Radiation: Count of Potential High Dose Radiation Imaging Studies: Computed Tomography (CT) and Cardiac Nuclear Medicine Studies
364	MIPS CQM	Optimizing Patient Exposure to Ionizing Radiation: Appropriateness: Follow-up CT Imaging for Incidentally Detected Pulmonary Nodules According to Recommended Guidelines
395	Medicare Part B Claims, MIPS CQM	Lung Cancer Reporting (Biopsy/Cytology Specimens)
396	MIPS CQM	Lung Cancer Reporting (Resection Specimens)
397	Medicare Part B Claims, MIPS CQM	Melanoma Reporting
405	MIPS CQM	Appropriate Follow-up Imaging for Incidental Abdominal Lesions
406	Medicare Part B Claims, MIPS CQM	Appropriate Follow-up Imaging for Incidental Thyroid Nodules in Patients
430	MIPS CQM	Prevention of Post-Operative Nausea and Vomiting (PONV) - Combination Therapy
440	MIPS CQM	Skin Cancer: Biopsy Reporting Time - Pathologist to Clinician
463	MIPS CQM	Prevention of Post-Operative Vomiting (POV) - Combination Therapy (Pediatrics)
477	MIPS CQM	Multimodal Pain Management

BILLING CODE 4169–69–C

We had considered proposing measures 143: Oncology: Medical and Radiation—Pain Intensity Quantified (eCQM and MIPS CQM), 320: Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patient (Medicare Part B Claims and MIPS CQM), and 350: Total Knee or Hip Replacement: Shared Decision-Making: Trial of Conservative (Non-surgical) Therapy (MIPS CQM) to be subject to the defined topped out measure benchmark for the CY 2027 performance period/2029 MIPS payment year since the measures meet the criteria for topped out measures in specialty measure sets or MVPs impacted by limited measure choice according to the methodology finalized in the CY 2026 PFS final rule (90 FR 49904 through 49908). However, we are not proposing these measures for the defined topped out measure benchmark for the CY 2027 performance period/2029 MIPS payment year because we are proposing to remove these measures from the

quality performance category measure inventory for the CY 2027 performance period/2029 MIPS payment year in section IV.A.4.d.(1)(e)(ii) of this proposed rule. We propose that if we do not finalize the removal of these measures from the MIPS quality performance category inventory for the CY 2027 performance period/2029 MIPS payment year, we would score these measures with the defined topped out measure benchmark for the CY 2027 performance period/2029 MIPS payment year.

We request public comment on this proposal.

(c) Proposal to Score Topped Out MIPS Core Measures According to Defined Topped Out Benchmark

In section IV.A.4.d.(1)(c)(iii)(B) of this proposed rule, we are proposing that MIPS eligible clinicians would need to report a MIPS core measure as one of their six required quality measures in traditional MIPS or one of their four required quality measures in MVP reporting, beginning in the CY 2027 performance period/2029 MIPS payment year. We refer readers to Appendix 1: MIPS Quality Measures of this proposed rule for the proposed MIPS core measure inventory. There are 19 proposed MIPS core measures that are topped out and subject to the 7-point topped out measure scoring cap for the CY 2026 performance period/2028 MIPS payment year. As described in section IV.B.1.b.(3)(a) of this proposed rule, to address scoring scenarios in which limited measure choice compels clinicians to report topped out measures with scoring caps, we finalized the defined topped out benchmark in the CY 2025 PFS final rule (89 FR 98428 through 98435). The defined topped out benchmark removes the 7-point scoring cap for topped out measures and scores them from 1 to 10 measure achievement points according to a benchmark calculated from performance data in the baseline period in which a performance rate of 97 percent corresponds to 10 percent of the performance threshold for the corresponding performance year.

The prevalence of topped out MIPS core measures, combined with the limited measure choice associated with MIPS core measures, could result in a clinician being compelled to report a topped out MIPS core measure as one of their six required quality measures in traditional MIPS or one of their four required quality measures in MVP reporting. Given the combination of limited measure choice and the 7-point scoring cap for topped out measures, we are concerned that the application of the 7-point scoring cap to topped out MIPS core measures would penalize clinicians for complying with the proposed reporting requirement. Therefore, we are proposing that MIPS core measures in their second or more consecutive year of being topped out would not be subject to the 7-point topped out measure scoring cap, and instead the measures would be scored from 1 to 10 measure achievement points according to the defined topped out benchmark.

Subsequently, we are proposing to create the scoring methodology for MIPS core measures that are topped out. Thus, we are proposing to amend and codify at § 414.1380(b)(1)(ii) by establishing a new provision at § 414.1380(b)(1)(ii)(H), which would establish the scoring (1 to 10 measure achievement points) for MIPS core measures that have benchmarks identified as topped out for 2 or more consecutive years. Specifically, we are proposing to establish and codify at § 414.1380(b)(1)(ii)(H), which would determine the following: Beginning in the CY 2027 performance period/2029 MIPS payment year, MIPS core measures, which are required under § 414.1335(a)(1)(i) and (ii), for which the benchmark for the applicable collection type is identified as topped out for 2 or more consecutive years, are scored from 1 to 10 measure achievement points according to defined topped out measure benchmarks calculated from performance data in the baseline period in which a performance rate of 97 percent corresponds to 10 percent of the performance threshold for the corresponding performance year. Also, we are proposing for MIPS core measures not to be subject to the 7-point topped out measure scoring cap. Specifically, we are proposing to amend and codify at § 414.1380(b)(1)(iv) by establishing a new provision at § 414.1380(b)(1)(iv)(D), which would determine the following: Beginning with the CY 2027 performance period/2029 MIPS payment year, MIPS core measures, which are required under § 414.1335(a)(1)(i) and (ii), are not subject to the 7 measure achievement point cap specified at § 414.1380(b)(1)(iv)(B).

We request public comment on this proposal.

(d) Clarification Regarding Scoring Non-Topped Out Measures According to Historical Benchmark

In the CY 2025 PFS final rule (89 FR 98428 through 98435), we finalized at § 414.1380(b)(1)(ii)(E) that beginning with the CY 2025 performance period/2027 MIPS payment year, CMS will publish a list in the **Federal Register** of topped out measures determined to be impacted by limited measure choice on an annual basis. Measures included in the list will be scored from 1 to 10 measure achievement points according to defined topped out measure benchmarks calculated from performance data in the baseline period in which a performance rate of 97 percent corresponds to 10 percent of the performance threshold for the corresponding performance year. The measures are identified using a methodology finalized in the CY 2026 PFS final rule (90 FR 49904 through 49908), which analyzes whether the prevalence of topped out measures within a specialty measure set or an MVP hinders a clinician's ability to successfully participate in the MIPS quality performance category. Using current benchmarking data, the analysis evaluates the ability of clinicians to reasonably achieve 75 percent of available quality achievement points given the measures available to them and program requirements.

At the time of the internal analysis to inform the list of measures impacted by limited measure choice, the most current benchmarking data is for the performance period prior to that which the defined topped out measure benchmark would be applied. For example, we analyzed CY 2026 benchmarks to inform the list of measures impacted by limited measure choice for the CY 2027 performance period/2029 MIPS payment year. Therefore, there are instances in which a measure is finalized to be scored according to the defined topped out benchmark for a given performance period, but it is later determined that the historic baseline period benchmark for that measure is not topped out for that performance period. This was the case for Medicare Part B Claims Measure 141: Primary Open-Angle Glaucoma (POAG): Reduction of Intraocular Pressure (IOP) by 20% OR Documentation of a Plan of Care for the CY 2026 performance period/2028 MIPS payment year. In the CY 2026 PFS final rule (90 FR 49906 through 49908), we finalized Medicare Part B Claims Measure 141 to be scored according to the defined topped out measure benchmark for the CY 2026 performance period/2028 MIPS payment year based on an analysis of the CY 2025 performance period/2027 MIPS payment year benchmarks, the most recently available benchmarks at the time of the analysis. However, the subsequently released benchmarks for the CY 2026 performance period/2028 MIPS payment year indicated that the baseline period benchmark for Medicare

Part B Claims Measure 141 was not topped out. Given the topped out measure lifecycle, as finalized in the CY 2018 Quality Payment Program final rule (82 FR 53721 through 53727), Medicare Part B Claims Measure 141 would not be capped at 7 measure achievement points for the CY 2026 performance period/2028 MIPS payment year since it was not topped out.

If a measure is not topped out, it no longer meets the criteria for the removal of the 7 measure achievement point cap. We clarify that if a measure previously finalized for removing the 7-point cap is no longer topped out, it would be scored using its historical benchmark instead of the topped-out measure benchmark.

(e) Proposal To Modify Location for Publishing List of Measures Subject to Defined Topped Out Benchmark

In the CY 2025 PFS final rule (89 FR 98428 through 98435), we finalized at § 414.1380(b)(1)(ii)(E) to state that beginning with the CY 2025 performance period/2027 MIPS payment year, CMS will publish a list in the **Federal Register** of topped out measures determined to be impacted by limited measure choice on a yearly basis. Measures included in the list are scored from 1 to 10 measure achievement points according to defined topped out measure benchmarks calculated from performance data in the baseline period in which a performance rate of 97 percent corresponds to 10 percent of the performance threshold for the corresponding performance year. In the CY 2026 PFS final rule (90 FR 49904 through 49908), we finalized the methodology to identify topped out measures impacted by limited measure choice. We analyze whether the prevalence of topped out measures with a 7-point cap within a specialty measure set or an MVP hinders a clinician's ability to successfully participate in the MIPS quality performance category. This analysis is based on the most current benchmarking data available at that time. We finalized in the CY 2018 Quality Payment Program final rule that MIPS eligible clinicians will know the quality performance category measure benchmarks in advance of the performance period, when possible (81 FR 77271 and 77272), and that the benchmarks will be posted on the Quality Payment Program website (81 FR 77139).

Given the benchmark availability timeline, the list of topped out measures scored from 1 to 10 measure achievement points according to the defined topped out measure benchmark published in the **Federal Register** for a performance period may not accurately indicate whether a measure is topped out for that performance period. For example, as discussed in section IV.B.1.b.(3)(d) of this proposed rule, a measure previously determined to be topped out and scored from 1 to 10 points for the CY 2026 performance period/2028 MIPS payment year based on data using the CY 2025 performance period benchmarks was later found not to be topped out based on the updated CY 2026 benchmarks. This occurs because, during the time of the analysis to identify measures impacted by limited measure choice, only the most recent benchmarks s from the prior performance period are available. For example, we analyzed CY 2026 performance period benchmarks to inform topped out measures impacted by limited measure choice for the CY 2027 performance period/2029 MIPS payment year.

We are concerned that publishing the list of topped out measures impacted by limited measure choice and scored from 1 to 10 measure achievement points according to the defined topped out measure benchmark in the **Federal Register**, prior to the benchmark information for that performance period being available, can lead to confusion. To avoid confusion for clinicians, we are proposing that, beginning in the CY 2027 performance period/2029 MIPS payment year, we would publish the list of topped out measures impacted by limited measure choice and scored from 1 to 10 measure achievement points according to the defined topped out measure benchmark annually on the Quality Payment Program website at *https://qpp.cms.gov.* Specifically, we are proposing to remove the phrase ''in the **Federal Register**'' under § 414.1380(b)(1)(ii)(E).

Further, we note that the measures included in this list would still be identified using the previously finalized methodology for determining topped out measures impacted by limited measure choice in specialty measure sets and MVPs, as finalized in the CY 2026 PFS final rule (90 FR 49904 through 49908). By publishing the list of topped out measures impacted by limited measure choice on the Quality Payment Program website, we would be able to update the list, once the benchmark information for that performance period becomes available, to remove measures that are not topped out for that performance period, consistent with the topped out measure lifecycle, finalized in the CY 2018 Quality Payment Program final rule (82 FR 53721 through 53727). We refer readers to section IV.B.1.b.(3)(d) of this proposed rule for our discussion that measures previously finalized to be scored using the defined topped out benchmark would instead be scored using the baseline period benchmark if updated benchmark data show the measure is not topped out for that performance period.

We would publish the list of topped out measures impacted by limited measure choice and scored from 1 to 10 measure achievement points according to the defined topped out measure benchmark on the Quality Payment Program website no later than the publication of the proposed rule for that CY performance period/MIPS payment year. This timeline would provide interested parties with sufficient opportunity to review and provide comments on the list of measures during the public comment period for that proposed rule. Once the list of topped out measures impacted by limited measure choice and scored from 1 to 10 measure achievement points according to the defined topped out measure benchmark is finalized during rulemaking, the only changes to the list would be the removal of a measure because it is no longer topped out based on most current benchmarks published in the performance period.

Thus, we are proposing to amend § 414.1380(b)(1)(ii)(E) by removing the phrase ''in the **Federal Register**''. Also, we are proposing a technical amendment in § 414.1380(b)(1)(ii)(E) for grammar purposes, which would modify the beginning of the second sentence in § 414.1380(b)(1)(ii)(E) from ''. . . measure included in the list . . .'' to ''measure included on the list . . .''. The revised § 414.1380(b)(1)(ii)(E) would state: Beginning with the CY 2025 performance period/2027 MIPS payment year, CMS will publish a list of topped out measures determined to be impacted by limited measure choice on a yearly basis. Measures included on the list are scored from 1 to 10 measure achievement points according to defined topped out measure benchmarks calculated from performance data in the baseline period in which a performance rate of 97 percent corresponds to 10 percent of the performance threshold for the corresponding performance year.

We request public comment on these proposals.

c. Scoring the Quality Performance Category for Medicare Shared Savings Program ACOs

(1) Proposal To Use Flat Benchmarks To Score Medicare Shared Savings Program ACOs Reporting Medicare CQMs

In the CY 2025 PFS final rule (89 FR 98117), we finalized our proposal to establish new benchmarks for scoring Medicare Shared Savings Program ACOs on the Medicare CQMs under MIPS in alignment with MIPS benchmarking policies. As historical Medicare CQM data would not be available, we finalized that for performance years 2024 and 2025, we will score Medicare CQMs using performance period benchmarks. We also finalized that, for performance year 2026 and subsequent performance years, when baseline period data are available to establish historical benchmarks in a manner that is consistent with the MIPS benchmarking policies at § 414.1380(b)(1)(ii), we would score Medicare CQMs using historical benchmarks. In the CY 2025 PFS final rule, we also finalized our proposal to add § 414.1380(b)(1)(ii)(F) to state that beginning in the CY 2025 performance period/2027 MIPS payment year, measures of the Medicare CQM collection type would be scored using flat benchmarks for their first two performance periods in MIPS (89 FR 98120).

As described in section III.G.3.c. of this proposed rule, we are proposing to modify § 414.1380(b)(1)(ii)(F) by removing the applicability of the first two performance periods to the use of flat benchmarks and extending the use of flat benchmarks to score all Medicare CQMs for performance year 2025 and subsequent performance years. Also, we are proposing to retroactively apply flat benchmarks to Quality IDs 001 (Diabetes: Glycemic Status Assessment Greater Than 9%), 134 (Preventive Care and Screening: Screening for Depression and Follow-up Plan), and 236 (Controlling High Blood Pressure), if reported via the Medicare CQMs collection type for performance year 2026.

Specifically, we are proposing to amend and codify at § 414.1380(b)(1)(ii)(F), by converting such section to a title section entitled ''Medicare CQMs collection type benchmarks'' and establishing § 414.1380(b)(1)(ii)(F)(*1*) and (*2*). In § 414.1380(b)(1)(ii)(F)(*1*), we are proposing that for the CY 2025 performance period/2027 MIPS payment year, measures of the Medicare CQMs collection type would utilize flat benchmarks for their first two performance periods in MIPS. In § 414.1380(b)(1)(ii)(F)(*2*), we are proposing to retroactively apply the utilization of flat benchmarks for the Medicare CQMs collection type beginning with the CY 2026 performance period/2028 MIPS payment year. Specifically, we are proposing that beginning with the CY 2026 performance period/2028 MIPS payment year, measures of the Medicare CQMs collection type would utilize flat benchmarks. We refer readers to section III.G.3.c. of this proposed rule for further discussion regarding the extension of applying the utilization of flat benchmarks for the Medicare CQMs collection type, including discussion about the retroactive use of flat benchmarks for the Medicare CQMs collection type in the CY 2026 performance period/2028 MIPS payment year.

We request public comment on these proposals.

(2) Proposal To Use Flat Benchmarks To Score Medicare Shared Savings Program ACOs Reporting Medicare eCQMs

As described in section III.G.3.d.(3) of this proposed rule, we are proposing to develop a policy that establishes the utilization of flat benchmarks for measures of the newly proposed Medicare eCQMs collection type reported by Medicare Shared Savings Program ACOs. As a result, Medicare eCQMs would be scored using flat benchmarks beginning with the 2027 performance period. To effectuate such proposal under MIPS for purposes of assessing and scoring performance for the quality performance category, we are proposing to add § 414.1380(b)(1)(ii)(G) to establish a new provision specific to benchmarks for measures of the Medicare eCQMs collection type, entitled ''Medicare eCQMs collection type benchmarks.'' Subsequently, we are proposing to add § 414.1380(b)(1)(ii)(G)(1), which establishes the utilization of flat benchmarks under the Medicare eCQMs collection benchmarks provision established at § 414.1380(b)(1)(ii)(G). Specifically, we are proposing in § 414.1380(b)(1)(ii)(G)(1) to establish that beginning with the CY 2027 performance period/2029 MIPS payment year, measures of the Medicare eCQMs collection type would utilize flat benchmarks.

We request public comment on this proposal.

d. Scoring the Promoting Interoperability Performance Category

Proposal To Modify the Scoring of the Electronic Prior Authorization Measure for CY 2027 Performance Period/2029 MIPS Payment Year

In section IV.A.4.d.(4)(f)(ii) of this proposed rule, we are proposing to modify the Electronic Prior Authorization measure by changing the measure from a required measure to an optional measure and eligible for 10 bonus points when MIPS eligible clinicians affirmatively attest (''Yes'' response) to meeting the requirements of the measure for the CY 2027 performance period/2029 MIPS payment year. We believe that the allocation of 10 bonus points is an appropriate and effective incentive to promote the adoption and use of certified technology for requesting electronic prior authorizations among MIPS eligible clinicians. To account for the allocation of bonus points specific to the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year, the scoring methodology for optional measures available for bonus points needs to be amended.

In § 414.1380(b)(4)(ii)(C)(3), the optional measures available for reporting are not identified or categorized by objective; however, the applicable optional measures available in the MIPS Promoting Interoperability performance category as of the CY 2026 performance period (Syndromic Surveillance Reporting, Public Health Registry Reporting, Clinical Data Registry Reporting, and Public Health Reporting Using TEFCA) are all under the Public Health and Clinical Data Exchange objective. When reporting one, more than one, or all such optional measures, the total number of bonus points that could be earned is five bonus points. To distinguish between such optional measures that are available under the Public Health and Clinical Data Exchange objective and the Electronic Prior Authorization measure as an optional measure for the CY 2027 performance period/2029 MIPS payment year that is under the Health Information Exchange objective and has an allocation of 10 bonus points, we are proposing to modify the scoring methodology to account for the optional measures available under each applicable objective within the MIPS Promoting Interoperability performance category.

We are proposing to modify the scoring methodology for optional measures to reflect an allocation of a total of five bonus points when

reporting one, more than one, or all optional measures (Syndromic Surveillance Reporting, Public Health Registry Reporting, Clinical Data Registry Reporting, and Public Health Reporting Using TEFCA) available under the Public Health and Clinical Data Exchange objective bonus and an allocation of a total of 10 bonus points when reporting the optional Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year available under the Health Information Exchange objective.

Thus, we are proposing to amend § 414.1380(b)(4)(ii)(C)(*3*) by modifying the provision to identify the MIPS Promoting Interoperability performance category objective, specifically the Public Health and Clinical Data Exchange objective, in which the applicable optional measures are available to earn a total of five bonus points when reporting one, more than one, or all optional measures. Specifically, we are proposing to amend § 414.1380(b)(4)(ii)(C)(*3*) by modifying the provision to indicate that the total number of bonus points available to be earned when reporting one optional measure, more than one optional measure, or all optional measures under the Public Health and Clinical Data Exchange objective is a total of five bonus points beginning with the CY 2026 performance period/2028 MIPS payment year. Additionally, we are proposing to establish a new provision at § 414.1380(b)(4)(ii)(C)(*4*) to account for the Electronic Prior Authorization measure being an optional measure under the Health Information Exchange objective and having an allocation of a total of 10 bonus points for the CY 2027 performance period/2029 MIPS payment year. Specifically, we are proposing to establish § 414.1380(b)(4)(ii)(C)(*4*), which would determine that the total number of bonus points available to be earned when reporting the Electronic Prior Authorization optional measure is a total of 10 bonus points for the CY 2027 performance period/2029 MIPS payment year. The establishment of such provision (only applicable to the CY 2027 performance period/2029 MIPS payment year) would enable a MIPS eligible clinician to earn 10 bonus points for affirmatively attesting that they requested a prior authorization electronically using CEHRT to send a request through a payer's Prior Authorization API for at least one medical item or service (excluding drugs) ordered within the CY 2027 performance period/2029 MIPS payment year.

We request public comment on this proposal.

e. MVP Scoring Request for Information

As discussed in section IV.A.3.c. of this proposed rule, we are proposing to move to full implementation of MVP reporting beginning in the CY 2029 performance year/2031 MIPS payment year. As a part of the transition to full MVP implementation, we intend to examine current MVP scoring policies to align with full MVP reporting. For example, we could consider scoring approaches that allow us to more fairly compare performance of clinicians within the same MVP. MVPs focus on measures that are relevant to a given specialty and offer clinicians with meaningful groupings of measures and activities that relate to a specialty or medical condition. Reporting from these smaller, more aligned sets of quality and cost measures, improvement activities, and foundational layer of Promoting Interoperability measures and population health measures allows for performance measurement that more closely compares clinicians within the same specialty and provides connected assessment of quality of care.

In the CY 2022 PFS final rule (86 FR 65419 through 65427), we finalized policies for MVP scoring at § 414.1365(d). We noted that unless there was a compelling reason to adopt a different scoring policy to further the goals of the MVP framework, we generally applied the traditional MIPS scoring policies to MVPs to reduce complexity as clinicians transition to reporting MVPs.

In the CY 2025 PFS proposed rule, we issued an RFI on how we can achieve full MVP implementation as we move toward the sunsetting of traditional MIPS (89 FR 62011 through 62016). In response to that RFI, we received feedback from interested parties regarding the scoring of MVPs. Commenters discussed scoring fairness within MVP reporting and across MVPs. Specifically, commenters shared concerns about the availability of measures in an MVP, having topped out measures with a 7-point cap, and reporting Class 2 measures that cannot be scored based on performance due to the lack of a benchmark or failure to meet the case minimum.

We recognize that MVP performance data is currently limited as we have data from only the CY 2023 through 2025 performance periods/2025 through 2027 MIPS payment years and MVP participation remains nascent in the early years. Hence, a small number of MIPS eligible clinicians voluntarily reported MVPs during those three performance periods. While additional data will be needed to confirm any findings, we are assessing whether an MVP score normalization is needed within an MVP to ensure scoring fairness across MVPs. We are also considering the timing for implementing a new MVP scoring methodology: beginning with the CY 2029 performance period/2031 MIPS payment year, consistent with the proposed timeline for full MVP implementation described in section IV.A.3.c. of this proposed rule, or whether an earlier pilot rollout would be appropriate to give clinicians experience with the new scoring approach while traditional MIPS reporting is available. We request feedback on when a potential change to MVP scoring should be implemented.

As we move toward the full implementation of MVPs in the CY 2029 performance period/2031 MIPS payment year, we are exploring scoring policies that consider commenter feedback and align with the intended goals of MVPs. Specifically, we are exploring an MVP scoring methodology and policies to fairly evaluate and reward MVP participants for delivering high-quality and low-cost care by comparing clinician performance to others reporting the same MVP. As we consider policy options for MVP scoring, we are seeking comments on the following questions to further discussion and considerations for the future of MVP scoring.

- We are seeking feedback on a scoring methodology that would help us ensure appropriate comparisons between clinicians participating in different MVPs, with each MVP focusing on measures and activities that are relevant to a given specialty or medical condition.

++ Prior to MIPS payment adjustment determination, should we consider normalizing scores, such that MIPS eligible clinicians reporting a given MVP would have their scores compared to other MIPS eligible clinicians reporting the same MVP? If so, should normalization occur at the final score level or at a performance category level? If at a performance category level, which performance category(ies) should be normalized?

++ For example, should we consider normalizing performance category or final scores using a methodology similar to the current standard-deviation based benchmark methodology used to score cost and administrative claims-based quality measures. Current cost and administrative claims-based quality measures use performance period standard deviation, median, and an

anchored point value that is derived from the performance threshold.

++ How would a new scoring approach of normalizing final scores influence provider behaviors?

++ How would a new scoring approach of normalizing performance category scores influence provider behaviors?

++ Should we normalize scores within each MVP to result in similar distributions of scores across MVPs? We anticipate doing so would change scores based on a clinician's relative performance within their MVP. Would this approach justify the interest of scoring fairness across MVPs while impacting final scores and payment adjustments?

• We are also soliciting feedback on any additional scoring methodologies or approaches we should consider to ensure fairness within and across MVPs.

• While we are considering scoring fairness within and across specialty-based MVPs as a primary goal for the future of MVP scoring, we are also interested in other goals to consider.

++ For example, should we consider whether MVP scoring policies provide more meaningful rewards for the high performing clinicians via larger positive payment adjustments?

++ Given that MIPS is a budget-neutral program, would an increase in rewards for high performers warrant the trade-off of having more clinicians receiving negative payment adjustments?

++ Some scoring approaches may increase scoring fairness within and across MVPs while it may also reduce a clinician's ability to predict their performance category or final score. However, clinicians and practices still have access to the benchmarks used for normalization in the prior year. How could we better support scoring transparency and predictability as a key consideration for the future of MVP scoring?

• If we move forward with proposing a scoring normalization for MVPs in future rulemaking, what resource materials would be most helpful to understand and navigate new MVP scoring policies?

Please note, this is an RFI only. In accordance with the implementing regulations of the Paperwork Reduction Act of 1995 (PRA), specifically 5 CFR 1320.3(h)(4), this general solicitation is exempt from the PRA. Facts or opinions submitted in response to general solicitations of comments from the public, published in the **Federal Register** or other publications, regardless of the form or format thereof, provided that no person is required to supply specific information pertaining to the commenter, other than that necessary for self-identification, as a condition of the agency's full consideration, are not generally considered information collections and therefore not subject to the PRA.

f. Proposed Improvement Activities Scoring for APMs

In the CY 2017 Quality Payment Program final rule (81 FR 77008 through 77012), we established policies for scoring the improvement activities performance category, including criteria for weighting and attestation. In that same rule, we also established special scoring provisions for MIPS eligible clinicians participating in Alternative Payment Models (APMs), recognizing that such clinicians are often already engaged in activities aligned with MIPS improvement activities through their APM participation. Specifically, we finalized a policy under § 414.1380(b)(3)(i) to assign a minimum score for the improvement activities performance category for MIPS eligible clinicians participating in APMs (81 FR 77096). We explained that this approach was intended to reduce reporting burden while acknowledging that APM participants are typically undertaking practice improvement efforts consistent with the goals of the improvement activities performance category.

We have maintained this policy in subsequent rulemaking, specifically the CY 2021 PFS final rule (85 FR 84472), we attempted to ensure that scoring this category did not inadvertently harm participants. However, in doing so we introduced scenarios where IA scores for some APM participants would not be awarded credit as established in section 1848(q) of the Act.

We are proposing to revise § 414.1380(b)(3)(i) to clarify and maintain that, for MIPS eligible clinicians participating in APMs, the improvement activities performance category score is at least 50 percent. This revision is consistent with the policy we established in the CY 2017 Quality Payment Program.

We request public comment on this proposal.

H. Third Party Intermediaries General Requirements

1. Background

We refer readers to 42 CFR 414.1305,414.1400, the CY 2017 Quality Payment Program final rule (81 FR 77362 through 77390), the CY 2018 Quality Payment Program final rule (82 FR 53806 through 53819), the CY 2019 PFS final rule (83 FR 59894 through 59910), the CY 2020 PFS final rule (84 FR 63049 through 63080), the May 8th COVID–19 IFC (85 FR 27594 and 27595), the CY 2021 PFS final rule (85 FR 84926 through 84947), the CY 2022 PFS final rule (86 FR 65538 through 65550), CY 2023 PFS final rule (87 70102 FR through 70109), the CY 2024 PFS final rule (88 FR 79381 through 79394), the CY 2025 PFS final rule (89 FR 98459), and the CY 2026 PFS final rule (90 FR 49920) for our previously established policies regarding third party intermediaries.

In this section of the proposed rule, we propose to update our requirements for third party intermediaries related to conditions for approval for Qualified Clinical Data Registries (QCDRs) and qualified registries, remove the additional requirements for health IT vendors, and update our remedial action/termination policies. Specifically, we propose the following:

• Additional Requirements for Health IT Vendors:

++ Clarifying that additional requirements for health IT vendors do not apply beginning with the CY 2025 performance period/2027 MIPS payment year, because beginning in the CY 2025 performance period/2027 MIPS payment year health IT vendors are no longer allowed to submit MIPS data as a third-party intermediary,

• Conditions for Approval:

++ Clarifying that performance feedback reports would be provided based on participation level (for example, individual, group, subgroup, virtual group, or APM entity).

++ Updating the existing two policies in which (1) a third party intermediary with fewer than 10 Quality Payment Program participants submitting MIPS data must audit all Quality Payment Program participants and (2) a third party intermediary submitting data for Quality Payment Program participants with fewer than 5 patient records must audit all patient records.

++ Updating the policy in which third party intermediaries that do not submit data for one year are required to submit a self-nomination participation plan.

++ Modifying the qualified postings' policy in which changes to the information submitted should not be done after the qualified posting is publicly posted on the Quality Payment Program's Resource Library page.

++ Revising existing policies to specify a QCDR or a qualified registry must be able to submit to CMS data for at least six quality measures including at least one MIPS core measure to align with the proposed removal of high priority designation from MIPS quality

measures and the MIPS core measure reporting requirements in section IV.A.4.d.(1)(c) of this proposed rule.

- Remedial Action and Termination of Third Party Intermediaries:

++ Clarifying that if a third party intermediary does not submit data for one year, they would be required to provide documentation and would be terminated if documentation cannot be provided and/or the documentation shows that they would not be submitting data for the given MIPS performance period.

2. Proposal To Further Clarify in Regulation Text That Health IT Vendors Can Not Submit Data Beginning With the CY 2025 Performance Period/2027 MIPS Payment Year and That Preexisting Requirements for Health IT Vendors No Longer Apply

In the CY 2017 Quality Payment Program final rule (81 FR 77377 through 77382), we established the category of health IT vendors as a type of third party intermediary in the Quality Payment Program. In the CY 2019 PFS final rule, we codified the definition of a health IT vendor as an entity that supports the health IT requirements on behalf of a MIPS eligible clinician (including obtaining data from a MIPS eligible clinician's Certified Electronic Health Record Technology (CEHRT) (83 FR 59907). In the CY 2022 PFS final rule (86 FR 65541), we finalized a reorganization of the regulatory text governing third party intermediaries to improve clarity and readability. In that revised text, we established general requirements at § 414.1400(a), additional requirements for QCDRs and qualified registries at § 414.1400(b), and additional requirements for health IT vendors at § 414.1400(c).

The CY 2024 PFS final rule eliminated health IT vendors from the category of third party intermediaries in the Quality Payment Program beginning in the CY 2025 performance period/2027 MIPS payment year at § 414.1400(a)(1)(iii) (88 FR 79390 and 79391). We noted that the removal of health IT vendors from the definition of third party intermediary would not preclude the vendors from assisting MIPS eligible clinicians with reporting under the program by providing their technology for clinicians to directly report under MIPS. We also noted that eliminating the category of health IT vendor as a distinct type of third party intermediary created a clearer distinction between (1) vendors that are submitting data to CMS for the purposes of MIPS and must meet the requirements of a qualified registry or QCDR, and (2) vendors that work with clinicians through the sale and support of health IT permitting the clinician or group to submit the data.

We recognize that § 414.1400(c)(1) outlines additional requirements for health IT vendors submitting data for the MIPS performance category beginning with the CY 2021 performance period/2023 MIPS payment year even though we removed the category of health IT vendors for the Quality Payment Program beginning in the CY 2025 performance period/2027 MIPS payment year at § 414.1400(a)(1)(iii). These requirements being left in the regulation text caused confusion for some organizations interested in serving as third party intermediaries because it was not clear that these additional requirements for health IT vendors were no longer in place. If an organization that was previously under the health IT vendor category as a third party intermediary would like to continue serving as a third party intermediary for the Quality Payment Program, they must meet the requirements to become a qualified registry or QCDR.

Therefore, to reduce confusion and further clarify our existing policies, we propose to add at § 414.1400(c)(2) that beginning with the CY 2025 performance period/CY 2027 MIPS payment year, health IT vendors cannot submit MIPS data unless they meet the requirements for a qualified registry or QCDR. We also propose to modify § 414.1400(c)(1) to clarify that the additional requirements for health IT vendors only apply for the CY 2021 performance period/CY 2023 MIPS payment year through the CY 2024 performance period/2026 MIPS payment year, when health IT vendors were still a separate type of third party intermediaries.

We request public comment on these proposals.

3. Conditions for Approval

a. Proposal To Provide Performance Feedback Reports at the Level of Data Submitted

In the CY 2017 Quality Payment Program final rule, we established requirements for performance feedback for QCDRs (81 FR 77367 through 77374) and qualified registries (81 FR 77383 through 77387) to provide timely feedback, at least four times a year, on all MIPS performance categories that the QCDR or qualified registry would report. We also finalized that the feedback should be given to the individual MIPS eligible clinician or group (if participating as a group) at the individual participant level or group level, as applicable, for which the QCDR or qualified registry reports. In the CY 2020 PFS final rule, we codified the requirement for QCDRs (84 FR 63057 and 63058) and qualified registries (84 FR 63076 and 63077) to provide timely feedback at least four times per year along with a new requirement to provide specific feedback to their clinicians and groups on how they compare to other clinicians who have submitted data on a given measure. In the CY 2022 PFS final rule (86 FR 65538 through 65550), we reorganized and consolidated the regulatory text governing third party intermediaries for clarity and simplicity and specifically to consolidate regulations that applied identically to both QCDRs and qualified registries. In that reorganization, the previously established policy for QCDRs and qualified registries to provide feedback which had been established at § 414.1400(b)(1) and (c)(1) was consolidated and redesignated at § 414.1400(b)(3)(iii) without a change in requirements. In the initial codification of the requirements for performance feedback in the CY 2020 PFS final rule for QCDRs (84 FR 63057 and 63058) and qualified registries (84 FR 63076 and 63077), we did not codify but also did not propose to remove the requirements previously established in the CY 2017 Quality Payment Program final rule for QCDRs (81 FR 77367 through 77374) and qualified registries (81 FR 77383 through 77387) that the feedback should be given to the individual MIPS eligible clinician or group (if participating as a group) at the individual participant level or group level, as applicable, for which the QCDR or qualified registry reports. We also did not refer to this requirement in the CY 2022 PFS final rule reorganization and redesignation of the regulatory text.

We have identified situations in which QCDRs or qualified registries provide the required performance feedback, but the feedback may reflect the performance of the individual when the clinician is reporting within a group. Alternatively, the feedback report reflects the performance of a group, but it was the individual that is reporting. We believe that this undermines the improvement opportunity that is inherent in these feedback reports and the value of these QCDRs and qualified registries. For this reason, we propose to add at § 414.1400(b)(3)(iii) that QCDRs and qualified registries must provide the performance feedback at the level at which the data was or will be submitted (for example, individual, group, virtual group, subgroup, APM entity). This proposal would codify the requirements

that were previously established but not codified in the CY 2017 Quality Payment Program final rule for QCDRs (81 FR 77367 through 77374) and qualified registries (81 FR 77383 through 77387) to provide feedback at the level at which data is submitted. We also propose to remove the term ''clinicians and groups'' in both places in this portion of the regulation. We believe that this requirement aligns with the requirement originally established in the CY 2017 Quality Payment Program Rule (81 FR 77363) but reflects the increased types of reporting entities available to MIPS eligible clinicians to include individuals, groups, virtual groups, subgroups, and APM entities.

We request public comment on these proposals.

b. Data Validation Requirements

(1) Background

Section 414.1400(b)(3)(v) outlines the requirements for a third party intermediary's annual data validation audit. As finalized in the CY 2024 PFS final rule (88 FR 79388), specified at § 414.1400(b)(3)(v)(E), the QCDR or qualified registry must conduct each data validation audit using a sampling methodology that meets the following requirements: (1) Uses a sample size of at least 3 percent of a combination of individual clinicians, groups, virtual groups, subgroups and APM entities for which the QCDR or qualified registry will submit data to CMS, except that the sample size may be no fewer than a combination of 10 individual clinicians, groups, virtual groups, subgroups and APM entities, and no more than a combination of 50 individual clinicians, groups, virtual groups, subgroups and APM entities; and (2) Uses a sample that includes at least 25 percent of the patients of each individual clinician, group, virtual group, subgroup or APM entity in the sample, except that the sample for each individual clinician, group, virtual group, subgroup or APM entity must include a minimum of 5 patients and need not include more than 50 patients.

(2) Proposal To Update Sampling Methodology for Data Validation Purposes

We noticed that recently certain third party intermediaries are using less than the minimum sample size as required by § 414.1400(b)(3)(v)(E), which raises concern as to whether the data sample that is being submitted is adequate. Hence, to ensure that our data remains true, accurate, and complete, we propose the following updates:

- If the third party intermediary submits MIPS data to CMS for fewer than 10 Quality Payment Program participants, the data validation audit sample must include all Quality Payment Program participants. Hence, we propose to modify the existing requirements at § 414.1400(b)(2)(v)(E)(1) and (2) that govern a QCDR or qualified registry's data validation audit sampling methodology. Specifically, we propose at § 414.1400(b)(2)(v)(E)(1) that if the intermediary submits MIPS data to CMS for fewer than 10 Quality Payment Program participants, the data validation audit sample must include all Quality Payment Program participants. If the intermediary submits data for 10 or more Quality Payment Program participants, it must use a sample size of at least 3 percent of a combination of the individual MIPS eligible clinicians, groups, virtual groups, subgroups and APM entities for which the QCDR or qualified registry will submit data to CMS, except that the sample size may be no fewer than a combination of 10 individual clinicians, groups, virtual groups, subgroups, or APM entities, and no more than a combination of 50 individual clinicians, groups, virtual groups, subgroups and APM entities.
- If there are fewer than 5 patient records from a Quality Payment Program participant, the patient record audit sample must include all patient records. Hence, we propose at § 414.1400(b)(2)(v)(E)(2) that if there are fewer than 5 patient records, the patient record audit sample must include all patient records. If there are 5 or more patient records, the intermediary must use a sample that includes at least 25 percent of the patient records of the individual clinician, group, virtual group, subgroup, or APM entity in the sample, except that the sample for each individual clinician, group, virtual group, subgroup or APM entity must include a minimum of 5 patients and need not include more than 50 patients.

These updates would help third party intermediaries submit data that is true, accurate, and complete while meeting their submission requirements for data validation purposes.

We request public comment on these proposals.

c. Proposal To Require a Submission of a Self-Nomination Plan for Third Party Intermediaries That Do Not Submit Data for One Year

In the CY 2022 PFS final rule, we noted that we had identified several QCDRs and qualified registries that continued to self-nominate to become a third party intermediary for the MIPS program but had not submitted clinician, group, or virtual group data to CMS (86 FR 65545). We further noted as the MIPS program continues to mature, we wished to reduce the number of third party intermediaries that self-nominate to become a CMS-approved third party intermediary but do not actively participate in the MIPS program. Maintaining these vendors who do not actively participate does not provide a benefit to the MIPS program, rather it creates interested parties confusion by including these vendors in our qualified postings. We also noted that our goal was to decrease the operational burden on CMS and those third party intermediaries that do not submit MIPS data to CMS (86 FR 65546).

Accordingly, we finalized requirements for approved QCDRs and qualified registries that have not submitted performance data to submit a participation plan as part of their self-nomination process. We finalized an incremental approach to addressing this issue. First, at § 414.1400(b)(3)(vii), we finalized a participation plan requirement, which requires a QCDR or qualified registry that was approved but did not submit data for any of the CY 2017 through 2020 performance periods/2019 through 2022 MIPS payment years to submit a participation plan in order to be approved for the CY 2023 performance period/2025 MIPS payment year (86 FR 65545 and 65546). Second, at § 414.1400(b)(3)(viii), we finalized that a QCDR or qualified registry that was approved but did not submit any MIPS data for either of the 2 years preceding the applicable self-nomination period must submit a participation plan in order for it to be approved for the CY 2024 performance period/2026 MIPS payment year or a future performance period/payment year (86 FR 65546).

While this policy has reduced the number of QCDRs and Qualified Registries that do not submit data, some QCDRs and Qualified Registries are still being listed on the qualified posting for as long as three years without submitting data. Maintaining these third party intermediaries that do not actively participate does not provide a benefit to the MIPS program, rather it creates confusion for interested parties by including these third party intermediaries in our qualified postings. We continue to emphasize that our goal is to continue decreasing the operational burden on CMS and interested parties. CMS would decrease its operational burden by eliminating the need to screen these third party intermediaries.

In an effort to avoid further confusion, reduce administrative burden for both

CMS and interested parties, and ensure compliance, we propose to reduce the timeframe available for a QCDR or qualified registry that was approved but did not submit any MIPS data to submit a participation plan. Currently, a QCDR or qualified registry must submit a participation plan if they do not submit data for either of the 2 years preceding the applicable self-nomination period. We propose to require a QCDR or qualified registry to submit a participation plan if they do not submit data for the year preceding the applicable self-nomination period. We propose to redesignate and amend § 414.1400(b)(3)(viii) and add § 414.1400(b)(3)(viii)(A) and (B). Additionally, we also note that we encourage QCDRs and qualified registries to implement the participation plan at the beginning of the calendar year instead of waiting until the self-nomination period, which generally opens on July 1 and closes on September 1 of the year prior to the applicable MIPS performance period.

In summary, we specifically propose to redesignate the existing text at § 414.1400(b)(3)(viii) to § 414.1400(b)(3)(vii)(B) and amend the text to reflect that this requirement applies from the CY 2024 performance period/2026 MIPS payment year through the CY 2026 performance period/2028 MIPS payment year. Additionally, we also propose to add at § 414.1400(b)(3)(vii)(C) that beginning with the CY 2027 performance period/2029 MIPS payment year, a QCDR or qualified registry that was approved but did not submit any MIPS data for the year preceding the applicable self-nomination period must submit a participation plan for CMS' approval. This participation plan must include the QCDR's and/or qualified registry's detailed plans about how the QCDR or qualified registry intends to encourage clinicians to submit MIPS data to CMS through the QCDR or qualified registry. We also propose to redesignate the existing text at § 414.1400(b)(3)(vii) to at § 414.1400(b)(3)(vii)(A) and add the heading participation plan for third party intermediary not submitting data at § 414.1400(b)(3)(vii).

We request public comment on these proposals.

d. Proposal To Update Qualified Posting

Every year, CMS publishes a qualified posting on the CMS website containing a list of all CMS-approved third party intermediaries that have self-nominated to submit data on behalf of MIPS eligible clinicians for the MIPS performance period. This list is updated to account for withdrawals, remedial action, or termination of third party intermediaries. The qualified posting contains information about approved third party intermediaries such as organization details, information about remedial action or termination, supported performance categories, specialty focus, a description of services they provide and associated costs, reporting options (MVP versus traditional MIPS) and participation options (individual clinician, group, subgroup, virtual group, APM entity) supported, and measures they are approved to support. MIPS eligible clinicians can refer to information in the qualified posting to identify and select a third party intermediary.

In the CY 2017 Quality Payment Program final rule (81 FR 77367 through 77369 and 77384 through 77385), we established that QCDRs and qualified registries must sign a document that verifies their name, contact information, cost for MIPS eligible clinicians or groups to use the qualified registry, services provided, and the specialty-specific measure sets the qualified registry intends to report. As technology progressed, we no longer needed third party intermediaries to sign a document and instead required an attestation. We became aware that this requirement was no longer consistent with our established policy in describing the manner in which the QCDR or qualified registry documents this information. To align with current processes, we finalized in the CY 2024 PFS final rule to add § 414.1400(b)(3)(xiv), which required that QCDRs and qualified registries attest that the information listed on the qualified posting is accurate (88 FR 79385). Additionally, we also finalized in the CY 2024 final rule, at § 414.1305, to define qualified posting as the document made available by CMS that lists QCDRs or qualified registries available for use by MIPS eligible clinicians, groups, subgroups, virtual groups, and APM Entities (88 FR 79385). We noted that we had used the term qualified posting since the inception of the Quality Payment Program but had not previously defined the term.

We have recently been made aware that certain third party intermediaries are making changes to the information that was provided for their qualified posting after receiving CMS approval of the qualified posting. Examples of changes include updates to costs, services that are included in the initial cost, and other administrative changes. This creates an increased administrative burden for CMS, who must identify and rectify such changes, and it creates confusion amongst clinicians who contract with the third party intermediary as to what they will pay for the cost of the third party intermediary's services. Subsequently, we must make additional updates to the qualified posting, which increases the administrative burden on us. Hence, in efforts to reduce administrative burden for both clinicians and CMS, we propose to update § 414.1400(b)(3)(xiv) by adding a requirement that changes to information (for example, cost, services included) on the qualified posting must be included and finalized during the qualified posting review period. We propose specifying in regulatory text that third party intermediaries will not be permitted to make changes after the qualified posting is publicly posted on the Quality Payment Program Resource Library page.

We request public comments on these proposals.

e. Proposal To Update CMS Data Submission Requirements for Third Party Intermediaries

In the CY 2017 Quality Payment Program final rule, we finalized at § 414.1400(b)(3)(x) and (b)(3)(x)(A) that a QCDR or a qualified registry must be able to submit to CMS data for at least six quality measures including at least one outcome measure and if no outcome measure is available, a QCDR or qualified registry must be able to submit to CMS results for at least one other high priority measure (81 FR 77368).

However, in section IV.A.4.d.(1)(c) of this proposed rule, we are proposing to remove the high priority designation from MIPS quality measures beginning in the CY 2027 performance period/CY 2029 MIPS payment year. Additionally, we are also proposing to remove the requirement to report an outcome measure and require reporting a MIPS core measure. Hence, under the new proposal, MIPS eligible clinicians participating through traditional MIPS must submit data on at least six measures, including at least one MIPS core measure.

To align third party intermediaries' requirements with the MIPS core measure set and high priority designation for MIPS quality measures proposals, we propose to revise § 414.1400(b)(3)(x)(B) to state that beginning in the CY 2027 performance period/2029 MIPS payment year, a QCDR or qualified registry must be able to submit to CMS, data for at least six quality measures including at least one MIPS core measure. We also propose to revise § 414.1400(b)(3)(x) and (b)(3)(x)(A) so that the requirement for a QCDR or qualified registry to be able to submit an outcome measure and if

the outcome measure is not available, then a high priority measure can be submitted, concludes with the CY 2026 performance period/CY 2028 MIPS payment year.

We request public comment on these proposals.

4. Remedial Action and Termination of Third Party Intermediaries

a. Background

We refer readers to § 414.1400(e), the CY 2017 Quality Payment Program final rule (81 FR 77548) the CY 2019 PFS final rule (83 FR 59908 through 59910), the CY 2020 PFS final rule (84 FR 63077 through 63080), the CY 2021 PFS final rule (85 FR 84947), the CY 2022 PFS final rule (86 FR 65542 and 65550), and the CY 2023 PFS final rule (87 FR 70106 through 70108) for previously finalized policies for remedial action and termination of third party intermediaries.

b. Proposed Termination of a Third Party Intermediary That Does Not Submit Data for 1 Year

In the CY 2023 PFS final rule, we established that we will terminate QCDRs and qualified registries that are required to submit participation plans during the applicable self-nomination period under § 414.1400(b)(3)(viii) because they did not submit any MIPS data for either of the 2 years preceding the applicable self-nomination period, and continue to not submit MIPS data to CMS for the applicable performance period (87 FR 70107 through 70108). We believe that timely termination of third party intermediaries that are not submitting data is important to minimize unnecessary operational and administrative tasks for both CMS and third party intermediaries. Maintaining third party intermediaries that do not actively participate does not provide a benefit to the MIPS program, rather it creates confusion for interested parties by including these third party intermediaries in our qualified postings (86 FR 65545).

We note that the policy for termination of third party intermediaries not submitting data would be impacted by the proposed requirement to submit a participation plan for third party intermediaries that do not submit data for one year in section IV.C.3.c. of this proposed rule. This proposed policy means that we would terminate QCDRs and qualified registries that were required to submit participation plans during the applicable self-nomination period under § 414.1400(b)(3)(viii) because they did not submit any MIPS data for 1 year (rather than 2 years) preceding the applicable self-nomination period, and continue to not submit MIPS data to CMS for the applicable performance period. However, because the data submission period lasts for one year following the performance period, there is a delay in CMS being made aware of whether a third party intermediary submitted data for a given year. Therefore, currently, CMS does not have a mechanism to acquire the necessary knowledge to appropriately terminate a third party intermediary until the year after the applicable performance period.

Currently, if a third party intermediary does not submit data for the performance period for which they submitted a self-nomination participation plan, they will be terminated. However, CMS does not become aware of the third party intermediary's failure to submit data for a given MIPS performance period until the year following the performance period. For example, under the current policy, if a third party intermediary self-nominated for the 2024 performance period and was required to submit a self-nomination participation plan but does not submit data for the 2024 performance period, CMS would not know the third party intermediary did not submit MIPS data for the 2024 performance period until the end of the submission period in March 2025. Therefore, the third party intermediary can continue to participate for the 2025 MIPS performance period as if they were already approved and posted as a 2025 CMS-approved third party intermediary. Hence, to shorten the timeline of when CMS is aware that the third party intermediary does not submit any data and when CMS appropriately terminates the third party intermediary, we propose to update our policy such that CMS would request documentation that the third party intermediary has contracted with Quality Payment Program's participants who will submit MIPS data for the given MIPS performance period. CMS's query for documentation would occur before the end of the calendar year for the given MIPS performance period. If the appropriate documentation cannot be provided by the date specified by CMS, the third party intermediary would be terminated. This proposal would provide the information needed to be able to terminate a third party intermediary during the applicable performance period year instead of having to wait until the following year to terminate them.

Specifically, we propose to add a new requirement for third party intermediaries to submit documentation about intent to submit MIPS data and to terminate a third party intermediary if they do not submit the appropriate documentation by the date specified by CMS. We also propose to add at § 414.1400(e)(5)(ii) that beginning with the CY 2027 performance period/2029 MIPS payment year, a QCDR or qualified registry that submits a participation plan as required under § 414.1400(b)(3)(viii), but does not submit MIPS data for the applicable performance period for which they self-nominated under § 414.1400(b)(3)(viii), will be queried by CMS before the end of the calendar year of the given MIPS performance period for documentation that they have contracted with Quality Payment Program participants who will submit data for the given MIPS performance period. If the appropriate documentation cannot be provided, the third party intermediary would be terminated. We also propose to redesignate the existing text at § 414.1400(e)(5) to § 414.1400(e)(5)(i). We also propose to add the heading ''Termination for Third Party Intermediary not submitting data.'' at § 414.1400(e)(5).

We request public comment on this proposal.

D. Calculating Final Score

1. Background

For a description of the statutory basis of and our previously finalized policies for calculating the final score for each MIPS eligible clinician, including performance category weights and reweighting the performance categories, we refer readers to § 414.1380(c) and the discussion in the CY 2017 and CY 2018 Quality Payment Program final rules, and the CY 2019, CY 2020, CY 2021, CY 2022, CY 2023, and 2025 PFS final rules (81 FR 77319 through 77329, 82 FR 53769 through 53785 and 53895 through 53900, 83 FR 59868 through 59878, 84 FR 63020 through 63031, 85 FR 84908 through 84917, 86 FR 65509 through 65527, 87 FR 70093 through 70096, 89 FR 98455 through 98459 respectively).

As described in more detail in the following sections, we propose to change the data source that CMS uses to determine eligibility for reweighting under the automatic extreme and uncontrollable circumstances (EUC) policy beginning with the CY 2027 performance period/2029 MIPS payment year. We also propose to change the deadline by which clinicians must request reweighting where data for a MIPS eligible clinician are inaccessible or unable to be submitted due to circumstances outside of the control of the clinician because the

MIPS eligible clinician delegated submission of the data to their third party intermediary.

Section 1848(q)(5)(A) of the Act requires the Secretary to develop a methodology for assessing the total performance of each MIPS eligible clinician according to the performance standards for the applicable measures and activities for each performance category applicable to such clinician for a performance period and, using the methodology, provide for a final score (using a scoring scale of 0 to 100) for each MIPS eligible clinician for the performance period.

Additionally, section 1848(q)(5)(E) of the Act specifies how we must weigh the scores for each performance category in our calculation of the MIPS eligible clinician's final score. We have codified these weights at § 414.1380(c)(1). Meanwhile, section 1848(q)(5)(F) of the Act provides that, if there are not sufficient measures and activities applicable and available to each type of MIPS eligible clinician involved, the Secretary shall assign different scoring weights (including a weight of 0). We also have finalized at § 414.1380(c)(2) several policies addressing the basis for reweighting one or more performance categories, and how those weights will be redistributed to the remaining performance categories.

2. Proposal To Use Alternative Data Sources to Determine Clinician Eligibility for the Automatic EUC

For the quality, cost, and improvement activities performance categories, under the current reweighting policies at § 414.1380(c)(2)(i)(A)(6) through (8), and for the Promoting Interoperability performance category, under the reweighting policies at § 414.1380(c)(2)(i)(C)(*2*) and (3), performance category weights may be redistributed to another performance category or categories in circumstances where MIPS eligible clinicians are subject to, or located in an area affected by, an EUC. This includes MIPS eligible clinicians with an approved application-based EUC reweighting request (83 FR 59871 through 59874 and 82 FR 53680 through 53687) or an automatic reweighting for a clinician identified as located in a CMS designated region affected by an EUC such as a Federal Emergency Management Agency (FEMA)-designated major disaster or a public health emergency (as determined by the Secretary of Health and Human Services) (82 FR 53895 through 53900). The automatic EUC policy for quality, cost, and improvement activities performance categories is described at § 414.1380(c)(2)(i)(A)(8) and the automatic EUC policy for the Promoting Interoperability performance category is described at § 414.1380(c)(2)(i)(C)(3). Additionally, we previously finalized at § 414.1380(c) that MIPS eligible clinicians scored on fewer than two performance category scores will receive a final score equal to the performance threshold, which will result in a neutral payment adjustment (81 FR 77326 through 77328 and 82 FR 53778 through 53779). We noted in the CY 2018 Quality Payment Program final rule that we anticipate the types of events that could trigger the automatic EUC policy would be events designated as a FEMA major disaster or a public health emergency declared by the Secretary, although we will review each situation on a case-by-case basis (82 FR 53897).

In the CY 2018 Quality Payment Program final rule, we specified that CMS will determine if an individual MIPS eligible clinician is located in an area affected by an EUC as identified by CMS based on the practice location address listed in the Provider Enrollment, Chain and Ownership System (PECOS) (82 FR 53898). Since adopting a policy to use PECOS data, recent clinician reweighting requests have increasingly identified clinicians who were incorrectly excluded from the automatic EUC policy because PECOS address data may be inaccurate or outdated in some cases. For example, individual MIPS eligible clinicians impacted by an EUC may not be identified by CMS in circumstances where a clinician has not updated their PECOS data or in circumstances where a clinician begins providing services in an additional geographic location or zip code. In order to ensure the accurate identification of impacted clinicians for subsequent performance periods, we propose that beginning with the CY 2027 performance period/2029 MIPS payment year CMS will use the most current and reliable data available to determine if an individual MIPS eligible clinician is located in an area that has been identified as being affected by an EUC. For example, we may use the zip codes on billed claims, that identify the location of service, to make this determination. This data source may be used in addition to or in lieu of the zip codes included in PECOS address data to achieve our goal of accurately identifying all impacted clinicians. This proposal will ensure that all individual MIPS eligible clinicians affected by natural disasters and public health emergencies are accurately identified by CMS.

We request public comment on this proposal.

3. Proposal To Update the Deadline for Clinicians To Inform CMS That Third Party Intermediary Did Not Submit Data Due to Reasons Outside the MIPS Eligible Clinician's Control

We previously finalized at § 414.1380(c)(2)(i)(A)(10) and (c)(2)(i)(C)(12) that beginning with the CY 2024 performance period/2026 MIPS payment year, we may reweight one or more of the quality, improvement activities, and Promoting Interoperability performance categories where we determine, based on documentation submitted to us through a reweighting request on or before November 1st of the year preceding the relevant MIPS payment year, that data for a MIPS eligible clinician are inaccessible or unable to be submitted due to circumstances outside of the control of the clinician because the MIPS eligible clinician delegated submission of their data to a third party intermediary, evidenced by a written agreement between the MIPS eligible clinician and the third party intermediary, and the third party intermediary did not submit the data for the performance category(ies) on behalf of the MIPS eligible clinician in accordance with applicable deadlines (89 FR 62096). We previously finalized that this reweighting policy is available only for the quality, improvement activities, and Promoting Interoperability performance categories because a MIPS eligible clinician may delegate data submission to a third party intermediary for these three performance categories, and not the cost performance category. MIPS eligible clinicians do not submit data separately for measures for the cost performance category; we score cost measures based solely on administrative claims data (89 FR 98455 through 98455).

As specified in the CY 2025 PFS final rule, we would only approve reweighting requests with evidence of a written agreement between the MIPS eligible clinician and a third party intermediary. Such written agreement must provide that the MIPS eligible clinician delegated submission of their data to the third party intermediary, and that the third party intermediary agreed to submit data on their behalf in accordance with applicable deadlines, for the performance category or performance categories in question. We review requests and make determinations to reweight based on our assessment that data were not submitted due to reasons outside the control of the MIPS eligible clinician (89 FR 62096).

Under this reweighting policy, the MIPS eligible clinician must submit reweighting requests beginning with the close of a relevant performance period's data submission period, only after it is confirmed that no data has been submitted in accordance with applicable deadlines. MIPS eligible clinicians must then submit reweighting requests on or before November 1st of the year preceding the associated MIPS payment year in order to allow time for CMS to re-calculate their final score and MIPS payment adjustment factor (89 FR 62096).

We propose to adjust the deadline by which clinicians would be able to submit reweighting requests for the quality, improvement activities, and Promoting Interoperability performance categories due to scenarios where a third party intermediary did not submit data on their behalf in accordance with the applicable data submission deadlines. Specifically, we propose that beginning with the CY 2025 performance period/2027 MIPS payment year, MIPS eligible clinicians would be able to submit reweighting requests on or before December 31st of the year preceding the relevant MIPS payment year. We also propose to codify this updated deadline at § 414.1380(c)(2)(i)(A)(10) for the quality and improvement activities performance categories and at § 414.1380(c)(2)(i)(C)(12) for the Promoting Interoperability performance category. Under this proposed reweighting policy, the MIPS eligible clinician must submit reweighting requests beginning with the close of a relevant performance period's data submission period, only after it is confirmed that no data has been submitted in accordance with applicable deadlines. Under this proposed deadline, MIPS eligible clinicians would still be able to submit reweighting requests before the beginning of the associated MIPS payment year.

The deadline for MIPS eligible clinicians to submit reweighting requests before the beginning of the associated MIPS payment year is aligned with the requirements finalized in the CY 2020 PFS final rule for clinicians to request reweighting in circumstances where data are inaccurate, unusable, or otherwise compromised. Under this policy, we apply reweighting only in cases when we learn of the compromised data before the beginning of the associated MIPS payment year (84 FR 63023 through 63026). We intend for this policy to offer increased flexibility to impacted clinicians and note that this timeline will encourage MIPS eligible clinicians and their third party intermediaries to inform us of these concerns in a timely manner so we can update our data sets while minimizing the impacts to other interested parties who utilize MIPS data. The proposed deadlines will still allow CMS to re-calculate final scores and MIPS payment adjustments factor in a timely manner.

We request public comment on these proposals.

E. Public Reporting

1. Background

Public reporting of Merit-based Incentive Payment System (MIPS) eligible clinician performance information on the Compare Tool on medicare.gov (here after referred to as the ''Compare Tool'') is authorized under section 10331(a)(1) and (2) of the Affordable Care Act (ACA). Section 10331(a)(1) of the ACA established a physician compare website for the public reporting of clinician performance information.

The Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) amended the Social Security Act by adding Section 1848(q)(9), which requires the Secretary to continue to make publicly available, on the Compare Tool and in an easily understandable format, information regarding the performance of individual MIPS eligible clinicians and groups (81 FR 77391).

For previous discussions and established policies regarding public reporting on the Compare Tool, we refer readers to § 414.1395 as well as, the CY 2016 PFS final rule (80 FR 71116 through 71123), the CY 2017 Quality Payment Program final rule (81 FR 77390 through 77399), the CY 2018 Quality Payment Program final rule (82 FR 53819 through 53832), the CY 2019 PFS final rule (83 FR 59910 through 59915), the CY 2020 PFS final rule (84 FR 63080 through 63083), the CY 2021 PFS final rule (85 FR 84947 through 84948), the CY 2022 PFS final rule (86 FR 65550 through 65554), the CY 2023 PFS final rule (87 FR 70109 through 70104), the CY 2024 PFS final rule (88 FR 79394 through 79401), and the CY 2026 PFS final rule (90 FR 49862). The Compare Tool is available at *https://www.medicare.gov/care-compare/* and in the Medicare Provider Data Catalog available at *https://data.cms.gov/provider-data/topics/doctors-clinicians.*

In this section of the proposed rule, we propose to remove the requirement preventing the public reporting of any performance data reported through a MIPS Value Pathway (MVP) on new improvement activities and Promoting Interoperability (PI) measures on the Compare Tools for the first year the new measures and activities are included in such MVP. We also include a request for information (RFI) to obtain feedback on potential improvements to the current star rating assignment methodology for quality measure scores reported under the administrative claims collection type.

2. Proposal To Remove the Public Reporting Requirements for the MIPS Value Pathway (MVP) Requirement at § 414.1395(c)(2)

In the CY 2022 PFS final rule (86 FR 65550 through 65552), we finalized a policy under which we would not publicly report any MVP data, or MIPS performance data reported through an MVP, on a new improvement activity or PI measure, objective, or activity for the first year the new activity or measure is included in an MVP. For example, if a new improvement activity is finalized for inclusion in MIPS and an MVP for the CY 2027 performance period/CY 2029 MIPS payment year, under the current regulatory framework, we would not publicly report the first year of its data for MIPS eligible clinicians who report the new improvement activity through the MVP reporting framework. The purpose of this requirement was to encourage participation in the new MVP reporting framework and to provide participants with additional time to transition to MVPs before their performance on new measures or activities is publicly reported. However, we have determined that this requirement has not served as an effective incentive for MVP participation because most improvement activities and PI measures included in MVPs are not considered new and would be publicly reported, as they have been included in MIPS for over a year.

Consistent with section 1848(q)(9)(A)(i)(II) of the Act, we finalized in the CY 2017 Quality Payment Program final rule a decision to make all measures, objectives, or activities under the MIPS quality, cost, improvement activities, and PI performance categories available for public reporting on the Compare tools (81 FR 77391 through 77396), using a phased approach for new performance information facilitated by Section 1848(q)(9)(A) and (D). In the CY 2018 PFS final rule (82 FR 53825 through 53827), we further finalized that the first year of data for new improvement activities and PI measures would be publicly reported for MIPS eligible clinicians on the Compare tools if all

other public reporting criteria established under § 414.1395(b) are met. Since we established § 414.1395(c)(2), the annual consumer testing conducted consistent with the requirements of § 414.1395(b) demonstrates that most patients and caregivers find the new improvement activities and PI information understandable and useful for their decision-making. Therefore, this information should be publicly reported. The purpose of the Compare Tools is to provide patients with the most timely, clear, and credible information on provider performance that is available for public reporting.

Since the adoption of the requirement to not publicly report the first year of new improvement activity or PI information for participants who report through the MVP reporting framework, we have observed that the policy does not apply to a sufficient number of MIPS eligible clinicians to encourage meaningful participation in MVPs. For example, during 2025, only four individual providers' performance information would not have been publicly reported for new improvement activities included in MVPs, and there were no new PI measures included in MVPs for 2025. This represented less than 1 percent of clinicians reporting the new improvement activities for that performance period. Similarly, we observed that this requirement applied to less than 1 percent of MIPS eligible clinicians reporting new improvement activities and PI information overall since MVPs became available as a reporting framework beginning with the CY 2023 performance period. There have not been a sufficient number of new PI measures or improvement activities included in MVPs, and there is not enough data to continue supporting this requirement.

We propose to remove the requirement at § 414.1395(c)(2) that we would not publicly report any MVP data on new improvement activity or PI measure, objective, or activity during the first year in which it is included in an MVP. Upon the removal of this requirement, we would revert to the original policy, finalized in the CY 2018 PFS final rule (82 FR 53825 through 53827), and would include all eligible performance information for new improvement activities and new PI measures in public reporting on the Compare Tools during the first year in which the measures and activities are included in the program.

We request public comments on this proposal.

3. Request for Information: Star Rating Assignment Methodology for Administrative Claims Quality Measures

a. Background

MACRA requires the continuous public display of individual MIPS eligible clinician and groups performance information, in an easily understandable format, on the CMS Compare tool on Medicare.gov (81 FR 77391). Our process for the assignment of star ratings is set forth in § 422.166(b), which establishes the public reporting parameters of star ratings.

As finalized in the CY 2015 and CY 2016 PFS final rules (79 FR 67547 and 80 FR 70885, respectively), CMS continued to expand public reporting on the Compare Tool. This expansion included publicly reporting both individual eligible clinicians and groups starting with 2016 data available for public reporting in late 2017, as well as the inclusion of a 5-star rating based on a benchmark in late 2017 based on 2016 data (80 FR 71125 and 71129), among other additions.

b. Adjustments to the Star Rating Assignment Methodology for Administrative Claims Quality Measures

The goal of publicly reporting clinician performance information is to ensure that patients can easily understand how quality measure scores reflect each provider's performance. While the current system of benchmarking for public reporting has been in place for several years, we are currently seeking feedback on alternative options for distributing scores. We are investigating improvements to the star rating assignment methodology for quality measure scores collected under the administrative claims collection type (42 CFR 414.1305). Our intent is to provide a more easily understood distribution of the administrative claims quality measure scores on clinician profile pages for patients via the Compare Tool on *https://www.medicare.gov/care-compare/.*

Administrative claims quality measures differ from other MIPS quality measure collection types as they are automatically calculated and risk-adjusted for groups and clinicians who meet measure requirements. The administrative claims quality measure scores have been found to form a more normal distribution. However, the existing quality measure score conversion calculations and supporting code for the current star rating assignment methodology may not optimally align with the standard deviation-based methodology employed by CMS to score administrative claims quality measures (42 CFR 414.1380(b)(2)(i)(B)). With more information, we can determine whether an alternative methodology for star rating assignments is more appropriate for administrative claims quality measures prior to the public reporting of these scores on clinicians' profile pages on the *Medicare.gov* Compare Tool. We have been investigating how to adjust these calculations so that measure-level scores are more representative of clinician performance and better understood by patients.

Currently, we calculate star rating cutoffs for the Achievable Benchmark of Care (ABC) 5-star methodology through the equal ranges method for a subset of Merit-based Incentive Payment System (MIPS) quality and promoting interoperability measures that meet the established public reporting standards and resonate with users (§ 414.1395(b)). The equal ranges method is based on the difference between an established ABC methodology benchmark and the lowest performance score for a given measure. This range is then used to assign star ratings of one to four stars. Clinicians who meet or exceed the ABC benchmark for the applicable measure receive 5 stars.[387]

We seek to investigate a new option that would assign star ratings using a standard-deviation-based approach for the administrative claims quality measure scores. The MIPS benchmarking process employed by CMS for measures of this collection type applies a standard deviation-based approach for a 10-point scoring scale,[388] which differs from the ABC methodology. We expect that using a similar standard deviation-based methodology for assigning star ratings, as is currently used in the MIPS benchmarking process, would be more straightforward and easier to understand. We also anticipate that this shift to using standard deviations for assigning star ratings to the administrative claims measures would avoid the clustering-around-the-mean issues observed under the ABC methodology, where virtually all scores result in 2, 3, or 4 stars.

In addition, the adoption of a standard-deviation-based methodology

[387] For more information about the equal ranges method and the ABC methodology, visit *https://www.cms.gov/files/document/2023-doctors-clinicians-star-ratings-fact-sheet-546-kb.pdf.*

[388] For a more detailed explanation of the standard deviation approach to the MIPS 10-point scale, please visit *MIPS Cost scores are coming—what to know for 2024 and prepping for 2025.*

may be extended to the public reporting of cost measures on clinician profile pages. Given that cost measure scores are automatically calculated and risk-adjusted using administrative claims data, star rating cutoffs may also require a similar standard deviation-based framework. We also seek feedback on developing a similar standard deviation-based approach for cost measures. We plan to investigate more ways to publicly report cost measures in a manner that better reflects provider performance and is more readily understood by patients. We are considering proposing to adopt a standard deviation-based methodology in the CY 2028 PFS rule to improve the clarity and interpretability of the distribution of the administrative claims quality measure scores displayed on the clinician profile pages of the *Medicare.gov* Compare Tool. We request public comments on the following topics regarding adjustments to a star rating assignment methodology:

- The public reporting methodology used for star rating assignments on clinician profile pages has used the equal ranges method based off an established ABC benchmark for calculating star rating cutoffs for several years. We request feedback on the current star rating assignment methodology and whether we must adjust this process for administrative claims quality measures.
- We request feedback on the statistical framework for transitioning the current star rating assignment methodology to a standard deviation-based methodology for administrative claims quality measures.
- We also request feedback on expanding the standard deviation-based adjustments for the administrative claims star rating assignment methodology to the public reporting of cost measures on clinician profile pages of the *Medicare.gov* Compare Tool in future program years. We seek to ensure that the display of cost measure performance more accurately reflects provider performance and can be understood by patients.
- We also request feedback on whether there are any unintended consequences or impacts to providers or patients that we must acknowledge before proposing any adjustments to the star rating assignment methodology for the administrative claims collection type.

5. Advanced APMs

a. Overview

The Quality Payment Program provides incentives for eligible clinicians to engage in value-based, patient-centered care under Medicare Part B via MIPS and Advanced APMs. The structure of the Quality Payment Program enables us to advance accountability and encourage improvements in care. Our vision for increased clinician participation in Advanced APMs is aimed at integrating individuals' clinical needs across a spectrum of providers and settings to improve patient care and population health. As we continue to make improvements to the Quality Payment Program, we seek to develop, propose, and implement policies that encourage broad and meaningful clinician participation in Advanced APMs.

In the CY 2026 PFS final rule (90 FR 50012), we finalized an update to our methodology to add an individual-level calculation to Qualifying APM Participant (QP) determinations, as set forth in §§ 414.1425(b)(3) and (c)(3), for all eligible clinicians participating in an Advanced APM, such that each eligible clinician would receive both APM Entity-level calculation and an individual-level calculation. Second, we finalized a policy at §§ 414.1435 and 414.1305 to perform QP determinations using both an E/M services approach and a Covered Professional Services approach.

Together with the addition of individual calculations and the use of specific services in our calculation, our methodology provides flexibility to ensure that participants receive incentives across model design and clinical specialty. However, we continue to identify misalignment between Advanced APM participation and the incentive structure of QPP, specifically in the application or the QP status to all of an eligible clinician's Tax Identification Number (TIN) reassignments irrespective of whether the TIN in question is participating in an Advanced APM. We also recognize the need for improvements and updates for technical or legislative reasons. The following policy proposals aim to address this misalignment and to make various improvements.

b. QP Determination

(1) General

In the CY 2017 Quality Payment Program final rule (81 FR 77439 through 77445), we finalized our policy for QP determinations at § 414.1425. We perform QP determinations for eligible clinicians three times during the QP Performance Period using claims data for services furnished from January 1 through each of the respective QP determination snapshot dates. An eligible clinician can be determined to be a QP only if the eligible clinician appears on the Participation List on a snapshot date that we use to determine the APM Entity group and to make QP determinations as described at § 414.1425.

In the CY 2017 Quality Payment Program final rule (81 FR 77433 through 77440) we established a process to calculate Partial QP status at § 414.1425(d). While to date our Partial QP policies have impacted only a small number of eligible clinicians, and thus we have not focused our discussion on this specific policy, we note that any changes to QP determinations at § 414.1425 also would likely require conforming changes to the policies for Partial QPs for consistency across the program.

(2) Applying QP Determinations at the TIN/NPI Level

When we initially established our policy in the CY 2017 Quality Payment Program final rule to make most QP determinations at the APM Entity level, we also specified that we would apply QP status at the NPI level (81 FR 77440). In other words, for a given eligible clinician (NPI), were one of their TIN/NPI relationships to be determined a QP, that QP status has applied all of their TIN/NPI relationships, both for purposes of being excluded from MIPS as well as for the application of QP financial incentives. Given the complexity of the program, we believed it was the best approach at the time to create one QP status result for a clinician at all of their billing organizations. However, we did not intend for the policy to create conflicting incentives to participation in Advanced APMs. We realized that an NPI being a QP at all of their TINs also meant that they would receive the financial incentives of QP status, at the time the APM Incentive Payment, across all of those TINs, irrespective of whether those TINs were participating with Advanced APMs. However, we believed that the significance of that incentive would serve to increase clinician participation in Advanced APMs, and that the application of the QP thresholds would ensure that the clinician was appropriately incented to try to increase their individual Advanced APM participation. Further, we also had finalized at § 414.1450(c)(1) that we would pay the entire APM Incentive Payment amount to the TIN associated with the QP's participation in the Advanced APM Entity through which QP status had been attained (81 FR 77555), and we believed that by directing the lump sum entirely to the

TIN participating with the Advanced APM Entity, we would reward the clinician without also rewarding non-participating TINs.

Upon gaining early experience implementing the APM Incentive Payments, we learned that for a variety of reasons (clinician movement, changes to a practice's TINs), we were not always able to send payment to the TIN associated with the APM Entity. We revised § 414.1450(c) in the CY 2021 PFS (88 FR 85035) to establish a hierarchy we would apply when determining where to send the APM Incentive Payments, which still prioritized TINs participating in Advanced APMs but allowed for payment to be sent to other, non-participating TINs if that was the only place we could find the clinician active at the time of payment. Still, we were satisfied that our prioritization of the lump-sum APM Incentive Payment to TINs that had Advanced APM participation remained a protection against providing non-participating TINs significant windfalls.

However, section 1848(d)(1)(A) of the Act establishes that, beginning with payment year 2026, QPs will receive a higher qualifying conversion factor update than non-QPs on their covered professional services claims. While the APM Incentive Payment has been extended multiple times as described in section XXX of this proposed rule, the implementation of the QP conversion factor means that a QP financial incentive goes directly to TINs in the form of claims payment. Particularly as the QP conversion factor grows and constitutes a larger proportion of the QP incentive structure over time, we are concerned that a significant proportion of incentives paid for QP status will be paid to TINs that are not part of an Advanced APM, creating a disincentive for these TINs to join an Advanced APM and meaningfully engage in risk-bearing value-based care.

As such, we propose adding new provisions at §§ 414.1425(c)(8) and (d)(5) to apply QP status and Partial QP status, respectively, strictly to an eligible clinician as such term is defined at § 414.1305, specifically as a TIN/NPI combination, and that meets the definition at § 414.1305 of Qualifying APM participant (QP) or Partial QP, respectively, by participating in an Advanced APM during the QP performance period. Under the proposal, QP status and Partial QP status would therefore only apply to the clinician at the TIN that is participating with the APM Entity in the Advanced APM. Therefore, the financial incentives in the form of both the APM Incentive Payment and the QP conversion factor would apply to the NPI's claims only with those TINs, as would the ability of a Partial QP to opt into or out of MIPS.

For an eligible clinician who is participating in multiple APM Entities, the proposal's effects would be based on how the clinician becomes a QP or Partial QP. Section 414.1435(h)(2) specifies that CMS assigns to the eligible clinician the score that results in the greater QP status. In accordance with this provision, if an eligible clinician attains QP status at the individual level from participation in multiple APM Entities, under the proposal we would assign the QP status at each of the clinician's TINs participating across those APM Entities. If, however, the eligible clinician did not attain QP status at the individual level and did attain QP status as part of a specific APM Entity-level determination, we would assign QP status to the clinician at only the TIN(s) that are associated with the APM Entity or Entities that collectively attained QP status. If the eligible clinician did not attain any QP status through any determination but did attain Partial QP status, this same preference for the highest status would apply for Partial QP status. This approach maintains the longstanding policy within QPP to give the clinician the highest possible outcome available to them.

This proposal would mean that QP status would no longer apply to a clinician as a whole and we recognize the possibility of this being perceived as introducing complexity into an eligible clinician's QPP experience, for example because under the proposal some eligible clinicians would be a QP with one TIN and participating in MIPS with another. We want to emphasize that for the majority of clinicians in Advanced APMs, this policy will not change their participation in QPP, because they are already participating with an APM Entity in an Advanced APM with all of their TIN reassignments. In these cases, the eligible clinician's QP status would apply at each of their TINs under the proposal. For the clinicians who are not already participating in an Advanced APM across all of their TIN reassignments, we believe that this policy would provide a meaningful incentive to increase their participation in an Advanced APM. Participation in Advanced APMs across Original Medicare continues to grow and we expect this policy to support our progress.

We note further that our proposal aligns with MIPS, which already operates on a TIN/NPI basis, meaning that QPP internal operations and communications would be the same for all clinicians. Under our current policy, we receive a significant number of inquiries from billing organizations where clinicians have been excluded from MIPS as a result of QP status with another billing organization where that organization is participating in an Advanced APM. In these cases, organizations have made a significant investment to report MIPS but do not receive a MIPS final score and MIPS payment adjustment for these clinicians. Our proposed policy would ensure that these billing organizations are in control of how MIPS eligibility criteria apply to clinicians that have been reassigned to their organizations.

In addition to programmatic alignment, our operational experience tells us that, when a TIN has any clinicians who are subject to MIPS, it most often simply reports on all of its clinicians, as including everybody is easier than removing clinicians before reporting. As such, we believe that in the relatively few situations where the proposal would result in an eligible clinician with QP status at one TIN being subject to MIPS at one or more other TINs, reporting is in many cases is already being done for that clinician, meaning that neither the clinician nor their MIPS-participating TIN(s) would bear any new burden as a consequence of the proposed policy. Further, as it was established at the outset operational experience indicates that MIPS eligible clinicians' experience has not been significantly impaired by the TIN/NPI operation of that portion of the program.

Finally, we recognize that this proposal would decrease the dollar value of the financial incentives available for affected QPs. However, we believe that assigning QP status at the TIN/NPI level will serve to prevent an increasing windfall for TINs that do not participate in Advanced APMs, particularly given that the higher qualifying conversion factor update that is now part of the physician fee schedule is baked in to the amount Medicare pays on claims and therefore always is paid to the TIN through which the service was furnished without regard to whether that TIN is part of the Advanced APM that conferred QP status to the clinician. We believe that this proposal would prevent waste and potential for abuse, and that these matters outweigh concerns around complexity or reduced incentives. Notably, under current law the QP conversion factor will compound to a greater degree each year relative to the non-QP conversion factor. In addition, because payment of the claims is made directly to the TINs through which the

services were billed means that CMS has no mechanism of directing these incentives to Advanced APM participating TINs in the way we have done with the APM Incentive Payment. As such, while relatively few QPs would be affected by this proposal, CMS anticipates the amount of the resulting windfall flowing directly to non-participating TINs under the current framework will increase over time, with little benefit to the clinician and no benefit to the practices that are doing the work of Advanced APM participation.

With respect to Partial QP status, the proposal would maintain programmatic alignment within QPP and would provide for the application of the ability to opt out of MIPS at the TIN/NPI level. While there are not financial incentives for these eligible clinicians in the same manner that there are for QPs, we believe that applying the opt-out flexibility at the TIN/NPI level similarly confers the burden reduction of Partial QP status only to those TINs that are affiliated with the APM Entity participating in the Advanced APM.

We propose amending § 414.1425(c) to add new subparagraph (8) to apply QP status strictly to the eligible clinician as such term is defined at § 414.1305, specifically as a TIN/NPI combination, and that meets the definition of Qualifying APM participant (QP) as defined at § 414.1305 by participating in an Advanced APM during the QP performance period. We also propose amending § 414.1425(d) to add new paragraph (5) to establish the same policy with respect to the application of Partial QP status.

We seek public comments on this proposal.

6. APM Entity Terminations

a. Overview

In the CY 2017 Quality Payment Program final rule (81 FR 77446 through 77447), we finalized for the timing of QP determinations that a QP Performance Period runs from January 1 through August 31 of the calendar year that is 2 years prior to the payment year. We finalized that during the QP Performance Period, we will make QP determinations at three separate snapshot dates (March 31, June 30, and August 31), each of which will be a final determination for the eligible clinicians who are determined to be QPs. The QP Performance Period and the three separate QP determinations apply similarly for both the group of eligible clinicians on a Participation List and the individual eligible clinicians on an Affiliated Practitioner List.

In the CY 2017 Quality Payment Program final rule, we finalized at §§ 414.1425(c)(5) and 414.1425(d)(3) that an eligible clinician is not a QP or Partial QP for a year, respectively, if the APM Entity group voluntarily or involuntarily terminates from an Advanced APM before the end of the QP Performance Period (81 FR 77446 through 77447). We also finalized at §§ 414.1425(c)(6) and 414.1425(d)(4) that an eligible clinician is not a QP or Partial QP for a year if one or more of the APM Entities in which the eligible clinician participates voluntarily or involuntarily terminates from the Advanced APM before the end of the QP Performance Period, and the eligible clinician does not achieve a Threshold Score that meets or exceeds the QP or Partial QP payment amount threshold or QP or Partial QP patient count threshold based on participation in the remaining non-terminating APM Entities (81 FR 77446 through 77447).

b. APM Entity Terminations Before Financial Risk Was Borne

In the CY 2020 PFS final rule (84 FR 63087 through 63089), we finalized revisions to § 414.1425(c)(5) to add § 414.1425(c)(5)(i) and (ii) to state, beginning with the 2020 QP Performance Period, that an eligible clinician is not a QP for a year if: (1) The APM Entity voluntarily or involuntarily terminates from an Advanced APM before the end of the QP Performance Period; (2) or the APM Entity voluntarily or involuntarily terminates from an Advanced APM at a date on which the APM Entity would not bear financial risk under the terms of the Advanced APM for the year in which the QP Performance Period occurs. We also finalized conforming revisions in § 414.1425(d)(3) with respect to Partial QP status. In addition, we finalized revisions to our regulation at § 414.1425(c)(6) and add §§ 414.1425(c)(6)(i) and (ii) to state, beginning with the 2020 QP Performance Period, that an eligible clinician is not a QP for a year if: (1) One or more of the APM Entities in which the eligible clinician participates voluntarily or involuntarily terminates from the Advanced APM before the end of the QP Performance Period, and the eligible clinician does not achieve a Threshold Score that meets or exceeds the QP payment amount threshold or QP patient count threshold based on participation in the remaining non-terminating APM Entities; or (2) one or more of the APM Entities in which the eligible clinician participates voluntarily or involuntarily terminates from the Advanced APM at a date on which the APM Entity would not bear financial risk under the terms of the Advanced APM for the year in which the QP Performance Period occurs, and the eligible clinician does not achieve a Threshold Score that meets or exceeds the QP payment amount threshold or QP patient count threshold based on participation in the remaining non-terminating APM Entities. We also finalized conforming revisions in § 414.1425(4)(3) with respect to Partial QP status.

When we finalized the revisions in the CY 2020 PFS, due to a clerical error we inadvertently included language in the text of § 414.1425(c)(5)(ii) that we believe is unnecessary and has potential to cause confusion. Specifically, § 414.1425(c)(5)(ii) states that an eligible clinician is not an QP for a year when an APM Entity termination occurs ''at a date on which the APM Entity would not bear financial risk for that QP performance period under the terms of the Advanced APM, *even if such termination date occurs within such QP Performance Period*'' (emphasis added). The inclusion of the emphasized language was a clerical error. This language did not appear in the CY 2020 PFS proposed rule regulation text for § 414.1425(c)(5)(ii) (84 FR 40929) nor does it appear in the companion finalized regulation for Partial QP status at § 414.1425(d)(3)(ii). What's more, in the CY 2020 PFS final rule, we indicated that we were finalizing these policies ''without modification'' (84 FR 63089), but the addition of this clause would have constituted a modification that we would have discussed if intentionally made. Further, we believe the language is unnecessary because § 414.1425(c)(5)(i) already addresses terminations within the QP performance period. Therefore, we believe that the clause not only serves no meaningful purpose, but also that it could result in confusion because it could appear to be filling a regulatory gap that in fact does not exist. However, we do not believe any clarifying language is necessary. The principal reasons that cause us to change proposed regulatory text in final are to address public comments or fix an error or address an issue that we recognized only after the proposal was made. We had not received any comments that indicated any confusion regarding the applicable timeframe for the proposed version of § 414.1425(c)(5)(ii) (that again, did not include the relevant clause), and we had not independently identified any problems with the proposed text, so we did not have any reason to believe we needed to clarify the applicable timing.

Furthermore, we have not experienced any problems in the implementation of the companion regulation with respect to Partial QP status, which also does not contain this additional clause.

Therefore, to align the QP regulation text at § 414.1425(c)(5)(ii) with the Partial QP regulation text at § 414.1425(d)(3)(ii), and to remove any potential for confusion with respect to the intended timeframe for APM Entity terminations before financial risk is borne in the Advanced APM, we now propose to amend the text of § 414.1425(c)(5)(ii) to remove ''**,** even if such termination date occurs within such QP Performance Period.'' Under this proposal, the text of § 414.1425(c)(5)(ii) will read ''The APM Entity voluntarily or involuntarily terminates from an Advanced APM at a date on which the APM Entity would not bear financial risk for that performance period under the terms of the Advanced APM.'' This proposed change will make the text of § 414.1425(c)(5)(ii) read as we always intended and will remove both the misalignment with the text of the Partial QP regulation and any confusion that the unnecessary clause might cause.

c. Clarification for APMs Without a Participation List

The definition of ''Participation List'' was first established in the CY 2017 QPP final rule, (81 FR 77008). In that rule, we codified the definition of ''Participation List'' at § 414.1305 as the mechanism by which CMS identifies the eligible clinicians associated with a given APM Entity for purposes of QP determinations and related QPP functions (81 FR 77246 through 77257). The definition has remained substantively unchanged since its initial adoption in the CY 2017 QPP final rule, though the regulatory provisions that rely upon it—including those governing QP determination methodology under § 414.1425, APM Entity group composition under § 414.1317, and APM Performance Pathway eligibility under § 414.1367—have been refined through subsequent annual rulemaking. The existing regulatory definition of ''Participation List'' does not expressly address the circumstance in which an APM does not require or generate a Participation List for its APM Entities. This gap has the potential to create interpretive ambiguity—particularly as CMS considers the design of future episode-based, mandatory, and other APMs under which Participation Lists may not be a structural feature of APM participation. To enhance regulatory clarity and ensure that the framework governing QP determinations and MIPS APM scoring can accommodate the full range of APM designs CMS may implement, we are proposing a clarification to ensure that in cases where a participation list is not operationally practicable, we would not include these APMs for MIPS scoring or QP determinations.

We seek public comments on this proposal.

d. APM Incentive Payment

(1) Overview

Section 1833(z)(1) of the Act establishes an incentive payment for participation in eligible alternative payment models, which originally ran from payment years 2019–2024. As such, when we established the definition of ''APM Incentive Payment'' at § 414.1305 in the CY 2017 Quality Payment Program final rule (81 FR 77008) we included in the definition that the payment would be made from payment year 2019 through payment year 2024. We also established at § 414.1450(b)(1) that the amount of the APM Incentive Payment was ''equal to 5 percent of the estimated aggregate payments for covered professional services as defined in section 1848(k)(3)(A) of the Act furnished during the calendar year immediately preceding the payment year'' (81 FR 77554).

(2) APM Incentive Payment Extension

The incentive payment originally was extended as part of the Consolidated Appropriations Act, 2023, which provided for a 3.5 percent payment in payment year 2025. In the CY 2023 PFS final rule (88 FR 79539), we finalized revisions to § 414.1450(a)(1)(i) to make reference payment years 2019 through 2025 and to § 414.1450(b)(1) to codify the legislative extension. The Consolidated Appropriations Act, 2024 provided an additional payment of 1.88 percent in payment year 2026, and in the CY 2024 PFS final rule (89 FR 98564) we again made conforming updates to §§ 414.1450(a)(1)(i) and (b)(1) to incorporate that extension. As such, currently, in §§ 414.1450(a)(i) and (b)(1), the lump sum APM Incentive Payment is available for payment years 2019 through 2026, with the applicable percentage varying by year in accordance with the statute: 5 percent for payment years 2019 through 2024, 3.5 percent for payment year 2025, 1.88 percent for payment year 2026.

The Consolidated Appropriations Act, 2026, now has provided for a 3.1 percent APM Incentive Payment in payment year 2028. Accordingly, we are proposing to codify this extension for 2028 into §§ 414.1450(a)(1)(i) and (b)(1). We also recognize that with several extensions of this payment now having occurred, and each extension having a new and unique applicable percentage, the current single-paragraph structure of the regulation at § 414.1450(b)(1) is beginning to get unwieldy and becoming harder to follow. Specifically, the relevant percentages and years have been listed within a single sentence at § 414.1450(b)(1) that describes the amount of the incentive payment. With each extension, this set of clauses has grown longer, creating greater distance between the concept of a percentage applying and the description of what the percentage in question applies to. Adding the most recent extension will make this sentence longer still.

Therefore, we are proposing a technical restructuring of § 414.1450(b)(1), which would not change the policies of this paragraph but, we believe, simply make it easier to read in light of now having three years of extensions at different percentages. Under the proposal, we would pull out the references to percentages and years from the first sentence of (b)(1) into a new list of subparagraphs, mirroring the way that the QP and Partial QP thresholds are listed in § 414.1430. Specifically, we propose to amend § 414.1450(b)(1) by: (1) remove all of the language in the first sentence that references percentages and payment years and begin the sentence ''The amount of the APM Incentive Payment is''; (2) insert after ''is'' the phrase ''the applicable percentage established for the payment year''; (3) add at the end of the subparagraph ''The applicable percentage is the following value for the indicated payment years:''; and (4) create new subparagraphs (i) through (iv) to list the specific applicable percentages, including the extension for 2028. The proposed revised paragraph would read:

''(1) The amount of the APM incentive payment is the applicable percentage established for the payment year of the estimated aggregate payments for covered professional services as defined in section 1848(k)(3)(A) of the Act furnished during the calendar year immediately preceding the payment year. CMS uses the paid amounts on claims for covered professional services to calculate the estimated aggregate payments on which CMS will calculate the APM Incentive Payment. The applicable percentage is the following value for the indicated payment years below.

- 2019 through 2024: 5 percent.
- 2025: 3.5 percent.
- 2026: 1.88 percent.

• 2028: 3.1 percent.''

We believe that this proposed revised structure is cleaner than the current single paragraph with its increasingly long detailing of years and percentages, and therefore will provide an easier-to-follow explanation of the APM Incentive Payment amount. These proposed technical structural changes would not modify the substantive policies of this provision. The only substantive change we are proposing is the codifying in new subparagraph § 414.1450(b)(1)(iv) of the 3.1 percent legislated for 2028.

(3) APM Incentive Payment Definition

As described in the overview, we established the definition of ''APM Incentive Payment'' at § 414.1305 in the CY 2017 Quality Payment Program final rule (81 FR 77008), we included language that specifically referenced payment years 2019 through 2024. However, when we revised § 414.1450 in the CY 2023 and CY 2024 PFS final rules to codify the legislative extensions of the APM Incentive Payment, we neglected to make conforming changes to the definition of ''APM Incentive Payment'' at § 414.1305 to reflect those subsequent legislative actions. As such, the current definition at § 414.1305 references only the original statutory payment years of 2019 through 2024, making it out-of-date. To address this, we are proposing to update the definition to remove the references to specific years and instead refer to § 414.1450(b)(1). The revised definition would read: ''*APM Incentive Payment* means the lump sum incentive payment for a year as described in section 414.1450(b)(1) and that is paid for an eligible clinician who is a QP for the applicable year.'' This proposal would allow for the APM Incentive Payment definition to automatically be inclusive of any year that may be added through future legislation and codified at § 414.1450(b)(1) without the need for a conforming change to the definition at § 414.1305 itself.

We seek public comment on this proposal.

(4) Summary

We are proposing to codify the most recent legislative extension of the APM Incentive Payment by: (1) revising § 414.1450(a)(1)(i) to include the payment amounts for 2019 through 2028; and (2) revising § 414.1450(b)(1) to make structural changes that include the applicable percentages for 2019 through 2024, 2025, 2026, and 2028, respectively at §§§§ 414.1450(b)(1)(i), (ii), (iii) and (iv). We note that the only substantive change involved in these modifications would be the addition of the 2028 extension. The proposed structural changes would not affect the policies of this provision but simply improve the readability of this paragraph.

We also are proposing to revise the definition of ''APM Incentive Payment'' at § 414.1305 to remove the current references to specific payment years and replace them with a reference to the years described in § 414.1450(b)(1).

We seek public comment on these proposals.

e. QP and Partial QP Thresholds

Section 1833(z)(2) of the Act specifies the thresholds for the level of participation in Advanced APMs required for an eligible clinician to become a QP for a year. The Medicare Option, based on Part B payments for covered professional services or counts of patients furnished covered professional services under Part B, has been applicable since payment year 2019 (performance period 2017). The All-Payer Combination Option, through which QP status is calculated using the Medicare Option in addition to an eligible clinician's participation in Other Payer Advanced APMs, has been applicable since payment year 2021 (performance period 2019). In the CY 2017 Quality Payment Program final rule (81 FR 77433 through 77439), we finalized our policy for QP and Partial QP Thresholds for the Medicare Option as codified at § 414.1430(a) and for the All-Payer Combination Option at § 414.1430(b). Section 304(a)(2) of Division G, Title I, Subtitle C, of the Consolidated Appropriations Act, 2024 (CAA, 2024) (Pub. L. 118–42, March 9, 2024) amended section 1833(z)(2) of the Act by extending for payment years 2025 and 2026 (performance periods 2023 and 2024) the applicable payment amount and patient count thresholds for an eligible clinician to achieve QP status. Specifically, section 304(a)(2) of the CAA, 2024, amended section 1833(z)(2) of the Act to continue the QP payment amount thresholds that applied in payment year 2025 (performance period 2023) to payment year 2026 (performance period 2024). Additionally, section 304(a)(2) of the CAA, 2024, amended section 1833(z)(2) of the Act to require that, for payment year 2026, the Secretary use the same percentage criteria for the QP patient count threshold that applied in payment year 2022. Section 304(b) of the CAA, 2024, also amended section 1848(q)(1)(C)(iii) of the Act to extend through payment year 2026 the Partial QP thresholds that were established beginning for payment year 2021 under the Medicare Option. Under the All-Payer Combination Option, the QP thresholds for payment year 2026 (performance period 2025) will remain at 50 percent for the payment amount method and 35 percent for the patient count method. The Partial QP thresholds for payment year 2026 (performance period 2024) will continue at 40 percent for the payment amount method and 25 percent for the patient count method. To become a QP through the All-Payer Combination Option, eligible clinicians must first meet certain minimum threshold percentages under the Medicare Option. For payment year 2026 (performance period 2024), the minimum Medicare Option threshold an eligible clinician must meet to be eligible for the All-Payer Combination Option is 25 percent for the payment amount method or 20 percent for the patient count method. For Partial QP status, the minimum Medicare Option threshold an eligible clinician must meet to be eligible for the All-Payer Combination Option is 20 percent for the payment amount method or 10 percent for the patient count method.

To conform our regulation with the amendments made by the CAA, 2024, we propose to amend § 414.1430 by revising paragraphs (a) and (b) to reflect the statutory QP and Partial QP threshold percentages for both the payment amount and patient count under the Medicare Option and the All-Payer Option with respect to payment year 2026 (performance period 2024). Over the years, as legislative changes have been enacted, we have added new regulatory subsections. Additionally, we note that these thresholds all increased for payment year 2027 (performance period 2025), and were legislatively restored to lower levels for payment year 2028 (performance period 2026). To maintain relative structural simplicity in the regulation, we are proposing to condense the lists of applicable years and thresholds. The proposed structure would limit duplication in our description of the applicable thresholds.

We propose the following revisions to § 414.1430(a) and (b) for the Medicare Option and All-Payer Combination Option QP and Partial QP thresholds as follows:

• Paragraph (a)(1)(vi) to state that for 2027 the amount is 75 percent, and a new paragraph (a)(1)(vii) to state that for 2028, the amount is 50 percent, and a new paragraph (a)(1)(viii) to state that for 2029 and later, the amount is 75 percent.

• Paragraph (a)(2)(vi) to state that for 2027 the amount is 50 percent, and a

new paragraph (a)(2)(vi) to state that for 2028 the amount is 40 percent, and a new paragraph that for 2028 and later, the amount is 50 percent.

- Paragraph (a)(3)(vi) to state that for 2027 the amount is 50 percent, and a new paragraph (a)(3)(vii) to state that for 2028, the amount is 35 percent, and a new paragraph (a)(3)(viii) to state that for 2029 and later, the amount is 50 percent.
- Paragraph (a)(4)(vi) to state that for 2027 the amount is 35 percent, and a new paragraph (a)(4)(vii) to state that for 2028, the amount is 25 percent, and a new paragraph (a)(3)(viii) to state that for 2029 and later, the amount is 35 percent.
- Paragraph (b)(1)(i)(B) to state that for 2027 the amount is 75 percent, and a new paragraph (b)(1)(i)(C) to state that for 2028, the amount is 50 percent, and a new paragraph (b)(1)(i)(D) to state that for 2029 and later, the amount is 75 percent.
- Paragraph (b)(2)(i)(B) to state that for 2027 the amount is 75 percent and a new paragraph (b)(2)(i)(C) to state that for 2027, the amount is 50 percent, and a new paragraph (b)(2)(i)(D) to state that for 2028 and later, the amount is 75 percent.
- Paragraph (b)(3)(i)(B) to state that for 2027 the amount is 50 percent, and a new paragraph (b)(3)(i)(C) to state that for 2028, the amount is 35 percent, and a new paragraph (b)(3)(i)(D) to state that for 2029 and later, the amount is 50 percent.
- Paragraph (b)(4)(i)(B) to state that for 2027 the amount is 35 percent, and a new paragraph (b)(4)(i)(C) to state that for 2028, the amount is 25 percent, and a new paragraph (b)(4)(i)(D) to state that for 2029 and later, the amount is 35 percent.

V. Collection of Information Requirements

Under the Paperwork Reduction Act of 1995 (PRA), 44 U.S.C. 3501–3520, we are required to provide notice in the **Federal Register** and solicit public comment before a collection of information requirement is submitted to the Office of Management and Budget (OMB) for review and approval. Collection of information is defined under 5 CFR 1320.3(c) of the PRA''s implementing regulations. To fairly evaluate whether an information collection should be approved by OMB, 44 U.S.C. 3506(c)(2)(A) requires that we solicit comment on the following issues:

- The need for the information collection and its usefulness in carrying out the proper functions of our agency.
- The accuracy of our estimate of the information collection burden.
- The quality, utility, and clarity of the information to be collected.
- Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.

We are soliciting public comment (see section V.D. of this proposed rule) on each of the aforementioned issues for the following sections of this document that contain confirmed or potential information collection requirements (ICRs). Comments, if received, will be responded to within the subsequent final rule (CMS–1848–F, OMB 0938–1485).

A. Wage Estimates

To derive average costs, we used data from the U.S. Bureau of Labor Statistics' (BLS) May 2025 National Occupational Employment and Wage Estimates for all salary estimates (*https://www.bls.gov/oes/tables.htm*). In this regard, Tables D–A1 and D–A2 present BLS' mean hourly wage, our estimated cost of fringe benefits and other indirect costs (calculated at 100 percent of salary), and our adjusted hourly wage. There are many sources of variance in the average cost estimates, both because fringe benefits and other indirect costs vary significantly from employer to employer, and because methods of estimating these costs vary widely from study to study. Therefore, we believe that doubling the hourly wage to estimate total cost is a reasonably accurate estimation method.

We note that the BLS data does not include median hourly wage rates for multiple physician occupation types listed in Table D–A2; in these cases, the BLS identifies that the median wage rate is equal to or greater than $115.00/hr or $239,200 per year. BLS data for prior years, such as the May 2022 and May 2023 data, provide similar notes for median wage rates for occupations that are above the same threshold ($115.00/hr or $239,200 per year for the May 2022 BLS data (*https://www.bls.gov/oes/2022/may/oes_nat.htm*) and May 2023 BLS data (*https://www.bls.gov/oes/2023/may/oes_nat.htm*)). Therefore, for consistency with previous years for estimating physician wage rates, we have continued to use mean hourly wage rates across our wage estimates.

TABLE D-A1: NATIONAL OCCUPATIONAL EMPLOYMENT AND WAGE ESTIMATES (EXCLUDING PHYSICIANS)

Occupation Title	Occupation Code	Mean Hourly Wage ($/hr)	Fringe Benefits and Other Indirect Costs ($/hr)	Adjusted Hourly Wage ($/hr)
Billing and Posting Clerks	43-3020	24.55	24.55	49.10
Business Operations Specialists	13-1000	44.63	44.63	89.26
Computer System Analysts	15-1211	55.10	55.10	110.20
General and Operations Managers	11-1021	64.87	64.87	129.74
Licensed Practical and Licensed Vocational Nurses	29-2061	32.24	32.24	64.48
Medical and Health Services Managers	11-9110	67.77	67.77	135.54
Software Quality Assurance Analysts and Testers	15-1253	53.60	53.60	107.20
Training and Development Managers	11-3131	71.33	71.33	142.66

For our purposes, BLS' May 2025 National Occupational Employment and Wage Estimates does not provide an occupation that we could use for ''Physician'' wage data. To estimate a Physician's costs, we used an average conglomerate wage of $307.74/hr as demonstrated in Table D–A2.

TABLE D-A2: NATIONAL OCCUPATIONAL EMPLOYMENT AND WAGE ESTIMATES (PHYSICIANS)

Occupation Title	Occupation Code	Mean Hourly Wage ($/hr)	Fringe Benefits and Other Indirect Costs ($/hr)	Adjusted Hourly Wage ($/hr)
Anesthesiologists	29-1211	173.35	173.35	346.70
Family Medicine Physicians	29-1215	122.99	122.99	245.98
General Internal Medicine Physicians	29-1216	128.46	128.46	256.92
Obstetricians and Gynecologists	29-1218	134.16	134.16	268.32
Orthopedic Surgeons, Except Pediatric	29-1242	179.60	179.60	359.20
Pediatric Surgeons	29-1243	241.37	241.37	482.74
Pediatricians, General	29-1221	101.98	101.98	203.96
Physicians, All Other	29-1229	125.98	125.98	251.96
Psychiatrists	29-1223	129.78	129.78	259.56
Surgeons	29-1240	175.17	175.17	350.34
Surgeons, All Other	29-1249	179.78	179.78	359.56
Total				3,385.24
Average Physician Wage (3,385.24/11)				307.74

Private Sector

To derive average costs, we used the most recently available data from the US Bureau of Labor Statistics (BLS), the May 2025 National Occupational Employment and Wage Statistics, for all salary estimates (*https://www.bls.gov/oes/tables.htm*). In this regard, Table D–A3 presents BLS' mean hourly wage, our estimated cost of fringe benefits and other indirect costs (calculated at 100 percent of salary), and our adjusted hourly wage.

TABLE D-A3: NATIONAL OCCUPATIONAL EMPLOYMENT AND WAGE ESTIMATES

Occupation Title	Occupation Code	Mean Hourly Wage ($/hr)	Fringe Benefits and Other Indirect Costs ($/hr)	Adjusted Hourly Wage ($/hr)
Billing and Posting Clerks	43-3021	24.55	24.55	49.10
Computer System Analysts	15-1211	55.10	55.10	110.20
General and Operations Managers	11-1021	64.87	64.87	129.74
Licensed Practical and Licensed Vocational Nurses	29-2061	32.24	32.24	64.48
Medical and Health Services Managers	11-9110	67.77	67.77	135.54
Physicians	29-1210	133.30	133.30	266.60
Software Quality Assurance Analysts and Testers	15-1253	53.60	53.60	107.20

As indicated, we are adjusting our employee hourly wage estimates by a factor of 100 percent. This is necessarily a rough adjustment, both because fringe benefits and other indirect costs vary significantly from employer to employer, and because methods of estimating these costs vary widely from study to study. Nonetheless, we believe that doubling the hourly wage to estimate the total cost is a reasonably accurate estimation method.

Wages for Individuals

We believe that the cost for beneficiaries undertaking administrative and other tasks on their own time is a post-tax wage of $24.05/hr.

The Valuing Time in U.S. Department of Health and Human Services Regulatory Impact Analyses: Conceptual Framework and Best Practices [389] identifies the approach for valuing time when individuals undertake activities on their own time. To derive the costs for beneficiaries, we used a measurement of the usual weekly earnings of wage and salary workers of $1,159 [390] for 2024 and then divided by 40 hours to calculate an hourly pre-tax wage rate of $28.98/hr. This rate is adjusted downwards by an estimate of the effective tax rate for median income households of about 17 percent or $4.93/hr ($28.98/hr × 0.17), resulting in the post-tax hourly wage rate of $24.05/hr ($28.98/hr − $4.93/hr). Unlike our

[389] *https://aspe.hhs.gov/sites/default/files/migrated_legacy_files//176806/VOT.pdf.*

[390] *https://fred.stlouisfed.org/series/LEU0252881500A.*

private sector wage adjustments, we are not adjusting beneficiary wages for fringe benefits and other indirect costs since the individuals' activities, if any, would occur outside the scope of their employment.

B. Proposed Information Collection Requirements (ICRs)

1. ICR Regarding Rebate Reduction Requests Under Sections 11101 and 11102 (§§ 427.402, 428.302, and 428.303)

This ICR collects information from manufacturers of Part B rebatable biosimilar biological products and generic Part D rebatable drugs and biosimilars that are requesting rebate reductions to inform CMS' determinations regarding such rebate reduction requests pursuant to the policies adopted in the CY 2025 PFS final rule (89 FR 97710). The information collection requirements for the Rebate Reduction Requests under sections 11101 and 11102 of the IRA ICR currently approved under OMB Control Number 0938–1474 are scheduled to expire on July 31, 2027. We intend to seek renewal of this collection from OMB prior to its expiration. The renewal will continue the currently approved requirements with technical updates to the forms, such as the email address to submit rebate reduction requests and references to relevant sections of the CY 2025 PFS final rule. No policy changes related to this collection are proposed in this rule. Consequently, we are not setting out any proposed burden estimates under this section of this proposed rule.

2. ICRs Regarding Clinical Laboratory Fee Schedule: Revised Data Reporting Period and Phase-In of Payment Reductions (§ 414.504)

As stated in section 1834A(h)(2) of the Act, chapter 35 of title 44 U.S.C., which includes such provisions as the PRA, does not apply to information collected under section 1834A of the Act. Consequently, we are not setting out any proposed burden estimates under this section of the proposed rule. Please refer to section VII.F.4. of this proposed rule for a discussion of the impacts associated with the proposed changes described in section III.C. of this proposed rule.

3. Ambulatory Specialty Model

In this proposed rule, we make several proposals related to the Ambulatory Specialty Model (ASM), which is tested under the authority of section 1115A of the Act. As stated in the CY 2026 PFS final rule (90 FR 49973), under section 1115A(d)(3) of the Act, Chapter 35 of title 44, United States Code, does not apply to the testing, evaluation, and expansion of models under section 1115A of the Act and, therefore, the information collection requirements associated with the ASM proposals in this rule are not subject to the PRA. Nevertheless, for transparency, we briefly describe the anticipated administrative effects of these proposals.

The proposed ASM revisions in this proposed rule would have limited impact on the collection of information overall. For example, within the quality ASM performance category, we propose to replace the Functional Status Change for Patients with Low Back Impairments (MIPS Q220) with the Functional Outcome Assessment (MIPS Q182) measure, which should not impact burden given we are removing one measure and replacing with another. The proposed addition of the administrative claims-based quality measure would not entail additional data collection or submission requirements given there is no data submission for such measures. Similarly, remaining proposals should not impact the collection of information significantly.

4. ICRs Regarding Limiting Medicare Coverage of Certain Individuals

In accordance with section 1899C of the Act and in this proposed rule, we intend to update the Medicare initial enrollment forms to expand the response options to include specific types of citizenship and alien status data elements to support Medicare Part A enrollment eligibility determinations. This is a small change that will not increase the burden already accounted for in OMB control numbers 0938–0251 (CMS 18–F–5), 0938–0245 (CMS 4040), 0938–0251 (CMS–10797) and 0938–0080 (CMS 43).

Our estimate is that the addition of the citizenship section to the CMS–10797, the form used to apply for Medicare using a Special Enrollment Period for Exceptional Conditions, does not change the currently approved burden estimates accounted for in OMB Control Number 0938–0251. The majority of respondents are expected to be U.S. citizens or nationals who will spend no more than one minute on the citizenship section, which is considered negligible. The currently approved burden for this collection reflects 34,612 respondents generating 34,612 total annual responses at 0.25 hours per response, for a total of 8,653 burden hours (34,612 responses × 0.25 hr/response) at a cost of $208,105 (8,653 hours × $24.05/hr), or $6.01 per respondent ($208,105/34,612 respondents). We request comment on the burden assumptions for the CMS–10797.

The addition of the new SEP category to the CMS–10797 creates additional burden for individuals who utilize the SEP to apply for re-enrollment in Medicare following a change in their citizenship, nationality, or immigration status. We do not have historical data on which to base a precise estimate of SEP utilization, as this is a newly proposed enrollment pathway with no prior utilization experience. OACT estimates that approximately 32,000 individuals will lose Medicare coverage beginning in 2027. For purposes of this burden estimate, we assume that approximately 10 percent of individuals projected to lose Medicare coverage, approximately 3,200 (32,000 × 0.10) individuals annually, may utilize the SEP to re-enroll in Medicare following a change in their citizenship, nationality, or immigration status. This is a placeholder assumption, as there is no historical precedent on which to base the estimate. We estimate 3,200 total respondents annually at 0.25 hours per response, for a total additional burden of 800 hours (3,200 responses × 0.25 hr/response) at a total estimated additional cost of $19,240 (800 × $24.05/hr), or $6.01 per respondent ($19,240/3,200 respondents), beginning in CY 2027. We assume that the 0.25 hours per response applies to this proposed SEP, as the burden associated with reestablishing immigration status and updating documentation is outside the Medicare enrollment process and therefore this burden estimate only accounts for time to enroll in Medicare.

The updated total burden for OMB control number 0938–1426, inclusive of both the currently approved burden and the additional SEP burden, is 37,812 total respondents (34,612 + 3,200) and 9,453 total burden hours (8,653 + 800) at a total cost of $227,345 ($208,105 + $19,240).

All information impacts related to the procedural steps that MA and Part D plans must take to receive and process disenrollment transactions have already been accounted for under OMB control numbers 0938–0753 (CMS–R–267) and 0938–0964 (CMS–10141) and no additional burden is attributed to this provision for those activities as this change is small relative to the number of disenrollment transactions processed by MA and Part D plans annually.

We are seeking public comments on all aspects of the proposed changes to entitlement and eligibility rules for Parts A and B, the underlying burden

assumptions, and the changes to limit coverage under Medicare cost plans, MA plans, and Part D plans.

5. ICR Regarding Medicare Prescription Drug Inflation Rebate (§ 428.203(c))

The following proposed changes will be submitted to OMB for review under control number 0938–1485 (CMS–10930).

In section III.G.3.c.2.c. of this proposed rule, we are proposing to require all providers and suppliers that are covered entities as defined under § 10.3 (hereinafter collectively ''340B providers'' unless otherwise noted) to submit data elements from their Part D 340B claims to the 340B repository for all covered Part D drugs billed to Medicare Part D by such covered entity or its contractor(s) beginning in 2027 for Part D claims with dates of service on or after January 1, 2027. To allow sufficient time for 340B providers to gather, validate, and submit the specified data to the 340B repository, we propose to require that 340B providers would be expected to report data on a quarterly basis (though they may choose to submit more frequently) to the 340B repository within one calendar quarter following the close of the relevant calendar quarter. For example, for claims with dates of service between October 1, 2027, through December 31, 2027, 340B providers would submit the data elements from Part D 340B claims to the 340B repository no later than March 31, 2028. 340B providers would submit this data directly to CMS to be included in the 340B repository. We propose that we would rely upon the completeness and accuracy of the data submitted by 340B providers to the 340B repository, consistent with the 340B provider requirement to certify the accuracy of such submissions, to consider all data elements received by the 340B repository to be associated with Part D 340B claims. We also propose, as part of every submission to require 340B providers (or an individual or contractor with the delegated authority as an authorized representative of the 340B provider to perform the certification) to certify that the data elements from all claims submitted to the 340B repository are from verified 340B claims and, to the best of the 340B provider's knowledge, its submissions include all Part D 340B claims for the 340B provider at the time of submission for the relevant period. 340B providers or their authorized representative would be required to certify the completeness and accuracy of the data submitted and to certify that the submitter is authorized to submit on behalf of the 340B provider. We would match the stored data elements in the 340B repository to PDE transactions for each Part D rebatable drug dispensed during the applicable period and would evaluate 340B repository data for: (1) data integrity, and (2) submission frequency and completeness across covered entity types and geographies.

The information collected by CMS from 340B providers would provide CMS with information to assess the usability of the data received and feasibility of CMS removing 340B units from the total number of units used to calculate the total rebate amount in the future based on the data submitted. This data and information is necessary to implement statutory requirements of the Medicare Part D Drug Inflation Rebate Program at section 1860D–14B(b)(1)(B) of the Act, which requires that beginning with plan year 2026, we shall exclude from the total number of units for a Part D rebatable drug, with respect to an applicable period, those units for which a manufacturer provides a discount under the 340B Program. As stated earlier, we are proposing to require all 340B providers to submit data elements from their Part D 340B claims to the 340B repository for all covered Part D drugs billed to Medicare Part D beginning in 2027 for Part D claims with dates of service on or after January 1, 2027.

Based on internal CMS analyses of the unique 340B ID numbers in the OPAIS database that are active (that is, not terminated) with at least one contract pharmacy association listed, we estimate that approximately 14,000 340B providers would respond by submitting data 4 times per year (quarterly) to the 340B repository in the format and manner specified by CMS.

For a 340B provider or its third-party administrator (TPA), we estimate it would take 6 hours at $107.20/hr for a Software Quality Assurance Analyst and Tester sampling for each submission and 2 hours at $129.74/hr for a General and Operations Manager to review each submission. In addition to the recurring submissions, we estimate it would take a General and Operations Manager one hour at $129.74/hr to complete the one-time registration for the 340B repository.

In aggregate, we estimate an annual burden of 462,000 hours ([56,000 responses × 8 hr/response] + [14,000 340B providers × 1 hr/registration]) at a cost of $52,366,440 [(2 hr × $129.74/hr × 56,000 responses) + (6 hr × $107.20/hr × 56,000 responses) + (1 hr × $129.74/hr × 14,000 registrations)]) (see Table D–A4).

TABLE D-A4: SUMMARY OF TOTAL ANNUAL BURDEN FOR ALL 340B PROVIDERS OR TPAS TO COMPLETE 340B REPOSITORY DATA ELEMENTS FORM IN 2026

Section(s) Under Title 42 of the CFR	OMB Control Number (CMS ID No.)	No. Respondents	Total Annual Responses	Time per Response (hours)	Total Annual Time (hours)	Labor Cost ($/hr)	Total Cost ($)
Regarding the Medicare Prescription Drug Inflation Rebate Program under Sections 11101 and 11102 of the Inflation Reduction Act	0938-1485 (CMS-10930)	14,000 340B Providers or TPAs	70,000 (14,000 registrations/year + 56,000 responses/year	Varies	462,000	Varies	52,366,440

6. ICRs Regarding the Medicare Shared Savings Program

Section 1899(e) of the Act provides that chapter 35 of title 44 U.S.C., which includes such provisions as the PRA, shall not apply to the Shared Savings Program. Accordingly, we are not setting out Shared Savings Program burden estimates under this section of the rule. Please refer to the Regulatory Impact Analysis (section VII. of this proposed rule) for a discussion of the impacts associated with the proposed changes to the Shared Savings Program as described in section III.G. of this proposed rule.

7. ICRs Regarding the Quality Payment Program

a. Background

The following identifies proposed changes will be submitted to OMB for review under control number 0938–1314 (CMS–10621).

However, independent of this proposed rulemaking's changes, we also intend to merge the information collection requests in the Virtual Groups PRA package (OMB control number 0938–1343, CMS–10652) into OMB control number 0938–1314 (CMS–10621) in order to consolidate QPP-related ICRs into a single collection of information request to avoid duplication. For more detailed information on our proposed policies, we refer readers to section IV. of this proposed rule.

We apply the updated BLS wage rate data identified in section V.A. of this proposed rule. We refer readers to section VII.F.11.e. of this proposed rule for the Regulatory Impact Analysis for discussion of impacts to final scores and payment adjustments.

All changes to burden and information collections for Quality Payment Program ICRs due to changes associated with proposed policies will be submitted to OMB for review under control number 0938–1314 (CMS–10621). Non-rulemaking revisions, resulting from updated data and assumptions, will also be submitted to OMB. It is intended to focus our PRA score on the impact of this rule's proposed policy changes.

(1) Framework for Understanding the Burden of MIPS Data Submission

Across organizations permitted or required to submit data on behalf of clinicians, there can be variation across the types of data provided, and whether a clinician is a MIPS eligible clinician or other eligible clinician voluntarily submitting data, a MIPS Alternative Payment Model (APM) participant, or an Advanced APM participant. MIPS eligible clinicians and other clinicians voluntarily submitting data to MIPS for the quality, Promoting Interoperability, and improvement activities performance categories may submit data as the following participation types: individual; group; virtual groups (available only for traditional MIPS); subgroups (available only for MIPS Value Pathways (MVPs)); and APM Entities. Eligible clinicians who attain Partial Qualifying APM Participant (QP) status may be subject to data collection burden if they elect to participate in MIPS. MIPS eligible clinicians are not required to submit any data for the cost performance category, as CMS calculates performance on measures specified for this performance category based on claims-data. Virtual groups are subject to the same data submission requirements per performance category as groups, and therefore, we will refer only to groups for the remainder of this section, unless otherwise noted.

For the aforementioned participation types, we assessed the same burden per reporting option and assumed from our available data that all non-Medicare Shared Savings Program (Shared Savings Program) APM Entity submissions are assessed based on a single Taxpayer Identification Number (TIN). Per section 1899(e) of the Act, the PRA does not apply to the Shared Savings Program, thus excluded submissions by Shared Savings Program APM Entities from our MIPS reporting estimates. The regulatory impact analysis in section VII.F.11.b. of this proposed rule discusses impacts to the Shared Savings Program from provisions associated with this proposed rule.

There are three MIPS reporting options: traditional MIPS, MVPs, and the APM Performance Pathway (APP). In section V.B.7.c.(1) of this proposed rule, we provide distinct estimates for the traditional MIPS and MVP reporting options for the quality performance category, focusing on changes to our currently approved burden estimates. As with the CY 2026 PFS final rule (90 FR 49942 through 49943), we have not separately estimated burden for traditional MIPS and MVPs for the Promoting Interoperability and improvement activity performance categories. Traditional MIPS and MVPs require reporting on all Promoting Interoperability performance category objectives and measures. Traditional MIPS reporting for the improvement activities performance category typically requires attestation to two improvement activities; however, clinicians, groups, and virtual groups with a special status designation are only required to attest to one improvement activity. All MVP participants are only required to attest to one improvement activity. For additional details on historic burden assumptions for the improvement activities performance category, we refer readers to the CY 2025 PFS final rule (89 FR 98492). In the related collection of information request (OMB control number 0938–1314, CMS–10621), we aggregate submissions across all reporting options. For additional burden historic frameworks, we refer readers to the CY 2024 PFS final rule (88 FR 79422 through 79424) and the CY 2025 PFS proposed rule (89 FR 62111 through 62114).

(2) Additional Data Considerations

The accuracy of our estimates of the total burden for data submission for MIPS performance categories may be impacted by several factors. First, we are unable to predict with certainty the number of participants who will obtain a QP status, thus exempt from MIPS reporting, for the CY 2027 performance period/2029 MIPS payment year and later years. Eligible clinicians who do not achieve QP status for a given performance period may be required to participate in the Merit-Based Incentive Payment System (MIPS). Second, it is difficult to predict whether Partial QPs, who can elect to report to MIPS, will choose to participate in the CY 2027 performance period/2029 MIPS payment year or later years. Therefore, the actual number of Partial QP participants and whether they elect to submit MIPS data may differ from our estimates. However, we believe our methodology for assessing burden, as described in the preceding Framework for Understanding the Burden of MIPS Data Submission section, is most appropriate given all the limitations. We refer readers to section VII.F.11.e.(2) (b) of this proposed rule for a discussion of the potential but unquantifiable burden implications on MIPS-related burden of the proposal to modify the application of the QP and partial QP status, presented in section IV.F.2. of this proposed rule.

b. ICRs Regarding Third Party Intermediaries (§ 414.1400)

We refer readers to § 414.1400(d) for our previously established requirements for CMS-approved third party intermediaries that may submit data on behalf of MIPS eligible clinicians, groups, virtual groups, subgroups, and APM Entities. The following sections detail proposals that impact existing ICRs relevant to Third Party Intermediaries. Additionally, in section

IV.C. of this proposed rule, we are proposing to (1) add a requirement that CMS-approved third-party intermediaries may be terminated after failure to submit data for 1 year ; and (2) add a new requirement for third party intermediaries to submit documentation about intent to submit MIPS data and to terminate a third party intermediary if they do not submit documentation by the date specified by CMS. We refer readers to section VII.F.11.e.(2)(c) of this proposed rule for additional discussion on the impact of these proposals for which burden is not quantifiable.

(1) Full and Simplified Self-Nomination for Qualified Clinical Data Registries (QCDRs) and Qualified Registries

As described in section IV.C. of this rule, we are proposing to: (1) further clarify that additional requirements for health IT vendors do not apply beginning with the CY 2025 performance period/2027 MIPS payment year because health IT vendors are no longer allowed to submit MIPS data as third party intermediaries starting in that year; (2) clarify the level at which performance feedback reports are provided; (3) update the existing sampling methodologies for data auditing purposes; and (4) update the policy so that third party intermediaries will not be permitted to make changes to the qualified posting after it is publicly posted on the Quality Payment Program resource library. We assume that there will be no impact on the time required to complete either the full or simplified self-nomination process due to these proposals. Additionally, related to our proposal to implement core measures in traditional MIPS and MVPs in section IV.A.4.d.(1)(c) of this proposed rule, we are proposing to revise the data submission requirement in which a QCDR or a qualified registry must be able to submit at least six qualified measures including at least one MIPS core measure, beginning with the CY 2027 performance period/2029 MIPS payment year. This proposal does not alter the minimum number of measures a qualified registry or QCDR is required to support; therefore, we assume no impact to the overall time estimated for qualified registries or QCDRs to submit their information at the time of self-nomination. We are not proposing revisions to our estimated responses and time per response for both the Full and Simplified Self-Nominations for Qualified Registries and QCDRs under OMB control number 0938–1314 (CMS–10621).

(2) Third Party Intermediary Plan Audits

We are proposing updates related to Third Intermediary Plan Audits, which include targeted audit requirements, participation plan submissions, and corrective action and termination processes for third party intermediaries.

(a) Participation Plans

In section IV.C.3.c. of this proposed rule, we are proposing to update the conditions for approval related to participation plans such that third party intermediaries that do not submit data for 1 year would be required to submit a participation plan during self-nomination. Currently, third party intermediaries are required to submit a participation plan only after not submitting data for 2 consecutive years. We do not expect this proposal to affect the number of participation plans submitted during the self-nomination process and therefore do not anticipate an impact on burden; therefore, we are not proposing to modify our burden estimates under OMB control number 0938–1314 (CMS–10621).

c. ICRs Regarding Quality Data Submission

(1) Proposed Changes to Quality Performance Category Submissions

In section IV.A.4.a. of this proposed rule, we are proposing to add three new MVPs beginning with the CY 2027 performance period/2029 MIPS payment year. In section IV.A.3. of this proposed rule, we are also proposing that beginning in the CY 2029 performance period/2031 MIPS payment year, eligible clinicians participating in MIPS, and not reporting the APM Performance Pathway (APP/APP+), would be required to report the measures and activities in a selected MVP. Related to this proposal, we are proposing to include virtual groups in MVP reporting beginning in the CY 2029 performance period/2031 MIPS payment year. We refer readers to sections V.B.7.c.(1)(a) of this proposed rule for additional details regarding the quality data reporting estimates for both MIPS and MVPs due to these updated proposals.

The following proposed policies would not have impact on burden as they do not affect the minimum reporting requirements for the respective quality performance category submission:

In section IV.A.4.a.(2) of this proposed rule, we are proposing MVP maintenance updates to our MVP inventory that are aligned with the MVP development criteria (85 FR 84849 through 84854), in section IV.A.4.d.(1)(c)(iii) of this proposed rule, we are also proposing MIPS core measures in traditional MIPS and MVPs with an attestation process. In section IV.A.4.d(1)(e) of this proposed rule, we are also proposing MIPS quality measure inventory updates.

In section IV.A.4.d.(1)(c)(iii) of this proposed rule, we are proposing to establish a MIPS core measure attestation process whereby the clinician would be required to attest during the data submission period that there was not an available and applicable MIPS core measure for them to report. We are not proposing revisions due to this proposal as we believe the currently approved burden for traditional MIPS and MVP quality measure submissions is sufficient to absorb the negligible effort of the attestation in lieu of reporting a quality measure.

In the following sections, we estimate the number of submissions for each collection type that require active reporting by individual clinicians, groups, subgroups (as applicable for MVP reporting), or non-Shared Savings Program APM Entities for the CY 2027 performance period/2029 MIPS payment year through CY 2029 performance period/2031 MIPS payment year per the policy proposals previously discussed. Available collection types include Medicare Part B claims measures (small practices only), MIPS Clinical Quality Measures (CQM), QCDR measures, and electronic Clinical Quality Measures (eCQMs). We do not assess burden for the administrative claims-based quality measures, as CMS automatically calculates scores for individual clinicians, groups, subgroups (as applicable for MVP reporting), or non-Shared Savings Program APM Entities that meet requirements to be scored. As there are no policy proposals related to the non-Shared Savings Program related APM Performance pathway, we assume no change to our currently approved burden estimates.

(a) CY 2027 Performance Period/2029 MIPS Payment Year and CY 2028 Performance Period/2030 MIPS Payment Year

The following section details the burden estimate for the proposal to add 3 new MVPs starting with the CY 2027 performance period/2029 MIPS payment year consistent with the proposals outlined in section V.B.7.c.(1)(a)(ii) of this rule. These burden estimates will also apply to the CY 2028 performance period/2030 MIPS payment year.

(i) Updated Data Assumptions for Quality Submissions

For the traditional MIPS and MVP Quality Performance Category ICRs, our currently approved estimates used submission data from the CY 2023 performance period/2025 MIPS payment year and estimated that: (1) 14 percent of quality submissions will submit as an MVP based on the MVP inventory available in the CY 2026 performance period/2028 MIPS payment year; and (2) 20 subgroups (90 FR 49948 through 49949). At the time of this rulemaking, we have updated historic submission data for the CY 2024 performance period/2026 MIPS performance year, inclusive of individual, group, and non-Shared Savings Program APM Entities.

In Tables D–A5 and D–A6, we identify the updated response estimates by reporting option due to the availability of this updated data and add our estimate of 20 subgroup submissions currently approved under OMB control number 0938–1314 (CMS–10621). The response estimates for these ICRs apply our existing approach for estimating the impact of MVPs as a percentage of historic submissions, the currently approved estimate of 14 percent as established in the CY 2026 PFS Final Rule (90 FR 49949).

The impact on burden for each proposal discussed in the following sections use these updated active response estimates when calculating change in total time and cost. The updated estimates will be submitted to OMB for review under control number 0938–1314 (CMS–10621).

TABLE D-A5: RESPONDENT COUNTS FOR QUALITY PERFORMANCE CATEGORY AND MVP REGISTRATION ICRs

Reporting Option	Performance Category	Requirement	Currently Approved Responses*	Revised Responses **	Change Due to Updated Data
Traditional MIPS	Quality	Medicare Part B Claims Measure Collection Type Submission	8,350	7,307	(1,043)
Traditional MIPS	Quality	MIPS CQM and QCDR Measure Collection Type Submission	17,407	18,820	1,413
Traditional MIPS	Quality	eCQM Collection Type Submission	23,936	22,830	(1,106)
MVPs	N/A	MVP Registration	8,110	7,989	(121)
MVPs	Quality	Medicare Part B Claims Measure Collection Type Submission	1,359	1,189	(170)
MVPs	Quality	MIPS CQM and QCDR Measure Collection Type Submission	2,844	3,074	230
MVPs	Quality	eCQM Collection Type Submission	3,907	3,726	(181)

*Under OMB control number 0938-1314 (CMS-10621).

**Traditional MIPS updates calculated as updated submission data for CY 2024 performance period/2026 MIPS payment year submissions minus 14 percent (existing MVP submission rate). MVPs calculated as 14 percent of historic submissions plus estimated subgroup submissions (split evenly across the eCQM and MIPS CQM/QCDR measure collection types).

(ii) MVP Participation Estimate

We estimate the number of MVP submissions for the CY 2027 performance period/2029 MIPS payment year as a percent of the total traditional MIPS and MVP submissions from the CY 2024 performance period/2026 MIPS payment year (see Table D–A5). We assessed measure-level submission trends from the CY 2024 performance period/2026 MIPS payment year data for the new MVPs as proposed in section IV.A.4.a. of this proposed rule. The total average of quality measure submissions for the proposed new MVPs was equivalent to approximately 6 percent of the total quality performance category submissions in the CY 2024 performance period/2026 MIPS payment year. With the existing 14 percent estimate previously finalized in the CY 2026 PFS final rule (90 FR 32789) plus the incremental change of an additional 6 percent due to the proposed new MVPs, we estimate that 20 percent of quality performance category submissions may report via MVPs for the CY 2027 performance period/2029 MIPS payment year (row b). While this approach to estimate MVP submissions as a function of historic traditional MIPS and MVP submissions, and not just MVP submissions from a given year, is used to estimate future reporting behaviors with an expect increased adoption due to the annual expansion of the MVP inventory, as summarized in section IV.A.4.a. of this proposed rule, there are limitations, such as lack of longitudinal data to appropriately assess behavior changes related to future adoptions or submissions in both new and existing MVPs. For example, the most recent submission data available is from the CY 2024 performance period/2026 MIPS payment year when the MVP inventory was composed of 16 MVPs, whereas for CY 2027 performance period/2029 MIPS payment year we are proposing an MVP inventory of 30 MVPs. Consistent with the past approach, we project any increase to our expected MVP participation rate reduces the number of estimated submissions for each quality performance category collection type via traditional MIPS.

Table D–A6 of this proposed rule identifies our methods to estimate the number of individual clinicians, groups, and non-Shared Savings Program APM Entities that may submit data via each collection type in the CY 2027 performance period/2029 MIPS payment year, separating traditional MIPS and MVP estimates. We identify estimated submissions per collection type from CY 2024 performance period/2026 MIPS payment year data (row a). Consistent with the policy finalized in the CY 2018 Quality Payment Program final rule that for MIPS eligible clinicians who collect measures via Medicare Part B claims, MIPS CQM/QCDR, or eCQM collection types and submit more than the required number of measures (82 FR 53735 through 54736), we will score the clinician on the required measures with the highest assigned measure achievement points and thus, the same clinician may be counted as a respondent for more than one collection type. Therefore, our columns in Table D–A6 are not mutually exclusive. We assume that each response or submission per collection type for traditional MIPS includes six quality measures, and that each response or submission per collection type for MVPs includes four quality measures.

TABLE D-A6: ESTIMATED NUMBER OF SUBMISSIONS FOR QUALITY PERFORMANCE CATEGORY BY COLLECTION TYPE

	Medicare Part B Claims Measure	MIPS CQM/QCDR Measure	eCQM
Total 2027 Performance Period Quality Performance Category Submissions (Excludes QPs) (a)	8,496	21,894	26,556
2026 Performance Period Approved MVPs (14 percent) (b) = (a) × 0.14	1,189	3,065	3,718
2027 Performance Period Proposed MVPs (20 percent) (c) = (a) × 0.20	1,699	4,379	5,311
2027 Traditional MIPS Performance Period (Excludes QPs and Estimated MVP Submissions) (d) = (a) - (c)	6,797	17,515	21,245
Number of Submissions Moving to MVPs due to New MVPs (e) = (c) - (b)	510	1,313	1,593

* Estimates in the table are rounded to the nearest whole number, therefore the Number of Submissions Moving to MVPs due to New MVPs row may deviate from the provided formula due to rounding.

(iii) Traditional MIPS Quality Data Submission

The following estimates apply to requirements for the traditional MIPS reporting option and submissions by individual clinicians, groups, and non-Shared Savings Program APM Entities. For our most recent discussions of related burden, we refer readers to the CY 2024 PFS final rule (88 FR 70149 through 70151) and the CY 2025 PFS final rule (89 FR 98479 through 98483), and CY 2026 PFS final rule (90 FR 49946 through 49949). All estimates encompass time to review measure specifications unless otherwise noted.

(A) Medicare Part B Claims Measure Collection Type

The following estimates apply to requirements for the traditional MIPS reporting option and submissions by individual clinicians from a small practice with less than 15 clinicians. We acknowledge a range of times for computer system analysts to submit quality measure data (minimum, mean, and maximum burden estimates) for this collection type. We continue to apply the maximum burden in our total burden estimates.

For the CY 2027 performance period/2029 MIPS payment year, we estimate a decrease of 510 submissions due to proposing three new MVPs in this proposed rule. When considering a range of Computer System Analyst response times (from 1.15 to 8.2 hr/response) we estimate a maximum total decrease of 7,242 hours and $883,105 as demonstrated in Tables D–A7 through D–A9.

TABLE D-A7: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR TRADITIONAL MIPS MEDICARE PART B CLAIMS MEASURE COLLECTION TYPE FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Range: Time/Cost	Time (hr) - Computer System Analyst	Time (hr) - Other Occupations	Total Time (hr)	Cost ($) - Computer System Analyst	Cost ($) - Other Occupations	Total Cost ($)
Minimum	(587)	(3,060)	(3,647)	(64,632)	(422,249)	(486,881)
Mean	(1,046)	(3,060)	(4,106)	(115,214)	(422,249)	(537,463)
Maximum	(4,182)	(3,060)	(7,242)	(460,856)	(422,249)	(883,105)

TABLE D-A8: ESTIMATED INFORMATION COLLECTION BURDEN RANGE FOR COMPUTER SYSTEM ANALYSTS IN TRADITIONAL MIPS MEDICARE PART B CLAIMS MEASURE COLLECTION TYPE FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Computer System Analyst	Wage ($/hr)		Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Minimum	110.20	(510)	1.15	(587)	(64,632)
Mean	110.20	(510)	2.05	(1,046)	(115,214)
Maximum	110.20	(510)	8.2	(4,182)	(460,856)

TABLE D-A9: ESTIMATED INFORMATION COLLECTION BURDEN RANGE FOR OTHER OCCUPATIONS IN TRADITIONAL MIPS MEDICARE PART B CLAIMS MEASURE COLLECTION TYPE FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Other Occupations	Wage ($/hr)		Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Billing Clerks	49.10	(510)	1	(510)	(25,041)
Licensed Practical Nurses (LPNs)	64.48	(510)	1	(510)	(32,885)
Medical and Health Service Managers	135.54	(510)	3	(1,530)	(207,376)
Physicians	307.74	(510)	1	(510)	(156,947)
Total	n/a	(510)	varies	(3,060)	(422,249)

(B) MIPS CQM and QCDR Measure Collection Types

For the CY 2027 performance period/2029 MIPS payment year, we estimate a decrease of 1,313 submissions due to proposing three new MVPs in this proposed rule. Multiplying the estimated change in submissions (1,313) by the time per submission by labor category, we estimate a decrease of 11,926 hours and $1,499,903 as demonstrated in Table D–A10.

TABLE D-A10: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR TRADITIONAL MIPS CQM AND QCDR MEASURE COLLECTION TYPES FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Other Occupations	Wage ($/hr)		Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	(1,313)	4.083	(5,361)	(590,782)
Billing Clerks	49.10	(1,313)	1	(1,313)	(64,468)
Licensed Practical Nurses (LPNs)	64.48	(1,313)	1	(1,313)	(84,662)
Medical and Health Service Managers	135.54	(1,313)	2	(2,626)	(355,928)
Physicians	307.74	(1,313)	1	(1,313)	(404,063)
Total	N/A	(1,313)	Varies	(11,926)	(1,499,903)

(C) MIPS eCQM Collection Type

For the CY 2027 performance period/2029 MIPS payment year, we estimate a decrease of 1,593 submissions due to proposing three new MVPs in this proposed rule. Multiplying the estimated change in submissions by the time per submission by labor category, we estimate a decrease of 12,744 hours and $1,629,639 as demonstrated in Table D–A11.

TABLE D-A11: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR TRADITIONAL MIPS eCQM COLLECTION TYPE FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Other Occupations	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	(1,593)	3	(4,779)	(526,646)
Billing Clerks	49.10	(1,593)	1	(1,593)	(78,216)
Licensed Practical Nurses (LPNs)	64.48	(1,593)	1	(1,593)	(102,717)
Medical and Health Service Managers	135.54	(1,593)	2	(3,186)	(431,830)
Physicians	307.74	(1,593)	1	(1,593)	(490,230)
Total	N/A	(1,593)	Varies	(12,744)	(1,629,639)

(iv) MVP Registration: Individuals, Groups, Subgroups, and APM Entities

We estimate that the proposed addition of three new MVPs would result in an increase of 3,416 MVP registrations. Using the currently approved estimate of 0.25/hr per registration, we estimate an annual burden increase of 854 hours (+3,416 registrations × 0.25 hr/registration) at a cost of +$94,111 (+854 hr × $110.20/hr for a computer system analyst or equivalent).

(v) MVP Quality Performance Category Submission

We estimate a change to the number of annual MVP quality performance category submissions per collection type from our currently approved burden estimates, beginning with the CY 2027 performance period/2029 MIPS payment year. These estimates include the figures detailed in section V.B.7.c.(1)(a) of this proposed rule. These estimates aggregate individual clinician, group, subgroup, and non-Shared Savings Program APM Entity submissions. All estimates presume maximum submission time and encompass time to review measure specifications unless otherwise noted.

(A) Medicare Part B Claims Measure Collection Type

We estimate an increase of 510 submissions due to the proposed addition of three new MVPs. Multiplying the estimated change in submissions (+510) by the time per submission by labor category, we estimate a total increase of 4,816 hours at a cost of $587,143 as demonstrated in Table D–A12.

TABLE D-A12: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR MVP MEDICARE PART B CLAIMS MEASURE COLLECTION TYPE FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	510	5.46	2,785	306,907
Medical and Health Service Managers	135.54	510	2	1,020	138,251
Licensed Practical Nurses (LPNs)	64.48	510	0.66	337	21,730
Billing Clerks	49.10	510	0.66	337	16,547
Physicians	307.74	510	0.66	337	103,708
Total	n/a	510	varies	4,816	587,143

(B) MIPS CQM and QCDR Measure Collection Type

We estimate an increase of 1,313 submissions due to the proposed addition of three new MVPs. Multiplying the estimated change in submissions (+1,313) by the time per submission by labor category, we estimate a total increase of 7,840 hours at a cost of $986,867 as demonstrated in Table D–A13.

TABLE D-A13: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR MVP CQM AND QCDR MEASURE COLLECTION TYPES FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	1,313	2.66	3,493	384,929
Medical and Health Service Managers	135.54	1,313	1.33	1,746	236,653
Licensed Practical Nurses (LPNs)	64.48	1,313	0.66	867	55,904
Billing Clerks	49.10	1,313	0.66	867	42,570
Physicians	307.74	1,313	0.66	867	266,811
Total	N/A	1,313	Varies	7,840	986,867

(C) eCQM Collection Type

We estimate an increase of 1,593 submissions due to the proposed addition of three new MVPs. Multiplying the estimated change in submissions (+1,593) by the time per submission by labor category, we estimate a total increase of 8,442 hours at a cost of $1,079,350 as demonstrated in Table D–A14.

TABLE D-A14: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR MVP eCQM COLLECTION TYPE FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	1,593	1.99	3,170	349,334
Medical and Health Service Managers	135.54	1,593	1.33	2,119	287,209
Licensed Practical Nurses (LPNs)	64.48	1,593	0.66	1,051	67,768
Billing Clerks	49.10	1,593	0.66	1,051	51,604
Physicians	307.74	1,593	0.66	1,051	323,435
Total	N/A	1,593	Varies	8,442	1,079,350

(vi) Summary of Quality Performance Category Estimated Information Collection Burden Change for CY 2027 Performance Period/2029 MIPS Payment Year and CY 2028 Performance Period/2030 MIPS Payment Year

Across the quality performance category collection types for Traditional MIPS and MVPs, we estimate that policy proposals would lead to a decrease in burden of 9,960 hours and a savings of $1,265,176 under OMB control number 0938–1314 (Table D–A15).

TABLE D-A15: SUMMARY OF QUALITY PERFORMANCE CATEGORY ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR AND CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Requirement	Change in Number of Respondents	Change in Time	Change in Cost ($)
Traditional MIPS Quality Submission	(3,416)	(31,912)	(4,012,647)
MVP Registration	3,416	854	94,111
MVP Quality Submission	3,416	21,098	2,653,360
Total	**0***	**(9,960)**	**(1,265,176)**

* Respondents moving from Traditional MIPS to MVPs need to complete MVP registration plus MVP Quality Submission, therefore the net number of new respondents will be 0.

(b) CY 2029 Performance Period/2031 MIPS Payment Year

The following section details the burden estimate for that beginning in the CY 2029 performance period/2031 MIPS payment year, eligible clinicians participating in MIPS, and not reporting the APP, would be required to report the measures and activities in a selected MVP as detailed in section IV.A.3. of this proposed rule.

(i) Traditional MIPS Quality Data Submission

For the CY 2029 performance period/2031 MIPS payment year, we assume that no Quality Performance category submissions will occur via Traditional MIPS due the proposal that eligible clinicians participating in MIPS and not reporting the APP, would be required to report the measures and activities in a selected MVP.

(A) Medicare Part B Claims Measure Collection Type

The following estimates apply to requirements for the traditional MIPS reporting option and submissions by individual clinicians. For the CY 2029 performance period/2031 MIPS payment year, we estimate a decrease of 6,797 submissions due to the proposal to require selection of an MVP for quality performance category reporting. Multiplying the estimated change in submissions (−6,797) by the time per submission by labor category, we estimate a maximum total decrease of 96,517 hours and savings of $11,769,506 as demonstrated in Table D–A16.

TABLE D-A16: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR TRADITIONAL MIPS MEDICARE PART B CLAIMS MEASURE COLLECTION TYPE FOR CY 2029 PERFORMANCE PERIOD/2031 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	(6,797)	8.2	(55,735)	(6,141,997)
Medical and Health Service Managers	135.54	(6,797)	3	(20,391)	(2,763,796)
Licensed Practical Nurses (LPNs)	64.48	(6,797)	1	(6,797)	(438,271)
Billing Clerks	49.10	(6,797)	1	(6,797)	(333,733)
Physicians	307.74	(6,797)	1	(6,797)	(2,091,709)
Total	N/A	(6,797)	Varies	(96,517)	(11,769,506)

(B) MIPS CQM and QCDR Measure Collection Types

For the CY 2029 performance period/2031 MIPS payment year, we estimate a decrease of 17,507 submissions due to the proposal to require selection of an MVP for quality performance category reporting. Multiplying the estimated change in submissions (−17,507) by the time per submission by labor category, we estimate a decrease of 159,016 hours and savings of $19,999,053 as demonstrated in Table D–A17.

TABLE D-A17: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR TRADITIONAL MIPS CQM AND QCDR MEASURE COLLECTION TYPES FOR CY 2029 PERFORMANCE PERIOD/2031 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	(17,507)	4.083	(71,481)	(7,877,206)
Medical and Health Service Managers	135.54	(17,507)	2	(35,014)	(4,745,798)
Licensed Practical Nurses (LPNs)	64.48	(17,507)	1	(17,507)	(1,128,851)
Billing Clerks	49.10	(17,507)	1	(17,507)	(859,594)
Physicians	307.74	(17,507)	1	(17,507)	(5,387,604)
Total	N/A	(17,507)	Varies	(159,016)	(19,999,053)

(C) MIPS eCQM Collection Type

For the CY 2029 performance period/2031 MIPS payment year, we estimate a decrease of 21,237 submissions due to the proposal to require selection of an MVP for quality performance category reporting. Multiplying the estimated change in submissions by the time per submission by labor category, we estimate a decrease of 169,896 hours and savings of $21,725,451 as demonstrated in Table D–A18.

TABLE D-A18: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR TRADITIONAL MIPS eCQM COLLECTION TYPE FOR CY 2029 PERFORMANCE PERIOD/2031 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	(21,237)	3	(63,711)	(7,020,952)
Medical and Health Service Managers	135.54	(21,237)	2	(42,474)	(5,756,926)
Licensed Practical Nurses (LPNs)	64.48	(21,237)	1	(21,237)	(1,369,362)
Billing Clerks	49.10	(21,237)	1	(21,237)	(1,042,737)
Physicians	307.74	(21,237)	1	(21,237)	(6,535,474)
Total	N/A	(21,237)	Varies	(169,896)	(21,725,451)

(ii) MVP Registration: Individuals, Groups, Subgroups, and APM Entities

For the CY 2029 performance period/2031 MIPS payment year, we assume that the total number of individual clinicians, groups, non-Shared Savings Program APM Entities, and subgroups that will complete the MVP registration process is 56,946.

We estimate that the proposed transition to MVPs would result in an increase of 45,541 MVP registrations. Using the currently approved estimate of 0.25/hr per registration, we estimate an annual burden change of +11,385 hours (+45,541 registrations × 0.25 hr/registration) at a cost of +$1,254,627 (+11,385 hr × $110.20/hr for a computer system analyst or equivalent).

(iii) MVP Quality Performance Category Submission

We estimate an increase to the number of annual MVP quality performance category submissions per collection type from our currently approved burden estimates, for the CY 2029 performance period/2031 MIPS payment year due to the proposal to require selection of an MVP for quality performance category submission. These estimates include the figures detailed in section V.B.7.c.(1)(a) of this proposed rule plus our currently approved estimate of 20 subgroup submissions (split evenly across the eCQM and MIPS CQM/QCDR measure collection types). These estimates aggregate individual clinician, group, subgroup, and non-Shared Savings Program APM Entity submissions. All estimates encompass time to review measure specifications unless otherwise noted. Related to this proposal, we are proposing to include virtual groups in MVP reporting beginning in the CY 2029 performance period/2031 MIPS payment year. Because virtual groups are included as groups in the burden estimates there is no additional burden change beyond what is already calculated.

(A) Medicare Part B Claims Measure Collection Type

We estimate an increase of 6,797 submissions due to the proposed transition to MVPs in this proposed rule. Multiplying the estimated change in submissions (+6,797) by the time per submission by labor category, we estimate a total change of +64,164 hours at a cost of +$7,822,315 as demonstrated in Table D–A19.

TABLE D-A19: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR MVP MEDICARE PART B CLAIMS MEASURE COLLECTION TYPE FOR CY 2029 PERFORMANCE PERIOD/2031 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	6,797	5.46	37,112	4,089,742
Medical and Health Service Managers	135.54	6,797	2	13,594	1,842,531
Licensed Practical Nurses (LPNs)	64.48	6,797	0.66	4,486	289,257
Billing Clerks	49.10	6,797	0.66	4,486	220,263
Physicians	307.74	6,797	0.66	4,486	1,380,522
Total	N/A	6,797	Varies	64,164	7,822,315

(B) MIPS CQM and QCDR Measure Collection Type

We estimate an increase of +17,507 submissions due to the proposed transition to MVPs in this proposed rule. Multiplying the estimated change in submissions (+17,507) by the time per submission by labor category, we estimate a total increase of 104,518 hours at a cost of $13,156,170 as demonstrated in Table D–A20.

TABLE D-A20: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR MVP CQM AND QCDR MEASURE COLLECTION TYPES FOR CY 2029 PERFORMANCE PERIOD/2031 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	17,507	2.66	46,569	5,131,904
Medical and Health Service Managers	135.54	17,507	1.33	23,284	3,155,913
Licensed Practical Nurses (LPNs)	64.48	17,507	0.66	11,555	745,066
Billing Clerks	49.10	17,507	0.66	11,555	567,351
Physicians	307.74	17,507	0.66	11,555	3,555,936
Total	N/A	17,507	Varies	104,518	13,156,170

(C) eCQM Collection Type

We estimate an increase of +21,237 submissions due to the proposed transition to MVPs in this proposed rule. Multiplying the estimated change in submissions (+21,237) by the time per submission by labor category, we estimate a total change of +112,555 hours at a cost of +$14,390,821 as demonstrated in Table D–A21.

TABLE D-A21: ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR MVP eCQM COLLECTION TYPE FOR CY 2029 PERFORMANCE PERIOD/2031 MIPS PAYMENT YEAR

Occupation	Wage ($/hr)	Respondents	Time per Submission (hr)	Total Time (hr)	Total Cost ($)
Computer System Analyst	110.20	21,237	1.99	42,262	4,657,272
Medical and Health Service Managers	135.54	21,237	1.33	28,245	3,828,327
Licensed Practical Nurses (LPNs)	64.48	21,237	0.66	14,016	903,752
Billing Clerks	49.10	21,237	0.66	14,016	688,186
Physicians	307.74	21,237	0.66	14,016	4,313,284
Total	N/A	21,237	Varies	112,555	14,390,821

(iv) Summary of Quality Performance Category Estimated Information Collection Burden Change for CY 2029 Performance Period/2031 MIPS Payment Year

Across the quality performance category collection types (Medicare Part B claims, CQM/QCDR, eCQMs) for Traditional MIPS and MVPs, we estimate that policy proposals will not change number of total respondents but will lead to a decrease in burden of 132,807 hours and a savings of $16,870,077 under OMB control number 0938–1314 (Table D–A22).

TABLE D-A22: SUMMARY OF QUALITY PERFORMANCE CATEGORY ESTIMATED INFORMATION COLLECTION BURDEN CHANGE FOR CY 2029 PERFORMANCE PERIOD/2031 MIPS PAYMENT YEAR

Requirement	Change in Number of Respondents	Change in Time	Change in Cost ($)
Traditional MIPS Quality Submission	(45,541)	(425,429)	(53,494,010)
MVP Registration	45,541	11,385	1,254,627
MVP Quality Submission	45,541	281,237	35,369,306
Total	**0**	**(132,807)**	**(16,870,077)**

* Respondents moving from Traditional MIPS to MVPs need to complete MVP registration plus MVP Quality Submission, therefore the net number of new respondents will be 0.

d. ICRs Regarding Reporting the MIPS Promoting Interoperability Performance Category

We refer readers to § 414.1375 for our previously established policies regarding reporting requirements for the MIPS Promoting Interoperability performance category. We also refer readers to § 414.1305 for the definition of attestation, § 414.1325 for data submission requirements, and §§ 414.1380(b)(4) and 414.1365(d)(3)(iv) for MIPS Promoting Interoperability performance category scoring. For historic assumptions on reporting requirements for the MIPS Promoting Interoperability performance category, we refer readers to the CY 2024 PFS final rule (88 FR 79449 through 79451).

In the CY 2026 PFS final rule (90 FR 49952), our burden estimates represent an assumed number of 20,881 respondents, which is based on submission data from the CY 2023 performance period/2025 MIPS payment year. In this proposed rule, we updated our burden estimates to represent an assumed number of respondents to 19,325, which is based on submission data from the CY 2024 performance period/2026 MIPS payment year.

In the following paragraphs, we outline the proposed changes to the MIPS Promoting Interoperability performance category reporting requirements discussed in section IV.A.4.d.(4) of this proposed rule. For the first three policy proposals, there are similar proposed policies for the Medicare Promoting Interoperability Program in the FY 2027 Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals and the Long-Term Care Hospital Prospective Payment Systems (IPPS/LTCH PPS) proposed rule (91 FR 19620 through 19629). Our burden assumptions for the MIPS Promoting Interoperability performance category proposals in this proposed rule are consistent with the burden assumptions for the Medicare Promoting Interoperability Program as described in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19760 through 19763). For the fourth policy proposal, we propose to change the burden for the MIPS Promoting Interoperability performance category due to the proposed addition of a new required measure. Lastly, we discuss the historical approach for estimating burden for this performance category and propose a reduction in the burden estimate for the proposal to remove the Security Risk Analysis measure.

First, beginning with the CY 2027 performance period/2029 MIPS payment year, we are proposing modifications to the MIPS Promoting Interoperability performance category Certified Electronic Health Record Technology (CEHRT) definition at 42 CFR 414.1305 to align with proposals to remove certain certification criteria from the Office of the National Coordinator for Health IT (ONC Health IT) Certification Program as detailed in Table C–G1 and as outlined in the Assistant Secretary for Technology Policy (ASTP)/ONC (Health Data, Technology, and Interoperability) HTI–5 proposed rule. As these proposed changes will not impact reporting burden for the MIPS Promoting Interoperability performance category, we are not proposing to modify our burden estimate for this proposal.

Second, beginning with the CY 2026 performance period/2028 MIPS payment year, we are proposing to remove the required ONC Direct Review attestation and the optional ONC-Authorized Certified Bodies (ACB) Surveillance attestation from the MIPS Promoting Interoperability performance category to reduce administrative burden. CY 2024 submission data show that 79 percent of MIPS eligible clinicians elect to report this optional ONC–ACB Surveillance attestation. If the proposal to remove the required ONC Direct Review attestation is finalized, we estimate that the removal would decrease burden by 1 minute (0.0167 hr). Therefore, we estimate that removing this attestation would result in an annual decrease in total cost of $35,595 for all responses (−0.0167 hr per response × 19,325 responses)[391] × $110.20/hr for a computer systems analyst to submit Promoting Interoperability data. Similarly, should the proposal to remove the optional ONC–ACB Surveillance attestation be finalized, we estimate that eligible clinicians who elect to submit the optional ONC–ACB Surveillance attestation would experience a decrease in burden of 1 minute (0.0167 hr) which is consistent with the CY 2027 IPPS/LTCH PPS proposed rule (91 FR 19761). Therefore, we estimate that removing this attestation would result in an annual decrease in total cost of $35,595 for all responses (−0.0167 hr per

[391] This figure is rounded to whole number.

response × 19,325 responses) [392] × $110.20/hr for a computer systems analyst to submit Promoting Interoperability data.

Third, we are proposing to modify the Electronic Prior Authorization measure to an optional (bonus) measure for the CY 2027 performance period/2029 MIPS payment year and a required measure starting with the CY 2028 performance period/2030 MIPS payment year. This measure was established in the CMS Interoperability and Prior Authorization final rule (89 FR 8758) and was referenced in the CY 2026 PFS final rule (90 FR 49952). Initially, the implementation of this measure as a requirement of the MIPS Promoting Interoperability performance category was specified starting with the CY 2027 performance period/2029 MIPS payment year. In this proposed rule, we are updating the burden estimates for such measure to reflect the proposal to require the reporting of such measure starting with CY 2028 performance period/2030 MIPS payment year. The proposal to require the use of specific Fast Healthcare Interoperability Resources (FHIR)-enabled ONC-certified health IT modules within CEHRT to complete at least one prior authorization request and determination for at least one medical item or service (excluding prescription drugs) would not impact reporting burden. Under OMB control number 0938–1278 (CMS–10552) the currently approved burden estimate for this measure is 0.5 minutes (0.0083 hours) per eligible MIPS eligible clinicians. Because we are unable to estimate the number of MIPS eligible clinicians who may attest to this as a bonus measure in CY 2027, we are not proposing to modify our burden estimates for CY 2027. If the proposal to require the Electronic Prior Authorization measure starting with CY 2028 performance period/2030 MIPS payment year is finalized, we estimate that the requirement to attest ''Yes''/''No'' to this measure would increase burden by 0.5 minutes (0.0083 hours). Therefore, we estimate the proposal to modify this measure would result in an annual increase in total cost of $17,632 for all responses (+0.0083 hours per response × 19,325 responses) [393] × $110.20/hr for a computer systems analyst to submit Promoting Interoperability data.

Fourth, we are proposing to require a new measure, Electronic Prior Authorization for Prescription Drugs, which would require the use of specific FHIR-enabled health IT modules within CEHRT to complete at least one prior authorization request and determination for prescription drugs and medications starting with the CY 2028 performance period/2030 MIPS payment year. If the proposal is finalized to require the reporting of the Electronic Prior Authorization for Prescription Drugs measure starting with the CY 2028 performance period/2030 MIPS payment year, we estimate that the requirement to attest ''Yes''/''No'' to this measure would increase burden by 0.5 minutes (0.0083 hours). Therefore, we estimate the proposal to add this measure would result in an annual increase in total cost of $17,632 for all responses (+0.0083 hr per response × 19,325 responses) [394] × $110.20/hr for a computer systems analyst to submit Promoting Interoperability data.

Lastly, starting with the CY 2027 performance period/2029 MIPS payment year, we are proposing to remove the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category to reduce burden. While the Security Risk Analysis measure has been required and included in the aggregate estimate for reporting burden for the MIPS Promoting Interoperability performance category (renamed from the Advancing Care Information performance category in the CY 2019 PFS final rule (83 FR 59719)) since the inception of MIPS under the Quality Payment Program as described in the CY 2017 Quality Payment Program final rule (81 FR 77014), we do not have a historic burden estimate attributed to this measure alone.

With the 2015 Medicare EHR Incentive Program final rule serving as the basis for developing the requirements and structure for the Advancing Care Information performance category under MIPS (81 FR 28215 through 28230), we reviewed how burden was historically estimated. We found that the 2015 Medicare EHR Incentive Program estimated burden by objective as follows: 10 minutes to attest to objectives with measures requiring a numerator and denominator to be generated, 1 minute to attest to objectives with measures with ''Yes''/''No'' attestations, and 6 hours to attest the Security Risk Analysis measure (80 FR 62918). The Security Risk Analysis measure requires providers to attest that they are protecting electronic health information which involves conducting or reviewing a security risk analysis in accordance with the requirements under 45 CFR 164.308(a)(1), including addressing the security (to include encryption) of data created or maintained by CEHRT in accordance with requirements under 45 CFR 164.312(a)(2)(iv) and 45 CFR 164.306(d)(3), implement security updates as necessary, and correct identified security deficiencies as part of the provider's risk management process.

In developing the Advancing Care Information performance category under MIPS in the CY 2017 Quality Payment Program final rule, we streamlined the submission requirements that were outlined in the 2015 Medicare EHR Incentive Program final rule and removed two objectives and their associated measures, thereby reducing burden from nearly seven hours in the Medicare EHR Incentive Program final rule to three hours for the MIPS Advancing Care Information performance category (81 FR 77510). In the CY 2026 PFS final rule (90 FR 49952), our finalized burden estimate for the reporting requirements to submit Promoting Interoperability data is 2.7 hours (162 minutes). Applying the same burden assumptions used in the 2015 Medicare EHR Incentive Program final rule of 10 minutes of burden per objectives with measures requiring the generation of a numerator/denominator and 0.5 to 1 minute of time for measures requiring ''Yes''/''No'' attestations to our currently approved requirements for reporting Promoting Interoperability data establishes a burden estimate of 36 minutes, we deduce that the remainder of time (126 minutes) can be attributed to the Security Risk Analysis measure. If the proposal to remove the required Security Risk Analysis measure is finalized, we estimate that the removal would decrease burden by 2.1 hours (126 minutes). Therefore, we estimate the proposal to remove this measure would result in an annual decrease in total cost of $4,472,247 for all responses (−2.1 hr per response × 19,325 responses) [395] × $110.20/hr for a computer systems analyst to submit Promoting Interoperability data beginning with the CY 2027 performance year/2029 MIPS payment year.

Tables D–A23 and D–A24 detail the estimated change in burden for each proposed measure/attestation change by performance year (CY 2027 performance year/2029 MIPS payment year and for the CY 2028 performance year/2030 MIPS payment year respectively) should the proposed policy changes be finalized. Each table includes an estimated total change in annual burden for submitting MIPS Promoting

[392] This figure is rounded to whole number.

[393] This figure is rounded to whole number.

[394] This figure is rounded to a whole number.

[395] This figure is rounded to a whole number.

Interoperability performance category data.

TABLE D-A23: CHANGE IN ESTIMATED BURDEN FOR PROMOTING INTEROPERABILITY PERFORMANCE CATEGORY DATA SUBMISSION FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR

Measure/Attestation	No. of Respondents	Total Annual Responses	Time per Response (hours)	Total Annual Time (hours)*	Labor Cost ($/hr)	Total Cost ($)*
Removal of ONC Direct Review Attestation +	19,325	19,325	(0.0167)	(323)	110.20	(35,595)
Removal of ONC-ACB Surveillance Attestation+	19,325	19,325	(0.0167)	(323)	110.20	(35,595)
Removal of Security Risk Analysis Measure	19,325	19,325	(2.1)	(40,583)	110.20	(4,472,247)
Total	19,325	19,325	(2.13)	(41,228)	110.20	(4,543,326)

*Total Annual Time estimates in the table are rounded to the hour and Total Cost estimates are rounded to the dollar, therefore the Total row may deviate from the sum of all rows.

+The proposals to remove the ONC attestations begin with the CY 2026 performance period/2028 MIPS payment year and will be updated under OMB control number 0938-1314.

If all policy proposals, as identified in Table D–A23 of this proposal rule, are finalized for the CY 2027 performance year/2029 MIPS payment year, we estimate a total reduction of 2.13 hours per response (0.0167 + 0.0167 + 2.1), resulting in an annual decrease in total hours of 41,228 (2.13 hr per response × 19,325 responses) [396] and total savings of $4,543,326 for all responses (−2.13 hr per response × 19,325 responses) [397] × $110.20/hr for a computer systems analyst to submit Promoting Interoperability data.

TABLE D-A24: CHANGE IN ESTIMATED BURDEN FOR PROMOTING INTEROPERABILITY PERFORMANCE CATEGORY DATA SUBMISSION FOR CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR

Measure/Attestation	No. of Respondents	Total Annual Responses	Time per Response (hours)	Total Annual Time (hours)*	Labor Cost ($/hr)	Total Cost ($)*
Add Electronic Prior Auth Measure	19,325	19,325	.0083	+161	110.20	+$17,632
Add Electronic Prior Auth for Prescription Drugs Measure	19,325	19,325	.0083	+161	110.20	+$17,632
Total	19,325	19,325	.0167	+323	110.20	+$35,595

*Total Annual Time estimates in the table are rounded to the hour and Total Cost estimates are rounded to the dollar, therefore the Total row may deviate from the sum of all rows.

If the two policy proposals, as identified in Table D–A24 of this proposed rule, are finalized starting with the CY 2028 performance year/2030 MIPS payment year, we estimate a total increase in 0.0167 hours per response (0.00833 + 0.00833), resulting in an annual increase in total hours of 323 (0.0167 hr × 19,325 responses) [398] and a cost of $35,595 for all responses (+0.0167 hr per response × 19,325 responses) [399] × $110.20/hr for a computer systems analyst to submit Promoting Interoperability data. The proposed changes relevant to the submission of Promoting Interoperability data requirements and burden will be submitted to OMB for review under control number 0938–1314 (CMS–10621).

e. ICRs Regarding Reporting for the Improvement Activities Performance Category

We refer readers to §§ 414.1355 and 414.1365(c)(3) for our previously established policies regarding reporting for the improvement activities performance category. We also refer readers to § 414.1305 for the definition of attestation, § 414.1360 for data submission requirements, and §§ 414.1380(b)(3) and 414.1365(d)(3)(iii) for improvement activities performance category scoring. For historic assumptions on reporting requirements for the improvement activities performance category, we refer readers to the CY 2024 PFS final rule (88 FR 79454 and 79455).

In section IV.A.4.d.(3) of this proposed rule, we are proposing changes to the Improvement Activities Inventory for the CY 2027 performance period/2029 MIPS payment year and subsequent years. Consistent with our assumptions in the CY 2023 PFS final rule (87 FR 70211), the CY 2024 PFS final rule (88 FR 79519), the CY 2025 PFS final rule (89 FR 98492), the CY 2026 PFS final rule (90 FR 49953), we

[396] This figure is rounded.

[397] This figure is rounded.

[398] This figure is rounded.

[399] This figure is rounded.

believe clinicians performing improvement activities will continue to perform the same activities because previously finalized improvement activities continue to apply for the current and future years unless otherwise modified via rulemaking (82 FR 54175). We refer readers to section VII.F.11.e.(2)(a) of this proposed rule for additional discussion.

Independent of these proposals, we are updating the number of submissions due to the availability of updated submission data from the CY 2024 performance period/2026 MIPS payment year. While not scored in this rule, the non-policy changes will be submitted to OMB under control number 0938–1314 (CMS–10621).

f. ICRs Regarding the Cost Performance Category

The cost performance category relies on administrative claims data. The Medicare Parts A and B claims submission process (OMB control number 0938–1197; CMS–1500 and CMS–1490S) is used to collect data on cost measures from MIPS eligible clinicians. MIPS eligible clinicians are not required to provide any documentation by Compact Disc or hardcopy. The proposal to update the Operational List of care episode and patient condition groups and codes beginning with the CY 2027 performance period/2029 MIPS payment year, detailed in section IV.A.4.d.(2) of this proposed rule, would not result in the need to add, revise, or delete any claims data fields. Consequently, we are not proposing changes under the aforementioned OMB control number.

g. ICRs Regarding Voluntary Participants Election To Opt Out of Performance Data Display on Compare Tools

As described in section IV.E.2. of this proposed rule, we are proposing to amend § 414.1395(c)(2) to remove the 1-year delay for publicly reporting new improvement activities and Promoting Interoperability measures, objectives, or activities included in a Merit-based Incentive Payment System Value Pathway (MVP), provided the data meet the public reporting standards at § 414.1395(b).

We are not updating our burden estimates under OMB control number 0938–1314 (CMS–10621) as this proposal affects the timing of public reporting for measures and activities included in MVPs but does not modify the existing process by which voluntary participants may elect to opt-out of having their performance data publicly displayed on Care Compare tools, as established under § 414.1395.

h. ICRs Regarding the Virtual Group Election

As described in section IV.A.3.d. of this proposed rule, we are proposing to include Virtual Groups in MVP reporting starting with the CY 2029 performance year/2031 MIPS payment year as the option for Traditional MIPS reporting would no longer be available. We are not updating our burden estimates under OMB control number 0938–1314 (CMS–10621) as the operational details of this proposal have not yet been developed. We will seek OMB approval for changes in burden due to this policy, once implementation details are sufficiently developed.

C. Summary of Proposed Annual Burden Estimates

Tables D–A25 through D–A27 sets out the burden for this rulemaking's proposals that are subject to the PRA. It does not score burden adjustments that are strictly based on updated data and are unrelated to any of this rule's proposals. Table D–A27 sets out the burden for this rulemaking's proposed provisions that are subject to the PRA. It does not score burden adjustments that are strictly based on updated data and are unrelated to any of the provisions.

D. Submission of PRA-Related Comments

We have submitted a copy of this proposed rule to OMB for its review of the rule's information collection requirements. The requirements are not effective until they have been approved by OMB.

To obtain copies of the supporting statement and any related forms for the proposed collections discussed previously, please visit the CMS website at *https://www.cms.gov/regulations-and-guidance/legislation/paperworkreductionactof1995/pra-listing* or call the Reports Clearance Office at 410–786–1326.

We invite public comments on these information collection, that is reporting, recordkeeping or third-party disclosure requirements, please submit your comments electronically as specified in the **DATES** and **ADDRESSES** sections of this proposed rule and identify the rule (CMS–1848–P), the ICR's CFR citation, and OMB control number.

VI. Response to Comments

Because of the large number of public comments, we normally receive on **Federal Register** documents, we are not able to acknowledge or respond to them individually. We will consider all comments we receive by the date and time specified in the **DATES** section of this preamble, and, when we proceed with a subsequent document, we will respond to the comments in the preamble to that document.

VII. Regulatory Impact Analysis

A. Statement of Need

In this proposed rule, we are proposing payment and policy changes under the Medicare PFS. Our proposed policies in this rulemaking specifically address: changes to the PFS and other changes to Medicare Part B payment policies to ensure that payment systems are updated to reflect changes in medical practice, the relative value of services, and changes in the statute; modifications to the Medicare Shared Savings Program (Shared Savings Program); updates to the Quality Payment Program (MIPS and Advanced APMs); changes to payment policies for drugs and biological products paid under Medicare Part B; changes to the Clinical Laboratory Fee Schedule requirements; other changes to Medicare Part B payment policies for Rural Health Clinics and Federally Qualified Health Centers; and changes to the regulations associated with the Ambulance Fee Schedule. The policies reflect CMS' stewardship of the Medicare program and overarching policy objectives for ensuring equitable beneficiary access to appropriate and quality medical care.

1. Statutory Provisions

a. Clinical Laboratory Fee Schedule (CLFS)—Proposed Revisions Consistent With Recent Statutory Changes

In section III.C. of this proposed rule, we propose the conforming regulations text changes for CLFS data reporting requirements due to the enactment of section 6226 of the Consolidated Appropriations Act, 2026 (CAA, 2026) (Pub. L. 119–75, February 3, 2026). Specifically, section 6226 of the CAA, 2026 revised the next required data reporting period for CDLTs that are not ADLTs to be May 1, 2026 through July 31, 2026, and specified that the applicable data collection period is January 1, 2025 through June 30, 2025. Additionally, section 6226 of the CAA, 2026 amended section 1834A(b)(3) of the Act to specify that the applicable percent was 0 percent for all of CY 2026, meaning that the payment amount determined for a CDLT for CY 2026 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2025, and to extend the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2029. Therefore, the applicable percent of up to 15 percent would apply for CYs 2027 through 2029.

2. Discretionary Provisions

a. Medicare Shared Savings Program

In section III.G. of this proposed rule, we are proposing modifications to the Shared Savings Program regulations that would accelerate accountable care service delivery, further CMS towards its goal of aligning spending and value in Original Medicare, and support achieving other related strategic objectives. The proposed changes to the Shared Savings Program include the following.

We are proposing changes to Shared Savings Program policies for determining beneficiary assignment, applicable for the performance year starting on January 1, 2028, and subsequent performance years, to exclude from assignment calculations allowed charges for primary care services billed through a non-ACO TIN by an ACO professional used in assignment and modify assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status. We are also proposing to revise the definition of primary care services for the performance year starting on January 1, 2027, and subsequent performance years, to align with payment policy proposals and include, among other services for purposes of beneficiary assignment, services for Screening, Brief Intervention, and Referral to Treatment, Vaccine Adverse Effects Management, and Advance Care Planning.

We are proposing to revise the quality performance standard and other quality reporting requirements, by extending the availability of the MIPS CQM collection type and the MIPS CQM reporting incentive for Shared Savings Program ACOs, extending the scoring of Shared Savings Program ACOs reporting Medicare CQMs using flat benchmarks, addressing ACOs' challenges with meeting the MIPS data completeness requirement, revising the Shared Savings Program scoring policy for excluded APP Plus measures and APP Plus measures that lack a benchmark, and updating the APP Plus quality measure set. We are also proposing to simplify the Shared Savings Program CEHRT use requirements by sunsetting existing Shared Savings Program CEHRT use and public reporting requirements, providing new options for ACOs to meet the Shared Savings Program CEHRT use requirement, and requiring that they publicly report their selected option. We are also seeking comment on applying electronic prior authorization measures to ACOs participating in the Shared Savings Program in future years.

We are proposing changes to the Shared Savings Program's benchmarking and financial methodology to strengthen financial incentives for ACOs to participate in the program while mitigating selection issues and benchmark rebasing concerns. We are proposing the following changes that would be applicable to agreement periods beginning on January 1, 2027, and in subsequent years: increasing the sharing rate under Level E of the BASIC track, reducing the maximum weight on the regional adjustment for lower-spending ACOs under the ENHANCED track, modifying the prior savings adjustment to increase the scaling factor, risk adjusting the 5 percent cap on upward adjustments to the historical benchmark, and incentivizing new participation through a growth adjustment to the historical benchmark. We are also proposing to reform the ACPT component of the three-way blended benchmark update factor to improve accuracy and strengthen Shared Savings Program financial incentives.

To expand the tools available to ACOs to support beneficiary engagement, we are proposing to allow eligible Shared Savings Program ACOs that have submitted a Part B cost sharing support application and for which CMS has approved their application to reduce or eliminate Part B cost sharing for eligible beneficiaries. We are also proposing to discontinue availability of the option for prepaid shared savings.

We are proposing to modify the methodology for determining quarterly advance investment payment amounts (for eligible ACOs), by removing use of the area deprivation index and adding instead a rural criterion within an approach where we would use a flat per-beneficiary payment amount. We are also proposing revisions to the definitions of experienced and inexperienced with performance-based risk Medicare ACO initiatives used in determining an ACO's eligibility for certain participation options. Finally, we are proposing to modify Shared Savings Program beneficiary notification requirements, by revising distribution timing of standardized written notices and removing the beneficiary follow-up notice.

b. Drugs and Biological Products Paid Under Medicare Part B

In section III.A.1. of this proposed rule, as part of our continued implementation of section 90004 of the Infrastructure Investment and Jobs Act (Pub. L. 117–58, November 15, 2021) (IIJA), which amended section 1847A of

the Act to require manufacturers to provide a refund to CMS for certain discarded amounts from a refundable single-dose container or single-use package drug (hereinafter, refundable drug), we discuss one application received for increased applicable percentage.

c. Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs)

In section III.B.2. of this proposed rule, we are proposing changes to the payment of Diabetes Self-Management and Training (DSMT) and Medical Nutrition Therapy (MNT) services in RHCs. We are proposing to recognize DSMT and MNT services as qualified visits that are covered and paid as stand-alone billable visits under the RHC benefit. Consequently, we are also proposing to revise § 405.2463(a) and (b)(2) to reflect that DSMT and MNT services would be stand-alone billable visits in RHCs.

In section III.B.3 of this proposed rule, we are proposing to make conforming regulatory text changes at §§ 405.2463(b)(3) and 405.2469(d) since section 6209(d) of the CAA, 2026 extended the abeyance of the RHC and FQHC mental health in-person requirements through December 31, 2027. This provision, as proposed, would require that the in-person visit requirements not apply to any services furnished through to December 31, 2027. We are also proposing technical changes to §§ 405.2464(g) and 405.2469(d).

In section III.B.4 of this proposed rule, we discuss the proposed CY 2027 FQHC PPS market basket update. Section 1834(o)(2)(B)(ii) requires the FQHC PPS base rate be updated annually by the percentage increase in a market basket of FQHC goods and services as issued through regulations, or if such an index is not available, by the percentage increase in the MEI (as defined in section 1842(i)(3) of the Act) for the year involved. For CY 2027, we are proposing to use an estimate of the 2022-based FQHC market basket to update payments to FQHCs based on the best available data. Consistent with CMS practice, we propose to use the update based on the most recent historical data available at the time of publication of the final rule.

d. Ambulatory Specialty Model (ASM)

In section III.D. of this proposed rule, we discuss proposals related to the Ambulatory Specialty Model (ASM), a mandatory alternative payment model that will be tested by the Innovation Center under the authority at section 1115A of the Act. Section 1115A of the Act authorizes the testing of innovative payment and service delivery models that reduce program expenditures while preserving or enhancing the quality of care furnished to Medicare, Medicaid, and CHIP beneficiaries.

Health care is becoming more fragmented as Medicare beneficiaries are increasingly seeing a greater number of specialists on a more regular basis. We believe there are opportunities to improve coordination between specialists and primary care providers (PCPs) and increase beneficiary engagement in care decisions, particularly with respect to preventing the onset and progression of chronic disease. ASM will evaluate select specialists that furnish a requisite volume of services related to heart failure or low back pain as measured by historic episode-based cost measure (EBCM) episode volume and test whether rewarding them based on measures of quality, cost, care coordination, and Promoting Interoperability results in enhanced quality of care and reduced costs through more effective upstream chronic condition management for ASM's targeted chronic conditions. We expect that a more targeted approach where specialists are evaluated: (1) on a set of relevant performance measures they are required to report; and (2) among specialists furnishing similar sets of services for similar chronic conditions, will produce final scores and subsequent payment adjustments that are more reflective of clinician performance. A more targeted approach to measurement will also offer more insight into how clinical decisions and processes, such as care coordination, affect patient outcomes. We believe this insight is necessary to support and encourage accountable care, increasing beneficiary access to coordinated specialty care.

We believe that ASM's meaningful comparisons of performance to similar specialists furnishing a substantial volume of services related to ASM's targeted chronic conditions when matched with a payment methodology that creates impactful Medicare Part B payment adjustments will encourage quality improvements in specialty care and meaningful engagement with PCPs to both prevent and manage the onset of chronic conditions, all while achieving net savings to Medicare.

We finalized ASM through notice and comment rulemaking in CY 2026 PFS final rule (90 FR 49562 through 49720). The proposals within this proposed rule address policy gaps and make technical or conforming updates to ensure ASM has sound and well-developed technical, administrative, and operational policies.

B. Overall Impact

We have examined the impacts of this rule as required by Executive Order 12866, Regulatory Planning and Review, Executive Order 13563, ''Improving Regulation and Regulatory Review;'' Executive Order 14192, ''Unleashing Prosperity Through Deregulation;'' the Regulatory Flexibility Act (RFA) (Pub. L. 96–354); section 1102(b) of the Act, section 202 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4); and Executive Order 13132, Federalism.

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits.

A regulatory impact analysis (RIA) must be prepared for regulatory actions that are significant under section 3(f)(1) of Executive Order 12866. Based on our estimates, OMB's Office of Information and Regulatory Affairs has determined this rulemaking is significant per section 3(f)(1)). Accordingly, we have prepared an RIA that, to the best of our ability, presents the costs and benefits of the rulemaking. The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small governmental jurisdictions. Most hospitals, practitioners, and most other providers and suppliers are small entities, either by nonprofit status or by having annual revenues that qualify for small business status under the Small Business

Administration standards. (For details, see the SBA's website at *https://www.sba.gov/document/support-table-size-standards* (refer to the 620000 series).) Individuals and States are not included in the definition of a small entity.

The RFA requires that we analyze regulatory options for small businesses and other entities. We prepare a regulatory flexibility analysis unless we certify that a rule would not have a significant economic impact on a substantial number of small entities. The analysis must include a justification concerning the reason action is being taken, the kinds and number of small entities the rule affects, and an explanation of any meaningful options that achieve the objectives with less significant adverse economic impact on the small entities.

Approximately 95 percent of practitioners, other suppliers, and

providers are considered to be small entities, based upon the SBA standards. There are over 1 million physicians, other practitioners, and medical suppliers that receive Medicare payment under the PFS. Because many of the affected entities are small entities, the analysis and discussion provided in this section, as well as elsewhere in this proposed rule is intended to comply with the RFA requirements regarding significant impact on a substantial number of small entities.

In addition, section 1102(b) of the Act requires us to prepare an RIA if a rule may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 603 of the RFA. For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of a Metropolitan Statistical Area for Medicare payment regulations and has fewer than 100 beds. Medicare does not pay rural hospitals for their services under the PFS; rather, Medicare payment is made under the PFS for physicians' services, which can be furnished by physicians and NPPs in a variety of settings, including rural hospitals. We did not prepare an analysis for section 1102(b) of the Act because we determined, and the Secretary certified, that this rulemaking will not have a significant impact on the operations of a substantial number of small rural hospitals.

Section 202 of the Unfunded Mandates Reform Act of 1995 also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2026, that threshold is approximately $193 million. This rule will impose no mandates on State, local, or tribal governments or on the private sector.

Executive Order 13132 establishes certain requirements that an agency must meet when it issues a proposed rule (and subsequent final rule) that imposes substantial direct requirement costs on State and local governments, preempts State law, or otherwise has federalism implications. Since this rulemaking does not impose any costs on State or local governments, the requirements of Executive Order 13132 are not applicable.

We prepared the following analysis, which, together with the information provided in the rest of this rule, meets all assessment requirements. The analysis explains the rationale for and purposes of this rule; details the costs and benefits of this rulemaking; analyzes alternatives; and presents the measures we will use to minimize the burden on small entities. As indicated elsewhere in this rule, we discussed various changes to our regulations, payments, or payment policies to ensure that our payment systems reflect changes in medical practice and the relative value of services and to implement provisions of the statute. We provide information for each policy change in the relevant sections of this proposed rule. We are unaware of any relevant Federal rules that duplicate, overlap, or conflict with this rule. The relevant sections of this rulemaking describe significant alternatives we considered, if applicable.

C. Executive Order 14192, ''Unleashing Prosperity Through Deregulation''

Executive Order 14192, titled ''Unleashing Prosperity Through Deregulation'' was issued on January 31, 2025, and requires that ''any new incremental costs associated with new regulations shall, to the extent permitted by law, be offset by the elimination of existing costs associated with at least 10 prior regulations.''

D. Effects of the Proposed Changes in Relative Value Units (RVUs)

1. Resource-Based Work, PE, and MP RVUs

Section 1848(c)(2)(B)(ii)(II) of the Act requires that increases or decreases in RVUs may not cause the amount of Medicare Part B expenditures for the year to differ by more than $20 million from what expenditures would have been in the absence of these changes. If this threshold is exceeded, we make adjustments to preserve budget neutrality.

Our estimates of changes in Medicare expenditures for PFS services compare payment rates for CY 2026 with payment rates for CY 2027 using CY 2025 Medicare utilization. The payment impacts described in this rule reflect averages by specialty based on Medicare utilization. The payment impact for an individual practitioner could vary from the average and will depend on the mix of services they furnish. The average percentage change in total revenues will be less than the impact displayed here because practitioners and other entities generally furnish services to both Medicare and non-Medicare patients. In addition, practitioners and other entities may receive substantial Medicare revenues for services under other Medicare payment systems. For instance, independent laboratories receive approximately 83 percent of their Medicare revenues from clinical diagnostic laboratory tests that are paid under the Clinical Laboratory Fee Schedule (CLFS).

As required by section 1848(d)(1)(A) of the Act, beginning in CY 2026, there are two separate conversion factors (CFs): one for items and services furnished by a qualifying APM participant as defined in section 1833(z)(2) of the Act (referred to as the qualifying APM conversion factor) and another for other items and services (referred to as the nonqualifying APM conversion factor), equal to the respective conversion factor for the previous year multiplied by the update established under section 1848(d)(20) of the Act for such respective conversion factor for such year. As specified by section 1848(d)(20) of the Act, the update to the qualifying APM conversion factor for CY 2027 is 0.75 percent while the update to the nonqualifying APM conversion factor for CY 2027 is 0.25 percent.

To calculate the estimated CY 2027 PFS conversion factors, we took the CY 2026 conversion factors without the payment increase of 2.50 percent provided by statute that applied to services furnished from January 1, 2026 through December 31, 2026 and multiplied them by the budget neutrality adjustment required as described in the preceding paragraphs, then multiplied by the qualifying APM and nonqualifying APM updates specified by section 1848(d)(20) of the Act. We estimate the CY 2027 PFS qualifying APM CF to be 33.1693 which reflects a 0.53 percent positive budget neutrality adjustment required under section 1848(c)(2)(B)(ii)(II) of the Act and the 0.75 percent update adjustment factor specified under section 1848(d)(20) of the Act. We estimate the CY 2027 PFS nonqualifying APM CF to be 32.8409 which reflects a 0.53 percent positive budget neutrality adjustment required under section 1848(c)(2)(B)(ii)(II) of the Act and the 0.25 percent update adjustment factor specified under section 1848(d)(20) of the Act. We estimate the CY 2027 anesthesia qualifying APM CF to be 20.4165 and the CY 2027 anesthesia nonqualifying APM CF to be 20.2143, reflecting the same overall PFS adjustments with the addition of anesthesia-specific PE and MP adjustments.

TABLE D-B1: CALCULATION OF THE CY 2027 PFS QUALIFYING APM CONVERSION FACTOR

CY 2026 Conversion Factor		33.5675
Conversion Factor without One Year 2.50% Increase		32.7488
CY 2027 Qualifying APM Update Factor	0.75 percent (1.0075)	
CY 2027 RVU Budget Neutrality Adjustment	0.53 percent (1.0053)	
CY 2027 Conversion Factor		**33.1693**

TABLE D-B2: CALCULATION OF THE CY 2027 PFS NON-QUALIFYING APM CONVERSION FACTOR

CY 2026 Conversion Factor		33.4009
Conversion Factor without One Year 2.50% Increase		32.5863

CY 2026 National Average Anesthesia Conversion Factor		20.4976
Conversion Factor without One Year 2.50% Increase		19.9976
CY 2027 Non-Qualifying APM Update Factor	0.25 percent (1.0025)	
CY 2027 RVU Budget Neutrality Adjustment	0.53 percent (1.0053)	
CY 2027 Anesthesia Fee Schedule Practice Expense and Malpractice Adjustment	0.30 percent (1.0030)	
CY 2027 Conversion Factor		**20.2143**

Table D–B5 shows the impact on PFS payment for physicians' services based on the proposed policies included in this rule. To the extent that there are year-to-year changes in the volume and mix of services provided by practitioners, the actual impact on total Medicare revenues will be different from those shown in Table D–B5 (CY 2027 PFS Estimated Impact on Total Allowed Charges by Specialty).

In recent years, we have received requests from interested parties to provide more granular information that separates the specialty-specific impacts by site of service. These interested parties have presented us with high-level information suggesting that Medicare payment policies are directly responsible for consolidating privately owned physician practices and freestanding supplier facilities into larger health systems. Their concerns highlight a need to update the information under the PFS to account for current trends in healthcare delivery, especially concerning independent versus facility-based practices. We published an RFI in the CY 2023 PFS proposed rule to gather feedback on this issue and refer readers to the discussion in the CY 2023 PFS final rule (87 FR 69429 through 69438). As part of our holistic review of how best to update our data and offer interested parties additional information that addresses some of the concerns raised, we have recently improved our current suite of public use files (PUFs) by including a new file that shows estimated specialty payment impacts at a more granular level, specifically by showing ranges of impact for practitioners within a specialty. This file is available on the CMS website under ''downloads'' for the CY 2027 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*.

Some of the proposed policies in this rule are estimated to have differential effects depending on the site of service, therefore, we are publishing the impact tables that include a facility/non-facility breakout of payment changes, as we believed that displaying the total impact by specialty alone, without the setting of care context, could be misleading for interested parties. The following is an

explanation of the information represented in Table D–B5.

- Column A (Specialty): Identifies the specialty for which data are shown.
- Column B (Setting): Identifies the facility or non-facility setting for which data are shown.
- Column C (Allowed Charges): The aggregate estimated PFS allowed charges for the specialty based on CY 2025 utilization and CY 2026 rates. That is, allowed charges are the PFS amounts for covered services and include coinsurance and deductibles (which are the financial responsibility of the beneficiary). These amounts have been summed across all services furnished by physicians, practitioners, and suppliers within a specialty to arrive at the total allowed charges for the specialty.
- Column D (Impact of Work RVU Changes): This column shows the estimated CY 2027 impact on total allowed charges of the changes in the work RVUs, including the impact of changes due to potentially misvalued codes.
- Column E (Impact of PE RVU Changes): This column shows the estimated CY 2027 impact on total allowed charges of the changes in the PE RVUs.
- Column F (Impact of MP RVU Changes): This column shows the estimated CY 2027 impact on total allowed charges of the changes in the MP RVUs.
- Column G (Combined Impact): This column shows the estimated CY 2027 combined impact on total allowed charges of all the changes in the previous columns. Column G may not equal the sum of columns D, E, and F due to rounding.

BILLING CODE 4169–69–C

2. CY 2027 PFS Impact Discussion

a. Changes in RVUs

The most widespread specialty-level impacts of the RVU changes are generally related to the changes to RVUs for specific services resulting from the misvalued code initiative, including RVUs for new and revised codes. The proposals to update code valuation and improve the accuracy of the practice expense methodology would have a significant positive impact on clinical psychologists and clinical social workers, with smaller increases to physical and occupational therapists, interventional radiology, and vascular surgery. To a lesser degree, projected increases for some specialties would result from the proposed changes to HCPCS code G2211 and the fourth and final year of the behavioral health work update. Increases would also result from proposed increases in valuation for particular services after considering the recommendations from the American Medical Association's (AMA) Relative Value Scale Update Committee (RUC) and CMS review, and increased payments resulting from supply and equipment pricing updates. For independent laboratories, it is important to note that these entities receive approximately 83 percent of their Medicare revenues from services that are paid under the Clinical Lab Fee Schedule.

Specialties that would see a significant decrease include dermatology, otolaryngology, orthopedic surgery, and hand surgery, and to a smaller extent, ophthalmology, podiatry, audiologists, neurosurgery, portable x-ray suppliers, and plastic surgeons. These changes can largely be attributed to the proposed changes to modifier –25 and the proposal to remove the Indirect Practice Cost Index (IPCI) from the calculation of the PE RVUs, although the effects on PE are mitigated by the proposed PE stabilization adjustment. The estimated impacts also reflect decreased payments due to continued implementation of previously finalized code-level reductions that are being phased in over several years.

The proposal to reduce payment when a separately identifiable office/outpatient E/M visit is furnished by the same physician (or a physician in the same group practice) on the same day as a 0-, 10-, or 90-day global procedure and identified on the claim with modifier –25 would have the largest negative impact on otolaryngology, dermatology, and podiatry, and to a smaller extent, hand surgery, physicians assistant, and colon and rectal surgery. These specialties frequently report E/M services with modifier –25 in conjunction with a 0-, 10-, or 90-day global procedure. Most other specialties receive a small increase due to the redistribution of those RVUs. Our utilization estimates for this proposal are reflected in the file titled ''CY 2026 PFS Proposed Rule 2025 Utilization Data Crosswalked to 2027'' available under ''downloads'' for the CY 2027 PFS proposed rule on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*.

The proposal to replace HCPCS code G2211 with a modifier (MOD1) that is set to 16 percent of the total RVUs for the E/M service on the claim is expected to have minimal impact given that the volume previously reported using HCPCS code G2211 would now be reported with the modifier, and that was accounted for using the weighted average of the percent increase for G2211 utilization and adjusted for budget neutrality. The proposal to pay for services furnished in an ACO using a modifier (MOD2) that pays 32 percent of the total RVUs for the E/M service on the claim is expected to increase payment for practitioners that furnish a higher percentage of their services in ACOs. Our utilization estimates for MOD1 and MOD2 are reflected in the file titled ''CY 2026 PFS Proposed Rule 2025 Utilization Data Crosswalked to 2027'' available under ''downloads'' for the CY 2027 PFS proposed rule on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*.

We often receive comments regarding the changes in RVUs displayed on the specialty impact table (Table D–B5), including comments received in response to the valuations. We remind interested parties that although the estimated impacts are displayed at the specialty level, typically, the changes are driven by the valuation of a relatively small number of new and potentially misvalued codes. The percentage changes in Table D–B5 are based upon aggregate estimated PFS allowed charges summed across all services furnished by physicians, practitioners, and suppliers within a specialty to arrive at the total allowed charges for the specialty and compared to the same summed total from the previous calendar year. Therefore, they are averages and may not necessarily represent what is happening to the particular services furnished by a single practitioner within any given specialty.

As previously discussed, we have reviewed our suite of PUFs and have worked on new ways to offer interested parties' additional information that addresses concerns about the lack of granularity in our impact tables. To illustrate how impacts can vary within specialties, we created a PUF that models the expected percentage change in total RVUs per practitioner. We also note the code level RVU changes are available in the Addendum B PUF available on the CMS website under ''downloads'' for the CY 2027 PFS proposed rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*.

The specialty impacts displayed in Table D–B5 reflect changes within the pool of total RVUs. The specialty impacts table, therefore, includes any changes in spending that result from proposed policies that are subject to the statutory budget neutrality requirement at section 1848(c)(2)(B)(ii)(II) of the Act but does not include any changes in spending which result from proposed policies that are not subject to the statutory budget neutrality adjustment, and therefore, have a neutral impact across all specialties. The 0.75 percent and 0.25 percent updates to the CY 2027 and nonqualifying APM conversion factors, respectively, are statutory changes that take place outside of BN, and therefore, are not captured in the specialty impacts displayed in Table D–B5.

b. Impact

Column G of Table D–B5 displays the estimated CY 2025 impact on total allowed charges, by specialty, of all the RVU changes. A table showing the estimated impact of all of the changes on total payments for selected high-volume procedures is available under ''downloads'' on the CY 2027 PFS proposed rule website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/PFS-Federal-Regulation-Notices.html*. We selected these procedures for the sake of illustration from among the procedures most commonly furnished by a broad spectrum of specialties. The change in both facility rates and non-facility rates are shown. For an explanation of facility and non-facility PE, we refer readers to Addendum A on the CMS website at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/PhysicianFeeSched/*.

E. Effects of the Proposed Changes Related to Telehealth Services

We are proposing the addition of several codes to the Medicare Telehealth Services List, including HCPCS codes GAPC1, GAPC2, GSMAS, GSLPP, and GADV1. We are proposing to revise the code descriptors for CPT codes G0508 and G0509. We are proposing to allow teaching physicians to bill for services involving residents when either the teaching physician or resident is in the same physical location as the beneficiary. These services, in addition to other Medicare Telehealth Services, are expected to substitute for in-person visits and as such would not have increase overall utilization of these services.

Section 6209(a) and (b) of the Consolidated Appropriations Act, 2026 (CAA, 2026) (Pub. L. 119–75, February 3, 2026) extends the flexibilities for Medicare telehealth services to remove the geographic restrictions, expand the list of acceptable originating sites, and expand the array of practitioners eligible to furnish telehealth services from January 30, 2026 to the extended date of December 31, 2027. Section 6209(d) of the CAA, 2026 delays the in-person visit requirements for mental health services furnished through telehealth from January 30, 2026 to the extended date of January 1, 2028. Section 6209(e) of the CAA, 2026 extends the flexibilities to allow audio-only Medicare telehealth services from January 30, 2026 to the extended date of January 1, 2028. Additionally, section 6209(g) of the CAA, 2026, requires CMS to establish modifiers for telehealth services in certain instances, effective January 1, 2027. We anticipate that our provisions will result in continued utilization of services that can be furnished as Medicare telehealth services during CY 2027 at levels comparable to observed utilization of these services during CY 2026.

F. Other Provisions of the Proposed Rule

1. Impacts Related to Technical Corrections of Comprehensive Outpatient Rehabilitation Facility (CORF) Services Regulations

As discussed in section II.F. of this proposed rule, we are proposing to amend the regulatory text at §§ 410.105 and 414.1105 for accuracy that we overlooked during CY 2008 PFS rulemaking when we amended § 410.100. As such, there are no impacts for the policies in section II.F. of this proposed rule.

2. Impacts Related to Drugs and Biological Products Paid Under Medicare Part B: Discarded Drugs

Section 90004 of the Infrastructure Investment and Jobs Act (Pub. L. 117–58, November 15, 2021) amended section 1847A of the Act to require manufacturers to provide a refund to CMS for certain discarded amounts from a refundable single-dose container or single-use package drug. The refund amount is either as noted in section 1847A(b)(1)(B) of the Act in the case of a single source drug or biological or as noted in section 1847A(b)(1)(C) of the Act in the case of a biosimilar biological product, multiplied by the amount of discarded drug that exceeds an applicable percentage, which is required to be at least 10 percent, of total charges (subject to certain exclusions) for the drug in a given calendar quarter. In the CY 2023, 2024, and 2025 PFS final rules, we finalized several policies to implement the provision. In December of 2025, CMS sent discarded drug refund reports for CY 2023 ''updated refund quarters'' and CY 2024 ''new refund quarters,'' as defined at § 414.902. The total refunds owed for these quarters amount to over $173 million, which was deposited into the Supplementary Medical Insurance trust fund, as required by law. In section III.A.1 of this proposed rule, we discuss one application (CMS 10835, OMB 0938–1435) for increased applicable percentage which will have no impact on Medicare spending.

3. Impacts Related to Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs)

In section III.B.2.c. of this proposed rule, to improve access to preventive services in RHCs, we propose changes to the payment of Diabetes Self-Management and Training (DSMT) and Medical Nutrition Therapy (MNT) services in RHCs. We are proposing to

recognize DSMT and MNT services as qualified visits that are covered and paid as stand-alone billable visits under the RHC benefit. A national claims-based analyses of evaluation and management billing patterns indicated that a nominal volume of DSMT and MNT services were bundled within payments to RHCs during 2025.

Since utilization of DSMT and MNT services are generally underutilized by the Medicare population, we believe that increase to Medicare Part B expenditures due to the proposal would be negligible. As discussed in section III.B.2.c of this proposed rule, an analysis of Medicare claims data from 2024 indicate that utilization of DSMT and MNT in RHC settings is substantially lower than in comparable care settings. In CY 2024, DSMT services were furnished to approximately 125 RHC beneficiaries, representing 0.005 percent of the total RHC beneficiary population of approximately 2.3 million. MNT services were furnished to approximately 439 RHC beneficiaries, representing 0.019 percent of the total RHC beneficiary population. On a claims basis, DSMT accounted for 0.002 percent and MNT for 0.007 percent of total RHC claims in CY 2024. By comparison, FQHCs, showed DSMT utilization rates approximately 22 times higher and MNT utilization rates approximately 28 times higher than RHCs on a per-beneficiary basis. On a claim basis, FQHC utilization of DSMT and MNT exceeded RHC utilization by approximately 31 times and 32 times, respectively. Rural physician offices, which share the geographic and demographic characteristics of RHC patient populations, showed DSMT and MNT utilization rates approximately 17 times and 7 times higher than RHCs, respectively, on a per-beneficiary basis. The analysis further demonstrated that within the PFS setting where DSMT and MNT are most readily identifiable in claims data, these services represent a very small share of total Medicare spending—less than 0.01 percent and 0.02 percent of total PFS line payments, respectively, in CY 2024. We believe that while our proposal would support an increase in the furnishing DSMT and MNT at RHCs, we do not expect a significant increase for CY 2027 since RHCs would need to determine potential changes to their care delivery and staffing which may impact timing for uptake.

4. Impacts Related to the Clinical Laboratory Fee Schedule (CLFS): CAA, 2026

In section III.D. of this proposed rule, we outline statutory amendments to section 1834A of the Act that revise the data reporting period, data collection period, and requirements for the phase-in of payment reductions under the CLFS. In accordance with section 6226 of the CAA, 2026, we are proposing to make certain conforming changes to the data reporting and payment requirements at 42 CFR part 414, subpart G. Specifically, we are proposing to revise § 414.502 to update the definitions of both the ''data collection period'' and ''data reporting period,'' specifying that the data collection period is the 6-month period from January 1 through June 30, during which applicable information is collected and that precedes the data reporting period, and that the data reporting period for CDLTs that are not ADLTs is the 3-month period, May 1 through July 31, and for ADLTs is the 3-month period, January 1 through March 31, during which a reporting entity reports applicable information to CMS and that follows the preceding data collection period.. We are also proposing to revise § 414.504(a)(1) to indicate that initially, data reporting begins January 1, 2017, and is required every 3 years beginning May 1, 2026. In addition, we are proposing to make conforming changes to our requirements for the phase-in of payment reductions to reflect the amendments in section 6226 of the CAA, 2026. Specifically, we are proposing to revise § 414.507(d) to indicate that for CY 2026, payment may not be reduced by more than 0.0 percent as compared to the amount established for CY 2025, and for CYs 2027 through 2029, payment may not be reduced by more than 15 percent as compared to the amount established for the preceding year.

We recognize that private payor rates for CDLTs paid on the CLFS and the volumes paid at each rate for each test, which are used to determine the weighted medians of private payor rates for the CLFS payment rates, have changed since the first data collection period (January 1, 2016 through June 30, 2016) and data reporting period (January 1, 2017, through March 31, 2017). In addition, as outlined in section III.C. of this proposed rule, in the CY 2019 PFS final rule (83 FR 59671 through 59676), we amended the definition of applicable laboratory to include hospital outreach laboratories that bill Medicare Part B using the CMS–1450 14x Type of Bill. As such, the CAA, 2026 amendments to the data reporting period will implement the use of updated private payor rate data to set revised CLFS payment rates for CDLTs that are not ADLTs.

Due to unforeseen changes in private payor rates due to shifts in market-based pricing for laboratory tests and the unpredictable nature of test volumes and their impact on calculating updated CLFS payment rates based on the weighted median of private payor rates, for purposes of this proposed rule, we are unable to estimate a budgetary impact. In other words, to assess the impact of implementation of updated CLFS rates, we will need to calculate weighted medians of private payor rates based on new data and compare the revised rates to the current rates. As such, we believe that we will only know the impact of the CAA, 2026 provisions after collecting actual updated applicable information from applicable laboratories and calculating the updated CLFS rates.

5. Ambulatory Specialty Model (ASM)

In section III.D. of this proposed rule, we discuss the Ambulatory Specialty Model (ASM) tested by the CMS Center for Medicare and Medicaid Innovation (hereinafter ''Innovation Center'') under the authority of section 1115A of the Act. Section 1115A of the Act authorizes the Innovation Center to test innovative payment and service delivery models to reduce program expenditures while preserving or enhancing the quality of care furnished to Medicare, Medicaid, and Children's Health Insurance Program beneficiaries. ASM will test whether adjusting payment for eligible specialists who furnish services related to ASM's targeted chronic conditions (that is, heart failure and low back pain) based on performance across targeted measures of quality, cost, care coordination, and meaningful use of certified electronic health record (EHR) technology (CEHRT) results in enhanced quality of care and reduced costs through more effective upstream chronic condition management. By testing ASM, we aim to reduce avoidable hospitalizations and unnecessary procedures, improve patient experience and outcomes, and lower Original Medicare expenditures by incentivizing preventive care, more effective management of chronic conditions, and enhanced coordination and collaboration among specialists and primary care providers. We finalized ASM's provisions in the CY 2026 PFS final rule (90 FR 49562 through 49720), including the framework for identifying ASM participants, performance

evaluation, scoring, and payment adjustments.

a. Proposed Effects of the Ambulatory Specialty Model

Based on feedback we received from interested parties after the publication of the CY 2026 PFS final rule and our own internal review, we propose several technical refinements and adjustments to ASM, including but not limited to revising select definitions, revising and adding ASM participant exceptions from specific ASM requirements, adjusting data submission requirements, incorporating a rural scoring adjustment to final scores, adjusting provisions related to collaborative care arrangements under ASM, and making minor adjustments to specific ASM performance category policies in this proposed rule. We believe these proposals would improve the clarity, practicality, and alignment of ASM implementation. Further, our proposals would not modify the fundamental framework of ASM for identifying ASM participants over the course of the ASM test period, overall performance evaluation, scoring, or payment adjustments and continue to support CMS priorities related to reducing low-value care, promoting preventive care, enhancing management of chronic conditions, and improving coordination and collaboration among specialists and primary care providers.

Accordingly, we believe our proposals in this proposed rule would not increase federal costs or alter the estimated Medicare program savings described in the CY 2026 PFS final rule (90 FR 49969 through 49975). In the CY 2026 PFS final rule, we estimated an impact of $177 million in net savings to the Medicare program due to ASM from January 1, 2029 through December 31, 2033 (90 FR 49972). This estimate reflects relevant finalized provisions including the ASM test period, geographic scope, participant eligibility, ASM risk levels, the amount of ASM incentive pools distributed to ASM participants in the form of payment adjustments, and the estimated amount of Medicare Part B covered professional service payments subject to ASM payment adjustments. We refer readers to the ASM section of the regulatory impact analysis of CY 2026 PFS final rule for additional information on our methodology and sensitivity analysis (90 FR 49969 through 90 FR 49975). Because we do not propose changes to key assumptions used to previously calculate the Medicare program savings estimate, we do not expect that the proposals in this proposed rule to materially affect the Medicare program savings estimates in the CY 2026 PFS final rule. For example, we do not anticipate that the proposed provisions related to ASM participant exceptions from specific ASM requirements would substantially affect the number of ASM participants meeting ASM requirements over the ASM test period because we believe any exceptions would be balanced by other participation provisions that allow for clinicians who newly meet the ASM participant eligibility criteria to be added as ASM participants over the course of the ASM test period. Therefore, ASM's previously estimated financial impact to the Medicare program remains unchanged from the CY 2026 PFS final rule.

6. Limiting Medicare Coverage of Certain Individuals

Section 71201 of the Working Families Tax Cut (WFTC) legislation, which added section 1899C to the Social Security Act (the Act), restricts Medicare eligibility to individuals who meet one of the following criteria: (1) U.S. citizens or nationals; (2) lawful permanent residents; (3) Cuban and Haitian entrants; or (4) individuals who lawfully reside in the United States in accordance with a Compact of Free Association. Individuals who do not meet these criteria and who were enrolled in Medicare on or before July 4, 2025, will have their coverage terminated effective February 1, 2027, which is the date that is 18 months after enactment of the WTFC legislation (July 4, 2025). As established in section 1899C(a) of the Act, individuals enrolled after July 4, 2025, who do not meet the eligibility requirements, are subject to denial or termination under the framework established at proposed §§ 406.14, 406.28 and 407.27.

Based on estimates from OACT, approximately 32,000 individuals are projected to lose Medicare coverage beginning in 2027, representing approximately 0.05 percent of the total Medicare-aged enrollment. OACT's estimate was derived from a 2025 Pew Research study on race and ethnicity in the United States and by using a Congressional report authored by the Department of Homeland Security (DHS). In addition, citing research on lower health care utilization by immigrants, OACT assumes that affected individuals have average Medicare spending equal to approximately two-thirds of the average Medicare beneficiary, reflecting the generally healthier and younger age profile of this population, as well as lower utilization due to increased barriers in accessing health care including language barriers, limited familiarity with the U.S. health system, and concerns related to immigration status that may discourage enrollment and utilization even among those who are eligible. The population captured in this estimate is certain immigrants with temporary protections who no longer meet the revised eligibility requirements, including those with pending asylum applications, parolees, temporary protected status, and victims of crime and violence.

TABLE D-B6: ESTIMATED IMPACT ON MEDICARE SPENDING – LIMITING MEDICARE COVERAGE OF CERTAIN INDIVIDUALS ($ MILLIONS)

Year	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2027-2036 Total
FY Cash	-$220	-$390	-$420	-$450	-$490	-$520	-$560	-$600	-$640	-$680	-$4,970

Source: Office of the Actuary (OACT), May 1, 2026. Negative values indicate reductions in Medicare program outlays.

The financial impact of this provision is classified as a transfer — specifically, a reduction in Medicare program outlays that would otherwise have been paid to plans and providers on behalf of affected individuals. Based on OACT's estimates, the 10-year reduction in Medicare spending attributable to this provision is approximately $4.97 billion, ranging from approximately $220 million in 2027 to approximately $680 million in 2036 (see Table D–B6).

Disenrollments from Medicare Advantage, Part D, and Medicare cost plans resulting from loss of Part A or Part B entitlement will be processed automatically by CMS when SSA provides updated eligibility and

entitlement records. Plans do not process these disenrollments and are not required to provide additional notification, as SSA provides a loss of entitlement notice directly to affected individuals. All information impacts related to the procedural steps plans must take to receive and process enrollment and disenrollment transactions have already been accounted for under OMB control numbers 0938–0753 (CMS–R–267) and 0938–0964 (CMS–10141). The burden associated with the revision of Medicare initial enrollment forms to support eligibility determinations under this provision is described in the Collection of Information Requirements section of this rule.

Dahl and Forbes (2023) estimate that 46 percent of individuals are willing to pay $638 per person, in 2011 dollars—or approximately $873 when updated for inflation—to avoid switching medical providers (specifically, primary-care physicians).[400] For purposes of this regulatory impact analysis, it is assumed that $873 is a reasonable estimate of an average that includes the 46-percent of WTP amounts above it and the 54-percent below. Multiplying this $873 annual amount by 32,000 disenrollments yields a cost estimate of $28 million. This quantitative estimate is characterized by various forms of uncertainty, including:

- *Tendency toward underestimation.* Switching insurance plans, or newly lacking insurance coverage altogether, involves a more sweeping set of changes than just reestablishing a new primary-care physician, so WTP to avoid the latter probably understates WTP to avoid the former.
- *Tendency toward overestimation.* The relatively low level of churn associated with employer-sponsored insurance (ESI) may offer a greater opportunity to establish doctor-patient relationships than what is available to individuals affected by this provision (due to many of them having non-permanent immigration status), so extrapolating an ESI-derived estimate may overstate the WTP for continuity that would be relevant for this regulatory impact analysis.

7. Medicare Prescription Drug Inflation Rebate Program

In section III.F. of this proposed rule, as part of our continued implementation of the Inflation Reduction Act of 2022 (IRA), which established the Medicare Prescription Drug Inflation Rebate Program under sections 11101 and 11102 of the Act, we are proposing several modifications. For the Medicare Part B Drug Inflation Rebate Program, this rulemaking proposes to modify the excluded product category for Part B rebatable drugs so that the exclusion applies only to certain skin substitute products and clarify what Consumer Price Index for all Urban Consumers (CPI–U) data CMS would use in the event CPI–U data are unavailable. Additionally, we propose to clarify the definition of ''first marketed date'' as used in the context of the Part B Drug Inflation Rebate Program. For the Medicare Part D Drug Inflation Rebate Program, this rulemaking proposes to clarify what CPI–U data CMS would use in the event CPI–U data are unavailable, a modification to the methodology finalized in the CY 2026 PFS final rule to account for 340B-eligible units for AIDS Drug Assistance Programs (ADAPs), and to require all providers and suppliers that are covered entities as defined under § 10.3 (hereinafter collectively ''340B providers'' unless otherwise noted) to submit data elements from their Part D 340B claims to the 340B repository beginning in 2027.

We do not expect the proposed policies regarding the Medicare Part B Drug Inflation Rebate Program and the Medicare Part D Drug Inflation Rebate Program to have a material impact on the calculation of total rebates in aggregate, as these proposals are refinements to regulatory requirements that improve program efficiency and do not otherwise change the current scope of rebatable drugs.

In section III.F.3.c.2.c. of this proposed rule, we are proposing to require all 340B providers to submit data elements from their Part D 340B claims for all covered Part D drugs billed to Medicare Part D by such covered entity or its contractor(s) beginning with claims with a date of service on or after in 2027. 340B providers would be required to follow the processes and requirements that CMS established for voluntary reporting starting in 2026 and the associated information collection currently approved under OMB control number 0938–1485. CMS would require that each 340B provider report data on a quarterly basis (though they may choose to submit more frequently) within 1 calendar quarter following the close of the relevant calendar quarter. CMS would consider all data elements received by the 340B repository to be associated with Part D 340B claims; therefore, the 340B repository would rely on the accuracy and completeness of the submitted, certified data to the 340B repository to verify the 340B status of a claim, and CMS would analyze these data to determine if they could be used reliably in the future to remove 340B units from Part D inflation rebate calculations in accordance with section 1860D–14B(b)(1)(B) of the Act. Under this process, CMS would require, as part of every submission, 340B providers (or an individual or contractor with the delegated authority as an authorized representative of the 340B provider to perform the certification) to certify that the data elements from all claims submitted to the 340B repository are from verified 340B claims and, to the best of the 340B provider's knowledge, its submissions include all Part D 340B claims for the 340B provider at the time of submission for the relevant period. 340B providers, or their authorized representative, would be required to certify the completeness and accuracy of the data submitted and to certify that the submitter is authorized to submit on behalf of the 340B provider.

In section III.F.3.c.1. of this proposed rule, we are proposing a modification to the Prescriber-Pharmacy Methodology whereby all claims for Part D drugs dispensed to beneficiaries identified as having ADAP supplemental coverage would be treated as 340B-eligible and excluded from Part D inflation rebate calculations, with safeguards to prevent double-counting of units already identified under the existing methodology. This proposed modification addresses a limitation to the Prescriber-Pharmacy Methodology that may under-identify 340B units for drug claims associated with ADAPs that use pharmacies not registered in the OPAIS database as contract pharmacies. This change may result in some overestimation of 340B-eligible units associated with ADAPs, although it is expected to have minimal or no impact on the percentage of Part D units identified as 340B eligible for most drug classes with the exception of antiretroviral medications used in the treatment of HIV/AIDS. The proposed change would be effective for Rebate Reports issued for applicable periods beginning October 1, 2025 and subsequent applicable periods.

In sections III.F.2.c. and III.F.3.b. of this proposed rule, we are proposing to amend §§ 427.302, 428.20, and 428.202 to address gaps in monthly CPI–U data by establishing a methodology that uses the first available CPI–U data following any unavailable month. CMS calculates the inflation-adjusted payment amount for Part B rebatable drugs using benchmark and rebate period CPI–U

[400] Dahl, G.B. & Forbes, S.J. (2023). Doctor switching costs. *Journal of Public Economics, 221,* 104858, *https://doi.org/10.1016/j.jpubeco.2023.104858.*

data, with the benchmark period CPI–U determined based on a drug's FDA approval and first marketed date, and the rebate period CPI–U set as the greater of the benchmark CPI–U or the CPI–U from two calendar quarters prior to the applicable quarter. CMS calculates inflation-adjusted payment amount for Part D rebatable drugs using benchmark period and applicable period CPI–U data, with the benchmark period CPI–U determined based on a drug's FDA approval and first marketed date, and the applicable period CPI–U set as the CPI–U for the first month of the applicable period. However, it was necessary to account for situations in which a monthly CPI–U figure is unavailable. Alternative approaches, including the Treasury Department's inflation contingency index, a CMS-calculated inflation factor, or using the prior month's data were considered but not proposed as either less consistent with statutory requirements or administratively impracticable.

We do not anticipate our inflation rebate proposed policies will result in an incrementally significant financial impact on the Medicare program relative to a baseline that reflects the status quo in the absence of any modifications to inflation rebate regulations at parts 427 and 428 as these finalized policies are refinements to regulatory requirements.

8. Medicare Shared Savings Program

a. General Impacts

As of January 1, 2026, the Shared Savings Program has 511 ACOs with over 700,000 healthcare providers and organizations providing care to over 12.6 million assigned beneficiaries.[401] The policies in this proposed rule are designed, in part, to strengthen financial incentives for ACOs to participate in the Shared Savings Program while mitigating selection issues and benchmark rebasing concerns, expand the population of Original Medicare beneficiaries for which ACOs are held accountable for quality and cost of care while minimizing gaming, advance ACO use of digital quality measures and reduce participant burden, and increase beneficiary engagement.

As we described in the CY 2026 PFS final rule (90 FR 32814), the ACOs in the program in PY 2023 combined to cover $128 billion in benchmark target spending. Actual ACO spending totaled approximately $123 billion—about $5.2 billion below combined benchmark. After accounting for $3.1 billion in net shared savings to ACOs, the remaining difference of $2.1 billion would represent federal savings from the program if benchmarks proved to be a perfect counterfactual in aggregate. The Regulatory Impact Analysis in the December 2018 final rule (see 83 FR 68044 through 68050) provided evidence that the benchmarks for PY 2016 combined to represent a lower spending target than the theoretical counterfactual for estimating what spending would have been in the total FFS Medicare Program had ACOs not been present that year. Evidence included all of the following:

- Lower combined market level spending trends observed for cohorts of Hospital Referral Regions (HRRs) with significant ACO formation relative to other HRRs without material ACO activity.
- Spillover effects on spending outside of ACO benchmarks, including non-assigned beneficiaries served by ACO providers and suppliers.
- Program design elements that restrained benchmark levels, including rebasing with agreement periods of only 3 years, feedback of communal ACO effects on national trends used to update benchmarks, and restrictions on risk adjustment.

The Regulatory Impact Analysis in the December 2018 final rule (83 FR 68048) estimated that ACOs may have been responsible for half of the 1.2 percent difference in spending trend observed between national average and the subset of HRRs with minimal ACO activity through 2016. This scaled impact represented about four times the gross savings measured relative to benchmarks, or about 0.5 percent net savings across the entire FFS program after accounting for shared savings payments despite benchmarks only officially showing roughly equivalent overall reductions in spending relative to benchmark compared to total outlays from shared savings payments. Since 2016, changes to the Shared Savings Program have potentially moved the benchmarks closer to what the spending would have been in the absence of the program.

In the CY 2026 PFS final rule (90 FR 49975 through 49976), we explained that updating the earlier study to compare more recent trends for markets with varying levels of ACO activity requires updates to the initial study approach, as ACOs have become active in an increasing majority of markets across the nation. There no longer exists a sufficient number of HRRs with nominal ACO penetration in 2023 to construct a de facto counterfactual similar to the study in the December 2018 final rule. An alternate method, however, continued to show spending trends inversely correlated with ACO penetration over time. Roughly 5 percent of beneficiaries live in HRRs with ACO penetration consistently below the national average by 10 percentage points or more over the 2013 to 2023 time series (''Lagging''), while about 9 percent of beneficiaries live in HRRs with ACO penetration 10 percentage points or more above the national average over the same period (''Leading''). Relative to the 2011 base year immediately preceding the Shared Savings Program's introduction, growth in average unadjusted per capita spending in 2023 for Lagging and Leading markets was 4.3 percent higher and 3.9 percent lower than the national average. The divergence in spending growth was even wider after HCC risk adjustment: 5.3 percent higher for Lagging markets and 4.6 percent lower for Leading markets.

These market trends potentially overstate the impact that ACOs may have had on program spending in 2023. The portion of the difference in spending growth driven by risk adjustment may reflect efforts by ACOs to increase coding intensity. Leading markets may exhibit higher participation rates in CMMI models. ACO participation may naturally flock to markets with lower trend for exogenous reasons. Still, conservatively assuming only 35 percent of the unadjusted trend gap is causally related to Shared Savings Program ACOs would roughly validate the $5.2 billion gross savings indicated by comparing aggregate program benchmarks to actual ACO spending in 2023, and the roughly $2 billion in net savings to FFS Medicare. A more optimistic estimate, assuming Shared Savings Program ACOs were responsible for 50 percent of the risk-adjusted spending growth difference (mirroring assumptions used in the December 2018 final rule), would imply net savings roughly 3 times greater, or roughly $6 billion net savings for FFS Medicare.

In the CY 2026 PFS final rule (90 FR 49976), we explained that a study of benchmark performance for cohorts of ACOs that participated in both PY 2022 and PY 2023 revealed that the BASIC track is the primary driver of net savings (as measured by program benchmark target spending less actual spending and shared savings payments). An updated analysis, summarized in Table D–B7, finds that ACOs remaining in the BASIC track continued to demonstrate roughly 50 percent higher net savings in PY 2024 (2.3 percent of benchmark) than

[401] See CMS, ''Shared Savings Program Fast Facts—As of January 1, 2026'', available at *https://www.cms.gov/files/document/2026-shared-savings-program-fast-facts.pdf*.

ACOs that remained in the ENHANCED track over the same three year period (1.5 percent of benchmark)—where 'net savings' is calculated as the difference in combined cohort spending from combined cohort benchmark spending net of combined cohort shared savings outlays, expressed as percentage of combined cohort benchmark (column D in Table D–B7). Meanwhile, ACOs moving into the ENHANCED track from the BASIC track show a marked decline in net savings. Thirty-eight ACOs moved from the BASIC track in PY 2022 (with net savings of 2.5 percent) to the ENHANCED track by PY 2024 with net savings dropping to 1.7 percent of benchmark.

TABLE D-B7: WEIGHTED AVERAGE FINANCIAL PERFORMANCE BY ACO COHORT DEFINED BY PATH OF PARTICIPATION OVER PY 2022 TO PY 2024 ($ BILLIONS; NEGATIVE VALUES REPRESENT SAVINGS TO THE PROGRAM)

Participation Pathway From PY22 to PY24	ACO Count	Benchmark ($B) [A]	Gross Savings % of Benchmark [B]			Shared Savings % of Benchmark [C]			Net Difference % of Benchmark [D]		
			2022	2023	2024	2022	2023	2024	2022	2023	2024
BASIC All 3 Years	210	51	-3.1	-3.4	-4.1	1.3	1.4	1.8	-1.8	-2.0	-2.3
BASIC->ENHANCED	38	14	-4.5	-5.8	-6.3	2.0	3.5	4.6	-2.5	-2.4	-1.7
ENHANCED All 3 Years	123	50	-4.8	-5.1	-5.8	3.5	3.8	4.3	-1.2	-1.4	-1.5

Notes: "Participation Pathway" are the following groups of ACOs, identified by the track/level of their participation in PY 2022, PY 2023 and PY 2024: "BASIC All 3 Years" are ACOs that remained in the BASIC track (Level A, B, C, D, or E) for PY 2022, PY2023, and PY 2024; "BASIC->ENHANCED" are ACOs that participated in BASIC in PY 2022 and either (a) remained in BASIC in PY 2023 before then advancing to the ENHANCED track in PY2024, or (b) advanced to the ENHANCED track in PY 2023 and remained in the ENHANCED track in PY 2024; and "ENHANCED ALL 3 Years" are ACOs that remained in the ENHANCED track for PY 2022, PY 2023, and PY 2024.
"Benchmark" **[A]** is the total PY 2024 benchmark spending for each cohort, in billions of dollars.
"Gross Savings % of Benchmark" **[B]** is the percentage that a cohort's combined spending deviated from their combined benchmark spending (a negative percentage implies savings).
"Shared Savings % of Benchmark" **[C]** is the cohort's combined shared savings (and losses) paid to (from) ACOs expressed as a percentage of benchmark.
"Net Difference % of Benchmark" **[D]** is the sum of "Gross Savings % of Benchmark" [B] and "Shared Savings % of Benchmark" [C] and represents the portion of gross savings (as measured by program benchmarks) retained by the Trust Funds.

Favorable regional adjustments have helped selective ACOs maximize earnings in the ENHANCED track without taking on a high degree of real risk. Only about 2 percent of ENHANCED track ACOs owed losses in PY 2024 while 90 percent earned shared savings. The ENHANCED track has grown from including only 14 percent of ACOs in 2020 to 58 percent in 2026.

The first impact estimate in this section assesses the coordinated set of proposals to rebalance the incentives between the BASIC track and ENHANCED track. These proposals include reducing the maximum weight used in calculating the positive regional adjustment for lower-spending ACOs under the ENHANCED track from 50 percent to 35 percent, increasing the prior savings adjustment's scaling factor from 50 percent to 75 percent, and increasing the shared savings rate for BASIC track Level E from 50 percent to 60 percent. A stochastic modeling approach consistent with the regulatory impact analysis from previous rules was employed to simulate the impact this set of proposals would have on existing ACOs and potential new ACOs over the 10 year scoring period. The changes will reduce the propensity for ACOs to be able to passively earn shared savings at the highest sharing rate by solely relying on baseline efficiency through the regional adjustment to the benchmark and instead will place a stronger incentive on generating new efficiency over the agreement period. Such incentive for new efficiency will also be incentivized by the increase in the prior savings adjustment's scaling factor. That change, combined with the higher sharing rate in BASIC track Level E, will likely attract a greater number of new ACOs serving populations, often with high spending at baseline relative to the regional average. The increase to the prior savings adjustment scaling factor would strengthen the degree that such higher spending ACOs would continue to share in savings originally made in their first agreement period despite then facing rebasing into a subsequent agreement period—a dynamic further enhanced by the proposal to risk adjust the cap on benchmark adjustments (currently defined as 5 percent of unadjusted national average assignable per capita spending). These proposals are together estimated to better allocate shared savings payments to ACOs creating new gains in efficiency as opposed to ACOs merely maintaining their historical baseline efficiency, resulting in $4.59 billion lower spending over 10 years, ranging from $6.42 billion lower spending to $2.88 billion lower spending at the 10th and 90th percentiles, respectively. The annual and 10-year total projections for the changes to Shared Savings Program participation options are detailed in Table D–B8.

TABLE D-B8: PROJECTED IMPACT OF FINANCIAL METHODOLOGY PROPOSALS TO REDUCE THE REGIONAL ADJUSTMENT WEIGHTING FOR ENHANCED TRACK ACOS, INCREASE SHARING RATE FOR BASIC TRACK LEVEL E, AND INCREASE THE PRIOR SAVINGS ADJUSTMENT PERCENTAGE ($ MILLIONS; NEGATIVE VALUES REPRESENT SAVINGS TO THE PROGRAM)

	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	Total
Impact Estimate	−580	−650	−720	−850	−980	−100	−140	−170	−190	−210	**−4,590**
Estimate Range:											
Low Estimate (10th Percentile)	−730	−810	−930	−1,150	−1,310	−300	−380	−420	−480	−510	**−6,420**
High Estimate (90th Percentile)	−450	−480	−510	−560	−680	100	70	70	70	100	**−2,880**

Note: Projections at the 10th and 90th percentiles are distinct at the annual level from the corresponding percentiles of the 10-year totals and therefore the sum of the annual percentiles will not necessarily match the corresponding percentiles of the 10-year totals.

The second area of material impact on program spending is for the creation of a growth adjustment to incentivize new participation among providers and suppliers that have not been part of a Medicare ACO within the past five years. As described in sections III.G.5.a and III.G.5.f of this proposed rule, participation in the Shared Savings Program has grown substantially since the program began in 2012, from approximately 3 million assigned beneficiaries assigned in its first year to more than 12 million assigned beneficiaries as of January 2026. This growth has occurred alongside strong program performance: We have observed that when participation in the program increases, we see increases in both quality improvements for beneficiaries and increased savings to the Trust Funds. The Shared Savings Program has had eight consecutive years of generating savings for Medicare relative to benchmarks, with over $12 billion in total savings,[402] with an upward trend in savings year over year. (As noted previously in this discussion, these savings measured by benchmarks are reasonably substantiated by lower observed per capita spending trend in markets with early ACO adoption versus higher average per capita spending trend in markets with lagging ACO adoption.) Additionally, we have observed that ACOs in the Shared Savings Program have demonstrated improved quality over time and higher quality relative to other physician groups, suggesting that the Shared Savings Program is achieving savings while improving quality of care.

This historical experience supports our expectation that expanding participation would extend the program's quality benefits to additional beneficiaries and create further opportunities for Medicare savings. The growth adjustment is part of a complementary package of proposed modifications to the benchmark methodology intended to realign financial incentives and grow participation, thus expanding the reach of quality improvements demonstrated in the Shared Savings Program, and encourage further savings.

The proposed growth adjustment would be applied on top of the highest of the existing benchmark adjustments, including regional adjustment, prior savings adjustment, or population adjustment (if eligible), and would not exceed a risk adjusted 5 percent cap for consistency with the proposed approach to capping other upward adjustments to the historical benchmark. The proposal is estimated to have the greatest impact on new ACOs that would have the greatest potential to bring in beneficiaries who have not been previously assigned to ACOs. The growth adjustment proposal is projected to increase ACO shared savings payments by $5.3 billion over 10 years, but most of that cost would be offset by new savings on reduced benefit spending from bringing additional populations into care management under Shared Savings Program ACOs. As a result, the estimated net cost to the program is estimated to be considerably less than the increase in net sharing to ACOs. This proposal is estimated to result in a net increase in spending by $1.67 billion over 10 years, with the annual increase declining in later years as savings from increased participation grow while the effect of the growth adjustment on benchmarks eventually moderates. We have observed that beneficiaries receive higher quality of care (as evidenced by ACOs' quality performance) when assigned to ACOs in the Shared Savings Program, and increasing participation in the Shared Savings Program through the growth adjustment has the potential to broaden higher quality of care to additional Medicare FFS beneficiaries. The range of uncertainty spans costs of $1.13 billion to $2.28 billion at the 10th and 90th percentiles, respectively. The annual and 10-year total projections for these provisions are detailed in Table D–B9.

[402] Additional information on past years Shared Savings Program Performance Year Finance and Quality Results is available at: *https://data.cms.gov/medicare-shared-savings-program/performance-year-financial-and-quality-results.*

TABLE D-B9: PROJECTED IMPACT FOR GROWTH ADJUSTMENT INCENTIVE TO ENCOURAGE NEW PARTICIPATION ($ MILLIONS; NEGATIVE VALUES REPRESENT SAVINGS TO THE PROGRAM)

	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	Total
Impact Estimate	290	270	310	320	330	20	10	30	50	40	**1,670**
Estimate Range:											
Low Estimate (10th Percentile)	240	210	250	300	300	-60	-120	-100	-80	-70	**1,130**
High Estimate (90th Percentile)	330	270	380	370	420	140	120	120	150	160	**2,280**

Note: Projections at the 10th and 90th percentiles are distinct at the annual level from the corresponding percentiles of the 10-year totals and therefore the sum of the annual percentiles will not necessarily match the corresponding percentiles of the 10-year totals.

The third portion of our impact estimate is for the proposed changes to beneficiary assignment, including removing from assignment calculations allowed charges for primary care services billed through a non-ACO TIN by an ACO professional used in assignment, and modifying regulatory criteria that exclude from eligibility for assignment Medicare FFS beneficiaries with any months of Part A only or Part B only enrollment, or Medicare or group health plan enrollment (including MA) during the assignment window. These changes would marginally increase the number of beneficiaries assigned to a given ACO. More importantly, they would improve the ability for the program to hold ACOs accountable for more of the patients actually served by ACO clinicians, including those with accentuated need for care management. The first proposal would reduce the ability for an ACO, through billings for primary care services by ACO professionals used in assignment, to 'lemon drop'—a potential form of gaming where patients with high needs are purposefully billed services through a TIN external to the ACO to engineer their assignment away from the ACO. The second proposal helps reduce a notable blind spot in the current assignment methodology. As enrollment in Medicare Advantage (MA) has grown over recent years, so has the number of beneficiaries switching back to OM from MA—a population that the proposed revised assignment criteria would more nimbly pick up for inclusion in ACO assignment. This proposal would also improve the symmetry in assignment for ACOs relative to the national and regional assignable populations because the Shared Savings Program does not currently employ the same exclusions based on Medicare enrollment status for identifying the assigned and assignable populations. Together these proposals are estimated to reduce program spending by $2.3 billion over 10 years, ranging from $2.97 billion to $1.69 billion savings at the 10th and 90th percentiles, respectively. Savings from these changes could effectively be materially higher if gaming of assignment were to otherwise significantly grow in popularity at baseline.

TABLE D-B10: PROJECTED IMPACT FOR CHANGES TO ASSIGNMENT METHODOLOGY ($ MILLIONS; NEGATIVE VALUES REPRESENT SAVINGS TO THE PROGRAM)

	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	Total
Impact Estimate	−380	−280	−220	−200	−200	−300	−230	−190	−160	−140	**−2,300**
Estimate Range:											
Low Estimate (10th Percentile)	−410	−330	−300	−300	−320	−410	−350	−320	−310	−290	**−2,970**
High Estimate (90th Percentile)	−350	−230	−140	−100	−80	−210	−120	−80	−10	−20	**−1,690**

Note: Projections at the 10th and 90th percentiles are distinct at the annual level from the corresponding percentiles of the 10-year totals and therefore the sum of the annual percentiles will not necessarily match the corresponding percentiles of the 10-year totals.

The last provision estimated to have a material impact on spending is the proposal to revise the methodology for the ACPT. The current policy includes a discretionary option for CMS to reduce the weight on the ACPT's contribution to the three-way blended update to ACO benchmarks if unforeseen circumstances arise. The proposed changes would create uniform annual one-year growth projections common to ACOs in overlapping agreement periods—eliminating reliance on multi-year projections that the ACPT currently employs—and a policy that, for agreement periods beginning on or after January 1, 2027, would limit the effect of under-projection or over-projection as compared to actual retrospective national expenditure trend such that an effective ACPT trend (cumulatively from BY3 to a given performance year) is no more than one percentage point below (or no more than 1.5 percentage points above) national growth. The asymmetry of these guardrails preserves a limited degree of margin related to the ideal scenario where ACOs as a group cause national trend to slow relative to projected trend over the course of a given agreement period, but more importantly has several notable advantages relative to the current methodology with potential down-weighting. It protects the validity of benchmark updates by limiting how

far the projected trend used in the ACPT portion of the three-way blended update factor would be allowed to deviate from observed national trend, and does so under an objective formula that eliminates the subjectiveness of the current down-weighting policy that would otherwise likely be invoked to a greater degree in years where down-weighting would favor ACOs as opposed to public pressure to maintain the one-third weighting in years where over-projection could favor ACOs. The proposal would also improve on the current down-weighting policy because it would preserve the role of national trend in the overall update, which can help preserve the incentive for neighboring ACOs to collectively lower spending in their overlapping service area (an outcome that down-weighting would penalize by increasing the effective weighting on regional trends in calculating benchmark updates). Despite estimating higher spending in 2027 and 2028 related partly to our separate proposal to only apply the lower 1.0 percentage point threshold for ACOs in existing agreement periods, the total impact over ten years is estimated to be a savings of $350 million, ranging from a $1.11 billion savings to a $340 million cost at the 10th and 90th percentiles, respectively. The estimates are shown in table D–B11:

TABLE D-B11: PROJECTED IMPACT FOR CHANGES TO ACPT AND ASSOCIATED GUARDRAILS ($ MILLIONS; NEGATIVE VALUES REPRESENT SAVINGS TO THE PROGRAM)

	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	Total
Impact Estimate	130	70	−10	−50	−70	−80	−90	−90	−80	−70	**−350**
Estimate Range:											
Low Estimate (10th Percentile)	−60	−40	−90	−140	−200	−250	−290	−300	−200	−190	**−1,110**
High Estimate (90th Percentile)	350	200	80	10	20	30	30	40	20	30	**340**

Note: Projections at the 10th and 90th percentiles are distinct at the annual level from the corresponding percentiles of the 10-year totals and therefore the sum of the annual percentiles will not necessarily match the corresponding percentiles of the 10-year totals.

The remaining changes to the Shared Savings Program regulations, as described in section VII.A.2.a. of this proposed rule, are not estimated to have an impact on program spending at the aggregate level.

The proposals detailed above are expected to increase assignment to ACOs in the program by 0.5 to 1.0 million beneficiaries on average per year. The combined impacts from all Shared Savings Program provisions on federal spending are shown in Table D–B12. Because estimates are rounded to the nearest $10 million, and because the percentiles are independently sorted for each year and for the 10-year totals, the annual estimates may not sum to exactly match the total 10-year estimates. Together these proposals are estimated to reduce program spending by $5.5 billion over 10 years, ranging from $8.9 billion to $2.3 billion savings at the 10th and 90th percentiles, respectively.

TABLE D-B12: PROJECTED IMPACT OF MEDICARE SHARED SAVINGS PROGRAM PROVISIONS (INDIVIDUALLY SHOWN IN TABLES D-B8 THROUGH D-B11) ($ MILLIONS; NEGATIVE VALUES REPRESENT SAVINGS TO THE PROGRAM)

	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	Total
Impact Estimate	−580	−640	−690	−830	−960	−410	−400	−360	−330	−340	**−5,550**
Estimate Range:											
Low Estimate (10th Percentile)	−970	−1,010	−1,090	−1,280	−1,510	−920	−980	−970	−890	−910	**−8,870**
High Estimate (90th Percentile)	−180	−300	−300	−400	−420	40	80	130	160	190	**−2,310**

Note: Projections at the 10th and 90th percentiles are distinct at the annual level from the corresponding percentiles of the 10-year totals and therefore the sum of the annual percentiles will not necessarily match the corresponding percentiles of the 10-year totals.

The proposals are expected to both decrease and increase net shared savings payments across the overall distribution of ACOs. The mean projection is an overall increase in such payments by $1.05 billion over 10 years, ranging from a $2.6 billion decrease to a $4.63 billion increase at the 10th and 90th percentiles, respectively. The increase in shared savings payments to ACOs is driven by the proposed growth adjustment policy, and without this proposed policy the majority of savings to Medicare would be achieved through reductions in shared savings payments. Annual and total projections for the impact on shared savings net of shared losses are shown in Table D–B13.

TABLE D-B13: PROJECTED IMPACT OF MEDICARE SHARED SAVINGS PROGRAM PROVISIONS ON SHARED SAVINGS PAYMENTS TO ACOS ($ MILLIONS; POSITIVE VALUES REPRESENT INCREASED NET PAYMENTS TO ACOS)

	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	Total
Impact Estimate	−220	−230	−200	−260	−300	270	350	450	560	640	**1,050**
Estimate Range:											
Low Estimate (10th Percentile)	−620	−560	−580	−700	−900	−220	−210	−150	10	50	**−2,600**
High Estimate (90th Percentile)	210	130	200	180	230	720	850	990	1,060	1,180	**4,630**

b. Compliance with Requirements of Section 1899(i)(3) of the Act

Certain policies, including both existing policies and the new proposed policies described in proposed rule, rely upon the authority granted in section 1899(i)(3) of the Act to use other payment models that the Secretary determines will improve the quality and efficiency of items and services furnished under the Medicare program, and that do not result in program expenditures greater than those that would result under the statutory payment model. The following proposed policies require the use of our authority under section 1899(i) of the Act: modifications to the ACPT component of the three-way blended benchmark update factor (described in section III.G.5.g of this proposed rule); discontinuing availability of the option for prepaid shared savings (described in section III.G.6.b of this proposed rule); and changes to the calculation methodology for quarterly advance investment payments (described in section III.G.7 of this proposed rule). When considered together, these changes to the Shared Savings Program are expected to improve the quality and efficiency of items and services furnished under the Medicare program by improving the accuracy of the benchmark update factor and strengthening financial incentives under the Shared Savings Program, decreasing administrative burden and conserving resources by discontinuing the availability of the prepaid shared savings option given low uptake and anticipated limited participation, and simplifying the calculation of quarterly amounts of advance investment payment (for eligible ACOs) while encouraging ACO formation in rural areas. These changes are not expected to result in a situation in which the payment methodology under the Shared Savings Program, including all policies we have adopted under the authority of section 1899(i) of the Act, results in more spending under the program than would have resulted under the statutory payment methodology in section 1899(d) of the Act.

In the CY 2023 PFS final rule (87 FR 70195 and 70196), we estimated that the projected impact of the payment methodology that incorporates all policies finalized by that final rule would result in $4.9 billion in greater program savings compared to a hypothetical baseline payment methodology that excluded the policies that we have enacted relying on the authority of section 1899(i)(3) of the Act. The marginal impact of the changes in the CY 2024 PFS final rule (88 FR 79496) were estimated to lower net spending by $330 million over the subsequent 10-year period (2024 through 2033) for all new policies combined. The marginal impact of the changes in the CY 2025 PFS final rule (89 FR 98527) were estimated to lower net spending by an additional $200 million in total through 2034. The marginal impact of the changes in the CY 2026 PFS final rule (90 FR 49978) were estimated to be a $20 million reduction in net spending through 2035. The marginal impact of the changes in this proposed rule is estimated to be $5.5 billion reduction in net spending through 2036. The incremental changes have been estimated to improve program financial savings since the CY 2023 PFS final rule, and hence the cumulative impact of all policies (including those in this proposed rule) is estimated to result in more than the previously-estimated $4.9 billion in greater program savings compared to a hypothetical baseline payment methodology that excludes the policies we have enacted relying on section 1899(i)(3) of the Act as authority. Therefore, we estimate that program expenditures associated with the implementation of the provisions in this proposed rule, in combination with other policies associated with the statutory payment model and current policies we have adopted under the authority of section 1899(i)(3) of the Act, are expected to improve the quality and efficiency of items and services furnished under the Medicare program and would not be expected to increase program expenditures relative to those of the statutory payment model.

We will continue to reexamine this projection in the future to ensure that an alternative payment model does not result in additional program expenditures and so continues to satisfy the requirement under section 1899(i)(3)(B) of the Act. Additional Shared Savings Program data accumulating after the end of the PHE for COVID–19, along with emerging information on the characteristics of, and performance trends for, new entrants in the Shared Savings Program for agreement periods beginning on January 1, 2024, January 1, 2025, and January 1, 2026, are anticipated to gradually improve our ability to reevaluate program impacts in a comprehensive fashion. If we later determine that the payment model that includes policies established under section 1899(i)(3) of the Act no longer meets this requirement, we will undertake notice and comment rulemaking to adjust the payment model to ensure continued compliance with the statutory requirements.

9. Changes to the Regulations Associated With the Ambulance Fee Schedule

As outlined in section III.H.2. of this proposed rule, section 6203 of the Consolidated Appropriations Act, 2026 amended section 1834(l)(12)(A) and (l)(13) of the Act to extend the payment add-ons sets forth in those sections through December 31, 2027. The ambulance extender provisions are enacted through legislation that is self-implementing. We are proposing to revise dates at § 414.610(c)(1)(ii) and (c)(5)(ii) to conform the regulations to

these self-implementing statutory requirements.

A plain reading of the statute requires only a ministerial application of the mandated rate increase and does not require any substantive exercise of discretion on the part of the Secretary. As a result, there are no policy proposals associated with these legislative provisions. We have estimated the cost of these provisions to be $260 million over the 10-year period and the Congressional Budget Office (CBO)'s estimated cost of these provisions was $52 million in FY 2026, $111 million in FY 2027, and $34 million in FY 2028 with minimal costs for the remaining 10 year period, resulting in a net effect of $197 million from FY 2026 to FY 2035 *(https://www.cbo.gov/system/files/2026-01/hr7148-CAA-2026.pdf, page 4).*

As discussed in section III.H.4., of this proposed rule, we are proposing to make use of the revised OMB delineations as set forth in OMB's July 21, 2023 bulletin (No. 23–01) and the most recent modifications of the RUCA codes for purposes of payment under the AFS. If we adopt OMB's revised delineations and the updated RUCA codes, ambulance providers and suppliers that pick up Medicare beneficiaries in areas that would be Micropolitan or otherwise outside of MSAs based on OMB's revised delineations or in a rural census tract of an MSA based on the updated RUCA codes (but are currently within urban areas) may experience increases in payment for such transports because they may become eligible for the rural adjustment factors discussed previously, while those ambulance providers and suppliers that pick up Medicare beneficiaries in areas that would be urban based on OMB's revised delineations and the updated RUCA codes (but are currently in Micropolitan Areas or otherwise outside of MSAs, or in a rural census tract of an MSA) may experience decreases in payment for such transports because they would no longer be eligible for the rural adjustment factors discussed previously.

The use of the revised OMB delineations and the updated RUCA codes would mean the recognition of new urban and rural boundaries based on the population migration that occurred over a 10-year period, between 2010 and 2020. As discussed previously in this section, we are proposing to use the updated 2020 RUCA codes to identify rural census tracts within MSAs, such that the census tracts falling at or above RUCA level 4.0 would continue to be designated as rural areas.

Based on our analysis, the geographic designations for approximately 95.87 percent of ZIP codes would be unchanged by using OMB's revised delineations and the updated RUCA codes. There are more ZIP codes that would change from urban to rural (1,172, or 2.73 percent) than rural to urban (602, or 1.40 percent). In general, it is expected that ambulance providers and suppliers in 1,172 ZIP codes within 47 States and Puerto Rico may experience payment increases if we adopt the revised OMB delineations and the updated RUCA codes, as these areas would be redesignated from urban to rural. The State of Maryland would have the most ZIP codes changing from urban to rural with a total of 49, or 7.78 percent. Ambulance providers and suppliers in 602 ZIP codes within 43 States may experience payment decreases if we adopt the revised OMB delineations and the updated RUCA codes, as these areas would be redesignated from rural to urban. The State of South Carolina would have the most ZIP codes changing from rural to urban (20, or 3.68 percent). Adoption of the revised OMB delineations and the updated RUCA codes would have no negative impact on ambulance transports in super rural areas, as none of the current super rural areas would lose their status due to the revised OMB delineations and the updated RUCA codes. We estimate that the adoption of the revised OMB delineations and the updated RUCA codes will have a minimal fiscal impact on the Medicare program.

10. Updates to the Quality Payment Program

In this section of the proposed rule, we estimate the impacts of the Quality Payment Program policies. We estimate participation, final scores, and payment adjustments for eligible clinicians participating through MIPS the Advanced APMs, and MVPs. For Advanced APMs, we estimate the impacts on the number of Qualified Participants (QPs) that are associated with our proposed policies.

a. Overall Impact Modeling Approach and Data Assessment

(1) MIPS Impact Modeling Approach

For this proposed rule, we used a similar modeling approach as the CY 2026 PFS final rule (90 FR 49266 through 50481). We created two MIPS impact models: a baseline and a proposed policies model. Our baseline model includes previously finalized policies that are still in effect for the CY 2027 performance period/2029 MIPS payment year and in the absence of any of the new policies in this proposed rule. Examples of previously finalized policies included in the baseline model are revised administrative claims quality measure benchmarking methodology, modifications to the Total Per Capita Cost measure, and removal of the topped-out measure scoring cap and application of the defined topped out measure benchmarks to 19 quality measures identified for CY 2026 performance period/2028 MIPS payment year. Please refer to CY2026 PFS final rule for a comprehensive, detailed discussion of finalized policies (90 FR 49266).

The policies model builds on the baseline model and incorporates the new MIPS policies we are proposing for the CY 2027 performance period/2029 MIPS payment year included in this proposed rule. By comparing the baseline model to the proposed policies model, we are able to estimate the impact of the policies in this proposed rule.

Our modeling approach utilizes the same scoring engine that is used to determine MIPS payment adjustments. This approach enables our model to align as much as possible with actual MIPS scoring

(2) Data Used to Estimate Future MIPS Performance

In the CY 2026 PFS proposed and final rules, we used data from performance year 2023 to construct baseline and policies model simulations. For this proposed rule, we used data from performance year 2024. This is the most recent available data and reflects our most up-to-date information on program participation, final scores, and payment adjustments.

b. APM Incentive Payments to QPs in Advanced APMs and Other Payer Advanced APMs

Beginning with QP Performance Period 2017 (payment year 2019), through the Medicare Option, eligible clinicians who are determined to have a sufficient percentage of their Medicare Part B payments for covered professional services or Medicare patients through Advanced APMs are QPs for the applicable QP performance period and the corresponding payment year. In payment years 2019 through 2024, these QPs received a lump-sum APM Incentive Payment equal to 5 percent of their estimated aggregate paid amounts for covered professional services furnished during the base year (the calendar year immediately preceding the payment year). In payment year 2025, eligible clinicians

who attained QP status for QP Performance Period 2023 will receive a lump-sum APM Incentive Payment equal to 3.5 percent of their estimated aggregate paid amounts for covered professional services furnished during CY 2024. In payment year 2026, eligible clinicians who attained QP status in QP Performance Period 2024 will receive a lump-sum APM Incentive Payment equal to 1.88 percent of their estimated aggregate paid amounts for covered professional services furnished during CY 2025. In payment year 2028, eligible clinicians who attained QP status in QP Performance Period 2026 will receive a lump-sum APM Incentive Payment equal to 3.1 percent of their estimated aggregate paid amounts for covered professional services furnished during CY 2027.

Beginning with QP Performance Period 2019 (payment year 2021), in addition to the Medicare Option, the All-Payer Combination Option also affords eligible clinicians an opportunity at QP status. The All-Payer Combination Option allows eligible clinicians to become QPs by assessing a combination of both Medicare Part B covered professional services furnished or patients through Advanced APMs and services furnished or patients through Other Payer Advanced APMs. Eligible clinicians who become QPs for a given QP Performance Period are not subject to MIPS reporting requirements and payment adjustments for the contemporaneous MIPS performance period/payment year. Eligible clinicians who do not become QPs but meet a lower threshold requirement to become Partial QPs for the year may elect to (or not to) report to MIPS. If they elect to report, they are subject to MIPS scoring and payment adjustment. Partial QPs are not eligible to receive the APM Incentive Payment.

If an eligible clinician does not attain either QP or Partial QP status and is not excluded from MIPS on another basis, the eligible clinician will be subject to the MIPS reporting requirements and will receive the corresponding MIPS payment adjustment.

Separately from the APM Incentive Payment, beginning in payment year 2026, there are two separate PFS CFs—one for QPs for the year (the qualifying APM CF), and the other for all non-QP eligible clinicians and other suppliers paid under the PFS (the non-qualifying APM CF). The update to the qualifying APM CF for a year is 0.75 percent, whereas the update to the non-qualifying APM CF for a year is 0.25 percent. Such updates produce approximately a 0.5 percent difference in the two conversion factors each year.

The thresholds to achieve QP status in the 2027 QP Performance Period (2029 payment year) are set to 75 percent for the payment amount, and 50 percent for the patient count. Overall, we estimated that for the 2026 QP Performance Period, between 517,800 and 530,900 eligible clinicians will become QPs, and therefore will be excluded from MIPS reporting requirements and payment adjustments.

In the CY2026 PFS final rule, we finalized our proposal to use two new definitions, ''Covered professional service attribution-eligible beneficiary'' and ''E/M attribution-eligible beneficiary'' such that we conduct two determination calculations, one that includes any beneficiary who has received a covered professional service furnished by the eligible clinician (NPI) for whom we are making the QP determination and one that continues to use Evaluation and Management services furnished by the eligible clinician (NPI) for whom we are making the QP determination. We also finalized our proposal to add a QP determination at the individual level for all Advanced APM participants, beginning with the 2026 QP Performance Period.

We project the number of eligible clinicians who will be QPs, and thus excluded from MIPS, using several sources of information. First, the projections are anchored in the most recently available public information on Advanced APMs. The projections reflect Advanced APMs that will be operating during the 2027 QP Performance Period. The following APMs are expected to be Advanced APMs for the 2027 QP Performance Period:

- Enhancing Oncology Model (EOM);
- Kidney Care Choices Model (Comprehensive Kidney Care Contracting Options, Professional Option and Global Option);
- Long Term Enhanced ACO Design (LEAD) Model;
- Medicare Shared Savings Program (Level E of the BASIC Track and the ENHANCED Track);
- States Advancing All-Payer Health Equity Approaches and Development (AHEAD) Model; and
- Transforming Episode Accountability Model (TEAM)

We used the Participation Lists and Affiliated Practitioner Lists, as applicable (see § 414.1425(a) for information on the APM Participant Lists used for QP determinations) for the 2024 QP performance period third snapshot QP determination date to estimate the number of QPs for the 2027 QP Performance Period. For models starting in the 2027 QP Performance Period we estimated performance based on projected participation. We examined the extent to which Advanced APM participants will meet the QP Thresholds of having at least 75 percent of their Part B covered professional services or at least 50 percent of their Medicare beneficiaries were attribution eligible thresholds.

c. Estimated Number of MIPS Eligible Clinicians in the CY 2027 Performance Period/2029 MIPS Payment Year

(1) Initial Population of Clinicians Included in the RIA Baseline and Proposed Policies Models

For this proposed rule, we applied the same assumptions as in the CY 2026 PFS final rule (90 FR 49980) to estimate our initial population of clinicians using 2024 performance data. Specifically, we used the CY 2024 final reconciled eligibility determination file, same as the 2023 file described in the CY 2026 PFS final rule (90 FR 49980). This file reconciles eligibility from two determination periods and aligns with the CY 2024 performance period submissions data on which we based this model. Our analysis included 1,984,786 clinicians with PFS claims in this initial population. This initial population of clinicians was used to determine eligibility using the methodology described in the following sections.

(2) Estimated Number of MIPS Eligible Clinicians After Applying Eligibility Assumptions

(a) Methods and Assumptions Used To Estimate Eligibility

After identifying the clinician population with PFS claims, we applied the same eligibility assumptions and determination process described in the CY 2026 PFS final rule (90 FR 49980). We did not propose any modifications to MIPS eligibility requirements and the same eligibility assumptions apply to both the baseline and proposed policies model.

For our impact analysis, we established the ''required eligibility'' category, which means the clinician exceeds the low-volume threshold in all three criteria (§§ 414.1305 and 414.1310(b)(1)(iii)) and is subject to a MIPS payment adjustment. We based this estimate on the CY 2024 performance period data described in this section of this proposed rule, which includes the three low-volume criteria.

Our next two eligibility assumptions concern clinicians participating in MIPS through groups. They may voluntarily participate in MIPS, but are not required to participate. First, our group eligibility, includes clinicians with a

group submission, and their group exceeds all three low-volume threshold criteria. Second, we apply our opt-in eligibility assumptions. Individuals or groups who exceed the low-volume threshold in at least one criterion, but not all three, may elect to opt in. Based on the number of individuals who opted in to MIPS in performance year 2024, our model estimates that these clinicians will continue to opt in to MIPS in CY2027 performance period/2029 MIPS payment year.

Additionally, we estimate the number of ''Potentially MIPS Eligible'' clinicians. These clinicians are not included in our total number of MIPS eligible clinicians. These clinicians are potentially eligible because they are either opt-in eligible but did not opt-in or group eligible but did not report.

Finally, we estimate the number of clinicians who are neither MIPS eligible nor potentially MIPS eligible. They include clinicians who are below all three low-volume threshold criteria (both as an individual and as a group), QPs, and clinicians excluded from MIPS for other reasons, such as those with a non-MIPS-eligible clinician type or newly enrolled in Medicare.

After applying these assumptions to our initial population, we estimate that there will be 586,925 MIPS eligible clinicians with ~$51.70 billion in allowed charges in the CY2027 performance period/2029 MIPS payment year.

(b) MIPS Eligibility Estimates

In our policies model, we estimate to have 586,925 MIPS eligible clinicians Table D–B14 summarizes our eligibility estimates for the policies model after applying our assumptions outlined in this section of this proposed rule.

TABLE D-B14: ESTIMATION OF MIPS ELIGIBILITY STATUS FOR CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR USING THE CY 2027 PFS PROPOSED RULE ASSUMPTIONS

Eligibility Status	Predicted Participation Status in MIPS Among Clinicians	Number of Clinicians	PFS allowed charges ($ in mil)[1]
MIPS Eligible Clinicians			
MIPS eligible (always subject to a MIPS payment adjustment because individual clinicians exceed the low-volume threshold in all 3 criteria)	Reported to MIPS	94,895	$28,668
	Did not Report to MIPS	36,898	$11,100
Group eligibility (only subject to payment adjustment because clinicians' groups exceed low-volume threshold in all 3 criteria)	Had a group submission	451,654	$11,710[2]
Subgroup Eligible	MVP Subgroup reporting	286	$14
Opt-In eligibility assumptions (only subject to a positive, neutral, or negative adjustment because the individual or group exceeds the low-volume threshold in at least 1 criterion but not all 3, and they elect to opt-in to MIPS)	Opted-in To MIPS	3,192	$204
Total Number of MIPS Eligible Clinicians and the associated PFS allowed charges		**586,925**	**$51,695**
Potentially MIPS Eligible Clinicians			
Potentially MIPS Eligible (not subject to payment adjustment for non-participation; could be eligible for one of two reasons: (1) meet group eligibility; or (2) opt-in eligibility criteria)	Opt-in Eligible; Do not opt-in	176,361	$5,594
	Group Eligible; Did not Report	497,433	$11,590
Total Number of Clinicians Potentially MIPS Eligible		673,794	$17,184
Not MIPS Eligible Clinicians			
Below the low-volume threshold (never subject to payment adjustment; both individual and group is below all 3 low-volume threshold criteria)	Not applicable	130,199	$807
Excluded for other reasons (Non-eligible clinician type, newly enrolled)	Not applicable	91,962	$635
Qualified Participant (QP)	Not applicable	501,906	$23,259
Total Number of Clinicians Not MIPS Eligible		**1,397,861**	**$41,885**
Total Number of Clinicians (MIPS and Not MIPS Eligible)		**1,984,786**	**$93,580**

[1]Allowed charges estimated in 2024 dollars and projected to 2029 dollars (payment year. Low-volume threshold is calculated using allowed charges. MIPS payment adjustments are applied to the paid amount.

[2]Most clinicians are represented by Group submissions yet are below LVT and have low allowed charges.

d. Modeling Approach and Methods for MIPS Value Pathways (MVPs) and Traditional MIPS

(1) Summary of Approach

In this proposed rule, we present several proposals that impact the measures and activities, the performance category scores, final scores, and MIPS payment adjustments for MIPS eligible clinicians. In section IV.A. of this proposed rule, we outline these changes in more detail and describe our methodology to estimate MIPS payment adjustments for the CY 2027 performance period/2029 MIPS payment year. We then present the impact of the policies in the CY 2027 performance period/2029 MIPS payment year by comparing select metrics to the baseline model. By comparing model outputs between the baseline model and the proposed policies model, we are able to observe the impact of the policies proposed for the CY 2027 performance period/2029 MIPS payment year. MIPS eligible clinicians' final scores are calculated based on the clinicians' performance on measures and activities specified under the four MIPS performance categories: quality, cost, improvement activities, and Promoting Interoperability. MIPS eligible clinicians can participate in the

four MIPS performance categories as an individual, group, virtual group, APM Entity, and via traditional MIPS, the APM Performance Pathway (APP), or MVP reporting options. MIPS APM participants who are ACOs participating in the shared saving program are required to report through the APP/APP+ measure set. The APP or APP+ reporting option only scored on three performance categories: quality, improvement activities, and Promoting Interoperability. Our simulation applies the proposed and baseline policies to the existing scoring engine.

(2) Methodology To Assess Impact for MIPS Value Pathways

At § 414.1365(b), we required MVP Participants (which can be a group, individual, subgroup, or APM entity) to register to report a particular MVP prior to submitting. We assessed whether to use 2024 MVP registration data to estimate MVP participation and policy impact but elected not to simulate the impact for MVP because we do not have sufficient MVP scoring data for modeling and simulation. Thus, modeling based on limited data is less reliable for impact assessment. As more MVP scoring data becomes available in the future, we will reassess our methodology for estimating MVP participation, final scores, and payment adjustments.

(3) Methodology To Assess Impact for Traditional MIPS

To estimate the impact of the policies on MIPS eligible clinicians, we use the data from performance year 2024, including data submitted for the quality, cost, improvement activities, and Promoting Interoperability performance categories and claims data for the cost performance category.

We supplemented this information with the most recent data available for CAHPS for MIPS and CAHPS for ACOs, administrative claims data for certain quality measures, and other data sets. For the CY 2027 performance period/2029 MIPS payment year, we calculate hypothetical final scores for the baseline and policies models for each MIPS eligible clinician by applying appropriate measure level, performance category, and final scoring policies.

(a) Methodology To Estimate the Quality Performance Category Score

We used the CY 2026 PFS final rules as the starting point of our baseline model (90 FR 49982). This includes our policies regarding the new benchmark for Administrative Claims measures and scoring topped out measures impacted by limited measure choice. Please refer to the CY 2026 PFS final rule for a comprehensive, detailed discussion of finalized policies (90 FR 49266).

Our policies model incorporates the following policies from this proposed rule:

- In section IV.B.1.b.(3) of this proposed rule, to facilitate fairer scoring, we proposed to remove the scoring cap and change the benchmarking approach for additional topped out measures applicable to clinicians facing both limited measure choice and limited scoring opportunities as well as MIPS Core Measures. We do not simulate the addition or removal of quality measures outlined in section IV.A.4.d.(1) of this proposed rule because current data from the CY 2024 performance period do not include new measures, and we cannot estimate the impact of removing measures since we are not able to predict clinician response in measure selections.

In section IV.B.1.b.(1) of this proposed rule, we proposed to remove the requirement to submit one outcome or high priority measures and instead require the submission of a MIPS Core Measure. We propose that small practices with no more than 15 clinicians would be exempt from the MIPS Core Measure requirement. CMS internal analysis found 57 percent of the MVP submissions in performance year 2024 did not contain any of the proposed MIPS Core measures. Modeling quality performance category score with insufficient historical submission data will introduce uncertainty and complexity to the modeling simulation. Working under this limitation, we believe the previous outcome/high-priority reporting requirement and scoring rules reflected in the performance year 2024 data can serve as a proxy for core measure reporting in the models. As a result, we do not simulate the MIPS Core Measure reporting proposal. We did, however, model the impact of the core measure exemption for small practices.

(b) Methodology To Estimate the Cost Performance Category Score

We estimate the cost performance category score using the same methodology as described in the CY 2026 PFS final rule (90 FR 49982) for the baseline and the proposed policies models.

We do not model the impact of the Acute Kidney Injury requiring New Inpatient Dialysis (AKI) measure because it was suppressed for the CY 2024 performance period/2026 MIPS payment year. Therefore, there was no performance data available in 2024 to model the impact of the Acute Kidney Injury requiring New Inpatient Dialysis (AKI) measure.

(c) Methodology To Estimate the Promoting Interoperability Performance Category Score

We estimate the Promoting Interoperability performance category score using the same methodology as described in the CY 2026 PFS final rule (90 FR 49982) for the baseline model and the proposed models.

For the proposed policy model, we simulate the following changes:

In section IV.A.4.d.(4) of this proposed rule, we propose the removal of three attestations in the Promoting Interoperability performance category: ONC Direct Review, ONC–ACB Surveillance, and Security Risk Analysis.

(d) Methodology To Estimate the Improvement Activities Performance Category Score

For the baseline model, we use the same method to estimate the improvement activities performance category score as described in the CY 2026 PFS final rule (90 FR 49983), including alignment with the clarification provided regarding IA automatic weighting for APM participants (89 FR 79366).

In section IV.A.4.d.(3) of this proposed rule, we propose updates to the Improvement Activities inventory, such as removing activities. There is no historical data reflecting IA inventory updates, such as activity removal, for us to estimate potential impact. Our RIA models cannot predict how clinicians will alter their behavior once activities are removed.

(e) Methodology To Estimate the Complex Patient Bonus Points

This proposed rule does not include proposals to modify the complex patient bonus. Therefore, for the baseline and proposed policies RIA model, we used the previously established method to calculate the complex patient bonus as described in the CY 2022 PFS final rule (86 FR 64996).

(f) Methodology To Estimate the Final Score

We do not propose any changes to how we calculate the MIPS final score. Our baseline and proposed policies models assign a final score for each TIN/NPI by multiplying each estimated performance category score by the corresponding performance category weight, adding the products together, multiplying the sum by 100 points,

adding the complex patient bonus, and capping at 100 points.

For both models, after adding any applicable complex patient bonus, we reset any final scores that exceeded 100 points to equal 100 points. For MIPS eligible clinicians who were assigned a weight of zero percent for any performance category, we redistributed the weights according to § 414.1380(c).

For the purposes of this model, if a MIPS eligible clinician was approved for reweighting of one or more performance categories in the baseline model according to the data from the CY 2024 performance period/2026 MIPS payment year, we continue to apply that reweighting in our proposed policy model by assigning them a neutral score equal to the performance threshold if all categories were reweighted or assigning the applicable weights to the categories which were reweighted. Although it is unlikely (but possible) that the exact same clinicians will apply for and receive reweighting in both the CY 2024 performance period/2026 MIPS payment year (which our data is based on) and the CY 2027 performance period/2029 MIPS payment year (which we are simulating), we believe that this assumption accurately reflects future clinician behavior for two reasons. First, while the exact same MIPS eligible clinicians may not receive reweighting in two different years, we believe that this assumption allows us to quantify the impact of the reweighting on a population level. In other words, even if the same clinicians do not apply for and receive reweighting in these two different years, the absolute number of reweighting and the characteristics of practices that receive reweighting are likely to remain similar. Secondly, if we were not to assign reweighting to those MIPS eligible clinicians, many of them would receive a very low final score because they did not submit data for one or more performance categories during the year in which they received reweighting. We do not believe that it is a realistic assumption that, in the absence of reweighting, those clinicians will continue not to submit data. For these reasons, we assume that clinicians who received reweighting in the CY 2024 performance period/2026 MIPS payment year are also approved for reweighting in the CY 2027 performance period/2029 MIPS payment year. These clinicians are assigned a score of the performance threshold (75) in our model because this corresponds with a neutral (0 percent) payment adjustment.

(g) Methodology To Estimate the MIPS Payment Adjustment

For the baseline and proposed policies models, we applied the hierarchy as finalized in the CY 2024 PFS final rule (86 FR 65536 through 65537) to determine which final score should be used for the payment adjustment for each MIPS eligible clinician when more than one final score is available. We then calculate the parameters of an exchange function in accordance with the statutory requirements related to the linear sliding scale, budget neutrality, and minimum and maximum adjustment percentages.

For the baseline model, we apply the performance threshold of 75 points finalized in the CY 2026 PFS final rule. In this proposed rule, we do not make any changes to the performance threshold. Therefore, for both the baseline and proposed policies models, we use a performance threshold of 75 to calculate the exchange function for MIPS payment adjustments. We note that the results of this exchange are not identical between the baseline and proposed policies models. This is because the scaling factor used to determine positive adjustments is dependent on the total dollar amount of negative payment adjustments, and those adjustments differ as final scores are not identical between both models.

For both the baseline and proposed policies models, we use these resulting parameters to estimate the positive or negative MIPS payment adjustment based on the estimated final score and the allowed charges for covered professional services furnished by the MIPS eligible clinician.

(4) Methodology To Assess Impact for APM Performance Pathways

Shared Savings Program Accountable Care Organizations, participating in MIPS through a MIPS APM are scored on performance in the quality, Promoting Interoperability, and Improvement Activities performance categories. We included the following previously finalized policies for SSP ACOs participating in a MIPS APM into the CY 2027 baseline model:

- In 2024, the CMS Web Interface continued to be a collection type available to Shared Savings Program Accountable Care Organizations (SSP ACOs) reporting under the Advanced Payment Pathway. Because our model simulation relies on data from performance year 2024, including CMS Web Interface submissions, we are unable to predict which collection type SSP ACOs will adopt in lieu of the web interface for CY 2027 performance period/2029 MIPS payment year, given that the Web Interface collection type was no longer available after the CY 2025 performance period/2027 MIPS payment year.

We do incorporate the following proposals into the proposed model:

- In section IV.B.1.c.(1) of this proposed rule, we proposed to score all Medicare CQMs using flat benchmarks retroactively beginning in CY 2026.

(5) Simulation Results and Projected Impact to MIPS Eligible Clinicians

Based on the methodology described in section VII.F.11.d(3) of the proposed rule, we create a baseline and proposed policies simulation. Using this simulation, we estimate the impact of the policies of this proposed rule.

(a) Impact on Clinician Eligibility

In section VII.F.11.(c) of this proposed rule, we noted that we do not modify clinician eligibility and therefore there is no difference in the total number of MIPS eligible clinicians between our models.

(b) Impact on Clinician's Final Scores for Traditional MIPS

Table D–B15 shows the median final score by practice size and the percentage of MIPS eligible clinicians of each practice size with a positive, neutral, or negative adjustment.

TABLE D-B15: CY 2027 FINAL SCORE ESTIMATES BY PRACTICE SIZE

Practice Size[1]	Total Number of MIPS Eligible Clinicians	Median Final Score Estimate[2]	Percent Eligible Clinicians with Positive Payment Adjustment	Percent Eligible Clinicians with Neutral Payment Adjustment	Percent Eligible Clinicians with Negative Payment Adjustment
Baseline					
(1) Solo	15,427	75.00	34.98	26.27	38.75
(a) Reporting	7,326	89.61	73.66	9.00	17.35
(b) Non-Reporting[3]	8,101	24.7	0.00	41.90	58.10
(2) Small (2 to 15)	60,634	87.98	67.60	14.84	17.36
(a) Reporting	47,596	91.35	86.37	4.02	9.62
(b) Non-Reporting[4]	13,040	75	0.04	54.33	45.64
(3) Medium (16 to 99)	115,077	88.63	89.91	7.17	11.92
(4) Large (100+)	395,787	89.20	94.19	1.67	4.14
Overall	586,925	88.83	87.30	4.76	7.94
Proposed Policies					
(1) Solo	15,427	75.00	34.77	26.28	38.95
(a) Reporting	7,325	90.23	73.23	9.00	17.77
(b) Non-Reporting	8,101	24.70	0.00	41.90	58.10
(2) Small (2 to 15)	60,634	88.61	67.65	14.83	17.52
(a) Reporting	47,596	91.84	86.17	4.01	9.82
(b) Non-Reporting	13,040	75	0.04	54.33	45.64
(3) Medium (16 to 99)	115,077	89.14	81.08	7.14	11.78
(4) Large (100+)	395,787	89.48	94.80	1.63	3.57
Overall	586,925	89.21	87.73	4.72	7.55

[1]Practice size refers to the number of NPIs in a TIN

[2]The median final score includes clinicians who receive reweighting for all MIPS performance categories our policies at § 414.1380(c)(2). These clinicians who have all performance categories reweighted are assigned a score of 75 (neutral payment adjustment) in our model.

[3]52.51% of the solo practitioners did not report by not submitting any data

[4]21.51% of the small practice providers did not report by not submitting any data

MIPS performance and financial distribution remain stable with marginal improvements in the overall median final scores and slightly higher overall percentage of clinicians receiving a positive payment adjustment. The overall median final score is 88.83 in the baseline model and 89.21 in the proposed policies model, a slight increase for all practice sizes. About 87.3 percent of eligible clinicians receive a positive payment adjustment in the baseline model and 87.73 percent in the proposed policies model Overall, the percentage of eligible clinicians with negative payment adjustment will drop slightly, from 7.94 percent baseline to 7.55 percent proposed.

Table D–B16 shows the median quality category score for MIPS eligible clinicians who are scored on the quality performance category for the baseline and proposed policies model. Overall, the median quality performance category score showed a marginal increase from 83.16 to 83.72. Solo practitioners, who actively report, experience the most noticeable increase (+2.25) in median quality performance category score compared to those of other practice sizes.

TABLE D-B16: CY 2027 QUALITY SCORE ESTIMATES BY PRACTICE SIZE

Practice Size	MIPS Eligible Clinicians Receiving Quality Score	Total Number of MIPS Eligible Clinicians	Percent of MIPS Eligible Clinicians Receiving Quality Score	Median Quality Score Estimate
Baseline				
Solo (1)	11,289	15,427	73.18	52.61
(a) Reporting	6,602	7,326	90.12	85.95

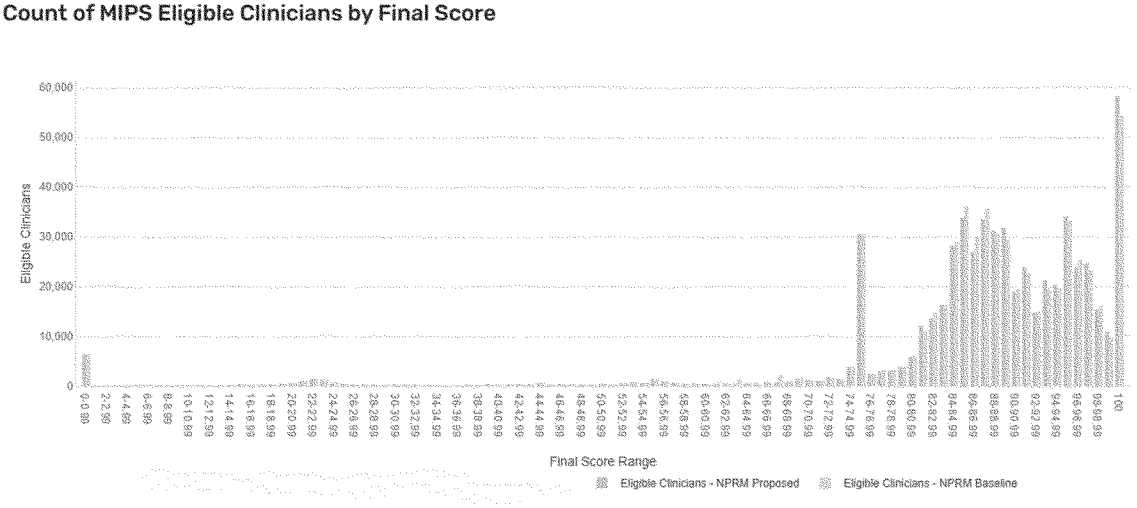
(a) Reporting	44,043	47,594	92.54	89.15
(b) Non-reporting	5,952	13,038	45.65	0
Medium (16-99)	97,892	115,077	85.07	81.89
Large (100+)	377,846	395,787	95.47	83.29
Overall	**537,022**	**586,925**	**91.50**	**83.16**
Proposed Policies				
Solo (1)	11,288	15,427	73.17	51.91
(a) Reporting	6,601	7,325	90.12	88.2
(b) Non-reporting	4,687	8,102	57.85	0
Small (2-15)	49,999	60,634	82.46	87.93
(a) Reporting	44,047	47,596	92.54	90.63
(b) Non-reporting	5,952	13,038	45.65	0
Medium (16-99)	97,926	115,077	85.10	83.13
Large (100+)	378,001	395,787	95.51	83.72
Overall	**537,214**	**586,925**	**91.53**	**83.72**

Figure D–B1 shows the distribution of final scores for all MIPS eligible clinicians. Note that there is a noticeable size of MIPS eligible clinicians with a final score of 75. MIPS eligible clinicians whom we approved for reweighting all MIPS performance categories in accordance with our reweighting policies at § 414.1380(c)(2) are assigned a final score of exactly the performance threshold (75). Overall, the distribution is left skewed, indicating that many more clinicians would receive final scores on the higher side.

FIGURE D-B1: Count of MIPS Eligible Clinicians by Final Score



(i) Impact to Small and Solo Practices

Across both the baseline and proposed policy models, approximately 15,427 MIPS-eligible clinicians are solo practitioners, accounting for 2.63 percent of all MIPS-eligible clinicians.

The median final score for solo practitioners who actively report data is 89.61 in the baseline model and 90.23 in the proposed policies model. However, the median final scores for solo practitioners who do not report data are substantially lower: 24.7 in both baseline and proposed policies models. The portion of all solo practitioners receiving a positive adjustment is starkly different between reporting and non-reporting solo practitioners. About 73.66 percent (baseline) and 73.23 percent (proposed) reporting solo practitioners will receive a positive payment adjustment; whereas 0 percent (both baseline and proposed) non-reporting solo practitioners will receive a positive payment adjustment.

Many solo practitioners do not actively submit data to MIPS despite being MIPS eligible clinicians. Based on the 2024 performance data, we estimate that about 52.51 percent of solo practitioners receiving a MIPS payment adjustment do not submit any data to MIPS.

Table D–B17 shows that, even among reporting solo practitioners, the percentage receiving a positive payment adjustment is lower than that of clinicians from small, medium, or large practices. Similarly, even for reporting solo practitioners, a higher proportion of them face negative payment adjustments compared to those in small, medium, and large practices Figure D–B2 shows the distribution of final scores for solo practitioners. Both baseline and proposed policies box plots show identical final score distributions, and both baseline and proposed policies models show a large distance between the lower and upper quartiles. Figure D–B3 shows the final score distribution for all MIPS eligible clinicians between the baseline and the proposed policies models. These box plots also show identical final score distributions; however, the distance between lower and upper quartiles is substantially narrower for all MIPS eligible clinicians than it is for solo practitioners.

BILLING CODE 4169–69–P

FIGURE D-B2: Distribution of Final Scores for Solo Practitioners

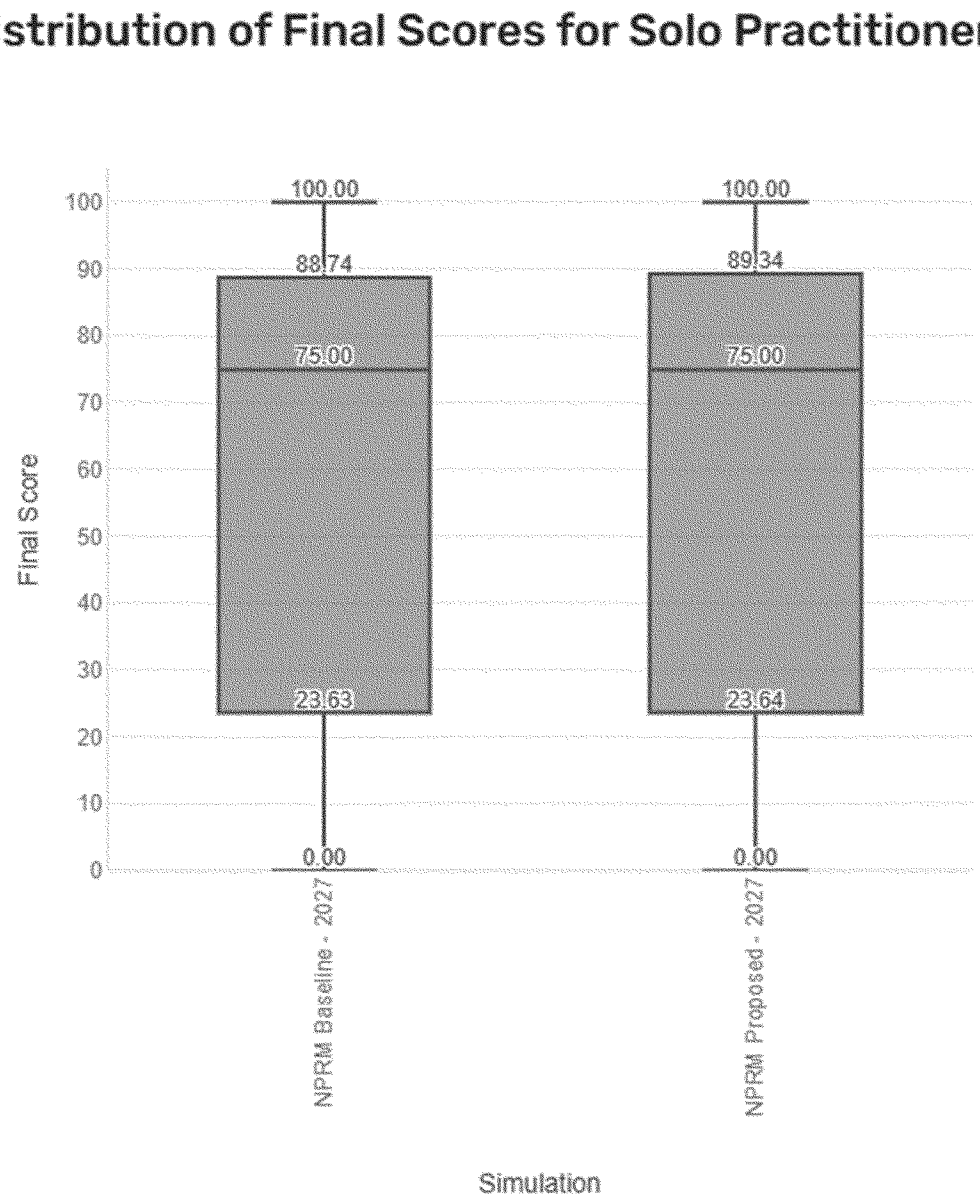


FIGURE D-B3: Distribution of Final Scores for All MIPS Eligible Clinicians

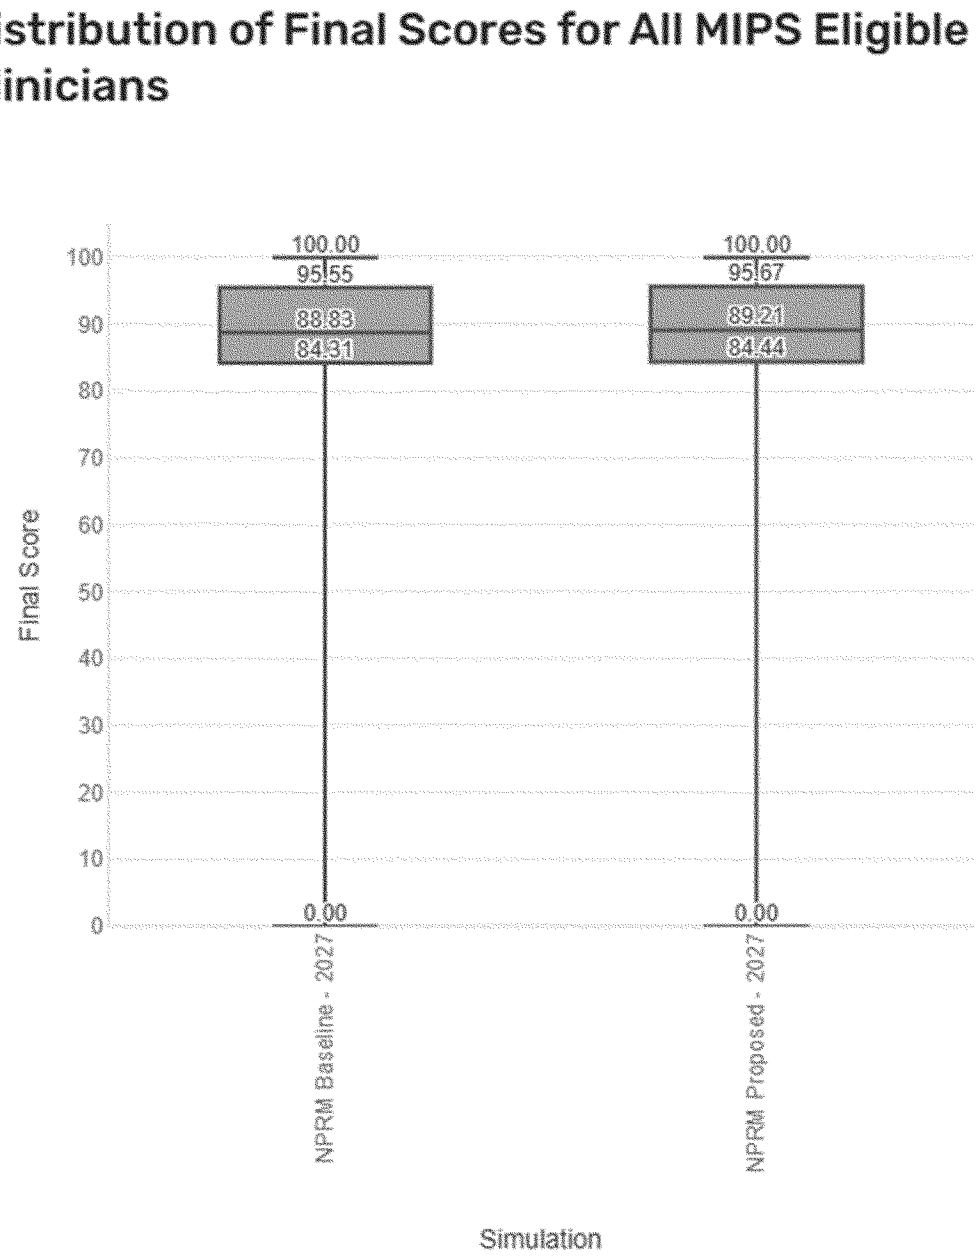

BILLING CODE 4169–69–C

Small practices, defined at § 414.1305 as groups with 2 to 15 clinicians, have a median final score of 87.98 in the baseline and 88.61 in the policies model. However, as shown in Table D–B15, the median final score for the reporting small practice providers is 91.35 (baseline) and 91.84 (proposed), substantially higher than the median final score of 75—in both baseline and proposed policies models—for the non-reporting small practice providers. They are also higher than the median final scores for all MIPS eligible clinicians who submit data, which are 89.85 in the proposed policy model and 89.66 in the baseline model. This indicates that small practice providers who submit MIPS data can perform better than it is for the medium-sized and large practice providers. Table D–B17 shows the percentage of clinicians, by practice size, either do or do not submit data to MIPS and their corresponding median final scores. Note that, in the proposed policies model, the median final scores for small, medium, and large practice clinicians who do not submit data are 75. This indicates that many small, medium or large practice clinicians who do not submit data to MIPS have been approved for reweighting of all of their MIPS performance categories under our policies at § 414.1380(c)(2). In contrast, the median final scores for solo clinicians, who do not submit data are 24.70. This indicates that many of them are either not being eligible for or not applying for our reweighting policies for extreme uncontrollable circumstances or hardships. Over 90 percent of the medium-sized and large practice clinicians submit data to MIPS. It is possible that the remaining 10 percent

or less MIPS eligible clinicians who do not submit data to MIPS are primarily those who have received reweighting under our policies at § 414.1380(c)(2).

TABLE D-B17: PERCENTAGE OF MIPS ELIGIBLE CLINICIANS WHO SUBMIT DATA AND MEDIAN FINAL SCORE

	Percent of MIPS Eligible Clinicians who Submit Data (by practice size)	Median Final Score of MIPS Eligible Clinicians who Submit Data	Median Final Score of MIPS Eligible Clinicians who Do not submit data.
Baseline			
(1) Solo	47.49	89.61	24.70
(2) Small (2 to15)	78.49	91.35	75.00
(3) Medium (16 to 99)	90.67	89.74	75.00
(4) Large (100+)	97.67	89.37	75.00
Overall	**93.00**	**89.66**	**75.00**
Proposed Policies			
(1) Solo	47.48	90.23	24.70
(2) Small (2 to 15)	78.50	91.84	75.00
(3) Medium (16 to 99)	90.71	90.26	75.00
(4) Large (100+)	97.71	89.66	75.00
Overall	**93.03**	**89.85**	**75.00**

(ii) Impact to Rural Providers

In our data we assign rural practitioners a special status. Impact assessment of this group of clinicians indicates that their overall final scores are slightly lower than the overall MIPS eligible clinicians. Table D–B18 shows the median final score and the percentage of eligible clinicians with a positive, neutral, or negative adjustment by practice size for rural practitioners.

TABLE D-B18: CY 2027 FINAL SCORE ESTIMATES BY PRACTICE SIZE FOR RURAL PRACTITIONERS ONLY

Practice Size	Total Number of MIPS Eligible Clinicians	Median Final Score Estimate	Percent Eligible Clinicians with Positive Payment Adjustment	Percent Eligible Clinicians with Neutral Payment Adjustment	Percent Eligible Clinicians with Negative Payment Adjustment
Baseline					
Solo (1)	1,941	75.00	39.41	16.80	43.79
(a) Reporting	1,038	88.34	73.70	5.68	20.62
(b) Non-reporting[1]	903	22.74	0.00	29.57	70.43
Small (2-15)	8,652	88.58	72.03	9.50	18.47
(a) Reporting	7,218	90.92	86.34	2.47	11.19
(b) Non-reporting[2]	1,434	26.77	0.00	44.91	55.09
Medium (16-99)	20,529	89.21	84.70	4.25	11.04
Large (100+)	35,683	87.23	96.07	1.48	2.45
Overall	**66,805**	**87.37**	**87.82**	**3.82**	**8.37**
Proposed Policies					
Solo (1)	1,941	75.00	39.26	16.80	43.95
(a) Reporting	1,038	88.9	73.41	5.68	20.91
(b) Non-reporting[1]	903	22.74	0.00	29.57	70.43
Small (2-15)	8,652	89.08	72.11	9.50	18.39
(a) Reporting	7,218	91.33	86.44	2.47	11.10
(b) Non-reporting[2]	1,434	26.77	0.00	44.91	55.09
Medium (16-99)	20,524	89.8	84.63	4.23	11.14
Large (100+)	35,684	87.22	96.09	1.42	2.49
Overall	**66,801**	**87.46**	**87.81**	**3.77**	**8.41**

[1]46.52% of the rural, solo practitioners did not report by not submitting any data[2]14.22% of the rural, small practice providers did not report by not submitting any data.

The overall median final score for rural practitioners is 87.37 in the baseline model and 87.46 in the policies model. This is slightly lower than the median final score for all MIPS eligible clinicians, which is 88.83 in the baseline model and 89.21in the policies model. According to the results from the proposed policies model, rural clinicians in large practices have a slightly lower median final score (87.22) than it is for reporting, rural, solo practitioners (88.9), reporting, rural, small practice providers (91.33), and rural medium-size practice providers (89.80).

(iii) Impact to Safety Net Providers

(A) Updated Definition of Safety Net Providers

In the CY 2022 PFS final rule (87 FR 70094), we finalized our complex patient bonus methodology. This bonus is composed of two distinct calculations which are added together: Medical Complexity and Social Risk. Medical Complexity is determined based on a MIPS eligible clinicians Hierarchical Conditions Categories risk score and social risk is determined based on the proportion of a MIPS eligible clinicians Medicare patient population who are dually eligible for both Medicare and Medicaid.

In the 2024 PFS final rule (88 FR 79513), we compared the performance of clinicians who received the complex patient bonus with our overall population. As we further developed our model, we decided to adopt a more precise definition of safety net providers. We believe that by narrowing our definition of safety net providers to clinicians fall in the top 20 percentile for their percentage of patients who are dually eligible for Medicare and Medicaid, we can identify providers who care for a large proportion of socially vulnerable individuals.

Table D–B19 shows the median final score estimates for safety net providers under this definition. In the proposed policies model, safety net providers have a higher median final score (93.22) than the overall MIPS eligible clinicians (89.21). Safety net solo practitioners who actively report data have a substantially higher median final score (93.84 in the proposed model) than that from the non-reporting, safety net, solo practitioners (29.41 in the proposed model). Almost 57 percent of safety net solo practitioners and over 30 percent of safety net small practice providers did not report by not submitting any MIPS data, compared to ~53 percent and ~22 percent of the overall solo practitioners and small practice providers, respectively.

TABLE D-B19: CY 2027 FINAL SCORE ESTIMATES BY PRACTICE SIZE FOR SAFETY NET PRACTITIONERS ONLY

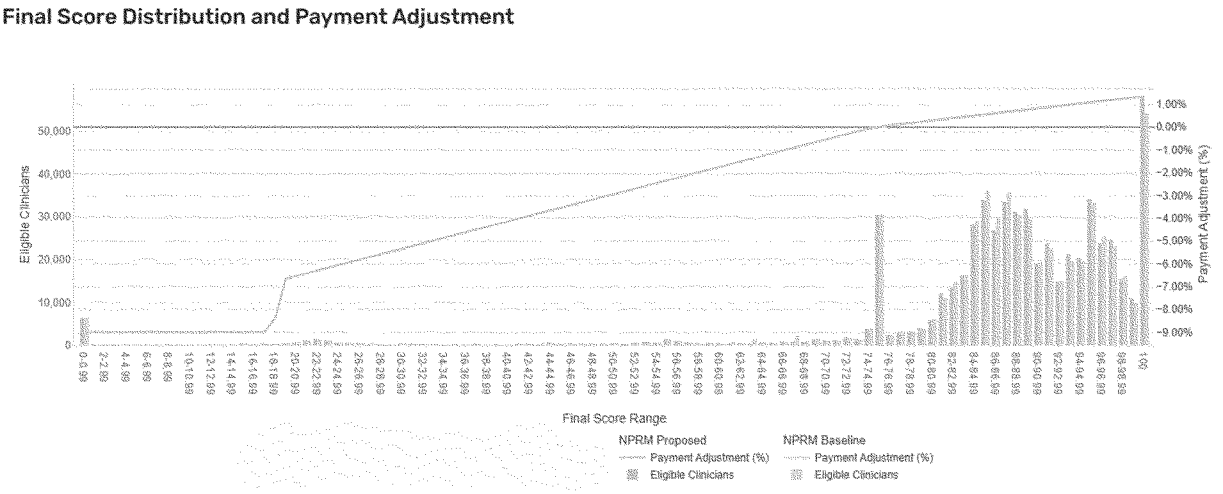
Overall	**118,634**	**93.22**	**86.57**	**5.44**	**7.99**

[1]56.37% of the safety-net, solo practitioners did not report by not submitting any data
[2]30.26% of the safety-net, small practice providers did not report by not submitting any data

(c) Impact to MIPS Eligible Clinicians' Payment Adjustments

We did not propose to increase the performance threshold in this final rule. Table D–B21 shows that the payment adjustments are very similar between the baseline and proposed policies model. This is because our proposed policies can maintain program stability. The maximum positive payment adjustment is 1.37 percent in the baseline model and 1.34 percent in the proposed policies model. The baseline model estimates redistributing $332 million, and the proposed policies model estimates redistributing $330 million. This slight decrease is due to slightly higher proportions of clinicians receiving positive payment adjustments in the proposed policies model (87.73 percent) than it is in the baseline model (87.30 percent). As the proportion of MIPS eligible clinicians receiving a positive payment adjustment increases slightly, the portion of clinicians receiving a negative payment adjustment also slightly decreases accordingly (7.55 percent in the proposed policies model vs. 7.94 percent in the baseline model). As the proportion of MIPS eligible clinicians receiving negative payment adjustments decreases slightly, the budget neutral funds available for redistribution also decrease somewhat.

FIGURE D-B5: Final Score Distribution and Payment Adjustment



We also report on the median positive and negative payment adjustments by practice size in Table D–B20.

TABLE D-B20: CY 2027 MEDIAN POSITIVE AND NEGATIVE PAYMENT ADJUSTMENT ESTIMATES BY PRACTICE SIZE

Practice Size	Median Positive Payment Adjustment[1]	Median Negative Payment Adjustment
Baseline		
Solo (1)	+1.01	-6.43
(a) Engaged	+1.01	-2.67
(b) Non-Reporting	N/A[2]	-9.00
Small (2-15)	+0.96	-6.08
(a) Reporting	+0.96	-1.50
(b) Non-Reporting	+0.08	-6.74
Medium (16-99)	+0.87	-1.92
Large (100+)	+0.81	-1.35
Overall	+0.83	-2.46
Proposed Policies Model		
Solo (1)	+1.03	-6.42
(a) Engaged	+1.03	-2.53
(b) Non-Reporting	N/A	-9.00
Small (2-15)	+0.97	-6.06
(a) Reporting	+0.97	-1.47
(b) Non-Reporting	+0.08	-6.74
Medium (16-99)	+0.88	-1.92
Large (100+)	+0.80	-2.08
Overall	+0.83	-2.62

[1]Final score above the performance threshold. The median negative adjustment is defined as the medium payment adjustment among clinicians with a final score below the performance threshold. Neither median includes clinicians with a final score equal to the performance threshold.

[2]There are no solo practitioners who did not report data and received a Positive payment adjustment. The maximum they could receive is from the Quality Admins Claims, and even if they received excellent scores, it would still be less than the performance threshold.

The overall median negative payment adjustment in the proposed policies model is slightly lower than it is in the baseline model. That is because the proposed policies model has a higher mean final score than the baseline model (89.21 proposed vs. 88.83 baseline).

e. Additional Impacts from Outside Payment Adjustments

(1) Burden Overall

In addition to policies affecting payment adjustments, we are proposing several policies that, if finalized, will impact burden. In section V.B.7. of this proposed rule, we estimate the burden impacts of proposed policy provisions.

(2) Additional Impacts to Clinicians

We provide additional burden discussions for policy provisions that we are unable to quantify.

(a) Modifications to the MIPS Improvement Activities Inventory

As discussed in section IV.A.4.d.(3) of this proposed rule, we are proposing updates to the MIPS Improvement Activities Inventory beginning with the CY 2027 performance period/2029 MIPS payment year. We do not expect these changes to affect our burden estimates for the number of estimated respondents or response time, as most of the improvement activities in the MIPS Improvement Activities Inventory remain unchanged for the CY 2027 performance period/2029 MIPS payment year. We refer readers to section IV.A.4.d.(3) of this proposed rule for details on the changes to the MIPS Improvement Activities Inventory.

(b) Qualifying Alternative Payment Model (APM) Participant (QP) Determinations

In section IV.F.2. of this proposed rule, we are proposing to modify the application of the QP and partial QP status. We note that year-over-year participation changes have historically had outsized impacts on our projections. For example, ACOs frequently add or remove participants as part of their operations. These changes in participation make it difficult to project how these proposals will impact clinicians who are determined to be QPs, Partial QPs, or previously reported MIPS (at the individual, group, subgroup, or APM Entity level), if at all. Accordingly, we have not adjusted our estimates related to performance category submissions due to these proposals. For details on these policies, see section IV.F.2. of this proposed rule.

(c) Third Party Intermediaries

In section IV.C. of this proposed rule, we are proposing to (1) add a requirement that CMS-approved third-party intermediaries may be terminated after failure to submit data for 1 year ; and (2) clarify that if a third party intermediary does not submit data for one year, they would be required to provide documentation and would be terminated if documentation cannot be provided and/or the documentation shows that they would not be submitting data for the given MIPS performance period. Due to the technical nature of these changes, there is no data available to quantify the burden for third party intermediaries during the CY 2027 performance period/2029 MIPS payment year. We refer readers to section IV.C. of this proposed rule for additional information on the policy proposals related to third party intermediaries.

G. Alternatives Considered

This proposed rule contains a range of policies, including some provisions related to specific statutory provisions. The preceding preamble provides descriptions of the statutory provisions that are addressed, identifies those policies when we exercise agency discretion, presents rationale for our policies, and, where relevant, alternatives that were considered. For purposes of the payment impact on PFS services of the policies contained in this proposed rule, we presented previously in this section the estimated impact on total allowed charges by specialty.

X. Alternatives Considered Related to the Ambulatory Specialty Model

In section X.E. of this proposed rule, we discuss the mandatory ASM. We will test whether ASM leads to improved chronic condition management, higher quality care, and reduced costs by incentivizing ASM participants with the opportunity for positive payment adjustments to Medicare Part B covered professional services payments based on their performance on data reported on quality, cost, improvement activities, and CEHRT interoperability.

Throughout this proposed rule, we have identified our proposed policies and alternatives that we have considered and provided information as to the effects of these alternatives and the rationale for each of the proposed policies. This proposed rule provides descriptions of the requirements that we would mandate and presents rationales for our decisions and, where relevant, alternatives that we considered. For example, we considered whether we should waive the requirement for ASM participants in rural areas to attest to complete IA–2: Establishing Communication and Collaboration Expectations with Primary Care using Collaborative Care Arrangements (CCAs) instead of providing the proposed rural scoring adjustment to an ASM participant's final score. Although ASM participants in rural areas may face challenges forming partnerships with primary care providers due to limited primary care availability, we believe that a rural scoring adjustment more broadly accounts for challenges that could affect ASM participant performance across the four ASM performance categories compared to only waiving IA–2.

We solicit comments on our proposals and on the alternatives that we have identified in this proposed rule.

H. Impact on Beneficiaries

As noted previously, we estimate that a combination of proposals for the Shared Savings Program, including introducing a growth adjustment, the increase to the sharing rate in BASIC track Level E, and the increase in the scaling factor for the prior savings adjustment, are expected to increase the number of ACOs in the program and correspondingly the size of the population of beneficiaries assigned to ACOs by up to one million beneficiaries per year, with roughly two-thirds of such increase attributable to the proposed growth adjustment. This growth in participation is likely to feature beneficiaries who might particularly benefit from care management because the growth adjustment is designed to attract new providers without experience in the program who are serving beneficiaries new to value-based care. Additionally, the proposed increase to the scaling factor for the prior savings adjustment, together with risk-adjusting the 5 percent cap on benchmark adjustments, could moderate the rebasing ratcheting effect and thereby improve the business case for ACOs serving high needs populations to invest additional resources in care management.

We note that in PY 2024, ACOs performed better on certain patient-experience and performance measures than physician groups participating in MIPS (90 FR 50003 and 50004). We refer readers to our discussion in the CY 2026 PFS final rule for additional details on ACOs' measure performance (90 FR 50002).

2. Quality Payment Program

There are several changes in this proposed rule that are expected to have a positive effect on beneficiaries. In general, we believe that many of these changes, including the MVP and subgroup provisions, will lead to meaningful feedback to beneficiaries on the type and scope of care provided by clinicians. Additionally, beneficiaries could use the publicly reported information on clinician performance in subgroups to identify and choose clinicians in multispecialty groups relevant to their care needs. Consequently, we anticipated the policies in this proposed rule will improve the quality and value of care provided to Medicare beneficiaries.

For example, several of the new quality measures include patient-reported outcome-based measures, which could be used to help patients make more informed decisions about treatment options. Patient-reported outcome-based measures provide information on a patient's health status from the patient's point of view and could also provide valuable insights on factors such as quality of life, functional status, and overall disease experience, which will not otherwise be available through routine clinical data collection. Patient-reported outcome-based measured are factors frequently of interest to patients when making decisions about treatment.

3. Ambulatory Specialty Model

We believe that the refinements to ASM proposed in this proposed rule would not change the potential effects of ASM on beneficiaries. We continue to believe that ASM would have no impact on cost to beneficiaries because ASM payment adjustments will not affect Medicare beneficiary coinsurance amounts. The coinsurance will be calculated based on the Medicare allowed amounts before any ASM payment adjustment multipliers are applied to Medicare Part B payments for covered professional services.

I. Estimating Regulatory Familiarization Costs

If regulations impose administrative costs on private entities, such as the time needed to read and interpret this rulemaking, we should estimate the cost associated with regulatory review. Due to the uncertainty involved with accurately quantifying the number of entities that will review the rule, we assume that the total number of unique commenters on this rule will be the number of reviewers on of this last year's proposed rule. We acknowledge that this assumption may understate or overstate the costs of reviewing this rulemaking. It is possible that not all commenters will review this rule in detail, and it is also possible that some reviewers will choose not to comment on this rule. For these reasons, we believe that the number of commenters will be a fair estimate of the number of reviewers of this year's rule.

Using the wage information from the BLS for medical and health service managers (Code 11–9111), we estimated that the cost of reviewing this rulemaking is $113.42, including overhead and fringe benefits *https://www.bls.gov/oes/current/oes_nat.htm*. Assuming an average reading speed, we estimate that it would take approximately 8.0 hours for the staff to review half of this proposed rule. For each facility that reviews the rule, the estimated cost is $907.36 (8.0 hours × $113.42). Therefore, we estimated that the total cost of reviewing this regulation is $12,239,821 ($907.36 × 13,549 reviewers on this year's proposed rule).

J. Accounting Statement

As required by OMB Circular A–4 (available at *https://www.reginfo.gov/public/jsp/Utilities/a-4.pdf*), in Tables D–BXX and D–BXX (Accounting Statements), we have prepared an accounting statement. This estimate includes growth in incurred benefits from CY 2026 to CY 2027 based on the FY 2027 President's Budget baseline.

TABLE D-B21: ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES

CATEGORY	TRANSFERS
CY 2027 Annualized Monetized Transfers	Estimated decrease in expenditures of $2.1 billion for PFS CF update.
Bearers of Transfer Gain	Federal Government to physicians, other practitioners and providers and suppliers who receive payment under Medicare.

TABLE D-B22: ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED COSTS, TRANSFER, AND SAVINGS

CATEGORY	TRANSFER
CY 2027 Annualized Monetized Transfers of beneficiary cost coinsurance.	-$0.4 billion
Bearers of Transfer Gain	Beneficiaries to Federal Government.

TABLE D-B23: ACCOUNTING STATEMENT FOR PROVISIONS FOR MEDICARE SHARED SAVINGS PROGRAM (CYS 2027 to 2036) ($ MILLIONS)

Category	Primary Estimate	Minimum Estimate	Maximum Estimate	Source Citation
BENEFITS				
Annualized monetized: Discount rate: 3%	-$565 million	-$1,058 million	-$115 million	Tables D-B8 through D-B11; summarized in total in Table D-B12
Annualized monetized: Discount rate: 7%	-$579 million	-$1,063 million	$134 million	Tables D-B8 through D-B11; summarized in total in Table D-B12

Notes: Negative values reflect a reduction in Federal net cost resulting from care management by ACOs. Estimates may be a combination of benefits and transfers. To the extent that the incentives created by Medicare payments change the amount of resources society uses in providing medical care, the more accurate categorization of effects would be as costs (positive values) or benefits/cost savings (negative values), rather than as transfers.

K. Conclusion

The analysis in the previous sections, together with the remainder of this proposed rule, provided an initial Regulatory Flexibility Analysis. The previous analysis, together with the preceding portion of this rule, provides an RIA. In accordance with the provisions of Executive Order 12866, this proposed rule was reviewed by the Office of Management and Budget.

Mehmet Oz, Administrator of the Centers for Medicare & Medicaid Services, approved this document on July 10, 2026.

List of Subjects

42 CFR Part 400

Grant programs-health, Health facilities, Health maintenance organizations (HMO), Medicaid, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 405

Administrative practice and procedure, Diseases, Health facilities, Health professions, Medical devices, Medicare, Reporting and recordkeeping requirements, Rural areas, X-rays.

42 CFR Part 406

Health facilities, Diseases, and Medicare.

42 CFR Part 407

Medicare.

42 CFR Part 410

Diseases, Health facilities, Health professions, Laboratories, Medicare, Reporting and recordkeeping requirements, Rural areas, X-rays.

42 CFR Part 414

Administrative practice and procedure, Biologics, Diseases, Drugs, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR 415

Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 417

Administrative practice and procedure, Grant programs-health, Health care, Health insurance, Health maintenance organizations (HMO), Loan programs-health, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 422

Administrative practice and procedure, Health facilities, Health maintenance organizations (HMO), Medicare, Penalties, Privacy, Reporting and recordkeeping requirements.

42 CFR Part 423

Administrative practice and procedure, Emergency medical services, Health facilities, Health maintenance organizations (HMO), Health professionals, Medicare, Penalties, Privacy, Reporting and recordkeeping requirements.

42 CFR Part 424

Emergency medical services, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 425

Administrative practice and procedure, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 427

Administrative practice and procedure, Biologics, Inflation rebates, Medicare, Prescription drugs.

42 CFR Part 428

Administrative practice and procedure, Biologics, Inflation rebates, Medicare, Prescription drugs.

42 CFR Part 512

Administrative practice and procedure, Health care, Health facilities, Health insurance, Intergovernmental relations, Medicare, Penalties, Privacy, and Reporting and recordkeeping requirements.

For the reasons set forth in the preamble, the Centers for Medicare & Medicaid Services proposes to amend 42 CFR chapter IV as set forth below:

PART 400—INTRODUCTION; DEFINITIONS

■ 1. The authority for part 400 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh, and 44 U.S.C. Chapter 35.

■ 2. Section 400.200 is amended by adding a definition for ''Eligible noncitizen'' in alphabetical order to read as follows:

§ 400.200 General definitions.

* * * * *

Eligible noncitizen means an individual who, effective July 4, 2025, is an—

(1) Alien lawfully admitted for permanent residence under the Immigration and Nationality Act;

(2) Alien who has been granted the status of Cuban and Haitian entrant, as defined in section 501(e) of the Refugee Education Assistance Act of 1980; or

(3) Individual who lawfully resides in the United States in accordance with a Compact of Free Association referred to in 8 U.S.C. 1612(b)(2)(G).

* * * * *

PART 405—FEDERAL HEALTH INSURANCE FOR THE AGED AND DISABLED

■ 3. The authority citation for part 405 continues to read as follows:

Authority: 42 U.S.C. 263a, 405(a), 1302, 1320b-12, 1395x, 1395y(a), 1395ff, 1395hh, 1395kk, 1395rr, and 1395ww(k).

■ 4. Section 405.2463 is amended by—

■ a. Adding paragraph (a)(1)(iii);

■ b. In paragraph (b)(2) introductory text, removing the phrase ''a FQHC patient'' and adding in its place the phrase ''an FQHC patient or a RHC patient''; and

■ c. In paragraph (b)(3), removing the phrase ''Not before October 1, 2025'' and adding in its place the phrase ''Not before January 1, 2028'';

The addition reads as follows:

§ 405.2463 What constitutes a visit.

(a) * * *

(1) * * *

(iii) Furnished under the direct supervision of the RHC practitioner, a face-to-face encounter between a patient and either of the following:

(A) A qualified provider of medical nutrition therapy services as defined in part 410, subpart G, of this chapter.

(B) A qualified provider of outpatient diabetes self-management training services as defined in part 410, subpart H, of this chapter.

* * * * *

§ 405.2464 [Amended]

■ 5. Section 405.2464 is amended by—

■ a. In paragraph (b)(1), removing the phrase ''paragraphs (d) and (e) of this section'' and adding in its place the phrase ''paragraphs (c) through (h) of this section'';

■ b. In paragraph (b)(2)(i), removing the reference ''§ 405.2462(c)(1)'' and adding in its place the reference ''§ 405.2462(e)(1)'';

■ c. In paragraph (b)(2)(ii), removing the reference ''§ 405.2462(c)(2)'' and adding in its place the reference ''§ 405.2462(e)(2)''; and

■ d. In paragraph (g), removing the term ''an encounter'' wherever it appears and adding in its place the term ''services''.

■ 6. Section 405.2469 is amended by revising paragraph (d) to read as follows:

§ 405.2469 FQHC supplemental payments.

* * * * *

(d) *Per visit supplemental payment.* A supplemental payment required under this section is made to the FQHC when a covered face-to-face encounter, or an encounter furnished using interactive, real-time, audio and video telecommunications technology, or audio-only interactions in cases where the patient is not capable of, or does not consent to, the use of video technology, for the purposes of diagnosis, evaluation, or treatment of a mental health disorder, occurs between a Medicare Advantage enrollee and a practitioner as set forth in § 405.2463. A mental health encounter furnished using interactive, real-time, audio and video telecommunications technology, or audio-only interactions, is not payable unless the FQHC is in compliance with the in-person requirements set forth in § 405.2463(b)(3).

PART 406—HOSPITAL INSURANCE ELIGIBILITY AND ENTITLEMENT

■ 7. The authority for part 406 is revised to read as follows:

Authority: 42 U.S.C. 1302, 1395i-2, 1395i-2a, 1395p, 1395q, and 1395hh.

■ 8. Section 406.5 is amended by revising paragraph (a) to read as follows:

§ 406.5 Basis of eligibility and entitlement.

(a) *Hospital insurance without premiums.* Hospital insurance is available to most individuals without payment of a premium if they meet the following conditions:

(1) The individual—

(i) Is age 65 or over;

(ii) Has received social security or railroad retirement disability benefits for 25 months; or

(iii) Has end-stage renal disease. Subpart B of this part explains the requirements such individuals must meet to obtain hospital insurance without premiums.

(2) Effective July 4, 2025, the individual is a citizen or national of the United States or an eligible noncitizen as defined in 42 CFR 400.200.

* * * * *

■ 9. Section 406.6 is amended by revising paragraph (b) and adding paragraph (f) to read as follows:

§ 406.6 Application or enrollment for hospital insurance.

* * * * *

(b) *Individuals who need not file an application for hospital insurance.* An individual who meets the requirements of § 406.5(a)(2), and any of the following conditions need not file an application for hospital insurance:

* * * * *

(f) *Special rules for eligible noncitizens.* Individuals who only meet the requirements of § 406.5(a)(1), but do not also meet the requirements of § 406.5(a)(2), may subsequently meet both § 406.5(a)(1) and (2) due to a change in U.S. citizenship, U.S. nationality, or immigration status or category. For these individuals, the following requirements apply:

(1) An individual who meets the conditions of paragraph (b) of this section must contact SSA to initiate entitlement to hospital insurance. Entitlement may be retroactive for up to 6 months, but not earlier than the first month in which the individual met all of the requirements of § 406.5(a).

(i) If acceptable evidence establishes the month in which the individual first satisfied § 406.5(a)(2), SSA will use that month, subject to the applicable retroactivity limits noted in the paragraph (f)(1) of this section.

(ii) If the earliest month of eligibility cannot be established based on acceptable documentary evidence, entitlement will begin on the first day of the month in which SSA verifies that the individual satisfies § 406.5(a)(2), based on applicable data made available by the Department of Homeland Security.

(2) An individual who meets the conditions of paragraph (c) of this section must contact SSA to file an application for hospital insurance. Entitlement may be retroactive for up to 6 months, but not earlier than the first month in which the individual met all of the requirements of § 406.5(a).

(i) If acceptable evidence establishes the month in which the individual first satisfied § 406.5(a)(2), SSA will use that month, subject to the applicable retroactivity limits noted in the paragraph (fx)(2) of this section.

(ii) If the earliest month of eligibility cannot be established based on acceptable documentary evidence, entitlement will begin on the first day of the month in which SSA verifies that the individual satisfies § 406.5(a)(2), based on applicable data made available by the Department of Homeland Security.

■ 10. Section 406.10 is amended by revising paragraph (a) and adding paragraph (b)(3) to read as follows:

§ 406.10 Individual age 65 or over who is entitled to social security or railroad retirement benefits, or who is eligible for social security benefits.

(a) *Requirements.* An individual is entitled to hospital insurance benefits under section 226 of the Act under the following conditions:

(1) The individual has attained age 65 and is—

(i) Entitled to monthly social security benefits under section 202 of the Act;

(ii) A qualified railroad retirement beneficiary who has been certified as such to the Social Security Administration by the Railroad

Retirement Board in accordance with section 7(d) of the Railroad Retirement Act of 1974; or

(iii) Effective January 1, 1981, eligible for monthly social security benefits under section 202 of the Act and has filed an application for hospital insurance.

(2) Effective July 4, 2025, the individual is a citizen or national of the United States or an eligible noncitizen as defined in 42 CFR 400.200.

(b) * * *

(3) Entitlement continues until the date entitlement is terminated in accordance with § 406.14(b) or (c).

■ 11. Section 406.11 is amended by revising paragraph (b)(2) to read as follows:

§ 406.11 Individual age 65 or over who is not eligible as a social security or railroad retirement benefits beneficiary, or on the basis of government employment.

* * * * *

(b) * * *

(2) *Residence and citizenship.* He or she is a resident of the United States and is

(i) A citizen or national of the United States;

(ii) An alien lawfully admitted for permanent residence under the Immigration and Nationality Act who has continuously resided in the United States for 5 years immediately preceding the first month in which he or she meets all other requirements for entitlement to hospital insurance;

(iii) An alien who has been granted the status of Cuban and Haitian entrant, as defined in section 501(e) of the Refugee Education Assistance Act of 1980; or

(iv) An individual who lawfully resides in the United States in accordance with a Compact of Free Association (COFA), as referred to in 8 U.S.C. 1612(b)(2)(G).

* * * * *

■ 12. Section 406.12 is amended by revising paragraph (a) and adding paragraph (d)(2)(v) to read as follows:

§ 406.12 Individual under age 65 who is entitled to social security or railroad retirement disability benefits.

(a) *Basic requirements.* An individual under age 65 is entitled to hospital insurance benefits under the following conditions:

(1) If, for 25 months, the individual has been—

(i) Entitled or deemed entitled to social security disability benefits as an insured individual, child, widow, or widower who is ''under a disability''; or

(ii) A disabled qualified beneficiary certified under section 7(d) of the Railroad Retirement Act.

(2) Effective July 4, 2025, the individual is a citizen or national of the United States or an eligible noncitizen as defined in 42 CFR 400.200.

* * * * *

(d) * * *

(2) * * *

(v) The date entitlement is terminated in accordance with § 406.14(b) or (c).

* * * * *

■ 13. Section 406.13 is amended by revising paragraphs (c) and (f) to read as follows:

§ 406.13 Individual who has end-stage renal disease.

* * * * *

(c) *Requirements.* An individual who has been medically determined to have ESRD is entitled to hospital insurance benefits under the following conditions:

(1) He or she is—

(i) Fully or currently insured under the social security program (title II of the Act) or would be fully or currently insured if his or her employment (after 1936) as defined under the Railroad Retirement Act were considered ''employment'' under the Act;

(ii) Entitled to monthly social security or railroad retirement benefits; or

(iii) The spouse or dependent child of a person who meets the requirements of paragraph (c)(1)(i) or (c)(1)(ii) of this section.

(2) He or she has filed an application for Medicare Part A.

(3) He or she has satisfied the waiting period explained in paragraph (e) of this section.

(4) Effective July 4, 2025, the individual is a citizen or national of the United States or an eligible noncitizen, as defined in 42 CFR 400.200.

* * * * *

(f) *End of entitlement.* Entitlement ends under any of the following conditions:

(1) With the end of the 12th month after the month in which a regular course of dialysis ends.

(2) With the end of the 36th month after the month in which the individual received a kidney transplant. Beginning January 1, 2023, an individual who is no longer entitled to Part A benefits due to this paragraph may be eligible to enroll in Part B solely for purposes of coverage of immunosuppressive drugs as described in § 407.55 of this subchapter.

(3) With the date entitlement is terminated in accordance with § 406.14(b) or (c).

* * * * *

■ 14. Section 406.14 is added to read as follows:

§ 406.14 End of entitlement due to change in U.S. citizenship, U.S. nationality, or immigration status or category.

(a) *Basis.* Individuals whose U.S. citizenship, U.S. nationality, or immigration status or category changes such that they no longer meet the requirements of § 406.5(a)(2) of this part will lose entitlement to hospital insurance benefits without premiums.

(b) For individuals who were entitled to, or enrolled for, hospital insurance benefits without premiums as of July 4, 2025, the SSA must, not later than 1 year after July 4, 2025, complete a review of individuals for purposes of identifying individuals not described by § 406.5(a)(2). SSA must notify each individual identified under such review that if SSA determines that an individual does not meet the requirements of § 406.5(a)(2), the individual's entitlement to, or enrollment for, hospital insurance benefits will be terminated in accordance with paragraph (d) of this section.

(c) Entitlement will end as provided under paragraph (d) of this section for individuals who were entitled to, or enrolled for, hospital insurance benefits without premiums who were not identified and notified by the SSA per § 406.14(b) and were subsequently determined by the SSA as not meeting the requirements of § 406.5(a)(2).

(d) *Termination notice.* The SSA will send notice to individuals if they no longer satisfy the requirements of § 406.5(a)(2). The notice contains the following information:

(1) Specifies the individual's appeal rights in accordance with 20 CFR part 404, subpart J.

(2) States the effective date of the hospital insurance benefits entitlement termination action, which will be the end of the month following the month in which the termination notice is dated.

(3) States that the individual should contact the SSA if their citizenship, nationality, or immigration status or category changes such that they may be entitled to, or enrolled for, hospital insurance benefits under this part.

(e) *Resumption of benefits.* An individual whose hospital insurance benefits were terminated under paragraph (d) of this section may request resumption of benefits if the individual's U.S. citizenship, U.S. nationality, or immigration status or category changes such that the individual meets the requirements of § 406.5(a)(2) of this part. To request resumption of entitlement, the individual must contact SSA and provide information sufficient to

establish that the requirements of § 406.5(a)(2) are met.

■ 15. Section 406.20 is amended by revising paragraph (b)(2) and adding paragraph (c)(5) to read as follows:

§ 406.20 Basic requirements.

* * * * *

(b) * * *

(2) Is a resident of the United States and, effective July 4, 2025, is—

(i) A citizen or national of the United States;

(ii) An alien lawfully admitted for permanent residence under the Immigration and Nationality Act who has continuously resided in the United States for 5 years immediately preceding the first month in which they meet all other requirements for entitlement to hospital insurance;

(iii) An alien who has been granted the status of Cuban and Haitian entrant, as defined in section 501(e) of the Refugee Education Assistance Act of 1980; or

(iv) An individual who lawfully resides in the United States in accordance with a Compact of Free Association referred to in 8 U.S.C. 1612(b)(2)(G).

* * * * *

(c) * * *

(5) Meets the eligibility requirements in paragraph (b)(2) of this section.

■ 16. Section 406.27 is amended by redesignating paragraph (f) as paragraph (g) and adding a new paragraph (f) to read as follows:

§ 406.27 Special enrollment periods for exceptional conditions.

* * * * *

(f) *Special enrollment period for eligible noncitizens.* An SEP exists for individuals who have not been entitled to, or enrolled for, Medicare due to failure to meet the requirements of § 406.20(b)(2), but subsequently meet the requirements or whose Medicare entitlement or enrollment was terminated due to loss of U.S. citizenship, U.S. nationality, or eligible noncitizen status, who subsequently meet the citizenship, nationality, or immigration status or category requirements specified in § 406.20(b)(2).

(1) *SEP parameters.* (i) An individual is eligible for this SEP if the individual otherwise met the eligibility requirements for Medicare, except for § 406.20(b)(2), and the individual subsequently meets the applicable Medicare eligibility requirements, including § 406.20(b)(2).

(ii)An individual is eligible for this SEP if the individual's prior Medicare entitlement or enrollment was terminated because the individual did not meet the requirements of § 406.20(b)(2) and the individual subsequently meets the applicable Medicare eligibility requirements, including § 406.20(b)(2).

(iii) An individual does not need to miss an enrollment period to be eligible for this SEP.

(2) *SEP duration.* The SEP begins on the first day of the month in which the individual contacts the SSA and provides information sufficient to establish that the requirements of § 406.20(b)(2) are met and ends on the last day of the fifth month after the month in which the SEP began.

(3) *Effective date of coverage.* Coverage under this paragraph begins on the first day of the month following the month of enrollment.

* * * * *

■ 17. Section 406.28 is amended by adding new paragraph (g) to read as follows:

§ 406.28 End of entitlement due to change in citizenship, nationality, or immigration status or category.

* * * * *

(g) *Loss of eligibility due to lack of U.S. citizenship, U.S. nationality, or eligible noncitizen status.* Individuals whose U.S. citizenship, U.S. nationality, or immigration status or category changes such that they no longer meet the requirements of § 406.20(b) of this part will lose entitlement to premium hospital insurance benefits.

(1) For individuals who were entitled to, or enrolled for, premium hospital insurance benefits as of July 4, 2025, the SSA must, not later than 1 year after July 4, 2025, complete a review of individuals for purposes of identifying individuals not described by § 406.20(b)(2). SSA must notify each individual identified under such review that if SSA determines that an individual does not meet the requirements of § 406.20(b)(2), the individual's entitlement to, or enrollment for, premium hospital insurance benefits will be terminated in accordance with paragraph (g)(3) of this section.

(2) Entitlement will end as provided under paragraph (g)(3) of this section for individuals who were entitled to, or enrolled for, premium hospital insurance benefits who were not identified and notified by the SSA per § 406.28(g)(1) and were subsequently determined by the SSA as not meeting the requirements of § 406.20(b)(2).

(3) *Termination notice.* The SSA will send notice to individuals if they no longer satisfy the requirements of § 406.20(b)(2). The notice contains the following information:

(i) Specifies the individual's appeal rights in accordance with 20 CFR part 404, subpart J.

(ii) States the effective date of the hospital insurance benefits entitlement termination action, which will be the end of the month following the month in which the termination notice is dated.

(iii) States that the individual should contact the SSA if their eligibility status changes such that they may be entitled to, or enrolled for, hospital insurance benefits under this part.

■ 18. Section 406.50 is amended by revising the section heading and paragraph (a) to read as follows:

§ 406.50 Nonpayment of benefits on behalf of eligible noncitizens.

(a) Hospital insurance benefit payments may not be made for services furnished to any eligible noncitizen, as defined in 42 CFR 400.200, for any month in which his or her monthly social security benefits are suspended (or would be suspended if he or she were entitled to those benefits) because the eligible noncitizen remains outside the United States for more than 6 months.

(b) Benefits will be payable beginning with services furnished in the first full calendar month the eligible noncitizen is back in the United States.

* * * * *

PART 407—SUPPLEMENTARY MEDICAL INSURANCE (SMI) ENROLLMENT AND ENTITLEMENT

■ 19. The authority for part 407 is revised to read as follows:

Authority: 42 U.S.C. 1302, 1395p, 1395q, and 1395hh.

■ 20. Section 407.10 is amended by revising paragraph (a) to read as follows:

§ 407.10 Eligibility to enroll.

(a) *Basic rule.* Except as specified in paragraph (b) of this section, an individual is eligible to enroll for SMI if he or she—

(1) Is entitled to hospital insurance under any of the rules set forth in §§ 406.10 through 406.15 of this chapter; or

(2) Meets the following requirements:

(i) Has attained age 65. (An individual is considered to have attained age 65 on the day before the 65th anniversary of his or her birth.)

(ii) Is a resident of the United States and, effective July 4, 2025, is—

(A) A citizen or national of the United States;

(B) An alien lawfully admitted for permanent residence under the Immigration and Nationality Act, who

has resided continuously in the United States during the 5 years preceding the month in which he or she applies for enrollment;

(C) An alien who has been granted the status of Cuban and Haitian entrant, as defined in section 501(e) of the Refugee Education Assistance Act of 1980; or

(D) An individual who lawfully resides in the United States in accordance with a Compact of Free Association as referred to in 8 U.S.C. 1612(b)(2)(G).

* * * * *

■ 21. Section 407.23 is amended by redesignating paragraph (f) as paragraph (g) and adding a new paragraph (f) to read as follows:

§ 407.23 Special enrollment periods for exceptional conditions.

* * * * *

(f) *Special enrollment period for eligible noncitizens.* An SEP exists for individuals who have not been entitled to, or enrolled for, Medicare due to failure to meet the requirements of § 407.10(a)(2), but subsequently meet the requirements or whose Medicare entitlement or enrollment was terminated due to loss of U.S. citizenship, loss of U.S. nationality, or eligible noncitizen status, who subsequently meet the citizenship, nationality, or immigration status or category requirements specified in § 407.10(a)(2).

(1) *SEP parameters.* (i) An individual is eligible for this SEP if the individual otherwise met the eligibility requirements for Medicare, except for § 407.10(a)(2), and the individual subsequently meets the applicable Medicare eligibility requirements, including § 407.10(a)(2).

(ii) An individual is eligible for this SEP if the individual's prior Medicare entitlement or enrollment was terminated because the individual did not meet the requirements of § 407.10(a)(2) and the individual subsequently meets the applicable Medicare eligibility requirements, including § 407.10(a)(2).

(iii) An individual does not need to miss an enrollment period to be eligible for this SEP.

(2) *SEP duration.* The SEP begins on the first day of the month in which the individual contacts the SSA and provides information sufficient to establish that the requirements of § 407.10(a)(2) are met and ends on the last day of the fifth month after the month in which the SEP began.

(3) *Effective date of coverage.* Coverage under this paragraph begins on the first day of the month following the month of enrollment.

* * * * *

■ 22. Section 407.27 is amended by adding paragraph (e) to read as follows:

§ 407.27 Termination of entitlement: Individual enrollment.

* * * * *

(e) *Loss of eligibility due to lack of U.S. citizenship, U.S. nationality, or eligible noncitizen status.* Individuals whose U.S. citizenship, U.S. nationality, or immigration status or category changes such that they do not meet the requirements of § 407.10(a)(2)(ii) of this part will lose entitlement to SMI.

(1) For individuals who were entitled to, or enrolled for, SMI as of July 4, 2025, the SSA must, not later than 1 year after July 4, 2025, complete a review of individuals for purposes of identifying individuals not described by § 407.10(a)(2). SSA must notify each individual identified under such review that if SSA determines that an individual does not meet the requirements of § 407.10(a)(2), the individual's entitlement to, or enrollment for, SMI will be terminated in accordance with paragraph (e)(3) of this section.

(2) Entitlement will end as provided under paragraph (e)(3) of this section for individuals who were entitled to, or enrolled for, SMI who were not identified and notified by the SSA per § 407.27(e)(1) and were subsequently determined by the SSA as not meeting the requirements of § 407.10(a)(2)(ii).

(3) *Termination notice.* The SSA will send notice to individuals if they no longer satisfy the requirements of § 407.10(a)(2). The notice contains the following information:

(i) Specifies the individual's appeal rights in accordance with 20 CFR part 404, subpart J.

(ii) States the effective date of the SMI entitlement termination action, which will be the end of the month following the month in which the termination notice is dated.

(iii) States that the individual should contact the SSA if their citizenship, nationality, or immigration status or category changes such that they may be entitled to, or enrolled for, SMI under this part.

■ 23. Section 407.55 is amended by revising paragraph (a) to read as follows:

§ 407.55 Eligibility to enroll.

(a) *Basic rules.*

(1) Except as specified in paragraph (b) of this section, an individual is eligible to enroll, be deemed enrolled, or reenroll in the Part B–ID benefit if their Part A entitlement ends as described in § 406.13(f)(2) of this subchapter.

(2) Effective July 4, 2025, the individual must meet the eligibility criteria set forth in § 407.10(a)(2)(ii).

* * * * *

■ 24. Section 407.62 is amended by redesignating paragraph (f) as paragraph (g) and adding a new paragraph (f) to read as follows:

§ 407.62 Termination of coverage.

* * * * *

(f) Enrollment in the Part B–ID benefit ends the date entitlement is terminated in accordance with § 407.27(e) due to the individual's failure to meet the citizenship, nationality, or eligible noncitizen requirements described in § 407.10(a)(2).

* * * * *

PART 410—SUPPLEMENTARY MEDICAL INSURANCE (SMI) BENEFITS

■ 25. The authority for part 410 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395m, 1395hh, 1395rr, and 1395ddd.

■ 26. Section 410.78 is amended by—

■ a. Revising paragraph (a)(3);

■ b. Adding paragraphs (b)(2)(xiii), (b)(3)(xiv)(D), (b)(3)(xv), and (b)(6); and

■ c. Revising paragraph (f);

The revisions and additions read as follows:

§ 410.78 Telehealth services.

(a) * * *

(3) *Interactive telecommunications system* means, except as otherwise provided in this paragraph (a)(3), multimedia communications equipment that includes, at a minimum, audio and video equipment permitting two-way, real-time interactive communication between the patient and distant site physician or practitioner.

(i) An interactive telecommunications system may also include two-way, real-time audio-only communication technology for any telehealth service furnished to a patient in their home on or before December 31, 2027.

(ii)(A) For telehealth services furnished after December 31, 2027 date, interactive telecommunications system may also include two-way, real-time audio-only communication technology for any telehealth service furnished to a patient in their home if the distant site physician or practitioner is technically capable of using an interactive telecommunications system as defined in this paragraph (a)(3), but the patient is not capable of, or does not consent to, the use of video technology.

(B) The following modifiers must be appended to a claim for telehealth services furnished using two-way, real-time audio-only communication technology to verify that the conditions set forth in paragraph (a)(3)(ii)(A) of this section have been met:

* * * * *

(b) * * *

(2) * * *

(xiii) Occupational therapists, physical therapists, speech-language pathologists, or audiologists, through December 31, 2027.

* * * * *

(3) * * *

(xiv) * * *

(D) Consistent with section 6209(d) of the CAA, 2026, in-person visit requirements for the purposes of diagnosis, evaluation, or treatment of a mental health disorder do not apply through December 31, 2027.

* * * * *

(6) Consistent with section 6209(a) of the CAA, 2026, the geographic requirements specified in paragraph (b)(4) of this section do not apply through December 31, 2027.

* * * * *

(f) *Process for adding or deleting services.* Except as otherwise provided in this paragraph (f), changes to the list of Medicare telehealth services are made through the annual physician fee schedule rulemaking process. CMS maintains the list of services that are Medicare telehealth services under this section, including the current HCPCS codes that describe the services on the CMS website.

§ 410.105 [Amended]

■ 27. Section 410.105 is amended in paragraph (b)(3)(ii) by removing the reference ''§ 410.100(m)'' and adding in its place the reference ''§ 410.100(1)''.

■ 28. Section 410.175 is amended by revising paragraphs (a) and (b) to read as follows:

§ 410.175 Alien absent from the United States.

(a) Medicare does not pay Part B benefits for services furnished to an eligible noncitizen, as defined in 42 CFR 400.200, if those services are furnished in any month for which the individual is not paid monthly social security cash benefits (or would not be paid if he or she were entitled to those benefits) because he or she has been outside the United States continuously for 6 full calendar months.

(b) Payment of benefits resumes with services furnished during the first full calendar month the eligible noncitizen, as defined in 42 CFR 400.200, is back in the United States.

* * * * *

PART 414—PAYMENT FOR PART B MEDICAL AND OTHER HEALTH SERVICES

■ 29. The authority citation for part 414 continues to read as follows:

Authority: 42 U.S.C. 1302, 1395hh, and 1395rr(b)(l).

■ 30. Section 414.502 is amended by revising the definitions of ''Data collection period'' and ''Data reporting period'' to read as follows:

§ 414.502 Definitions.

* * * * *

Data collection period is the 6 months from January 1 through June 30, during which applicable information is collected and that precedes the data reporting period.

Data reporting period for CDLTs that are not ADLTs is the 3-month period, May 1 through July 31, and for ADLTs is the 3-month period, January 1 through March 31, during which a reporting entity reports applicable information to CMS and that follows the preceding data collection period.

* * * * *

§ 414.504 [Amended]

■ 31. Section 414.504 is amended in paragraph (a)(1) by removing the date ''January 1, 2026'' and adding in its place the date ''May 1, 2026''.

■ 32. Section 414.507 is amended by—

■ a. Revising paragraph (d) introductory text and paragraph (d)(9); and

■ b. Adding paragraph (d)(12).

The revisions and addition read as follows:

§ 414.507 Payment for clinical diagnostic laboratory tests.

* * * * *

(d) *Phase-in of payment reductions.* For years 2018 through 2029, the payment rates established under this section for each CDLT that is not a new ADLT or new CDLT, may not be reduced by more than the following amounts for—

* * * * *

(9) 2026—0.0 percent of the payment rate established in 2025.

* * * * *

(12) 2029—15 percent of the payment rate established in 2028.

* * * * *

■ 33. Section 414.523 is amended by revising paragraph (a)(1)(v) to read as follows:

§ 414.523 Payment for laboratory specimen collection fee and travel allowance.

(a) * * *

(1) * * *

(v) For a specimen collected from a Medicare beneficiary in a skilled nursing facility or on behalf of a home health agency, the specimen collection fee otherwise payable under paragraph (a)(1) of this section is increased by $2.00.

■ 34. Section 414.610 is amended by—

■ a. Revising paragraph (c)(1)(ii) introductory text; and

■ b. In paragraph (c)(5)(ii) removing the date ''September 30, 2025'' and adding in its place the date ''December 31, 2027''.

The revision reads as follows:

§ 414.610 Basis of payment.

* * * * *

(c) * * *

(1) * * *

(ii) For services furnished during the period July 1, 2008 through December 31, 2027, ambulance services originating in either of the following:

* * * * *

■ 35. Section 414.1105 is amended by revising paragraph (c) introductory text to read as follows:

§ 414.1105 Payment for Comprehensive Outpatient Rehabilitation Facility (CORF) services.

* * * * *

(c) *Payment for supplies and durable medical equipment, prosthetic and orthotic devices.* Supplies and durable medical equipment that are CORF services under § 410.100(k), prosthetic device services that are CORF services under § 410.100(f), and orthotic devices that are CORF services under § 410.100(g) are paid the lesser of 80 percent of the following:

* * * * *

■ 36. Section 414.1305 is amended by revising the definitions of ''APM Incentive Payment'', ''Certified Electronic Health Record Technology (CEHRT)'' paragraph (2), ''Collection type'', ''MVP participant'' and ''Participant List'' to read as follows:

§ 414.1305 Definitions.

* * * * *

APM Incentive Payment means the lump sum incentive payment for a year as described in section 414.1450(b)(1) and that is paid for an eligible clinician who is a QP for the applicable year.

* * * * *

Certified Electronic Health Record Technology (CEHRT) * * *

(2) * * *

(i) For CY 2019 through CY 2026, at 45 CFR 170.315(a)(12) (family health

history) and 45 CFR 170.315(e)(3) (patient health information capture); and

(ii) * * *

(A) For CY 2019 through CY 2026, the applicable measure calculation certification criterion at 45 CFR 170.315(g)(1) or (2) for all certification criteria that support a meaningful use objective with a percentage-based measure.

(B) Clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3), and for CY 2019 through CY 2026, optionally (c)(4), and can be electronically accepted by CMS.

* * * * *

Collection type means a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: Electronic clinical quality measures (eCQMs); MIPS clinical quality measures (MIPS CQMs); QCDR measures; Medicare Part B claims measures; CMS Web Interface measures (except as provided in paragraph (1) of this definition, for the CY 2017 through CY 2022 performance periods/2019 through 2024 MIPS payment years); the CAHPS for MIPS survey measure; administrative claims measures; Medicare Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQMs); and Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs).

* * * * *

MVP participant means an individual MIPS eligible clinician, multispecialty group, single-specialty group, subgroup, or APM Entity that is assessed on an MVP in accordance with § 414.1365 for all MIPS performance categories. For the CY 2026 performance period/2028 MIPS payment year and future years, MVP participant means an individual MIPS eligible clinician, single-specialty group, multispecialty group that meets the requirements of a small practice, subgroup, or APM Entity that is assessed on an MVP in accordance with § 414.1365 for all MIPS performance categories. Beginning in the CY 2029 performance period/2031 MIPS payment year, MVP participant means an individual MIPS eligible clinician, single specialty group, multispecialty group that meets the requirements of a small practice, virtual group, subgroup, or APM Entity that is assessed on an MVP in accordance with § 414.1365 for all MIPS performance categories.

* * * * *

Participation List means the list of participants in an APM Entity that is compiled from a CMS-maintained list where practicable.

* * * * *

■ 37. Section 414.1330 is amended by revising paragraph (c)(2)(iv) to read as follows.

§ 414.1330 Quality performance category.

(c) * * *

(2) * * *

(iv) Whether the quality measure is designated as high priority or not, through the CY 2026 performance period/2028 MIPS payment year.

* * * * *

■ 38. Section 414.1335 is amended by—

■ a. Revising paragraphs (a)(1)(i) introductory text, (a)(1)(ii), and (a)(4)(i);

■ b. Adding paragraph (a)(1)(iii);

■ c. Revising paragraph (a)(4)(i); and

■ d. Adding paragraph (a)(5).

The revisions and additions read as follows:

§ 414.1335 Data submission criteria for the quality performance category.

(a) * * *

(1) * * *

(i) For the CY 2017 through 2026 performance periods/2019 through 2028 MIPS payment years, except as provided in paragraph (a)(1)(ii) of this section, submits data on at least six measures, including at least one outcome measure. If an applicable outcome measure is not available, reports one other high priority measure. If fewer than six measures apply to the MIPS eligible clinician, group, virtual group, or APM Entity, reports on each measure that is applicable. Beginning in the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians, except as provided in paragraphs (a)(1)(ii) and (a)(1)(iii) of this section, submits data on at least six measures, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure. If fewer than six measures apply then the MIPS eligible clinician, group, virtual group, or APM Entity must report on each measure that is applicable.

* * * * *

(ii) For the CY 2017 through 2026 performance periods/2019 through 2028 MIPS payment years, a MIPS eligible clinician, group, virtual group, and APM Entity that report on a specialty or subspecialty measure set, as designated in the MIPS final list of quality measures established by CMS through rulemaking, must submit data on at least six measures within that set, including at least one outcome measure. If an applicable outcome measure is not available, report one other high priority measure. If the set contains fewer than six measures or if fewer than six measures within the set apply to the MIPS eligible clinician, group, virtual group, or APM Entity, report on each measure that is applicable. Beginning in the CY 2027 performance period/2029 MIPS payment year, except as provided in paragraph (a)(1)(iii) of this section, a MIPS eligible clinician that reports on a specialty or subspecialty measure set, as designated in the MIPS final list of quality measures established by CMS through rulemaking, must submit data on at least six measures within that set, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure within that set. If the set contains fewer than six measures or if fewer than six measures within the set apply to the MIPS eligible clinician, report on each measure that is applicable.

* * * * *

(iii) *Small practices.* Beginning with the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians in small practices are not required to submit at least one MIPS core measure or attest to not having an applicable and available MIPS core measure. MIPS eligible clinicians in small practices must submit data on at least six measures, if applicable.

* * * * *

(4) *For Medicare CQMs.* (i) A MIPS eligible clinician, group, and APM Entity reportingquality data on beneficiaries eligible for Medicare CQMs as defined at § 425.20) within the APP measure set or APP Plus measure set (as applicable) and administering the CAHPS for MIPS Survey as required under the APP.

(ii) [Reserved]

(5) *For Medicare eCQMs.* (i) A MIPS eligible clinician, group, and APM Entity reporting on the Medicare eCQMs (reporting quality data on beneficiaries eligible for Medicare eCQMs as defined at § 425.20) within the APP Plus measure set and administering the CAHPS for MIPS Survey as required under the APP.

(ii) [Reserved]

* * * * *

■ 39. Section 414.1340 is amended by—
■ a. Revising paragraphs (d) and (e); and
■ b. Adding paragraph (f).

The revisions and additions read as follows:

§ 414.1340 Data completeness criteria for the quality performance category.

* * * * *

(d) APM Entities, specifically Medicare Shared Savings Program Accountable Care Organizations meeting reporting requirements under the APP, submitting quality measure data on Medicare CQMs must submit data on the following:

(1) At least 75 percent of the applicable beneficiaries eligible for the Medicare CQM, as defined at § 425.20, who meet the measure's denominator criteria for MIPS payment year 2026 and future MIPS payment years.

(e) APM Entities, specifically Medicare Shared Savings Program Accountable Care Organizations meeting reporting requirements under the APP, submitting quality measure data on Medicare eCQMs must submit data on the following:

(1) At least 75 percent of the applicable beneficiaries eligible for the Medicare eCQM, as defined at § 425.20, who meet the measure's denominator criteria for MIPS payment years 2029 and future MIPS payment years.

(2) [Reserved]

(f) If quality data are submitted selectively such that the submitted data are unrepresentative of a MIPS eligible clinician, group, virtual group, subgroup, or APM Entity's performance, any such data would not be true, accurate, or complete for purposes of § 414.1390(b) or § 414.1400(a)(5).

■ 40. Section 414.1365 is amended by—
■ a. Adding paragraph (a)(2); and
■ b. Revising paragraphs (c)(1) introductory text and (c)(1)(ii).

The revisions and additions read as follows:

§ 414.1365 MIPS Value Pathways.

(a) * * *

(2) Beginning in the CY 2029 performance period/2031 MIPS payment year, except for MIPS eligible clinicians reporting under the APM Performance Pathway in accordance with § 414.1367, all MIPS eligible clinicians must report an MVP.

* * * * *

(c) * * *

(1) *Quality.* Through the CY 2026 performance period/2028 MIPS payment year, except as provided in paragraph (c)(1)(i) of this section, an MVP participant must select and report, if applicable, four quality measures, including one outcome measure (or, if an outcome measure is not available, one high priority measure), included in the MVP, excluding the population health measure required under paragraph (c)(4)(ii) of this section. Beginning in the CY 2027 performance period/2029 MIPS payment year, except as provided in paragraphs (c)(1)(i) and (c)(1)(ii) of this section, an MVP participant must select and report, if applicable, four quality measures, including one MIPS core measure available in the MVP, excluding the population health measure required under paragraph § 414.1365(c)(4)(ii). If there is not an available and applicable MIPS core measure, an MVP participant must attest to not having an available and applicable MIPS core measure and submit a separate MIPS quality measure within the MVP.

* * * * *

(ii) *Small practices.* Beginning with the CY 2027 performance period/2029 MIPS payment year, an MVP participant that meets the requirements of a small practice is not required to submit at least one MIPS core measure or attest to not having an available and applicable MIPS core measure. Except as provided in paragraph (c)(1)(i) of this section, an MVP participant that meets the requirements of a small practice must select and report, if applicable, at least four quality measures included in the MVP, excluding the population health measure required under paragraph (c)(4)(ii) of this section.

* * * * *

■ 41. Section 414.1375 is amended is amended by revising paragraphs (b)(2)(ii)(A) and (b)(3)(i) introductory text to read as follows:

§ 414.1375 Promoting Interoperability (PI) performance category.

* * * * *

(b) * * *

(2) * * *

(ii) * * *

(A) Through the 2028 MIPS payment year, report that the MIPS eligible clinician completed the actions included in the Security Risk Analysis measure during the year in which the performance period occurs;

* * * * *

(3) * * *

(i) *Supporting providers with the performance of CEHRT (SPPC).*

From the 2019 MIPS payment year through the 2027 MIPS payment year, to engage in activities related to supporting providers with the performance of CEHRT, the MIPS eligible clinician—

* * * * *

■ 42. Section 414.1380 is amended by—
■ a. Revising paragraphs (b)(1)(ii)(E) and (b)(1)(ii)(F);
■ b. Adding paragraphs (b)(1)(ii)(G) and (H), and (b)(1)(iv)(D);
■ c. Revising paragraphs (b)(3)(i) and (b)(4)(ii)(C)(*3*);
■ d. Adding paragraph (b)(4)(ii)(C)(*4*); and
■ e. Revising paragraphs (c)(2)(i)(A)(*10*) and (c)(2)(i)(C)(*12*).

The revisions and additions read as follows:

§ 414.1380 Scoring.

* * * * *

(b) * * *

(1) * * *

(ii) * * *

(E) Beginning with the CY 2025 performance period/2027 MIPS payment year, CMS will publish a list of topped out measures determined to be impacted by limited measure choice on a yearly basis. Measures included on the list are scored from 1 to 10 measure achievement points according to defined topped out measure benchmarks calculated from performance data in the baseline period in which a performance rate of 97 percent corresponds to 10 percent of the performance threshold for the corresponding performance year.

(F) *Medicare CQMs collection type benchmarks.*

(*1*) Beginning in the CY 2025 performance period/2027 MIPS payment year, measures of the Medicare CQMs collection type use flat benchmarks for their first two performance periods in MIPS.

(*2*) Beginning with the CY 2026 performance period/2028 MIPS payment year, measures of the Medicare CQMs collection type use flat benchmarks.

(G) *Medicare eCQMs collection type benchmarks.*

(*1*) Beginning with the CY 2027 performance period/2029 MIPS payment year, measures of the Medicare eCQMs collection type use flat benchmarks.

(*2*) [Reserved]

(H) Beginning in the CY 2027 performance period/2029 MIPS payment year, MIPS core measures, which are required under § 414.1335(a)(1)(i) and (ii), for which the benchmark for the applicable collection type is identified as topped out for 2 or more consecutive years, are scored from 1 to 10 measure achievement points according to defined topped out measure benchmarks calculated from performance data in the baseline period in which a performance rate of 97 percent corresponds to 10 percent of the

performance threshold for the corresponding performance year.

* * * * *

(iv) * * *

(D) Beginning with the CY 2027 performance period/2029 MIPS payment year, MIPS core measures, which are required under § 414.1335(a)(1)(i) and (ii), are not subject to the 7 measure achievement point cap specified in paragraph (b)(1)(iv)(B) of this section.

* * * * *

(3) * * *

(i) For MIPS eligible clinicians participating in APMs, the improvement activities performance category score is at least 50 percent.

* * * * *

(4) * * *

(i) * * *

(C) * * *

(ii) * * *

(C) * * *

(3) Beginning with the CY 2026 performance period/2028 MIPS payment year, the total number of bonus points available to be earned when reporting one optional measure, more than one optional measure, or all optional measures under the Public Health and Clinical Data Exchange objective is a total of 5 bonus points.

(4) For the CY 2027 performance period/2029 MIPS payment year, the total number of bonus points available to be earned when reporting the Electronic Prior Authorization optional measure is a total of 10 bonus points.

* * * * *

(c) * * *

(2) * * *

(i) * * *

(A) * * *

(10) Beginning with the 2026 MIPS payment year, for the quality and improvement activities performance categories, CMS determines based on documentation provided to the agency that data for a MIPS eligible clinician are inaccessible or unable to be submitted due to circumstances outside of the control of the clinician because the MIPS eligible clinician delegated submission of the data to their third party intermediary, evidenced by a written agreement between the MIPS eligible clinician and third party intermediary, and the third party intermediary did not submit the data for the performance category(ies) on behalf of the MIPS eligible clinician in accordance with applicable deadlines. To determine whether to apply reweighting to the affected performance category(ies), CMS will consider: whether the MIPS eligible clinician knew or had reason to know of the issue with its third party intermediary's submission of the clinician's data for the performance category(ies); whether the MIPS eligible clinician took reasonable efforts to correct the issue; and whether the issue between the MIPS eligible clinician and their third party intermediary caused no data to be submitted for the performance category(ies) in accordance with applicable deadlines.

(i) For the 2026 MIPS payment year, requests must be submitted by November 1st of the year preceding the relevant MIPS payment year.

(ii) Beginning with the 2027 MIPS payment year, requests must be submitted by December 31st of the year preceding the relevant MIPS payment year.

* * * * *

(C) * * *

(12) Beginning with the 2026 MIPS payment year, CMS determines based on documentation provided to the agency that data for a MIPS eligible clinician are inaccessible or unable to be submitted due to circumstances outside of the control of the clinician because the MIPS eligible clinician delegated submission of the data to their third party intermediary, evidenced by a written agreement between the MIPS eligible clinician and third party intermediary, and the third party intermediary did not submit the data for the performance category on behalf of the MIPS eligible clinician in accordance with applicable deadlines. To determine whether to apply reweighting to the Promoting Interoperability performance category, CMS will consider: whether the MIPS eligible clinician knew or had reason to know of the issue with its third party intermediary's submission of the clinician's data for the performance category; whether the MIPS eligible clinician took reasonable efforts to correct the issue; and whether the issue between the MIPS eligible clinician and their third party intermediary caused no data to be submitted for the performance category in accordance with applicable deadlines.

(i) For the 2026 MIPS payment year, requests must be submitted by November 1st of the year preceding the relevant MIPS payment year.

(ii) Beginning with the 2027 MIPS payment year, requests must be submitted by December 31st of the year preceding the relevant MIPS payment year.

* * * * *

§ 414.1395 [Amended]

■ 43. Section 414.1395 is amended by removing and reserving paragraph (c)(2).

■ 44. Section 414.1400 is amended by—

■ a. Revising paragraphs (b)(3)(iii), (b)(3)(v)(E)(*1*),

■ b. Redesignating paragraph (b)(3)(vi) and (viii) as (b)(3)(vii)(A) and (B), respectively;

■ c. Adding paragraph (b)(3)(vii)(C);

■ d. Reserving paragraphs (b)(3)(vi) and (viii);

■ e. Revising paragraphs (b)(3)(x), (b)(3)(xiv), and (c)(1) introductory text;

■ b. Adding paragraphs (c)(2); and

■ c. Revising paragraph (e)(5);

The revisions and additions read as follows:

§ 414.1400 Third party intermediaries.

* * * * *

(b) * * *

(3) * * *

(iii) Beginning with the CY 2021 performance period/2023 MIPS payment year, the QCDR or qualified registry must provide performance feedback at least 4 times a year and provide specific feedback on how they compare to other clinicians who have submitted data on a given measure within the QCDR or qualified registry. Feedback must be provided at the level at which data is submitted. Exceptions to this requirement may occur if the QCDR or qualified registry submits notification to CMS within the performance period promptly within the month of realization of the impending deficiency and provides sufficient rationale as to why they do not believe they would be able to meet this requirement (for example, if the QCDR does not receive the data from their clinician until the end of the performance period).

* * * * *

(v) * * *

(E) * * *

(*1*) If the intermediary submits MIPS data to CMS for fewer than 10 Quality Payment Program participants, the data validation audit sample must include all Quality Payment Program participants. If the intermediary submits data for 10 or more Quality Payment Program participants, it must use a sample size of at least 3 percent of a combination of the individual MIPS eligible clinicians, groups, virtual groups, subgroups and APM entities for which the QCDR or qualified registry will submit data to CMS, except that the sample size may be no fewer than a combination of 10 individual clinicians, groups, virtual groups, subgroups and APM entities, no more than a combination of 50 individual clinicians, groups, virtual groups, subgroups and APM entities.

(*2*) If there are fewer than 5 patient records, the patient record audit sample must include all patient records. If there

are 5 or more patient records, the intermediary must use a sample that includes at least 25 percent of the patients of each individual clinician, group, virtual group, subgroup or APM entity in the sample, except that the sample for each individual clinician, group, virtual group, subgroup or APM entity must include a minimum of 5 patients and need not include more than 50 patients.

* * * * *

(vi) [Reserved].

(vii) Participation plan for third party intermediary not submitting data.

(A) For the CY 2024 performance period/2026 MIPS payment year through CY 2026 performance period/2028 MIPS payment year, a QCDR or qualified registry that was approved but did not submit any MIPS data for either of the 2 years preceding the applicable self-nomination period must submit a participation plan for CMS' approval. This participation plan must include the QCDR's and/or qualified registry's detailed plans about how the QCDR or qualified registry intends to encourage clinicians to submit MIPS data to CMS through the QCDR or qualified registry.

(B) Beginning with the CY 2027 performance period/2029 MIPS payment year, a QCDR or qualified registry that was approved but did not submit any MIPS data for the year preceding the applicable self-nomination period must submit a participation plan for CMS' approval. This participation plan must include the QCDR's and/or qualified registry's detailed plans about how the QCDR or qualified registry intends to encourage clinicians to submit MIPS data to CMS through the QCDR or qualified registry.

(viii) [Reserved].

* * * * *

(x) For the CY 2017 performance period/2019 MIPS payment year through CY 2026 performance period/CY 2028 MIPS payment year, a QCDR or a qualified registry must be able to submit to CMS data for at least six quality measures including at least one outcome measure.

(A) For the CY 2017 performance period/2019 MIPS payment year through CY 2026 performance period/CY 2028 MIPS payment year, if no outcome measure is available, a QCDR or qualified registry must be able to submit to CMS results for at least one other high priority measure.

(B) Beginning with CY 2027 performance period/2029 MIPS payment year, a QCDR or a qualified registry must be able to submit to CMS data for at least six quality measures including at least one MIPS core measure.

* * * * *

(xiv) A QCDR or a qualified registry must attest that the information listed on the qualified posting is accurate. Changes to information (for example, cost, services included) on the qualified posting must be included and finalized during the qualified posting review period. Third party intermediaries will not be permitted to make changes after the qualified posting is publicly posted on the Quality Payment Program Resource Library page.

* * * * *

(c) * * *

(1) For the CY 2021 performance period/2023 MIPS payment year through the CY 2024 performance period/2026 MIPS payment year, health IT vendors must be able to submit data for the MIPS performance categories as follows:

* * * * *

(2) Beginning with the CY 2025 performance period/2027 MIPS payment year, health IT vendors cannot submit MIPS data.

* * * * *

(5) *Termination for third party intermediary not submitting data.*

(i) Beginning with the CY 2024 performance period/2026 MIPS payment year, a QCDR or qualified registry that submits a participation plan as required under paragraph (b)(3)(viii) of this section, but does not submit MIPS data for the applicable performance period for which they self-nominated under paragraph (b)(3)(viii) of this section, will be terminated.

(ii) Beginning with the CY 2027 performance period/2029 MIPS payment year, a QCDR or qualified registry that submits a participation plan as required under paragraph (b)(3)(viii) of this section, but does not submit MIPS data for the applicable performance period for which they self-nominated under paragraph (b)(3)(viii) of this section, will be queried by CMS before the end of the calendar year for the given MIPS performance period requesting documentation that they have contracted with Quality Payment Program participants who will submit data for the given MIPS performance period. If documentation cannot be provided or the third-party intermediary will not be submitting MIPS data or both for the given MIPS performance period, the third-party intermediary will be terminated.

■ 45. Section § 414.1425 is amended by—

■ a. Revising paragraph (c)(5); and

■ b. Adding paragraphs (c)(8) and (d)(5).

The revision and additions read as follows:

§ 414.1425 Qualifying APM participant determination: In general.

* * * * *

(c) * * *

(5) * * *

(ii) The APM Entity voluntarily or involuntarily terminates from an Advanced APM at a date on which the APM Entity would not bear financial risk for that QP performance period under the terms of the Advanced APM, even if such termination date occurs within such QP Performance Period.

* * * * *

(8) Beginning in the 2027 QP Performance Period, application of QP determination is limited strictly to eligible clinicians as defined at § 414.1305 and that meet the definition of Qualifying APM participant (QP) as defined at § 414.1305 by participating in an Advanced APM during the QP performance period.

* * * * *

(d) * * *

(5) Beginning in the 2027 QP Performance Period, application of Partial QP determination is limited strictly to eligible clinicians as defined at § 414.1305 that meet the definition of Partial Qualifying APM Participant (Partial QP) as defined at § 414.1305 by participating in an Advanced APM during the QP performance period.

* * * * *

■ 46. Section § 414.1430 is amended by revising paragraphs (a), (b(1)(i), (2)(i), (3)(i), and (4)(i) to read as follows:

§ 414.1430 Qualifying APM participant determination: QP and partial QP thresholds.

(a) * * *

(1) *QP payment amount threshold.* The QP payment amount thresholds are the following values for the indicated payment years: (i) 2019 and 2020: 25 percent.

(ii) 2021 through 2026: 50 percent.

(iii) 2027: 75 percent.

(iv) 2028: 50 percent.

(v) 2029 and thereafter: 75 percent.

(2) *Partial QP payment amount threshold.* The Partial QP payment amount thresholds are the following values for the indicated payment years:

(i) 2019 and 2020: 20 percent.

(ii) 2021 through 2026: 40 percent.

(iii) 2027: 50 percent.

(iv) 2028: 40 percent.

(v) 2029 and thereafter: 50 percent.

(3) *QP patient count threshold.* The QP patient count thresholds are the following values for the indicated payment years: (i) 2019 and 2020: 20 percent.

(ii) 2021 through 2026: 35 percent.
(iii) 2027: 50 percent.
(iv) 2028: 35 percent.
(v) 2029 and thereafter: 50 percent.
(4) *Partial QP patient count threshold.* The Partial QP patient count thresholds are the following values for the indicated payment years: (i) 2019 and 2020: 10 percent.
(ii) 2021 through 2026: 25 percent.
(iii) 2027: 35 percent.
(iv) 2028: 25 percent.
(v) 2029 and thereafter: 35 percent.
(b) * * *
(1) * * *
(i) * * *
(A) 2021 through 2026: 50 percent
(B) 2027: 75 percent.
(C) 2028: 50 percent.
(D) 2029 and thereafter: 75 percent.
(2) * * *
(i) * * *
(A) 2021 through 2026: 40 percent
(B) 2027: 50 percent.
(C) 2028: 40 percent.
(D) 2029 and thereafter: 75 percent.
* * * * *
(3) * * *
(i) * * *
(A) 2021 through 2026: 35 percent.
(B) 2027: 50 percent.
(C) 2028: 35 percent.
(D) 2029 and thereafter: 50 percent.
* * * * *
(4) * * *
(i) * * *
(A) 2021 through 2026: 25 percent
(B) 2027: 35 percent.
(C) 2028: 25 percent.
(D) 2029 and thereafter: 35 percent.
* * * * *

■ 47. Section § 414.1450 is amended by revising paragraphs (a)(1)(i) and (b)(1) to read as follows:

§ 414.1450 APM Incentive Payment.

(a) * * *
(1) * * *
(i) For payment years in which an APM incentive payment is authorized under section 1833(z)(1)(A) of the Act, CMS makes a lump sum payment to QPs in the amount described in paragraph (b) of this section for the applicable payment year and in the manner described in paragraphs (d) and (e) of this section.
(b) * * *
(1) The amount of the APM incentive payment is the applicable percentage established for the payment year of the estimated aggregate payments for covered professional services as defined in section 1848(k)(3)(A) of the Act furnished during the calendar year immediately preceding the payment year. CMS uses the paid amounts on claims for covered professional services to calculate the estimated aggregate payments on which CMS will calculate the APM Incentive Payment. The applicable percentage is the following value for the indicated payment years:
(i) 2019 through 2024: 5 percent.
(ii) 2025: 3.5 percent.
(iii) 2026: 1.88 percent.
(iv) 2028: 3.1 percent.
* * * * *

PART 415—SERVICES FURNISHED BY PHYSICIANS IN PROVIDERS, SUPERVISING PHYSICIANS IN TEACHING SETTINGS, AND RESIDENTS IN CERTAIN SETTINGS

■ 48. The authority citation for part 415 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 49. Section 415.172 is amended by revising paragraphs (a) introductory text and (b)(2) to read as follows:

§ 415.172 Physician fee schedule payment for services of teaching physicians.

(a) *General rule.* If a resident participates in a service furnished in a teaching setting, physician fee schedule payment is made only if a teaching physician is present during the key portion of any service or procedure for which payment is sought. For all teaching settings, if a resident participates in a service furnished in a teaching setting, physician fee schedule payment is made if a teaching physician is present during the key portion of the service including for Medicare telehealth services, through audio/video real-time communications technology for any service or procedure for which payment is sought, when either the teaching physician or resident is in the same physical location as the beneficiary or in instances when the service is a 3-way telehealth visit, with the teaching physician, resident, and patient in different locations.
* * * * *
(b) * * *
(2) For all teaching settings, except for services furnished as set forth in §§ 415.174 (concerning an exception for services furnished in hospital outpatient and certain other ambulatory settings), 415.176 (concerning renal dialysis services), and 415.184 (concerning psychiatric services), the medical records must document whether the teaching physician was physically present or present through audio/video real-time communications technology at the time the service (including a Medicare telehealth service) is furnished. The medical records must contain a notation describing the specific portion(s) of the service for which the teaching physician was present through audio/video real-time communications technology. The presence of the teaching physician during procedures and evaluation and management services may be demonstrated by the notes in the medical records made by the physician or as provided in § 410.20(e) of this chapter.

■ 50. Section 415.174 is amended by revising paragraph (a) introductory text to read as follows:

§ 415.174 Exception: Evaluation and management services furnished in certain centers.

(a) In the case of certain evaluation and management codes (as specified by CMS in program instructions), MACs may make physician fee schedule payment for a service furnished by a resident without the presence of a teaching physician. For the exception to apply, all of the following conditions must be met:
* * * * *

PART 417—HEALTH MAINTENANCE ORGANIZATIONS, COMPETITIVE MEDICAL PLANS, AND HEALTH CARE PREPAYMENT PLANS

■ 51. The authority for part 417 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh, and 300e, 300e–5, and 300e–9, and 31 U.S.C. 9701.

■ 52. Section 417.2 is amended by revising paragraph (b) to read as follows:

§ 417.2 Basis and scope.

* * * * *
(b) Subparts G through R of this part set forth the rules for Medicare contracts with, and payment to, HMOs and competitive medical plans (CMPs) under sections 1876 and 1899C of the Act and 8 U.S.C. 1611.
* * * * *

■ 53. Section 417.422 is amended by revising paragraph (h) to read as follows:

§ 417.422 Eligibility to enroll in an HMO or CMP.

* * * * *
(h) Effective July 4, 2025, is a United States citizen or national, or an eligible noncitizen as defined in 42 CFR 400.200.

■ 54. Section 417.460 is amended by revising paragraphs (b)(2)(iv) and (j) to read as follows:

§ 417.460 Disenrollment of beneficiaries by an HMO or CMP.

* * * * *
(b) * * *
(2) * * *

(iv) No longer meets the requirements of § 417.422(h); or

* * * * *

(j) *Enrollee is not a United States citizen or national, or an eligible noncitizen.* Disenrollment is effective the first day of the month following notice by CMS that the individual is ineligible in accordance with § 417.422(h).

PART 422—MEDICARE ADVANTAGE PROGRAM

■ 55. The authority for part 422 continues to read as follows:

Authority: 42 U.S.C. 1302, 1306, 1395w–21 through 1395w–28, and 1395hh.

■ 56. Section 422.1 is amended by adding paragraph (a)(1)(xii) and removing and reserving paragraph (a)(2) to read as follows:

§ 422.1 Basis and scope.

(a) * * *

(1) * * *

(xii) 1899C–Limiting Medicare coverage of certain individuals.

(2) [Reserved]

* * * * *

■ 57. Section 422.50 is amended by revising paragraph (a)(7) to read as follows:

§ 422.50 Eligibility to elect an MA plan.

* * * * *

(a) * * *

(7) Effective July 4, 2025, is a United States citizen or national, or an eligible noncitizen as defined in 42 CFR 400.200.

* * * * *

■ 58. Section 422.62 is amended by revising paragraph (b)(16) to read as follows:

§ 422.62 Election of coverage under an MA plan.

* * * * *

(b) * * *

(16) The individual becomes an eligible noncitizen.

(i) The SEP begins when the individual provides the Social Security Administration with sufficient information to demonstrate that the requirements of § 406.20(b)(2) and § 407.10(a)(2)(ii) have been met and is entitled to Medicare Part A and enrolled in Medicare Part B. The SEP continues for the first 2 months after the date that the individual is entitled to Medicare Part A and enrolled in Medicare Part B.

* * * * *

■ 59. Section 422.74 is amended by revising paragraphs (b)(2)(v) and (d)(9) to read as follows:

§ 422.74 Disenrollment by the MA organization.

* * * * *

(b) * * *

(2) * * *

(v) The individual no longer meets the requirements of § 422.50(a)(7).

* * * * *

(d) * * *

(9) *Enrollee loses U.S. citizenship, U.S. nationality, or eligible noncitizen status.* Disenrollment is effective the first day of the month following notice by CMS that the individual is ineligible in accordance with § 422.50(a)(7) of this chapter.

* * * * *

PART 423—VOLUNTARY MEDICARE PRESCRIPTION DRUG BENEFIT

■ 60. The authority for part 423 continues to read as follows:

Authority: 42 U.S.C. 1302, 1306, 1395w–101 through 1395w–152, and 1395hh.

■ 61. Section 423.1 is amended by adding a section in numerical order in paragraph (a)(1) and removing and reserving paragraph (a)(3) to read as follows:

§ 423.1 Basis and scope.

(a) * * *

(1) * * *

1899C. Limiting Medicare coverage of certain individuals.

* * * * *

(3) [Reserved]

* * * * *

■ 62. Section 423.30 is amended by revising paragraph (a)(1)(iii) to read as follows:

§ 423.30 Eligibility and enrollment.

(a) * * *

(1) * * *

(iii) Effective July 4, 2025, is a United States citizen or national, or an eligible noncitizen as defined in 42 CFR 400.200.

* * * * *

■ 63. Section 423.38 is amended by revising paragraphs (c)(21)(i) and (ii) to read as follows:

§ 423.38 Enrollment periods.

* * * * *

(c) * * *

(21) * * *

(i) The individual becomes an eligible noncitizen.

(ii) The SEP begins when the individual provides the Social Security Administration with sufficient information to demonstrate that the requirements of § 406.20(b)(2) or § 407.10(a)(2)(ii) have been met and is entitled to, or enrolled for, either Medicare Part A or Part B. The SEP continues for the first 2 months after the Part A or Part B entitlement date, whichever is earlier.

* * * * *

■ 64. Section 423.44 is amended by revising paragraphs (b)(2)(vi) and (d)(8) heading to read as follows:

§ 423.44 Involuntary disenrollment from Part D coverage.

* * * * *

(b) * * *

(2) * * *

(vi) The individual no longer meets the requirements of § 423.30(a)(1)(iii).

* * * * *

(d) * * *

(8) *Individual loses U.S. citizenship, U.S. nationality, or eligible noncitizen status.* * * *

* * * * *

PART 424—CONDITIONS FOR MEDICARE PAYMENT

■ 65. The authority for part 424 continues to read as follows:

Authority: 42 U.S.C. 1302 and 1395hh.

■ 66. Section 424.516 is amended by adding paragraph (f)(4) to read as follows:

§ 424.516 Additional provider and supplier requirements for enrolling and maintaining active enrollment status in the Medicare program.

* * * * *

(f) * * *

(4) A provider or supplier that is a covered entity as defined at 42 CFR 10.3 is required to—

(i) Submit to CMS the documentation set forth at § 428.203(c)(1) and (2) relating to covered Part D drugs written or ordered by such provider or supplier.

(ii) Comply with the submission requirements set forth at § 428.203(c)(3) and (4).

* * * * *

PART 425—MEDICARE SHARED SAVINGS PROGRAM

■ 67. The authority citation for part 425 continues to read as follows:

Authority: 42 U.S.C. 1302, 1306, 1395hh, and 1395jjj.

■ 68. Section 425.20 is amended by—

■ a. Revising and republishing the definition of ''Beneficiary eligible for Medicare CQMs'';

■ b. Adding the definition of ''Beneficiary eligible for Medicare eCQMs'' in alphabetical order;

■ c. Revising paragraph (2) in the definition of ''Experienced with performance-based risk Medicare ACO initiatives'';

■ d. Revising paragraph (2) in the definition of ''Inexperienced with performance-based risk Medicare ACO initiatives''; and
■ e. Adding the definition of ''Rural county status'' in alphabetical order.

The revisions, republication, and additions read as follows:

§ 425.20 Definitions.

* * * * *

Beneficiary eligible for Medicare CQMs means a beneficiary identified for purposes of reporting Medicare CQMs for ACOs participating in the Medicare Shared Savings Program (Medicare CQMs), who meets the following requirements (as applicable):

(1) For performance years 2024 through 2026, the beneficiary is either of the following:

(i) A Medicare fee-for-service beneficiary (as defined at § 425.20) who—

(A) Meets the criteria for a beneficiary to be assigned to an ACO described at § 425.401(a); and

(B)(*1*) For performance year 2024, had at least one claim with a date of service during the measurement period from an ACO professional who is a primary care physician or who has one of the specialty designations included in § 425.402(c), or who is a physician assistant, nurse practitioner, or clinical nurse specialist.

(*2*) For performance years 2025 and 2026, had at least one primary care service with a date of service during the applicable performance year from an ACO professional who is a primary care physician or who has one of the specialty designations included in § 425.402(c), or who is a physician assistant, nurse practitioner, or clinical nurse specialist.

(ii) A Medicare fee-for-service beneficiary who is assigned to an ACO in accordance with § 425.402(e) because the beneficiary designated an ACO professional participating in an ACO as responsible for coordinating their overall care.

(2) For performance years 2027 and subsequent performance years, a beneficiary that is assigned to the ACO under subpart E of this part.

Beneficiary eligible for Medicare eCQMs means a beneficiary identified for purposes of reporting Medicare eCQMs for ACOs participating in the Medicare Shared Savings Program (Medicare eCQMs), who is a beneficiary that is assigned to the ACO under subpart E of this part.

* * * * *

Experienced with performance-based risk Medicare ACO initiatives * * *

(2) Forty percent or more of the ACO's ACO participants participated in a performance-based risk Medicare ACO initiative, or in an ACO that deferred its entry into a second Shared Savings Program agreement period under a two-sided model under § 425.200(e), in any of the 5 most recent performance years. An ACO participant is considered to have participated in a performance-based risk Medicare ACO initiative if the ACO participant TIN was or will be included in financial reconciliation for one or more performance years under such initiative during any of the 5 most recent performance years, unless the ACO participant TIN did not have a written agreement to participate in the performance-based risk Medicare ACO initiative.

* * * * *

Inexperienced with performance-based risk Medicare ACO initiatives

* * *

(2) Less than 40 percent of the ACO's ACO participants participated in a performance-based risk Medicare ACO initiative, or in an ACO that deferred its entry into a second Shared Savings Program agreement period under a two-sided model under § 425.200(e), in each of the 5 most recent performance years. An ACO participant is considered to have participated in a performance-based risk Medicare ACO initiative if the ACO participant TIN was or will be included in financial reconciliation for one or more performance years under such initiative during any of the 5 most recent performance years, unless the ACO participant TIN did not have a written agreement to participate in the performance-based risk Medicare ACO initiative.

* * * * *

Rural county status means a county that has a status of Micropolitan (population of 10,000 to 50,000 individuals) or Noncore (population less than 10,000 individuals) per the Federal Office of Rural Health Policy (FORHP) county designation using the most recently available version of the United States Census Bureau Delineation File.

* * * * *

■ 69. Section 425.304 is amended by—
■ a. In paragraph (a)(2), removing the phrase ''paragraph (b) or (c) of this section'' and adding in its place the phrase ''paragraph (b), (c), or (e) of this section''; and
■ b. Adding paragraph (e).The addition reads as follows:

§ 425.304 Beneficiary incentives.

* * * * *

(e) *Part B Cost Sharing Support.*

(1) *General.* ACOs, subject to certain conditions and safeguards, may enter into Part B cost sharing support arrangements with ACO participants, pursuant to which the ACO participants reduce or eliminate cost sharing for those categories of eligible Part B items and services and eligible beneficiaries identified by the ACO. This cost sharing support could include both or either of Medicare FFS deductible and coinsurance amounts.

(2) *Application of the CMS-sponsored model safe harbor.* CMS has determined that the Federal anti-kickback statute safe harbor for CMS-sponsored model arrangements and CMS-sponsored model patient incentives (§ 1001.952(ii)(1) and (2) of this title) is available to protect remuneration exchanged under Part B cost sharing support arrangements between ACOs and ACO participants, and patient incentives in the form of Part B cost sharing support furnished to eligible beneficiaries under the Shared Savings Program that meet all of the requirements of this section and the anti-kickback statute safe harbor requirements set forth at § 1001.952(ii) of this title.

(3) *Application procedures.*

(i) *General.* An ACO must submit a Part B cost sharing support implementation plan in the form and manner and by a deadline specified by CMS. The implementation plan must include the following:

(A) The categories of eligible beneficiaries for which the ACO plans to make Part B cost sharing support available.

(B) The categories of eligible Part B items and services for which the ACO plans to make Part B cost sharing support available.

(C) A description of how the ACO's planned Part B cost sharing support strategy meets at least one of the clinical goals in paragraph (e)(4)(iii) of this section.

(D) The procedures that the ACO will implement to ensure that ACO participants that have entered into a Part B cost sharing support arrangement with the ACO have access to the most current list of beneficiaries eligible to receive Part B cost sharing support.

(E) A requirement for the ACO to submit to CMS a complete and accurate list of ACO participants that have entered into a Part B cost sharing support arrangement with the ACO according to paragraph (e)(5)(i) of this section.

(F) An attestation that, in any marketing or communications regarding the availability of Part B cost-sharing support, the ACO and its ACO participants will not represent such support as a substitute for supplemental

insurance coverage or encourage beneficiaries to reduce or terminate such coverage.

(G) Such other information as may be specified by CMS.

(ii) *CMS review.* CMS evaluates an ACO's implementation plan and approves or denies the application. An ACO may only offer Part B cost sharing support to beneficiaries if CMS approves its application. CMS may reject the ACO's application on the basis of one or more of the following:

(A) The ACO's and the ACO participant's history of noncompliance in the Shared Savings Program.

(B) The ACO's history of noncompliance in CMMI ACO models.

(C) Whether the implementation plan complies with the requirements of § 425.304.

(D) Such other factors as CMS deems reasonable to protect the integrity of the Shared Savings Program, including concerns that the use of Part B cost sharing support may contribute to fraud, waste or abuse.

(iii) *Changes to the implementation plan.* If an ACO wants to make a change to its implementation plan, the ACO must submit a description of the change to CMS in a form and manner and by a deadline or deadlines specified by CMS. CMS evaluates the proposed change and either approves or rejects it.

(4) *Part B cost sharing support requirements.*

(i) *Beneficiary eligibility.* Beneficiaries are eligible to receive Part B cost sharing support if they meet the following criteria:

(A) The beneficiary is assigned to the applying ACO (as described at § 425.400(a)(1)(i)) if the ACO has selected prospective assignment or the beneficiary is an assignable beneficiary (as defined at § 425.20), if the applying ACO has selected preliminary prospective assignment with retrospective reconciliation.

(B) The beneficiary does not have secondary insurance that covers the associated Part B cost sharing obligation.

(C) The beneficiary's overall health is expected to be improved or maintained by receiving the associated Part B item or service.

(ii) *Eligible Part B items and services.* ACOs may reduce or eliminate beneficiary cost sharing for all Medicare FFS Part B items and services except durable medical equipment, prosthetics, orthotics, supplies, and prescription drugs.

(iii) *Clinical goals.* Cost sharing support must advance one or more of the following clinical goals:

(A) Adherence to a treatment regime.

(B) Adherence to a drug regime.

(C) Adherence to a follow-up care plan.

(D) Management of a chronic disease or condition.

(5) *Part B cost sharing support arrangements.*

(i) *ACO participant agreements.* The ACO must have a written agreement with each ACO participant that has agreed to reduce or eliminate Part B cost sharing for eligible ACO beneficiaries under a Part B cost sharing support arrangement with the ACO. The terms of the Part B cost sharing support agreement must include all of the following:

(A) The categories of eligible beneficiaries and eligible Part B items and services for which the ACO participant may reduce or eliminate Part B cost sharing.

(B) A requirement that the ACO participant reduce or eliminate cost sharing in accordance with the ACO's approved implementation plan.

(C) The amount and frequency with which the ACO will reimburse the ACO participant for the cost sharing amounts not collected.

(D) A requirement for ACO participants to maintain copies of records that identify each beneficiary who received a reduction or elimination of Part B cost sharing, the type and date of item or service for which cost sharing support was provided, and the dollar amount of the cost sharing support.

(E) The ability for the ACO or ACO participant to terminate the Part B cost sharing support agreement if the ACO or ACO participant fails to comply with the requirements of this section.

(F) A requirement that the ACO or ACO participants will not market to beneficiaries the availability of the Part B cost sharing support as a substitute for their supplemental insurance coverage.

(ii) *Other rules governing participation.*

(A) An ACO participant must not be required by an ACO to participate in a Part B cost sharing support arrangement.

(B) An ACO may participate in Part B cost sharing support in accordance with an approved implementation plan even if not all of its ACO participants agree to participate.

(iii) *Source of funding.* The ACO must finance all payments made to ACO participants in accordance with the Part B cost sharing support agreement from its own funds.

(6) *Record retention.*

(i) The ACO must maintain copies of the written Part B cost sharing support agreement with ACO participants, as well as the following records:

(A) Records that identify each beneficiary who received a reduction or elimination of Part B cost sharing.

(B) Records that document the type and date of the Part B item or service for which Part B cost sharing was reduced or eliminated.

(C) Records that document the dollar amount of Part B cost sharing that was reduced or eliminated.

(D) Records that document the ACO participant that furnished the item or service for which Part B cost sharing was reduced or eliminated.

(ii) The ACO must provide the records specified in paragraph (e)(6)(i) of this section to CMS upon request.

(7) *Addressing compliance problems.* At any time, CMS may suspend or prohibit the ACO or any ACO participant from participating in a Part B cost sharing support arrangement if CMS determines that the ACO or its ACO participants have failed to comply with any of the requirements of this part. This suspension or prohibition will be effective, in CMS' discretion, regardless of whether the ACO has corrected or otherwise resolved the noncompliance.

■ 70. Section 425.308 is amended by—

■ a. In paragraph (b)(9) introductory text, removing the phrase ''For performance year 2025 and subsequent performance years,'' and adding in its place the phrase ''For performance years 2025 and 2026,''; and

■ b. Adding paragraph (b)(11).The addition reads as follows:

§ 425.308 Public reporting and transparency.

* * * * *

(b) * * *

(11) For performance year 2027 and subsequent performance years, the CEHRT use activity selected by the ACO for the purpose of meeting the ACO CEHRT use requirement at § 425.507(c).

* * * * *

■ 71. Section 425.312 is amended by—

■ a. Revising the last sentence in paragraph (a)(2)(iii);

■ b. Adding a new sentence at the end of paragraph (a)(2)(iv); and

■ c. Removing paragraph (a)(2)(v).The revision and addition read as follows:

§ 425.312 Beneficiary notifications.

(a) * * *

(2) * * *

(iii) * * * The standardized written notice must be furnished to all of these beneficiaries by May 30, unless CMS specifies a later date during the performance year.

(iv) * * * The standardized written notice must be furnished to all of these beneficiaries by May 30, unless CMS

specifies a later date during the performance year.

* * * * *

■ 72. Section 425.400 is amended by revising paragraph (c)(1)(x) introductory text and adding paragraph (c)(1)(xi) to read as follows:

§ 425.400 General.

* * * * *

(c) * * *

(1) * * *

(x) For the performance year starting on January 1, 2026, as follows:

* * * * *

(xi) For the performance year starting on January 1, 2027, and subsequent performance years as follows:

(A) CPT codes:

(*1*) 96160 and 96161 (codes for administration of health risk assessment).

(*2*) 96202 and 96203 (codes for caregiver behavior management training).

(*3*) 97550, 97551, and 97552 (codes for caregiver training services).

(*4*) 98016 (code for virtual check-in).

(*5*) 99201 through 99215 (codes for office or other outpatient visit for the evaluation and management of a patient).

(*6*) 99304 through 99318 (codes for professional services furnished in a nursing facility; professional services or services reported on an FQHC or RHC claim identified by these codes are excluded when furnished in a skilled nursing facility (SNF)).

(*7*) 99319 through 99340 (codes for patient domiciliary, rest home, or custodial care visit).

(*8*) 99341 through 99350 (codes for evaluation and management services furnished in a patient's home).

(*9*) 99354 and 99355 (add-on codes, for prolonged evaluation and management or psychotherapy services beyond the typical service time of the primary procedure; when the base code is also a primary care service code under this paragraph (c)(1)(xi)).

(*10*) 99406 and 99407 (codes for smoking and tobacco-use cessation counseling services).

(*11*) 99421, 99422, and 99423 (codes for online digital evaluation and management).

(*12*) 99424, 99425, 99426, and 99427 (codes for principal care management services).

(*13*) 99437, 99487, 99489, 99490 and 99491 (codes for chronic care management).

(*14*) 99439 (code for non-complex chronic care management).

(*15*) 99452 (code for interprofessional consultation service).

(*16*) 99483 (code for assessment of and care planning for patients with cognitive impairment).

(*17*) 99484, 99492, 99493 and 99494 (codes for behavioral health integration services).

(*18*) 99495 and 99496 (codes for transitional care management services).

(*19*) 99497 and 99498 (codes for advance care planning; services identified by these codes furnished in an inpatient setting are excluded).

(B) HCPCS codes:

(*1*) G0019 and G0022 (codes for community health integration services).

(*2*) G0023 and G0024 (codes for principal illness navigation services).

(*3*) G0101 (code for cervical or vaginal cancer screening).

(*4*) G0136 (code for physical activity and nutritional assessment services).

(*5*) G0317, G0318, and G2212 (codes for prolonged office or other outpatient visit for the evaluation and management of a patient).

(*6*) G0402 (code for the Welcome to Medicare visit).

(*7*) G0438 and G0439 (codes for the annual wellness visits).

(*8*) G0442 (code for alcohol misuse screening service).

(*9*) G0443 (code for alcohol misuse counseling service).

(*10*) G0444 (code for annual depression screening service).

(*11*) G0463 (code for services furnished in electing teaching amendment (ETA) hospitals).

(*12*) G0506 (code for chronic care management).

(*13*) G0537 and G0538 (codes for cardiovascular risk assessment and risk management services).

(*14*) G0539 and G0540 (codes for individual behavior management/modification caregiver training services).

(*15*) G0541, G0542, and G0543 (codes for direct care caregiver training services).

(*16*) G0544 (code for post-discharge telephonic follow-up contacts intervention).

(*17*) G0556, G0557, and G0558 (codes for advanced primary care management services).

(*18*) G0560 (code for safety planning interventions).

(*19*) G0568 and G0569 (codes for behavioral health integration add-on when furnished with advanced primary care management services).

(*20*) G0570 (code for psychiatric collaborative care model add-on when furnished with advanced primary care management services).

(*21*) G2010 (code for the remote evaluation of patient video/images).

(*22*) G2011, G0396, G0397 (codes for screening, brief intervention, and referral to treatment).

(*23)* G2012 and G2252 (codes for virtual check-in).

(*24*) G2058 (code for non-complex chronic care management).

(*25*) G2064 and G2065 (codes for principal care management services).

(*26*) G2086, G2087, and G2088 (codes for office-based opioid use disorder services).

(*27*) G2211 (code for visit complexity inherent to evaluation and management services add-on).

(*28*) G2214 (code for psychiatric collaborative care model).

(*29*) G3002 and G3003 (codes for chronic pain management).

(*30*) GACP1 and GACP2 (codes for advance care planning).

(*31*) GADV1 (code for assessment and treatment of vaccine adverse effects).

(C) Primary care service codes include any CPT code identified by CMS that directly replaces a CPT code specified in paragraph (c)(1)(xi)(A) of this section or a HCPCS code specified in paragraph (c)(1)(xi)(B) of this section, when the assignment window or expanded window for assignment (as defined in § 425.20) for a benchmark or performance year includes any day on or after the effective date of the replacement code for payment purposes under FFS Medicare.

* * * * *

■ 73. Section 425.401 is revised and republished to read as follows:

§ 425.401 Criteria for a beneficiary to be assigned to an ACO.

(a) *Assignment eligibility criteria.* A beneficiary may be assigned to an ACO under the assignment methodology in §§ 425.402 and 425.404, for a performance or benchmark year, if the beneficiary meets all of the following criteria during the assignment window:

(1) For performance years starting prior to January 1, 2028 (as applicable):

(i)(A) Has at least 1 month of Part A and Part B enrollment; and

(B) Does not have any months of Part A only or Part B only enrollment.

(ii) Does not have any months of Medicare group (private) health plan enrollment.

(iii) Is not assigned to any other Medicare shared savings initiative.

(iv) Lives in the United States or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residence at the end of the assignment window.

(2) For the performance year starting on January 1, 2028, and subsequent performance years:

(i) Has at least 1 month of Part A and Part B enrollment and does not have Medicare group (private) health plan enrollment during that same month during the assignment window.

(ii) Is not assigned to any other Medicare shared savings initiative.

(iii) Lives in the United States or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residence at the end of the assignment window.

(b) *Prospective assignment exclusion criteria.* A beneficiary is excluded from the prospective assignment list of an ACO that is participating under prospective assignment under § 425.400(a)(3) at the end of a performance or benchmark year and quarterly during each performance year consistent with § 425.400(a)(3)(ii), or at the end of CY 2019 as specified in § 425.609(b)(1)(ii) and (c)(1)(ii) if the beneficiary meets any of the following criteria during the performance or benchmark year:

(1) For performance years starting prior to January 1, 2028 (as applicable):

(i)(A) Does not have at least 1 month of Part A and Part B enrollment; and

(B) Has any months of Part A only or Part B only enrollment.

(ii) Has any months of Medicare group (private) health plan enrollment.

(iii) Did not live in the United States or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residency at the end of the year.

(2) For the performance year starting on January 1, 2028, and subsequent performance years:

(i) Does not have at least 1 month of Part A and Part B enrollment without Medicare group (private) health plan enrollment during that same month during the assignment window.

(ii) Did not live in the United States or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residency at the end of the year.

■ 74. Section 425.402 is amended by revising and republishing paragraphs (b)(3), (b)(4) and (b)(5)(iv) to read as follows:

§ 425.402 Basic assignment methodology.

* * * * *

(b) * * *

(3)(i) Under the first step, a beneficiary identified in paragraph (b)(1) of this section is assigned to an ACO if the allowed charges for primary care services furnished to the beneficiary by primary care physicians who are ACO professionals and non-physician ACO professionals in the ACO are greater than the allowed charges for primary care services furnished by primary care physicians, nurse practitioners, physician assistants, and clinical nurse specialists who are—

(A) ACO professionals in any other ACO; or

(B) Not affiliated with any ACO and identified by a Medicare-enrolled billing TIN.

(ii) For performance year 2028 and subsequent performance years, if an ACO professional for which CMS identifies a primary care service under paragraph (b)(2) of this section also bills primary care services under a Medicare-enrolled billing TIN unaffiliated with any ACO, then CMS excludes from consideration in assignment under paragraph (b)(3)(i) of this section the allowed charges for primary care services billed by the ACO professional under the non-ACO TIN during the applicable assignment window.

(4)(i) The second step considers the remainder of the beneficiaries identified in paragraph (b)(1) of this section who have not had a primary care service rendered by any primary care physician, nurse practitioner, physician assistant, or clinical nurse specialist, either inside the ACO or outside the ACO. The beneficiary will be assigned to an ACO if the allowed charges for primary care services furnished to the beneficiary by physicians who are ACO professionals with specialty designations as specified in paragraph (c) of this section are greater than the allowed charges for primary care services furnished by physicians with specialty designations as specified in paragraph (c) of this section—

(A) Who are ACO professionals in any other ACO; or

(B) Who are unaffiliated with an ACO and are identified by a Medicare-enrolled billing TIN.

(ii) For performance year 2028 and subsequent performance years, if an ACO professional for which CMS identifies a primary care service under paragraph (b)(2) of this section also bills primary care services under a Medicare-enrolled billing TIN unaffiliated with any ACO, then CMS excludes from consideration in assignment under paragraph (b)(4)(i) of this section the allowed charges for primary care services billed by the ACO professional under the non-ACO TIN during the applicable assignment window.

(5) * * *

(iv)(A) A beneficiary identified in paragraph (b)(5)(ii) of this section is assigned to the ACO if the allowed charges for primary care services furnished to the beneficiary by ACO professionals in the ACO who are primary care physicians, physicians with specialty designations included in paragraph (c) of this section, or non-physician ACO professionals during the applicable expanded window for assignment are greater than the allowed charges for primary care services furnished by primary care physicians, physicians with specialty designations as specified in paragraph (c) of this section, nurse practitioners, physician assistants, and clinical nurse specialists who are—

(*1*) ACO professionals in any other ACO; or

(*2*) Not affiliated with any ACO and identified by a Medicare-enrolled billing TIN.

(B) For performance year 2028 and subsequent performance years, if an ACO professional for which CMS identifies a primary care service under paragraph (b)(5)(iii) of this section also bills primary care services under a Medicare-enrolled billing TIN unaffiliated with any ACO, then CMS excludes from consideration in assignment under paragraph (b)(5)(iv)(A) of this section the allowed charges for primary care services billed by the ACO professional under the non-ACO TIN during the applicable expanded window for assignment.

* * * * *

■ 75. Section 425.507 is amended by—

■ a. In paragraph (a) introductory text, removing the phrase ''For performance years beginning on or after January 1, 2025,'' and adding in its place the phrase ''For performance years 2025 and 2026,'';

■ b. In paragraph (b) introductory text, by adding the words ''For performance years 2025 and 2026,'' to the beginning of the first sentence; and

■ c. Adding paragraph (c).The addition reads as follows:

§ 425.507 Incorporating Promoting Interoperability requirements related to the Quality Payment Program for performance years beginning on or after January 1, 2025.

* * * * *

(c) For performance years beginning on or after January 1, 2027, an ACO must demonstrate the use of CEHRT (as defined in paragraph (3) of the CEHRT definition at § 414.1305 of this chapter) in one of the following manners:

(1) The ACO uses CEHRT (as defined in paragraph (3) of the CEHRT definition at § 414.1305 of this chapter) that also supports the calculation and reporting of clinical quality measures by being certified to the ONC health IT certification criteria at 45 CFR 170.315(c)(2) and (c)(3), to completely

report at least one of the measures in the APP Plus quality measure set using the eCQMs or Medicare eCQMs collection types and meets the data completeness requirement at § 414.1340 of this chapter for the applicable performance year.

(2) The ACO completely reports at least one measure in the APP Plus quality measure set and meets the data completeness requirement at § 414.1340 of this chapter for the applicable performance year using EHR technology that meets paragraph (3) of the CEHRT definition at § 414.1305 of this chapter and attests that it used data collected from an HL7® Fast Healthcare Interoperable Resources (FHIR®)-based API to support quality measurement using a Health IT Module (as defined in 45 CFR 170.102) that has been certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access.

(3) The ACO attests to at least one of the Shared Savings Program CEHRT use metrics from the list of metrics established for the applicable performance year.

■ 76. Section 425.508 is amended by adding paragraphs (c)(1) through (4) to read as follows:

§ 425.508 Incorporating quality reporting requirements related to the Quality Payment Program.

* * * * *

(c) * * *

(1) For performance years beginning on or after January 1, 2026. ACOs may exclude one or more TINs of ACO participants from an ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure as required in this paragraph (c). Applicable exclusions may include:

(i) Unforeseen circumstance(s) that are outside of the control of the ACO, such as the unexpected closure of a group or individual's practice that bills under the ACO participant TIN.

(ii) An ACO participant TIN has a CEHRT that is intended for specialty use and does not support the measure(s) included in the APP Plus quality measure set.

(iii) Other circumstances as determined by CMS.

(2) ACOs may not exclude an ACO participant TIN from the ACO's quality data submission for each measure based on the following:

(i) The demographics of the beneficiaries who had an encounter during the performance year with an ACO participant TIN.

(ii) The health status of the beneficiaries who had an encounter during the performance year with an ACO participant TIN.

(iii) The estimated impact of the ACO participant TIN on the ACO's quality performance.

(3) The ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure must include ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the ACO under subpart E of this part prior to the application of the measure specifications.

(4) CMS retains the right to audit and validate eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data reported by an ACO and may request documentation from the ACO related to the exclusion of ACO participant TINs under paragraph (c)(1) of this section. Failure to report quality measure data accurately, completely, and timely may result in compliance actions as described in §§ 425.216 and 425.218.

* * * * *

■ 77. Section 425.512 is amended by—

■ a. In paragraph (a)(2)(iv), removing the phrase ''eCQMs/Medicare CQMs'' and adding in its place the phrase ''eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs'';

■ b. In paragraph (a)(5)(i)(B) introductory text, removing the phrase ''For performance years 2025 and 2026,'' and adding in its place the phrase ''For performance year 2025 and subsequent performance years,'';

■ c. Removing paragraph (a)(5)(i)(C);

■ d. In paragraph (a)(5)(iii)(C), removing the phrase ''eCQMs/Medicare CQMs'' and adding in its place the phrase ''eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs'';

■ e. In paragraph (a)(7)(ii), removing the phrase ''For performance year 2025 and subsequent performance years,'' and adding in its place the phrase ''For performance years 2025 and 2026''; and

■ f. Adding paragraph (a)(7)(iii).

The addition reads as follows:

§ 425.512 Determining the ACO quality performance standard for performance years beginning on or after January 1, 2021.

(a) * * *

(7) * * *

(iii) For performance year 2027 and subsequent performance years, if an ACO reports all of the required measures in the APP Plus quality measure set, meeting the data completeness requirement at § 414.1340 of this subchapter for each measure in the APP Plus quality measure set, and receiving a MIPS Quality performance category score as described at § 414.1380(b)(1) of this subchapter, for the relevant performance year, and the ACO meets the following—

(A) The ACO's MIPS Quality performance category score is calculated on less than five measures; and

(B) Any unscored measure(s) must meet all of the following:

(*1*) The ACO's total available measure achievement points used to calculate the ACO's MIPS Quality performance category score are reduced under § 414.1380(b)(1)(vii)(A) of this subchapter.

(*2*) The ACO's total measure achievement points used to calculate the ACO's MIPS Quality performance category score are not reduced under § 414.1380(b)(1)(iii) of this subchapter.

* * * * *

§ 425.600 [Amended]

■ 78. Section 425.600 is amended in paragraph (f)(4)(ii) by removing the references ''§§ 425.601(f), and 425.656(e)'' and adding in their place the references ''§ 425.601(f), and § 425.656(e) and (f)''.

■ 79. Section 425.605 is amended by—

■ a. Revising paragraph (d)(1)(v)(A)(*3*)(*ii*), the first sentence of paragraph (d)(1)(v)(A)(*4*) introductory text, and paragraph (d)(1)(v)(A)(*4*)(*ii*);

■ b. Adding paragraph (d)(1)(v)(A)(*5*);

■ c. In paragraph (h)(2), removing the references ''paragraph (d)(1)(i)(A)(*4*), (d)(1)(ii)(A)(*4*), (d)(1)(iii)(A)(*4*), (d)(1)(iv)(A)(*4*), or (d)(1)(v)(A)(*4*) of this section'' and adding in their place the references ''paragraph (d)(1)(i)(A)(*4*), (d)(1)(ii)(A)(*4*), (d)(1)(iii)(A)(*4*), (d)(1)(iv)(A)(*4*), (d)(1)(v)(A)(*4*) or (d)(1)(v)(A)(*5*) of this section'';

■ d. In paragraph (i)(2)(i) introductory text, removing the phrase ''paragraph (i)(2)(ii) of this section'' and adding in its place the phrase ''paragraph (i)(2)(ii) or (i)(2)(iii) of this section, as applicable''; and

■ e. Adding new paragraph (i)(2)(iii).

The revisions and additions read as follows:

§ 425.605 Calculation of shared savings and losses under the BASIC track.

* * * * *

(d) * * *

(1) * * *

(v) * * *

(A) * * *

(*3*) * * *

(*ii*) 50 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(4)(ii).

(*4*) *For ACOs in agreement periods beginning on July 1, 2019, through January 1, 2026, for performance years beginning on or after January 1, 2024.*

* * *

(*ii*) 50 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(5)(ii).

(*5*) *For ACOs in agreement periods beginning on or after January 1, 2027, for performance years beginning on or after January 1, 2027.* An ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level E, receives a shared savings payment equal to a percentage of all the savings under the updated benchmark (up to the performance payment limit described in paragraph (d)(1)(v)(B) of this section). Except as provided in paragraph (h) of this section, the percentage is as follows:

(*i*) 60 percent for an ACO that that meets the quality performance standard by meeting the criteria specified in § 425.512(a)(2) or (a)(5)(i).

(*ii*) 60 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(5)(ii).

* * * * *

(i) * * *

(2) * * *

(iii) For agreement periods beginning on or after January 1, 2024, and before January 1, 2027, for performance year 2025 and subsequent performance years of the ACO's agreement period. CMS calculates the benchmark-based loss recoupment limit as follows:

(A) Calculates the value for total benchmark expenditures as the product of an ACO's per capita updated benchmark expenditures for the performance year prior to the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

(B) Calculates the value for total benchmark expenditures as the product of an ACO's per capita updated benchmark expenditures for the performance year after the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

(C) Calculates the product of the percentage specified in paragraph (d)(1)(iii)(D)(*2*), (d)(1)(iv)(D)(*2*), and (d)(1)(v)(D)(*2*) of this section, as applicable, and the lesser of the ACO's total benchmark expenditures calculated according to paragraphs (i)(2)(iii)(A) and (i)(2)(iii)(B) of this section.

■ 80. Section 425.610 is amended by—

■ a. In paragraph (l)(2) introductory text, removing the phrase ''paragraph (l)(3) of this section'' and adding in its place the phrase ''paragraph (l)(3) or (l)(4) of this section, as applicable''; and

■ b. Adding paragraph (l)(4).

The addition reads as follows:

§ 425.610 Calculation of shared savings and losses under the ENHANCED track.

* * * * *

(l) * * *

(4) For agreement periods beginning on or after January 1, 2024, and before January 1, 2027, for performance year 2025 and subsequent performance years of the ACO's agreement period. The amount of shared losses for which an eligible ACO is liable may not exceed 15 percent of the lesser of the following:

(i) Total benchmark expenditures calculated as the product of an ACO's per capita updated benchmark expenditures for the performance year prior to the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

(ii) Total benchmark expenditures calculated as the product of an ACO's per capita updated benchmark expenditures for the performance year after the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

§ 425.612 [Amended]

■ 81. Section 425.612(a)(1)(iv)(A)(*2*) is amended by removing the references ''§ 425.401(a)(1) and (2)'' and adding in its place the references ''§ 425.401(a)(1)(i)-(ii) and (a)(2)(i) (as applicable)''.

■ 82. Section 425.630 is amended by—

■ a. In paragraph (e)(1), removing the phrase ''social determinants of health'' and adding in its place the phrase ''upstream drivers of health'';

■ b. Revising paragraph (f)(2)(ii) introductory text to add a new first sentence; and

■ c. Revising and republishing paragraphs (f)(2)(iii) and (f)(2)(iv).

The revisions and republications read as follows:

§ 425.630 Option to receive advance investment payments.

* * * * *

(f) * * *

(2) * * *

(ii) For performance years 2023 through 2027.

* * * * *

(iii) Determines a beneficiary's payment amount.

(A) For performance years 2023 through 2027. For each beneficiary in the assigned population identified in paragraph (f)(2)(i) of this section, CMS determines the payment amount that corresponds to the beneficiary's risk factors-based score determined in paragraph (f)(2)(ii) of this section. The beneficiary payment amount is as follows:

TABLE 1 TO PARAGRAPH (f)(2)(iii)(A)

Rick factors-based score	1–24	25–34	35–44	45–54	55–64	65–74	75–84	85–100
Payment amount	$0	$20	$24	$28	$32	$36	$40	$45

(B) For performance year 2028 and subsequent performance years. For each beneficiary in the assigned population identified in paragraph (f)(2)(i) of this section, CMS determines the quarterly payment amount, as follows:

(*1*) An ACO will receive a quarterly payment of $45 for each beneficiary that meets any of the following criteria:

(*i*) Is enrolled in the LIS.

(*ii*) Is dually eligible for Medicare and Medicaid.

(*iii*) Is residing in a county with rural county status (as defined at § 425.20). CMS determines the county of residence for the beneficiary based on the beneficiary's mailing address.

(*2*) An ACO will receive a quarterly payment of $25 for each beneficiary that does not meet any of the criteria listed in paragraph (f)(2)(iii)(B)(*1*) of this section.

(iv) Calculates the ACO's quarterly payment amount.

(A) For performance years 2023 through 2027. The ACO's quarterly payment amount is the sum of the beneficiary payment amounts corresponding to each assigned beneficiary's risk factors-based score, specified in paragraph (f)(2)(iii)(A) of this section, capped at 10,000 beneficiaries. If the ACO has more than 10,000 assigned beneficiaries according to paragraph (f)(2)(i) of this section, CMS will calculate the quarterly

payment amount based on the 10,000 assigned beneficiaries with the highest risk factors-based scores determined according to paragraph (f)(2)(ii) of this section.

(B) For performance year 2028 and subsequent performance years. The ACO's quarterly payment amount is the sum of the beneficiary payment amounts corresponding to the quarterly payments specified in paragraph (f)(2)(iii)(B) of this section. If the ACO has more than 10,000 assigned beneficiaries according to paragraph (f)(2)(i) of this section, CMS will calculate the quarterly payment amount based on the 10,000 assigned beneficiaries with the highest quarterly payment amount determined according to paragraph (f)(2)(iii)(B) of this section.

* * * * *

■ 83. Section 425.640 is amended by—

■ a. In paragraph (b)(1)(i), removing the phrase ''January 1, 2026, or in subsequent years'' and adding in its place the phrase ''January 1, 2026 or January 1, 2027'';

■ b. In paragraph (c)(1), removing the phrase ''January 1, 2026, or in subsequent years'' and adding in its place the phrase ''January 1, 2026 or January 1, 2027''; and

■ c. Revising paragraphs (f)(1)(i) and (ii).

The revisions read as follows:

§ 425.640 Option to receive prepaid shared savings.

* * * * *

(f) * * *

(1) * * *

(i) An eligible ACO entering an agreement period beginning on January 1, 2026 or January 1, 2027 will receive quarterly prepaid shared savings payments through December 31, 2027, unless the payment is withheld or terminated under paragraph (h) of this section.

(ii) An eligible ACO participating in an agreement period beginning on January 1, 2025, will receive quarterly prepaid shared savings payments starting with the performance year beginning on January 1, 2026 through December 31, 2027, unless the payment is withheld or terminated under paragraph (h) of this section. The ACO will not receive additional or catch-up payments for performance year 2025.

* * * * *

§ 425.650 [Amended]

■ 84. Section 425.650 is amended in paragraph (a) by removing the references ''§§ 425.652 through 425.662'' and adding in their place the references ''§§ 425.652 through 425.664''.

■ 85. Section 425.652 is amended by adding paragraph (a)(8)(iii) to read as follows:

§ 425.652 Establishing, adjusting, and updating the benchmark for agreement periods beginning on January 1, 2024, and in subsequent years.

(a) * * *

(8) * * *

(iii) For agreement periods beginning on January 1, 2027, and in subsequent years, in addition to any adjustment applied to the historical benchmark in accordance with paragraph (a)(8)(ii) of this section (either a regional adjustment, prior savings adjustment, or population adjustment, as applicable), the ACO will receive a growth adjustment (as calculated under § 425.664), if eligible. The sum of the adjustment amount (if any) applied in paragraph (a)(8)(ii) of this section and the growth adjustment (determined according to § 425.664(i)(1)) may not exceed an amount equal to the cap specified in § 425.664(i)(2).

* * * * *

■ 86. Section 425.656 is amended by—

■ a. Revising paragraph (a);

■ b. In paragraph (c)(2), removing the phrase ''paragraph (e) of this section'' and adding in its place the phrase ''paragraphs (e) or (f) of this section (as applicable)'';

■ c. Revising and republishing paragraph (c)(3);

■ d. Revising paragraph (e) introductory text;

■ e. Redesignating paragraph (f) as paragraph (g);

■ f. Adding new paragraph (f); and

■ g. In newly redesignated paragraph (g) introductory text, removing the phrase ''paragraphs (b) through (e) of this section'' and adding in its place the phrase ''paragraphs (b) through (f) of this section''.

The revisions, republications, and addition read as follows:

§ 425.656 Calculating the regional adjustment to the historical benchmark.

(a) *General.* This section describes the methodology for calculating the regional adjustment to the historical benchmark based on the ACO's regional service area expenditures, making separate calculations for the following populations of beneficiaries: ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries. This section applies to regional adjustment calculations for agreement periods beginning on January 1, 2024, and in subsequent years, except as specified otherwise.

* * * * *

(c) * * *

(3)(i) For agreement periods beginning on or after January 1, 2024 and before January 1, 2027. Caps the per capita dollar amount for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) calculated under paragraph (c)(2) of this section at a dollar amount equal to a percentage of national per capita expenditures for Parts A and B services under the original Medicare fee-for-service program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary. The cap is applied as follows:

(A) For positive adjustments, the per capita dollar amount for a Medicare enrollment type is capped at 5 percent of the national per capita expenditure amount for the enrollment type for BY3.

(B) For negative adjustments, the per capita dollar amount for a Medicare enrollment type is capped at negative 1.5 percent of the national per capita expenditure amount for the enrollment type for BY3.

(ii) For agreement periods beginning on January 1, 2027, and in subsequent years. Caps the per capita dollar amount for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) calculated under paragraph (c)(2) of this section at a dollar amount, as follows:

(A) For positive adjustments, the per capita dollar amount for a Medicare enrollment type is capped at a dollar amount calculated as follows:

(*1*) Calculate the product of the following:

(*i*) The amount of national per capita expenditures for Parts A and B services under the original Medicare fee-for-service program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary.

(*ii*) The ACO's weighted average CMS–HCC risk score for the enrollment type for BY3.

(*2*) Calculate 5 percent of the enrollment type-specific product determined in paragraph (c)(3)(ii)(A)(*1*) of this section.

(B) For negative adjustments, the per capita dollar amount for a Medicare enrollment type is capped at a dollar amount equal to negative 1.5 percent of national per capita expenditures for Parts A and B services under the original Medicare fee-for-service

program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary.

* * * * *

(e) *Phase-in of weights used in the regional adjustment calculation for agreement periods beginning on or after January 1, 2024 and before January 1, 2027.*

* * * * *

(f) *Phase-in weights used in the regional adjustment calculation for agreement periods beginning on January 1, 2027, and in subsequent years.*

(1) The first time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, CMS calculates the regional adjustment as follows:

(i) Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's initial or rebased historical benchmark, if the ACO is determined to have lower spending than the ACO's regional service area.

(ii) Using 15 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's initial or rebased historical benchmark, if the ACO is determined to have higher spending than the ACO's regional service area.

(2) The second time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, CMS calculates the regional adjustment as follows:

(i) For an ACO participating under the BASIC track—

(A) Using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

(B) Using 25 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

(ii) For an ACO participating under the ENHANCED track—

(A) Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

(B) Using 25 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

(3) The third time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, CMS calculates the regional adjustment as follows:

(i) For an ACO participating under the BASIC track—

(A) Using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

(B) Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

(ii) For an ACO participating under the ENHANCED track—

(A) Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

(B) Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

(4) The fourth or subsequent time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, CMS calculates the regional adjustment as follows:

(i) For an ACO participating under the BASIC track, using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark.

(ii) For an ACO participating under the ENHANCED track—

(A) Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

(B) Using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

(5) To determine if an ACO has lower or higher spending compared to the ACO's regional service area, CMS does the following:

(i) Multiplies the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's historical benchmark for each population of beneficiaries (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) as calculated under paragraph (c)(1) of this section by the applicable proportion of the ACO's assigned beneficiary population (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) for BY3 of the historical benchmark.

(ii) Sums the amounts determined in paragraph (f)(5)(i) of this section across the populations of beneficiaries (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries).

(iii) If the resulting sum is a net positive value, the ACO is considered to have lower spending compared to the ACO's regional service area. If the resulting sum is a net negative value, the ACO is considered to have higher spending compared to the ACO's regional service area.

(iv) If during the term of the agreement period CMS adjusts the ACO's benchmark, as specified in § 425.652(a)(9), CMS redetermines whether the ACO is considered to have lower spending or higher spending compared to the ACO's regional service area for purposes of determining the percentage in paragraphs (f)(1) through (4) of this section used in calculating the regional adjustment.

* * * * *

■ 87. Section 425.658 is amended by—

■ a. Revising paragraph (c)(1) introductory text and paragraph (c)(2); and

■ b. In paragraph (d), removing the phrase ''paragraph (c)(1) of this section'' and adding in its place the phrase ''paragraph (c) of this section''.

The revisions read as follows:

§ 425.658 Calculating the prior savings adjustment to the historical benchmark.

* * * * *

(c) * * *

(1) For agreement periods beginning on or after January 1, 2024 and before January 1, 2027. If an ACO is eligible for the prior savings adjustment as determined in paragraph (b)(3) of this section, the prior savings adjustment will equal the lesser of the following:

* * * * *

(2) For agreement periods beginning on January 1, 2027, and in subsequent years. If an ACO is eligible for the prior savings adjustment as determined in paragraph (b)(3) of this section, the prior savings adjustment will equal the lesser of the following:

(i) 75 percent of the pro-rated average per capita amount computed in paragraph (b)(3)(ii) of this section.

(ii) A single per capita value that is calculated as follows:

(A) Calculate the product of the following for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries)—

(*1*) The national per capita expenditures for Parts A and B services under the original Medicare fee-for-service program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary; and

(*2*) The ACO's weighted average CMS–HCC risk score for that enrollment type for BY3.

(B) Calculate 5 percent of each enrollment type-specific product determined in paragraph (c)(2)(ii)(A) of this section.

(C) Calculate the single per capita value as a person-year weighted average by multiplying each of the enrollment type-specific values determined in accordance with paragraph (c)(2)(ii)(B) of this section by the proportion of the ACO's assigned beneficiaries within that particular enrollment type, and then summing the results.

* * * * *

■ 88. Section 425.660 is revised to read as follows:

§ 425.660 Accountable Care Prospective Trend (ACPT).

(a) *General.* The methodology by which CMS calculates and adjusts a projected growth rate called the Accountable Care Prospective Trend (ACPT) is described in this section. CMS incorporates the ACPT into the blended update factor described in § 425.652(b) when updating an ACO's benchmark for each performance year of the agreement period, for agreement periods beginning on January 1, 2024, and in subsequent years.

(b) *Determination of ACPT.* An ACPT is a flat dollar amount calculated using one or more annualized growth rates based on national fee-for-service Medicare expenditures projected by the CMS Office of the Actuary. In determining the ACPT for a Medicare enrollment type for each performance year, CMS does all of the following:

(1) *Calculate annualized projected growth rates.* The annualized projected growth rates are calculated as an annual rate of growth in projected expenditures relative to the prior year. CMS projects annualized per capita growth in Parts A and B fee-for-service expenditures for each performance year of the ACO's agreement period. In calculating the annualized projected growth rates, CMS does all of the following:

(i) Excludes IME and DSH payments, and the supplemental payment for IHS/Tribal hospitals and Puerto Rico hospitals.

(ii) Makes separate expenditure calculations for each of the following populations of beneficiaries:

(A) ESRD.

(B) Aged/Disabled.

(iii) Calculates one or more annualized projected growth rates for the ESRD population of beneficiaries described in paragraph (b)(1)(ii)(A) of this section, and one or more annualized growth rates for the Aged/Disabled population of beneficiaries described in paragraph (b)(1)(ii)(B) of this section, as follows:

(A) Using a uniform annualized projected rate of growth over each of the 5 performance years of the 5-year agreement period (for agreement periods beginning on or after January 1, 2024, and before January 1, 2027), or for each performance year (for agreement periods beginning on January 1, 2027, and in subsequent years), as applicable; or

(B) If annualization as specified in paragraph (b)(1)(iii)(A) of this section is determined not to reasonably fit the anticipated growth curve, CMS applies an alternative annualization technique using two or more annualized growth rates reflecting the projected rates of growth during the 5 performance years comprising the 5-year agreement period (for agreement periods beginning on or after January 1, 2024, and before January 1, 2027), or for each performance year (for agreement periods beginning on January 1, 2027, and in subsequent years), as applicable.

(2) *Calculate cumulative projected growth rate.* For each performance year, CMS calculates cumulative projected growth rates relative to the ACO's benchmark year (BY) 3, using the annualized projected growth rates, determined in accordance with paragraph (b)(1) of this section, for each population of beneficiaries: the ESRD population and the Aged/Disabled population.

(3) *Express cumulative projected growth rate as a flat dollar amount.* For each performance year, CMS multiplies the applicable cumulative projected growth rate described in paragraph (b)(2) of this section by BY3 truncated national per capita fee-for-service Medicare expenditures for assignable beneficiaries for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries) identified for the 12-month calendar year corresponding to BY3 to express the cumulative projected growth rate as a flat dollar amount as follows:

(i) The ESRD cumulative projected growth rate calculated in accordance with paragraph (b)(2) of this section is used for the ESRD population.

(ii) The Aged/Disabled cumulative projected growth rate calculated in accordance with paragraph (b)(2) of this section is used for the following populations: disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries.

(4) *Risk adjust the flat dollar amount.* CMS adjusts the flat dollar amounts described in paragraph (b)(3) of this section for each performance year for differences in severity and case mix between the ACO's BY3 assigned beneficiary population and the national assignable FFS population for each Medicare enrollment type identified for the 12-month calendar year corresponding to BY3.

(5) *Calculate ACO-specific ACPT growth rates.* CMS divides the risk adjusted flat dollar amounts described in paragraph (b)(4) of this section by the ACO's historical benchmark expenditures described in § 425.652(a) for each Medicare enrollment type to calculate the percentage increase to be included in the blended update factor described in § 425.652(b)(4).

(6) *Timing of calculations.*

(i) For agreement periods beginning on or after January 1, 2024, and before January 1, 2027.

(A) At the beginning of the ACO's agreement period, CMS calculates the annualized projected growth rates for all performance years of the ACO's

agreement period in accordance with paragraph (b)(1) of this section. These annualized projected growth rates will remain fixed over the ACO's agreement period.

(B) For a given performance year, CMS calculates an ACO-specific ACPT value, in accordance with paragraphs (b)(2) through (b)(5) of this section, using the annualized projected growth rates calculated at the beginning of the ACO's agreement period, as described in paragraph (b)(6)(i)(A) of this section.

(ii) For agreement periods beginning on January 1, 2027, and in subsequent years.

(A) In the calendar year preceding a given performance year, CMS calculates the annualized projected growth rates in accordance with paragraph (b)(1) of this section for that performance year.

(B) For a given performance year, CMS calculates an ACO-specific ACPT value, in accordance with paragraphs (b)(2) through (b)(5) of this section, using the annualized projected growth rates calculated in the preceding calendar year, as described in paragraph (b)(6)(ii)(A) of this section.

(c) *Recomputation of ACPT.* At financial reconciliation for a given performance year, CMS may recompute the ACO-specific ACPT value for a Medicare enrollment type initially determined at paragraph (b)(5) of this section for that performance year, to address under-projection or over-projection of the ACPT (as applicable), as follows:

(1) For agreement periods beginning on or after January 1, 2024, and before January 1, 2027.

(i) For performance year 2025 and subsequent performance years of the ACO's agreement period, CMS separately calculates for the ESRD and Aged/Disabled populations the difference between the cumulative projected growth rates calculated in paragraph (b)(2) of this section and the cumulative observed growth in per capita expenditures for the national assignable FFS population.

(ii) For the ESRD and Aged/Disabled populations separately, if the difference calculated in paragraph (c)(1)(i) of this section is less (more negative) than −1.0 percentage point, CMS will recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at paragraph (b)(5) of this section. CMS will calculate an ACO-specific ACPT value for the corresponding enrollment type(s), in accordance with paragraphs (b)(3) through (b)(5) of this section, using the cumulative observed growth in expenditures for the national assignable FFS population minus 1.0 percentage point.

(iii) For the ESRD and Aged/Disabled populations separately, if the difference calculated in paragraph (c)(1)(i) of this section is greater than (less negative) or equal to −1.0 percentage point, CMS will not recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at paragraph (b)(5) of this section.

(2) For agreement periods beginning on January 1, 2027, and in subsequent years.

(i) CMS separately calculates for the ESRD and Aged/Disabled populations the difference between the cumulative projected growth rates calculated in paragraph (b)(2) of this section and the cumulative observed growth in per capita expenditures for the national assignable FFS population.

(ii) For the ESRD and Aged/Disabled populations separately, if the difference calculated in paragraph (c)(2)(i) of this section is less (more negative) than −1.0 percentage point, CMS will recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at paragraph (b)(5) of this section. CMS will calculate an ACO-specific ACPT value for the corresponding enrollment type(s), in accordance with paragraphs (b)(3) through (b)(5) of this section, using the cumulative observed growth in expenditures for the national assignable FFS population minus 1.0 percentage point.

(iii) For the ESRD and Aged/Disabled populations separately, if the difference calculated in paragraph (c)(2)(i) of this section is greater than or equal to +1.5 percentage points, CMS will recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at paragraph (b)(5) of this section. CMS will calculate an ACO-specific ACPT value for the corresponding enrollment type(s), in accordance with paragraphs (b)(3) through (b)(5) of this section, using the cumulative observed growth in expenditures for the national assignable FFS population plus 1.5 percentage point.

(iv) For the ESRD and Aged/Disabled populations separately, if the difference calculated in paragraph (c)(2)(i) of this section is between −1.0 and +1.5 percentage points, inclusive, CMS will not recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at paragraph (b)(5) of this section.

■ 89. Section 425.662 is amended by revising and republishing paragraph (b)(2) to read as follows:

§ 425.662 Calculating the population adjustment to the historical benchmark.

* * * * *

(b) * * *

(2)(i) For agreement periods beginning on January 1, 2025, or January 1, 2026. Calculates a scaler as the difference between 5 percent of the national per capita expenditure amount, expressed as single value as calculated in paragraph (b)(1) of this section, and the higher of: the regional adjustment, expressed as a single value as described in § 425.656(d); the per capita prior savings adjustment determined in § 425.658(c); or no adjustment, in the case where the regional adjustment is negative and the ACO is not eligible for the prior savings adjustment under § 425.658(b)(3)(i).

(ii) For agreement periods beginning on January 1, 2027, and in subsequent years. Calculates a scaler as the difference between the following:

(A) A single per capita value that is calculated as follows:

(*1*) Calculate the product of the following for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries):

(*i*) The national per capita expenditures for Parts A and B services under the original Medicare fee-for-service program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary.

(*ii*) The ACO's weighted average CMS–HCC risk score for that enrollment type for BY3.

(*2*) Calculate 5 percent of each enrollment type-specific product determined in paragraph (b)(2)(ii)(A)(*1*) of this section.

(*3*) Calculate a single per capita value as a person-year weighted average by multiplying each of the enrollment type-specific values determined in accordance with paragraph (b)(2)(ii)(A)(*2*) of this section by the proportion of the ACO's assigned beneficiaries within that particular enrollment type, then summing the results.

(B) The highest among—

(*1*) The regional adjustment, expressed as a single value as described in § 425.656(d);

(*2*) The per capita prior savings adjustment determined in § 425.658(c); or

(*3*) No adjustment, in the case where the regional adjustment is negative and the ACO is not eligible for the prior

savings adjustment under § 425.658(b)(3)(i).

* * * * *

■ 90. Section 425.664 is added to read as follows:

§ 425.664 Calculating the growth adjustment to the historical benchmark .

(a) *General.* This section describes the methodology for calculating the growth adjustment to the historical benchmark for agreement periods beginning on January 1, 2027, and in subsequent years.

(b) *Determine an ACO's new growth share of assigned beneficiary person years.*

(1) *Identify shared savings initiatives for the growth adjustment.* CMS means, for purposes of this part, an initiative implemented by CMS, including the following options and initiatives—

(i) The Shared Savings Program;

(ii) The Innovation Center ACO models; or

(iii) Other initiatives that may be specified by CMS.

(2) *Identify ACO professionals who are inexperienced in shared savings initiatives.* CMS determines that an ACO professional is inexperienced in a shared savings initiative if the ACO professional has not billed primary care services through a participant in the Shared Savings Program, or participated in an Innovation Center ACO model, or other initiative specified by CMS in financial reconciliation for one or more performance years under such initiative during any of the 5 performance years directly preceding the start of the current agreement period.

(3) *Identify beneficiaries who are inexperienced with shared savings initiatives assigned to the ACO.* CMS determines that a beneficiary assigned to an ACO is inexperienced with shared savings initiatives if the beneficiary was not included in assignment in financial reconciliation to an ACO in the Shared Savings Program, Innovation Center ACO model, or other initiative specified by CMS in the performance year that corresponds to the ACO's BY3.

(4) *Calculate an ACO's new growth for the applicable performance year.* CMS calculates an ACO's new growth as follows:

(i) CMS determines the number of beneficiary person years for beneficiaries who are inexperienced with shared savings initiatives (as determined under paragraph (b)(3) of this section) with an ACO professional who is inexperienced with shared savings initiatives (as determined under paragraph (b)(2) of this section) as the ACO professional who provided the highest number of primary care services at the ACO within the assignment window, or to whom the beneficiary was voluntarily aligned, in the performance year as follows:

(A) Count the primary care services (as defined at § 425.20) each assigned beneficiary who is inexperienced with shared savings initiatives (as determined under paragraph (b)(3) of this section) has with each ACO professional participating in the ACO within the assignment window, or to whom the beneficiary was voluntarily aligned for the applicable performance year.

(B) For the purposes of this calculation, attribute the assigned beneficiary who is inexperienced with shared savings initiatives (as determined under paragraph (b)(3) of this section) to the ACO professional with whom the beneficiary had the highest number of primary care services (as defined at § 425.20) for the applicable performance year.

(C) CMS counts, as new growth for the performance year, the number of beneficiary person years for beneficiaries who are inexperienced with shared savings initiatives (as determined under paragraph (b)(3) of this section) and who received the highest number of primary care services (as defined at § 425.20) for the applicable performance year from an ACO professional who is inexperienced with shared savings initiatives (as determined under paragraph (b)(2) of this section).

(ii) [Reserved]

(c) *Determine an ACO's overall growth assigned beneficiary person years.* CMS calculates an ACO's overall growth as the number of assigned beneficiary person years in the performance year minus the number of assigned beneficiary person years in the performance year that corresponds to the ACO's BY3. If the ACO is a new entrant or re-entering ACO, the overall growth is equal to the number of assigned beneficiary person years in the performance year.

(d) *Determine an ACO's capped new growth for the performance year.* An ACO's new growth is the lesser of an ACO's new growth (as determined in paragraph (b) of this section) and an ACO's overall growth (as determined in paragraph (c) of this section).

(e) *Apply the minimum new growth thresholds for the performance year.* CMS applies the minimum new growth threshold for each performance year, expressed in absolute terms and relative terms. CMS determines the minimum new growth threshold that applies as the lesser of the relative minimum new growth threshold multiplied by the number of total assigned beneficiary person years and the absolute minimum new growth threshold. The absolute minimum new growth threshold and the relative minimum new growth threshold are as follows:

TABLE 1 TO PARAGRAPH (e)

	PY 1	PY 2	PY 3	PY 4	PY 5
Absolute Minimum New Growth Threshold	100	300	600	900	1,200
Relative Minimum New Growth Threshold	0.5%	1.5%	3.5%	5.5%	7.5%

(f) *Calculate the new growth above the minimum and below the cap for the performance year.* CMS calculates the new growth above the minimum and below the cap for each performance year as the difference between an ACO's capped new growth for the applicable performance year (as determined under paragraph (d) of this section) and the minimum new growth threshold applied for the performance year (as determined under paragraph (e) of this section), or zero, if negative. The ACO is eligible for a growth adjustment for the applicable performance year if the new growth above the minimum and below the cap is greater than zero.

(g) *Calculate the new growth share for the performance year.* CMS calculates the new growth share for the performance year as the new growth above the minimum and below the cap in the performance year (as determined under paragraph (f) of this section) divided by the total assigned beneficiary person years in the performance year.

(h) *Determine ACO's incentive factor.* The ACO's incentive factor is an ACO-specific per capita dollar amount calculated as 5 percent of the per capita historical benchmark expressed as a single value before the application of the adjustments to the historical

benchmark specified at § 425.652(a)(8)(ii) (as applicable).

(i) *Determine the ACO's growth adjustment to the historical benchmark.*

(1) CMS calculates the growth adjustment to the historical benchmark as the product of the ACO's new growth share (as determined under paragraph (g) of this section) and the ACO's incentive factor (as determined under paragraph (h) of this section).

(2) The per capita dollar amount for a Medicare enrollment type is capped at 5 percent of the product of the following—

(i) The national per capita expenditure amount for the enrollment type for BY3; and

(ii) The ACO's weighted average CMS–HCC risk score for the enrollment type for BY3.

§ 425.672 [Amended]

■ 91. Section 425.672 is amended in paragraph (c)(2)(iv) by removing the reference ''§ 425.658(c)(1)(ii)'' and adding in its place the references ''§ 425.658(c)(1)(ii) and (c)(2)(ii)''.

§ 425.702 [Amended]

■ 92. Section 425.702 is amended in paragraph (c)(1)(iii) introductory text by removing the phrase ''For performance year 2024 and subsequent performance years,'' and adding in its place the phrase ''For performance years 2024 through 2026,''.

PART 427—MEDICARE PART B DRUG INFLATION REBATE PROGRAM

■ 93. The authority citation for part 427 continues to read as follows:

Authority: 42 U.S.C. 1395w–3a(i), 1302, and 1395hh.

■ 94. Section 427.20 is amended by revising the definition of ''First marketed date'' to read as follows:

§ 427.20 Definitions.

* * * * *

First marketed date means the earliest date of first sale of any NDC–11 within a billing and payment code among all products and package sizes under the same FDA application. The first marketed date will be identified using ASP data reported by NDC–11 to CMS by a manufacturer as required under sections 1927(b)(3)(A)(iii)(I) and 1847A(f)(2) of the Act, if available. If ASP date are not available, the first marketed date will be identified using an alternative public source, such as the NDC Directory.

■ 95. Section 427.101 is amended by revising paragraph (b)(5) to read as follows.

§ 427.101 Identification of the Part B rebatable drugs.

(b) * * *

(5) *Skin substitutes.* A product included within the suite of cellular- and tissue-based products that aid wound healing, other than skin substitute products that are licensed as a drug or biological product under section 351 of the Public Health Service Act.

■ 96. Section 427.302 is amended by adding paragraph (e)(6) and revising paragraph (f) to read as follows.

§ 427.302 Calculation of the per unit Part B rebate.

* * * * *

(e) * * *

(6) For paragraphs (e)(2) through (e)(5) of this section, in the event CPI–U data are unavailable for the month described in such paragraph, CMS will use the first month for which CPI–U data are available following the month for which CPI–U data are unavailable.

(f) *Identification of the rebate period CPI–U.* For each Part B rebatable drug by billing and payment code, CMS will identify and use the greater of the benchmark period CPI–U index level or the CPI–U index level for the first month of the calendar quarter that is 2 calendar quarters before the applicable calendar quarter in which the Part B rebatable drug is furnished.

(1) In the event CPI–U data are unavailable for the month described in such paragraph, CMS will use the first month for which CPI–U data are available following the month for which CPI–U data are unavailable.

(2) [Reserved].

PART 428—MEDICARE PART D DRUG INFLATION REBATE PROGRAM

■ 97. The authority citation for part 428 continues to read as follows:

Authority: 42 U.S.C. 1395w–114b, 1302, and 1395hh.

■ 98. Section 428.20 is amended by revising the definition of ''Applicable period Consumer Price Index for All Urban Consumers (CPI–U)'' to read as follows.

§ 428.20 Definitions.

* * * * *

Applicable period Consumer Price Index for All Urban Consumers (CPI–U) means, with respect to an applicable period, the CPI–U for the first month of such applicable period (that is, October). In the case where the first month's CPI–U data are unavailable, CMS will use the first month for which CPI–U data are available following the month for which CPI–U data are unavailable.

■ 99. Section 428.202(e) is amended by adding paragraph (e)(6) to read as follows.

§ 428.202 Calculation of the per unit Part D rebate amount.

* * * * *

(e) * * *

(6) For paragraphs (e)(2) through (e)(5) of this section, in the event CPI–U data are unavailable for the month described in such paragraph, CMS will use the first month for which CPI–U data are available following the month for which CPI–U data are unavailable.

■ 100. Section 428.203 is amended by adding paragraph (c) to read as follows.

§ 428.203 Determination of the total number of units dispensed under Part D.

* * * * *

(c) *Data reporting requirement.*

(1) Beginning with claims with a date of service on or after January 1, 2027, a provider or supplier that is a covered entity as defined at § 10.3 must submit the data elements associated with each claim for a covered Part D drug billed to Medicare Part D for which such covered entity or its contractor(s) (such as contract pharmacies) dispensed units of a drug for which a manufacturer provides a discount under the 340B Program to such covered entity:

(i) Date of service.

(ii) Prescription or service reference number.

(iii) Fill number.

(iv) Dispensing pharmacy NPI.

(v) NDC–11.

(2) In addition to submitting the data elements set forth in paragraph (c)(1) of this section, such provider or supplier must submit its 340B ID and name as designated in the 340B Office of Pharmacy Affairs Information System (OPAIS) database.

(3) The data elements and information set forth in paragraphs (c)(1) and (2) of this section must be submitted on a quarterly basis and in a form and manner specified by CMS in accordance with the following timelines:

(i) Data elements and information associated with claims with dates of service during the first calendar quarter must be submitted by the close of the second calendar quarter.

(ii) Data elements and information associated with claims with dates of service during the second calendar quarter must be submitted by the close of the third calendar quarter.

(iii) Data elements and information associated with claims with dates of service during the third calendar quarter must be submitted by the close of the fourth calendar quarter.

(iv) Data elements and information associated with claims with dates of

service during the fourth calendar quarter must be submitted by the close of the first calendar quarter of the immediately following calendar year.

(4) Data elements and information submitted in accordance with paragraph (c)(3) of this section that is either incomplete or contains invalid data must be resubmitted at a later time in a form and manner specified by CMS.

PART 512—STANDARD PROVISIONS FOR MANDATORY INNOVATION CENTER MODELS AND SPECIFIC PROVISIONS FOR CERTAIN MODELS

■ 101. The authority citation for part 512 continues to read as follows:

Authority: 42 U.S.C. 1302, 1315a, and 1395hh.

■ 102. Section 512.705 is amended by—
■ a. Revising the definition for ''ASM beneficiary'' and ''Dual eligible proportion''; and
■ b. Adding definitions for ''PECOS'' and ''Rural area'' in alphabetical order.

The revisions and additions read as follows:

§ 512.705 Definitions.

* * * * *

ASM beneficiary means a Medicare FFS beneficiary who is being treated by an ASM participant for an ASM targeted chronic condition.

* * * * *

Dual eligible proportion means the share of an ASM participant's beneficiaries who are dually eligible Medicare beneficiaries.

* * * * *

PECOS stands for the Provider Enrollment, Chain, and Ownership System.

* * * * *

Rural area has the same meaning as the term is defined at 42 CFR 414.1305 under MIPS.

* * * * *

■ 103. Section 512.710 is amended by—
■ a. Revising paragraph (a)(1) introductory text;
■ b. Revising paragraphs (a)(2) and (c);
■ c. Revising the introductory text of paragraphs (d)(1) and (d)(2); and
■ d. Adding paragraph (h).

The revisions and additions read as follows:

§ 512.710 Participant eligibility and selection.

(a) * * *

(1) A clinician selected by CMS as an ASM participant for any ASM performance year and who furnishes covered services during any applicable ASM performance year remains an ASM participant for the duration of the ASM test period unless CMS either terminates ASM in accordance with § 512.165 or the ASM participant receives notice of termination as described in paragraph (h) of this section.

* * * * *

(2) *Effect of not meeting ASM participant eligibility criteria for an ASM performance year.* For any ASM performance year within the ASM test period that an ASM participant does not meet the criteria for mandatory participation set forth in this section, the ASM participant is—

(i) Not subject to §§ 512.715, 512.720, and 512.745 for the applicable ASM performance year;

(ii) Not subject to § 512.750 for the corresponding ASM payment year;

(iii) Not eligible for the waivers described in § 512.775 for the applicable ASM performance year; and

(iv) Not eligible for the CMS-sponsored model arrangements and patient incentives safe harbor described in § 512.765 with respect to remuneration attributable to the applicable ASM performance year; and

* * * * *

(c) *Exceptions to specific ASM performance requirements.*

(1) *Exceptions.* CMS may in its sole discretion determine that an ASM participant who meets the requirements described in paragraph (c)(1)(i) or (c)(1)(ii) is excepted from model requirements as described in paragraph (c)(2) of this section for the duration specified in paragraph (c)(3) of this section.

(i) *Exception based on change in TIN.* An ASM participant stops reassigning billing rights to the TIN that CMS used to select the ASM participant for the applicable ASM performance year and satisfies the written notice requirements in paragraph (c)(1)(i)(A) or (c)(1)(i)(B) of this section.

(A) *Notification of change in TIN before an ASM performance year.* An ASM participant who stops reassigning billing rights to the TIN that CMS used to select the ASM participant before the applicable ASM performance year must provide written notice of the change to CMS in a form and manner determined by CMS no later than 60 days after the start of the applicable ASM performance year.

(B) *Notification of change in TIN during an ASM performance year.* An ASM participant who stops reassigning billing rights to the TIN that CMS used to select the ASM participant during an applicable ASM performance year must provide written notice of the change to CMS in a form and manner determined by CMS within 30 days of the effective date of the termination of reassignment to the ASM participant's TIN.

(ii) *Exception based on ASM heart failure participant specialty type redesignation.* An ASM heart failure participant redesignates their primary specialty type through the applicable paper CMS–855 form or internet-based PECOS before or during the applicable ASM performance year to a specialty type described in paragraph (c)(1)(ii)(A) and satisfies the written notice requirements in paragraph (c)(1)(ii)(B) of this section.

(A) *Specialty type redesignations for ASM heart failure participants.*

(*1*) Cardiac Electrophysiology.

(*2*) Cardiac Surgery.

(*3*) Interventional Cardiology.

(*4*) Advanced Heart Failure and Transplant Cardiology.

(*5*) Adult Congenital Heart Disease

(B) *Notification of specialty type redesignation.* An ASM heart failure participant who redesignates their primary specialty type through the applicable paper CMS–855 form or internet-based PECOS before or during the applicable ASM performance year as described in paragraph (c)(1)(ii) of this section must provide written notice of the CMS-approved redesignation together with verification of board certification in the newly designated primary specialty type to CMS in a form and manner determined by CMS within 30 days of the effective date of the CMS-approved redesignation.

(2) *Effect of exception.* If CMS determines an ASM participant meets an exception under paragraph (c)(1) of this section, the ASM participant is—

(i) Not subject to §§ 512.715, 512.720, and 512.745 for the applicable ASM performance year;

(ii) Not subject to § 512.750 for the corresponding ASM payment year;

(iii) Not eligible for the waivers described in § 512.775 for the applicable ASM performance year;

(iv) Not eligible for the CMS-sponsored model arrangements and patient incentives safe harbor described at § 512.765 with respect to remuneration attributable to the period beginning on the CMS-determined date of the exception described in paragraph (c)(3) of this section.

(3) *Duration of exception.*

(i) An exception under paragraph (c)(1)(i) of this section is effective on the CMS-determined date and applies for the ASM performance year specified by CMS.

(ii) An exception under paragraph (c)(1)(ii) of this section is effective on the CMS-determined date and applies for the ASM performance year specified by CMS and for the remainder of the ASM test period.

(d) * * *

(1) Heart failure specialty type—

* * * * *

(2) Low back pain specialty type—

* * * * *

(h) *Termination.*

(1) CMS may in its sole discretion terminate an ASM participant's participation in the model immediately or upon advance notice if CMS determines:

(i) One or more grounds for remedial action described in § 512.160(a) have occurred with respect to the ASM participant; or

(ii) The ASM participant's continued participation would be inconsistent with the purposes of ASM, the requirements of this part, or applicable law.

■ 104. Section 512.720 is amended by—

■ a. Revising paragraphs (a)(1)(i), (a)(ii)(B), and (e); and

■ b. Removing paragraph (f).

The revisions read as follows:

§ 512.720 Data submission requirements.

(a) * * *

(1) * * *

(i) * * *

(A) Include numerator and denominator data for at least one applicable quality measure described in § 512.725(b) or (c) that is not an administrative claims-based collection type and that meets the data completeness requirement as specified at § 512.725(f); and

(B) Except as provided in paragraph (a)(1)(i)(C) of this section, be submitted at the TIN/NPI level.

(C) An ASM participant who is in a small practice may submit quality ASM performance category data at either the TIN/NPI or the TIN level.

(ii) * * *

(B) Be submitted at either the TIN/NPI or TIN level;

* * * * *

(e) * * *

(1) *Quality ASM performance category.*

(i) If CMS receives multiple data submissions in the quality ASM performance category in accordance with paragraph (a)(1)(i) of this section from submitters in multiple organizations (for example, qualified registry, practice administrator, or EHR vendor) for an individual ASM participant, CMS scores each submission and assigns the highest score.

(ii) If CMS receives multiple data submissions for the quality ASM performance category in accordance with paragraph (a)(1)(i) of this section from one or more submitters in the same organization for an individual ASM participant, CMS scores the most recent submission and assigns that score.

(iii) If CMS receives a TIN-level data submission in the quality ASM performance category in accordance with paragraph (a)(1)(i) of this section for an ASM participant in a small practice, CMS scores the TIN-level submission and assigns that score to all individual ASM participants in the small practice, regardless of any TIN/NPI-level submission(s) received for one or more of those ASM participants.

(2) *Improvement activities ASM performance category.*

(i) If CMS receives multiple data submissions in the improvement activities ASM performance category in accordance with paragraph (a)(1)(ii) of this section from submitters in multiple organizations (for example, qualified registry, practice administrator, or EHR vendor) for an individual ASM participant, CMS scores each submission and assigns the highest score.

(ii) If CMS receives multiple data submissions in the improvement activities ASM performance category in accordance with paragraph (a)(1)(ii) of this section from one or more submitters in the same organization for an individual ASM participant, CMS scores the most recent submission and assigns that score.

(3) *Promoting Interoperability ASM performance category.*

(i) For multiple data submissions received for the Promoting Interoperability ASM performance category in accordance with paragraph (a)(1)(iii) of this section, CMS calculates a score for each submission and assigns the highest of the scores.

* * * * *

■ 105. Section 512.725 is amended by—

■ a. Revising paragraph (c)(4);

■ b. Adding paragraphs (c)(5), (e)(3)(i), and adding and reserving paragraph (e)(3)(ii);

■ c. Revising paragraphs (f)(3), (h)(1)(i), (h)(2) introductory text, and (h)(2)(i) introductory text;

■ d. Removing paragraph (h)(2)(iii);

■ e. Redesignating paragraph (h)(2)(iv) as paragraph (h)(2)(iii); and

■ f. Adding new paragraphs (h)(2)(iv) and (i).

The revisions and additions read as follows:

§ 512.725 Quality ASM performance category.

* * * * *

(c) * * *

(4) Functional Outcome Assessment (MIPS Q182).

(5) Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM).

* * * * *

(e) * * *

(3) * * *

(i) For ASM participants in small practices, CMS scores all administrative claims-based quality measures at the TIN/NPI level according to the measure specifications for the applicable ASM performance year.

(ii) [Reserved].

* * * * *

(f) * * *

(3) CMS excludes from an ASM participant's total measure achievement points and total available measure achievement points any measure required under paragraph (b) or (c) of this section that meets the respective measure's data completeness requirement but does not have a benchmark.

* * * * *

(h) * * *

(1) * * *

(i) For each ASM performance year, an ASM participant receives between 1 and 10 measure achievement points (including partial points) for each measure specified in paragraph (b) or (c) of this section that satisfies the requirements described in paragraph (h)(1)(i)(A) or (h)(1)(i)(B) of this section, as applicable.

(A) For each measure other than an administrative claims-based quality measure under the quality ASM performance category on which data is submitted in accordance with paragraph (e) of this section, the measure must do all of the following:

(*1*) Have a benchmark specified in paragraph (h)(2) of this section.

(*2*) Meet the case minimum requirements specified in paragraph (g) of this section.

(*3*) Meet the data completeness criteria specified in paragraph (f) of this section.

(B) For each administrative claims-based quality measure calculated by CMS under the quality ASM performance category, the measure must have a benchmark as specified in paragraph (h)(2) of this section and meet the case minimum requirements specified in paragraph (g) of this section.

* * * * *

(2) *Benchmarks for quality ASM performance category.*

(i) CMS bases benchmarks on an ASM participant's performance by collection type, from one of the following data sources:

* * * * *

(iv) CMS excludes from an ASM participant's total measure achievement points and total available measure achievement points any measure required under paragraphs (b) or (c) of this section that does not have a benchmark.

* * * * *

(i) *Voluntary submission of patient-reported outcome data.* For any ASM cohort and ASM performance year for which CMS specifies that a voluntary patient-reported outcome data submission is available, CMS may add 5 additional points to the ASM participant's quality ASM performance category score for the ASM participant's voluntary submission of patient-reported outcome data that meets the applicable requirements set forth in paragraph (i)(1) of this section for any CMS-specified data collection period. Additional points awarded under this paragraph are added to the ASM participant's total measure achievement points calculated under paragraph (h)(4)(i) of this section, subject to the limitation set forth under paragraph (h)(4)(i)(B) of this section.

(1) *Requirements for successful voluntary submission of patient-reported outcome data.* To be eligible to receive the additional points for the quality ASM performance category for the applicable ASM performance year described in paragraph (i) of this section, an ASM participant must submit all of the following:

(i) Baseline assessment data for at least 20 ASM beneficiaries for a first CMS-specified data collection period or follow-up assessment data for at least 20 ASM beneficiaries who received a baseline assessment during the preceding data collection period.

(ii) All data elements for the applicable voluntary patient-reported outcome instrument for each required assessment, as specified and in a form and manner determined by CMS, for the applicable data collection period.

(iii) Data on all risk variables, as specified and in a form and manner determined by CMS, for each ASM beneficiary from whom an ASM participant voluntarily collects patient-reported outcome data during the applicable data collection period.

(iv) The voluntary patient-reported outcome data in a form and manner determined by CMS by the data submission deadline for the applicable ASM performance year as described at § 512.720(d).

(2) *Correction and resubmission of voluntary patient-reported outcome data.*

(i) An ASM participant may correct or resubmit any data needed to meet the voluntary data submission requirements described in paragraph (i)(1) of this section.

(ii) CMS does not accept new submissions, corrected submissions, or resubmissions of voluntary patient-reported outcome data after the applicable data submission deadline described in paragraph (i)(1)(iv) of this section.

(3) *Timely error notice for determination of quality ASM performance category scoring incentive.* An ASM participant may submit a written timely error notice as described at § 512.755 if the ASM participant believes an error occurred in CMS' determination of whether the ASM participant met the requirements described in paragraph (i)(1) of this section to receive the additional quality ASM performance category points described in paragraph (i) of this section for the applicable ASM performance year as provided to an ASM participant by CMS in an ASM performance report.

■ 106. Section 512.740 is amended by—

■ a. Revising paragraphs (b)(2)(ii), (b)(2)(iv), and (b)(3)(i)(C);

■ b. Removing paragraph (b)(3)(ii);

■ c. Redesignating paragraph (b)(3)(iii) as paragraph (b)(3)(ii);

■ d. Removing paragraph (b)(4)(i);

■ e. Redesignating paragraph (b)(4)(ii) as paragraph (b)(4)(i) and reserving paragraph (b)(4)(ii);

■ f. Revising newly redesignated paragraph (b)(4)(i);

■ g. Redesignating paragraph (c)(2) as paragraph (c)(3); and

■ h. Adding new paragraph (c)(2).

The revisions and addition read as follows:

§ 512.740 Promoting Interoperability ASM performance category.

* * * * *

(b) * * *

(2) * * *

(ii) An ASM participant must fulfill the Health Information Exchange objective through the following:

(A) For each ASM performance year, report one of the following options:

(1) Support Electronic Referral Loops by Sending Health Information (Measure ID # PI_HIE_1) and Support Electronic Referral Loops by Receiving and Reconciling Health Information (Measure ID # PI_HIE_4).

(2) Health Information Exchange (HIE) Bi-Directional Exchange (Measure ID # PI_HIE_5).

(3) Enabling Exchange Under the Trusted Exchange Framework and Common Agreement (TEFCA) (Measure ID # PI_HIE_6).

(B) For the 2027 ASM performance year, an ASM participant may, but is not required to, report the Electronic Prior Authorization measure (Measure ID # PI_HIE_7).

(C) Beginning with the 2028 ASM performance year, an ASM participant must report both measures described in paragraphs (b)(2)(ii)(C)*(1)* and (b)(2)(ii)(C)*(2)* of this section, report one measure and claim one exclusion, or claim exclusions to both measures:

(1) Electronic Prior Authorization (Measure ID # PI_HIE_7).

(2) Electronic Prior Authorization for Prescription Drugs (Measure ID # PI_HIE_8).

* * * * *

(iv) An ASM participant must fulfill the Public Health and Clinical Data Exchange objective by reporting both measures described in paragraphs (b)(2)(iv)(A) and (b)(2)(iv)(B) of this section, reporting one measure and claiming one exclusion, or claiming exclusions to both measures:

(A) Immunization Registry Reporting (Measure ID # PI_PHCDRR_1).

(B) Electronic Case Reporting (Measure ID # PI_PHCDRR_3).

* * * * *

(3) * * *

(i) * * *

(C) An exclusion for each measure that includes an option for an exclusion.

(ii) Submit an affirmative attestation regarding the ASM participant's completion of the annual self-assessment checklist under the MIPS Promoting Interoperability High Priority Practices Guide of the SAFER Guides measure (Measure ID# PI_PPHI_2) within the calendar year of the ASM performance year.

(4) * * *

(i) *Actions to limit or restrict the compatibility or interoperability of CEHRT.* To fulfill ASM requirements for activities related to limiting or restricting the compatibility or interoperability of CEHRT, an ASM participant must not knowingly and willfully take action, such as disabling functionality, to limit or restrict the compatibility or interoperability of CEHRT.

(ii) [Reserved].

* * * * *

(c) * * *

(2) *Promoting Interoperability measure suppression.* If certain circumstances occur that impact CMS' assessment of the performance of ASM participants on a measure specified for the Promoting Interoperability ASM performance category, CMS may in its sole discretion suppress the affected measure by excluding it from CMS' assessment of ASM participant performance while allocating the

maximum points available or providing full credit for the affected measure as long as the affected measure is reported, resulting in a suppressed measure contributing to the Promoting Interoperability ASM performance category objective score under paragraph (c)(3) of this section; or excluding it from the determination of a meaningful EHR user if the affected measure is not scored. CMS determines whether certain circumstances exist that warrant suppression of a measure based on CMS' consideration of one or more of the following factors:

(i) The nature, breadth, and duration of the circumstances' effect on ASM participants' ability to fulfill the measure requirement.

(ii) The availability of certified health IT modules to fulfill the measure.

(iii) The circumstance affects the measure such that calculating the measure score would lead to misleading or inaccurate results, which may include performance or compliance.

(iv) Out-of-date or conflicting technical standards.

(v) Technical and operational capacity of required partners.

(vi) Other factors as determined by CMS.

* * * * *

■ 107. Section 512.745 is amended by—

■ a. Revising paragraph (a) introductory text and paragraph (a)(2)(iii)(B);

■ b. Redesignating paragraph (a)(5) as paragraph (a)(6);

■ c. Adding new paragraph (a)(5);

■ d. Revising newly redesignated paragraph (a)(6);

■ e. Revising paragraphs (b)(2) through (b)(6); and

■ f. Adding paragraphs (b)(7) and (b)(8).

The revisions and additions read as follows:

§ 512.745 Final scoring.

(a) *Final score calculation.* CMS calculates a final score of zero to 100 points using the formula specified at paragraph (a)(6) of this section for each ASM participant that meets the requirements to receive a final score as specified in paragraph (a)(2) of this section.

* * * * *

(2) * * *

(iii) * * *

(B) Do not receive either a—

(*1*) Quality ASM performance category score under § 512.725(h)(4)(iii); or

(*2*) Cost ASM performance category score under § 512.730(e)(3)(i).

* * * * *

(5) *Rural scoring adjustment.*

(i) *Scoring adjustment for an ASM participant in a rural area.* CMS adds 5 points to the final score of an ASM participant who is in a rural area as defined at § 512.705 and meets the requirements to receive a final score greater than zero as described in paragraph (a)(2)(i) of this section for an applicable ASM performance year.

(6) *Final score formula.* Final score = [(quality ASM performance category score × quality ASM performance category weight) + (cost ASM performance category score × cost ASM performance category weight)] × 100 + improvement activities ASM performance category scoring adjustment + Promoting Interoperability ASM performance category scoring adjustment + complex patient scoring adjustment + small practice scoring adjustment + rural scoring adjustment. The final score cannot be below zero points or exceed 100 points.

(b) * * *

(2) The ASM participant's quality ASM performance category scoring incentive for voluntary reporting of patient-reported outcome data under § 512.725(i), as applicable.

(3) The ASM participant's complex patient scoring adjustment under paragraph (a)(3) of this section, as applicable.

(4) The ASM participant's small practice or solo practitioner scoring adjustment under paragraph (a)(4) of this section, as applicable.

(5) The ASM participant's rural scoring adjustment under paragraph (a)(5) of this section, as applicable.

(6) The ASM participant's final score, as applicable.

(7) The ASM payment adjustment factor under § 512.750(c)(1).

(8) The ASM payment multiplier under § 512.750(c).

* * * * *

■ 108. Section 512.750 is amended by revising paragraphs (f)(1) and (f)(2) to read as follows:

§ 512.750 Payment adjustment.

* * * * *

(f) * * *

(1) If an NPI submits Part B covered professional service claims during an ASM payment year under a different TIN than the TIN CMS selected them as an ASM participant for that same ASM performance year and to which the NPI began assigning billing rights after the applicable ASM performance year but before the end of the corresponding ASM payment year, CMS multiplies the amount otherwise paid under Part B for covered professional services to the different TIN by the ASM payment multiplier calculated for the ASM participant based on their performance in the corresponding ASM performance year.

(2) CMS multiplies the amount otherwise paid under Part B for covered professional services by the highest ASM payment multiplier calculated for an NPI who meets all the following:

(i) Is an ASM participant under multiple TINs for a given ASM performance year.

(ii) Submits Part B covered professional service claims during an ASM payment year under a TIN by which CMS did not select the NPI as an ASM participant and to which the ASM participant began reassigning billing rights after the applicable ASM performance year but before the end of the corresponding ASM payment year.

* * * * *

■ 109. Section 512.765 is amended by adding paragraph (c) to read as follows:

§ 512.765 Application of the CMS-sponsored model arrangements and patient incentives safe harbor.

* * * * *

(c) *Scope.* The CMS-sponsored model arrangements and patients incentives safe harbor described in paragraphs (a) and (b) of this section is available only with respect to remuneration exchanged or furnished in connection with an ASM participant's performance under the model and does not apply with respect to remuneration attributable to any period for which CMS determines the ASM participant does not meet ASM participant eligibility criteria under § 512.710(a)(2) or is excepted from specified ASM requirements under § 512.710(c).

■ 110. Section 512.771 is amended by—

■ a. Revising paragraphs (a)(1), (a)(2), (a)(5), and (a)(6);

■ b. Redesignating paragraphs (a)(7) and (a)(8) as paragraphs (d)(2) and (d)(3), respectively.

■ c. Redesignating paragraphs (a)(9) through (13) as (a)(7) through (11), respectively.

■ d. Revising newly redesignated paragraphs (a)(7) and (a)(9); and

■ e. Adding paragraph (d).

The revisions and additions read as follows:

§ 512.771 Collaborative care arrangements.

(a) * * *

(1) The collaborative care arrangement must be in writing, signed by all parties, specify the effective date, and be exclusively between one or more ASM participants who reassign billing rights through the same TIN and a primary care practice.

(2) The primary care practice party and an ASM participant party to the

collaborative care arrangement must share one or more patients who are ASM beneficiaries.

* * * * *

(5) All parties to the collaborative care arrangement must comply with the provisions of this section and all other applicable statutes, regulations, and guidance.

(6) Neither the opportunity to enter into a collaborative care arrangement nor remuneration given or received under a collaborative care arrangement may be conditioned directly or indirectly on the volume or value of past or anticipated referrals or business generated by, between, or among the parties to the collaborative care arrangement or any other person. A selection criterion that considers whether an ASM participant and primary care practice share one or more ASM beneficiaries for the purpose of satisfying the requirement set forth in paragraph (a)(2) of this section will be deemed not to violate the volume or value standard of this section if the purpose of the criterion is to further the purpose of the collaborative care arrangement.

(7) All parties to the collaborative care arrangement must retain the ability to make decisions in the best interests of ASM beneficiaries, including the selection of clinicians, devices, supplies, and treatments.

* * * * *

(9) An ASM participant must maintain contemporaneous documentation, in accordance with § 512.135, regarding all collaborative care arrangements entered into, including the following:

(i) The relevant written agreements.

(ii) Records of all remuneration exchanged, if any, for each ASM participant party to a collaborative care arrangement, including, at a minimum, all of the following:

(A) A description of the remuneration.

(B) The value of remuneration.

(C) The methodology for determining the value of any in-kind remuneration in accordance with paragraph (d)(2)(ii) of this section, if applicable.

(D) The date on which the remuneration was exchanged.

(iii) The identity of each ASM participant who is a party to the collaborative care arrangement.

* * * * *

(d) *Remuneration under a collaborative care arrangement.* If the parties to a collaborative care arrangement elect to include terms allowing for the exchange of remuneration under the collaborative care arrangement, the parties must also comply with all of the following:

(1) The purpose of the exchange of remuneration under the collaborative care arrangement must be reasonably related to the purpose of the collaborative care arrangement, consistent with the requirements of paragraph (a)(3) of this section.

(2) The total amount of any remuneration exchanged under a collaborative care arrangement in a given ASM performance year must not exceed an amount equal to the ASM participant's ASM payment adjustment factor for the applicable ASM performance year multiplied by the amount otherwise paid to the ASM participant by CMS under Part B for covered professional services during the applicable ASM performance year.

(i) The collaborative care arrangement must specify a methodology for the parties to identify and calculate the total amount of remuneration exchanged under such arrangement in the ASM performance year for each ASM participant and determine within a reasonable amount of time after the information necessary to make the calculation in paragraph (d)(2) of this section becomes available whether the total amount of remuneration exceeds the limitation in paragraph (d)(2) of this section.

(ii) For in-kind remuneration, the value of remuneration exchanged for the purpose of this section is determined based on the offeror's cost for the remuneration, using any reasonable accounting methodology, or the fair market value of the in-kind remuneration.

(iii) The collaborative care arrangement must require the parties to reconcile any remuneration exchanged by each ASM participant under the arrangement in the ASM performance year after the limitation in paragraph (d)(2) of this section is determined.

(iv) If the total amount of remuneration received by a party in the ASM performance year exceeds the limitation in paragraph (d)(2) of this section, the collaborative care arrangement must require the party that received the excess amount to repay the excess amount to the other party within a reasonable amount of time after the reconciliation.

(3) Any remuneration exchanged under a collaborative care arrangement must be solely between the parties to the arrangement. To the extent that remuneration exchanged is monetary, any payment between the parties must be made by check, electronic funds transfer, or another traceable cash transaction.

* * * * *

■ 111. Section 512.775 is amended in paragraph (a) by removing the reference ''§ 512.710(a)(2)'' and adding in its place the phrase ''§ 512.710(a)(2) or § 512.710(c)''.

Robert F. Kennedy, Jr.,

Secretary, Department of Health and Human Services.

Note: The following Appendices will not appear in the Code of Federal Regulations.

Appendix 1: MIPS Quality Measures

Note: Except as otherwise noted in this proposed rule, previously finalized measures and specialty sets would continue to apply for the CY 2027 performance period/2029 MIPS payment year and future years. Previously finalized measures and specialty sets are in the CY 2017 through CY 2026 PFS final rules: 81 FR 77558 through 77816, 82 FR 53966 through 54174, 83 FR 60097 through 60285, 84 FR 63205 through 63513, 85 FR 85045 through 85369, 86 FR 65687 through 65968, 87 FR 70250 through 70633, 88 FR 79556 through 79964, 89 FR 98599 through 98957, and 90 FR 50036 through 50353. In addition, electronic clinical quality measures (eCQMs) that are endorsed by a Consensus-Based Entity (CBE) are shown in Table A of this Appendix as follows: CBE #/ eCQM CBE #.

Note: In section IV.A.4.d.(1)(c)(i) of this proposed rule, we are proposing to implement MIPS core measures for traditional MIPS and MVP reporting which are identified in the tables in this Appendix. In addition, in section IV.A.4.d.(1)(c)(ii) of this proposed rule, we are proposing to remove the high priority designation from MIPS quality measures and therefore, we have removed the high priority indicator across all tables in this Appendix.

BILLING CODE 4169–69–P

Table Group A: New MIPS Quality Measures Proposed for the CY 2027 Performance Period/2029 MIPS Payment Year and Future Years

Note: Proposed specialty sets for new measures are indicated under Table Group A of this Appendix within the last row of each A table.

We request comments on these new measures and the applicable specialty sets.

A.1. Low Density Lipoprotein Cholesterol (LDL-C) Monitoring and Management

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of patients aged 18 years and older with clinical atherosclerotic cardiovascular disease (ASCVD) who received a low-density lipoprotein cholesterol (LDL-C) test via lipid panel and achieved an LDL-C of <70mg/dL on the most recent test during the performance period.
Measure Steward:	American Heart Association
Numerator:	Numerator 1: Patients aged 18 years and older with clinical atherosclerotic cardiovascular disease (ASCVD) who had a low density lipoprotein cholesterol (LDL-C) test via a lipid panel. Numerator 2: Patients aged 18 years and older with clinical ASCVD and had a lipid panel completed during the 12-month measurement period who achieved an LDL-C of <70 mg/dL on the most recent test during the 12-month measurement period.
Denominator:	Denominator 1: All patients aged 18 years and older diagnosed with clinical atherosclerotic cardiovascular disease (ASCVD). Denominator 2: All patients aged 18 years and older with clinical ASCVD who had a low density lipoprotein cholesterol (LDL-C) test via a lipid panel during the measurement period.
Exclusions:	Pregnancy, ESRD, hospice, over age 66+ with advanced illness, frailty, or dementia medications
Measure Type:	Intermediate Outcome
MIPS Core Measure:	Yes
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

Category	Description
Rationale:	We are proposing this intermediate outcome measure because it addresses appropriate care for adult patients with clinical atherosclerotic cardiovascular disease (ASCVD), ensuring patients diagnosed with this condition are annually tested for LDL-C and achieve a desired level. Studies support that elevated LDL-C levels contribute to ASCVD and once identified can be addressed via lipid management. Lowering LDL-C produces a marked reduction in clinical ASCVD and evidence shows that lower LDL-C levels are associated with better outcomes.[403] This measure ensures that patients receiving cholesterol lowering treatment, such as statin therapy, achieve a reduction in LDL-C, which in turn reduces risk of ASCVD and other patient outcomes, such as hospitalizations and cardiovascular death.[404] This measure is based on peer-reviewed evidence demonstrating that, for adults 20 years of age or older and not on lipid-lowering therapy, measurement of either a fasting or non-fasting plasma lipid profile is effective in estimating ASCVD risk and documenting baseline LDL-C.[405] This measure would expand on current MIPS measure Q438: Statin Therapy for the Prevention and Treatment of Cardiovascular Disease, which focuses on appropriate statin treatment of patients at high risk for cardiovascular events. While measure Q438 assesses for the prescribing of statin therapy, this new measure would build on measure Q438 by assessing the outcome of LDL-C treatment, through achievement of reaching a desired LDL-C level. The Pre-Rulemaking Measure Review (PRMR) Clinician Recommendation Committee reached consensus agreement to recommend the measure. Testing indicated good reliability based on signal to noise ratio and adequate face validity. Testing of measure performance indicated a gap in care with a mean performance rate of 46.8 percent for the first criteria and 64.9 percent for the second criteria. This demonstrates that there is room for improvement among clinicians treating this patient population. This measure is not currently CBE endorsed. Although CBE endorsement is preferred, it is still recommended this measure be added to MIPS because it is an evidence-based measure, satisfying the requirement set forth at section 1848(q)(2)(D)(v) of the Act, stating that any measure selected for inclusion in MIPS that is not endorsed by a CBE shall have a focus that is evidence-based. This measure could be added to multiple MVPs in the future, including the proposed Hypertension MVP, Advancing Care for Heart Disease MVP, and Value in Primary Care MVP. We are proposing to add this measure to applicable specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties. Note: Refer to the PRMR Clinician Recommendation Committee Spreadsheet of Final Recommendations to CMS and HHS at *https://p4qm.org/sites/default/files/2026-02/Final-2025-2026-MUC-Recommendations-Report-508.pdf.*
Measure Proposed for Addition to the Following Specialty Sets:	Cardiology, Endocrinology, Family Medicine, Geriatrics, Internal Medicine, Nephrology, Neurology, Obstetrics/Gynecology, Preventive Medicine, Vascular Surgery

[405] See footnote Grundy et al., 2019.

A.2. Functional Improvement for Patients with Neck Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of patients aged 18 years and older with a neck impairment that met the risk-adjusted Predicted Moderate Clinical Improvement (P-MCI) on the PROMIS Pain Interference (PPI) or the alternative (legacy) patient-reported outcome measure (PROM), the Neck Disability Index (NDI).
Measure Steward:	Limber Health, Inc. and Patient360, LLC
Numerator:	Patients whose most recent PPI score beyond the baseline score meets or exceeds the P-MCI at the time of the completed episode of care.
Denominator:	All patients aged 18 years or older at the start of the episode of care with a neck impairment who completed a baseline PPI.
Exclusions:	Pre-operative Care: Patients who are being seen for pre-operative care and/or have surgery for the neck impairment within 30 days after the initial assessment, documented in the medical record. Cognitive Deficit: A significant mental or cognitive impairment that compromises the patient's ability to complete the PROM, such as dementia or intellectual disabilities, documented in the medical record. Hospice: Patient is in hospice care or receiving palliative care for terminal illness, as documented in the medical record. Active Cancer Treatment: The patient is in active treatment for cancer (e.g., undergoing chemotherapy, radiation therapy, immunotherapy, or cancer-related surgery) AND the goal of musculoskeletal care is primarily to avoid or minimize decline in function, documented in the medical record. Maintenance Therapy: The patient meets Medicare requirements for maintenance therapy, such as the maintenance of functional status or prevention of a slow deterioration in function, as defined by the Medicare Benefits Policy Manual, Chapter 15,[406] as documented in the medical record.
Measure Type:	Patient-Reported Outcome-Based Performance Measure (PRO-PM)
MIPS Core Measure:	No
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

[406] Medicare Benefit Policy Manual. https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/bp102c15.pdf.

Category	Description
Rationale:	We are proposing this current QCDR patient-reported outcome-based performance measure to replace current MIPS quality measure Q478: Functional Status Change for Patients with Neck Impairments. This new measure would address the same clinical topic as measure Q478; however, it allows for broader implementation by including widely available, non-proprietary tools to assess physical function improvement. Additionally, this measure's analytic allows independent calculation of performance by the clinician, or easy and free collaboration with the steward, which supports clinicians reporting this important aspect of rehabilitative care. This measure utilizes the PROMIS® Pain Interference tool, which was developed using item response theory (IRT) methods. Evidence indicates that the PROMIS-PI items constitute a psychometrically sound item bank for assessing the negative effects of pain on functioning across the range commonly experienced by people who have pain.[407] It allows clinician flexibility in administration as it uses computer adaptive testing (CAT) or a fixed-length short form. This measure also allows utilization of the Neck Disability Index (NDI), which is a commonly used tool for neck pain with established reliability and validity.[408] [409] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. This measure may be added to the Rehabilitative Support for Musculoskeletal Care MVP (currently proposed to be renamed as the Rehabilitative Support MVP under Appendix 3: MVP Inventory, Table B.24). We are proposing to add this measure to the Chiropractic Medicine and Physical Therapy/Occupational Therapy specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.
Measure Proposed for Addition to the Following Specialty Sets:	Chiropractic Medicine, Physical Therapy/Occupational Therapy

[407] Amtmann, D., Cook, K. F., Jensen, M. P., Chen, W. H., Choi, S., Revicki, D., Cella, D., Rothrock, N., Keefe, F., Callahan, L., & Lai, J. S. (2010). Development of a PROMIS Item Bank to Measure Pain Interference. *Pain*, *150*(1), 173–182. https://doi.org/10.1016/j.pain.2010.04.025.

A.3. Functional Improvement for Patients with Upper Extremity Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of patients aged 18 years and older with an upper extremity impairment that met the risk-adjusted Predicted Moderate Clinical Improvement (P-MCI) on the PROMIS Upper Extremity (PUE) or the alternative (legacy) patient-reported outcome measure (PROM), the Quick Disabilities of the Arm, Shoulder, & Hand (QDASH).
Measure Steward:	Limber Health, Inc. and Patient360, LLC
Numerator:	Patients whose most recent PUE score beyond the baseline score meets or exceeds the P-MCI at the time of the completed episode of care.
Denominator:	All patients aged 18 years or older at the start of the episode of care with an upper extremity impairment who completed a baseline PUE.
Exclusions:	Pre-operative Care: Patients who are being seen for pre-operative care and/or have surgery for upper extremity impairment within 30 days after the initial assessment, documented in the medical record. Cognitive Deficit: A significant mental or cognitive impairment that compromises the patient's ability to complete the PROM, such as dementia or intellectual disabilities, documented in the medical record. Hospice: Patient is in hospice care or receiving palliative care for terminal illness, as documented in the medical record. Active Cancer Treatment: The patient is in active treatment for cancer (e.g., undergoing chemotherapy, radiation therapy, immunotherapy, or cancer-related surgery) AND the goal of musculoskeletal care is primarily to avoid or minimize decline in function, documented in the medical record. Maintenance Therapy: The patient meets Medicare requirements for maintenance therapy, such as the maintenance of functional status or prevention of a slow deterioration in function, as defined by the Medicare Benefits Policy Manual, Chapter 15,[410] as documented in the medical record.
Measure Type:	Patient-Reported Outcome-Based Performance Measure (PRO-PM)
MIPS Core Measure:	No
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

[410] Medicare Benefit Policy Manual. https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/bp102c15.pdf.

Category	Description
Rationale:	We are proposing this current QCDR patient-reported outcome-based performance measure to replace current MIPS quality measure Q221: Functional Status Change for Patients with Shoulder Impairments and Q222: Functional Status Change for Patients with Elbow, Wrist or Hand Impairments. This new measure would address the same clinical topics as measures Q221 and Q222; however, it allows for broader implementation by including widely available, non-proprietary tools to assess physical function improvement. Additionally, this measure's analytic allows independent calculation of performance by the clinician, or easy and free collaboration with the steward, which supports clinicians reporting this important aspect of rehabilitative care. This measure utilizes the PROMIS® Upper Extremity tool, which was developed using item response theory (IRT) methods and evidence supports high reliability and validity[411]. It allows clinician flexibility in administration as it uses computer adaptive testing (CAT) or a fixed-length short form. This measure also allows use of the Quick Disabilities of the Arm, Shoulder, and Hand (QuickDASH) tool, which has also shown to be highly reliable and valid for use in patients with upper extremity musculoskeletal disorders.[412] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. This measure may be added to the Rehabilitative Support for Musculoskeletal Care MVP (currently proposed to be renamed as the Rehabilitative Support MVP under Appendix 3: MVP Inventory, Table B.24). We are proposing to add this measure to the Chiropractic Medicine and Physical Therapy/Occupational Therapy specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.

A.4. Functional Improvement for Patients with Back Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of patients aged 18 years and older with a back impairment that met the risk-adjusted Predicted Moderate Clinical Improvement (P-MCI) on the PROMIS Pain Interference (PPI) or the alternative (legacy) patient-reported outcome measure (PROM), the Modified Low Back Disability Questionnaire (MDQ).
Measure Steward:	Limber Health, Inc. and Patient360, LLC
Numerator:	Patients whose most recent PPI score beyond the baseline score meets or exceeds the P-MCI at the time of the completed episode of care.
Denominator:	All patients aged 18 years or older at the start of the episode of care with a back impairment who completed a baseline PPI.
Exclusions:	Pre-operative Care: Patients who are being seen for pre-operative care and/or have surgery for the back impairment within 30 days after the initial assessment, documented in the medical record. Cognitive Deficit: A significant mental or cognitive impairment that compromises the patient's ability to complete the PROM, such as dementia or intellectual disabilities, documented in the medical record. Hospice: Patient is in hospice care or receiving palliative care for terminal illness, as documented in the medical record. Active Cancer Treatment: The patient is in active treatment for cancer (e.g., undergoing chemotherapy, radiation therapy, immunotherapy, or cancer-related surgery) AND the goal of musculoskeletal care is primarily to avoid or minimize decline in function, documented in the medical record. Maintenance Therapy: The patient meets Medicare requirements for maintenance therapy, such as the maintenance of functional status or prevention of a slow deterioration in function, as defined by the Medicare Benefits Policy Manual, Chapter 15,[413] as documented in the medical record.
Measure Type:	Patient-Reported Outcome-Based Performance Measure (PRO-PM)
MIPS Core Measure:	Yes
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

[413] Medicare Benefit Policy Manual. https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/bp102c15.pdf.

Category	Description
Rationale:	We are proposing this current QCDR patient-reported outcome-based performance measure to replace current MIPS quality measure Q220: Functional Status Change for Patients with Low Back Impairments. This new measure would address the same clinical topic as measure Q220; however, it allows for broader implementation by including widely available, non-proprietary tools to assess physical function improvement. Additionally, this measure's analytic allows independent calculation of performance by the clinician, or easy and free collaboration with the steward, which supports clinicians reporting this important aspect of rehabilitative care. This measure utilizes the PROMIS® Pain Interference tool, which was developed using item response theory (IRT) methods. Evidence indicates that the PROMIS-PI items constitute a psychometrically sound item bank for assessing the negative effects of pain on functioning across the range commonly experienced by people who have pain.[414] It allows clinician flexibility in administration as it uses computer adaptive testing (CAT) or a fixed-length short form. This measure also allows utilization of the Modified Low Back Disability Questionnaire (MDQ), which has shown to be a valid, reliable, and responsive condition-specific assessment tool that is suited for use in clinical practice.[415] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. This measure may be added to the Rehabilitative Support for Musculoskeletal Care MVP (currently proposed to be renamed as the Rehabilitative Support MVP under Appendix 3: MVP Inventory, Table B.24). We are proposing to add this measure to the Chiropractic Medicine and Physical Therapy/Occupational Therapy specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.
Measure Proposed for Addition to the Following Specialty Sets:	Chiropractic Medicine, Physical Therapy/Occupational Therapy

A.5. Functional Improvement for Patients with Lower Extremity Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of patients aged 18 years and older with a lower extremity impairment—not including knee impairments—that met the risk-adjusted Predicted Moderate Clinical Improvement (P-MCI) on the PROMIS Physical Function (PPF) or alternative (legacy) patient-reported outcome measure (PROM), the Lower Extremity Functional Scale (LEFS).
Measure Steward:	Limber Health, Inc. and Patient360, LLC
Numerator:	Patients whose most recent PPF score beyond the baseline score meets or exceeds the P-MCI at the time of the completed episode of care.
Denominator:	All patients aged 18 years or older at the start of the episode of care with a non-knee impairment who completed a baseline PPF.
Exclusions:	Pre-operative Care: Patients who are being seen for pre-operative care and/or have surgery for the non-knee lower extremity impairment within 30 days after the initial assessment, documented in the medical record. Cognitive Deficit: A significant mental or cognitive impairment that compromises the patient's ability to complete the PROM, such as dementia or intellectual disabilities, documented in the medical record. Hospice: Patient is in hospice care or receiving palliative care for terminal illness, as documented in the medical record. Active Cancer Treatment: The patient is in active treatment for cancer (e.g., undergoing chemotherapy, radiation therapy, immunotherapy, or cancer-related surgery) AND the goal of musculoskeletal care is primarily to avoid or minimize decline in function, documented in the medical record. Maintenance Therapy: The patient meets Medicare requirements for maintenance therapy, such as the maintenance of functional status or prevention of a slow deterioration in function, as defined by the Medicare Benefits Policy Manual, Chapter 15,[416] as documented in the medical record.
Measure Type:	Patient-Reported Outcome-Based Performance Measure (PRO-PM)
MIPS Core Measure:	No
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

[416] Medicare Benefit Policy Manual. https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/bp102c15.pdf.

Category	Description
Rationale:	We are proposing this current QCDR patient-reported outcome-based performance measure to replace current MIPS quality measures Q218: Functional Status Change for Patients with Hip Impairments and Q219: Functional Status Change for Patients with Lower Leg, Foot or Ankle Impairments. This new measure would address the same clinical topics as measures Q218 and Q219; however, it allows for broader implementation by including widely available, non-proprietary tools to assess physical function improvement. Additionally, this measure's analytic allows independent calculation of performance by the clinician, or easy and free collaboration with the steward, which supports clinicians reporting this important aspect of rehabilitative care. This measure utilizes the PROMIS® Physical Function (PPF) tool, which was developed using item response theory (IRT) methods and has demonstrated reliability, convergent and known-groups discriminant validity, and responsiveness in a sample of patients with a lower extremity orthopedic trauma injury.[417] This measure also allows utilization of the Lower Extremity Functional Scale (LEFS). Evidence supports the reliability, validity, and responsiveness of LEFS scores for assessing functional impairment in a wide array of patient groups with lower extremity musculoskeletal conditions.[418] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. This measure may be added to the Rehabilitative Support for Musculoskeletal Care MVP (currently proposed to be renamed as the Rehabilitative Support MVP under Appendix 3: MVP Inventory, Table B.24). We are proposing to add this measure to the Chiropractic Medicine and Physical Therapy/Occupational Therapy specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.

Measure Type:	Patient-Reported Outcome-Based Performance Measure (PRO-PM)
MIPS Core Measure:	No
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

[419] Medicare Benefit Policy Manual. https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/bp102c15.pdf.

Category	Description
Rationale:	We are proposing this current QCDR patient-reported outcome-based performance measure to replace current MIPS quality measure Q217: Functional Status Change for Patients with Knee Impairments. This new measure would address the same clinical topic as measure Q217; however, it allows for broader implementation by including widely available, non-proprietary tools to assess physical function improvement. Additionally, this measure's analytic allows independent calculation of performance by the clinician, or easy and free collaboration with the steward, which supports clinicians reporting this important aspect of rehabilitative care. This measure utilizes the PROMIS® Physical Function (PPF) tool, which was developed using item response theory (IRT) methods and has demonstrated reliability, convergent and known-groups discriminant validity, and responsiveness in a sample of patients with a lower extremity orthopedic trauma injury.[420] This measure also allows utilization of the Knee Outcome Survey (KOS). Evidence shows it is a reliable, valid, and responsive instrument for the assessment of functional limitations that result from a wide variety of pathological disorders and impairments of the knee.[421] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. This measure may be added to the Rehabilitative Support for Musculoskeletal Care MVP (currently proposed to be renamed as the Rehabilitative Support MVP under Appendix 3: MVP Inventory, Table B.24). We are proposing to add this measure to the Chiropractic Medicine and Physical Therapy/Occupational Therapy specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.
Measure Proposed for Addition to the Following Specialty Sets:	Chiropractic Medicine, Physical Therapy/Occupational Therapy

A.7. Age-Related Hearing Loss: Comprehensive Audiometric Evaluation

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of patients aged 50 years and older who failed a hearing screening and/or who report suspected hearing loss or tinnitus who were ordered or referred for a comprehensive audiometric evaluation on the day of diagnosis/office visit OR received a comprehensive audiometric evaluation within 4 weeks of the office visit.
Measure Steward:	American Academy of Otolaryngology - Head and Neck Surgery Foundation
Numerator:	Patients were ordered or referred for a comprehensive audiometric evaluation on the day of diagnosis/office visit OR received a comprehensive audiometric evaluation within 4 weeks of the office visit.
Denominator:	All patients aged 50 years and older who failed a hearing screening and/or who report suspected hearing loss or tinnitus.
Exclusions:	None
Measure Type:	Process
MIPS Core Measure:	Yes
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

Category	Description
Rationale:	We are proposing this current QCDR measure as it fills a gap in the Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP. It is specific to audiology and ensures that patients suspected of having age-related hearing loss, either identified through a failed hearing screen or diagnosis, are referred for or receive a comprehensive audiometric evaluation. Implementation of this measure as a MIPS CQM would allow wider availability for reporting by MIPS eligible clinicians. The objective of auditory assessment is to diagnose the type and magnitude of hearing loss and the need for treatment, including candidacy for amplification. Age-related hearing loss (ARHL), despite being the most common sensory deficit seen in the older population, remains an underdiagnosed and undertreated condition among individuals aged 50 years and above.[422] Identifying ARHL in early stages could prevent its known adverse outcomes, such as lower quality of life and ability to function.[423] [424] Undertreatment may lead to associated health risks, including dementia, depression, cardiovascular disease, and falls.[425] This measure is based on clinical guidelines intended to inform the practice of hearing care professionals involved in the audiological management of adults with severe to profound hearing loss.[426] Additionally, the guidelines identify quality improvement opportunities and evidence-based recommendations regarding the identification and management of ARHL.[427] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. We are proposing to add this measure to the Audiology and Otolaryngology specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.
Measure Proposed for Addition to the Following Specialty Sets:	Audiology, Otolaryngology

[427] See footnote Tsai et al., 2024.

A.8. Patient-Reported Experience with Anesthesia

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of patients, aged 18 and older, who were surveyed on their patient experience and satisfaction with anesthesia care and who reported a positive experience.
Measure Steward:	American Society of Anesthesiologists Anesthesia Quality Institute
Numerator:	Numerator 1. Patients who received a valid survey within 30 days of the procedure to assess their experience and satisfaction with anesthesia. Numerator 2. Patients who reported a positive experience with anesthesia care within 60 days of receipt of the survey.
Denominator:	Denominator 1. Patients aged 18 and older, who undergo a procedure under anesthesia during the denominator identification period. Denominator 2. All patients from Submission Criteria 1 who complete a survey on their patient experience and satisfaction with anesthesia care within 60 days of receipt of the survey.
Exclusions:	Organ Donors as designated by American Society of Anesthesiologists (ASA) Physical Status 6[428] Patient died within 30 days of the procedure Patients who did not complete the mandatory anesthesia satisfaction question within 60 days of receipt of the survey
Measure Type:	Patient-Reported Outcome-Based Performance Measure (PRO-PM)
MIPS Core Measure:	No
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	A minimum of 20 completed surveys required to be eligible to report Denominator 2
Rationale:	We are proposing this current QCDR patient-reported outcome-based performance measure as it fills a gap in the Anesthesiology specialty set. It would be the only patient experience of care measure for that specialty and is reported for each procedure. The measure assesses for patients that receive a valid survey and report a positive experience with their anesthesia care. The assessment of patient satisfaction with anesthesia care provides important feedback allowing clinicians to improve the quality-of-care delivery.[429] There are a variety of surveys available for practices and clinicians to implement based upon local patient populations, such as the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS): Patients' Perspectives of Care Survey[430] and Outpatient and Ambulatory Surgery CAHPS.[431] However, the measure would not require the use of a specific survey to collect patient feedback. Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. This measure may be added to the Patient Safety and Support of Positive Experiences with Anesthesia MVP. We are proposing to add this measure to the Anesthesiology specialty set based on available coding and because the clinical quality action is within the scope of care for anesthesiologists.
Measure Proposed for Addition to the Following Specialty Sets:	Anesthesiology

[428] American Society of Anesthesiologists (ASA) Physical Status 6 is defined as a declared brain-dead patient whose organs are being removed for donor purposes.

[430] CMS. (2025). HCAHPS: Patients' Perspectives of Care Survey. https://www.cms.gov/data-research/research/consumer-assessment-healthcare-providers-systems/hospital-cahps-hcahps.
[431] CMS. (2026). Outpatient and Ambulatory Surgery CAHPS (OAS CAHPS). https://www.cms.gov/data-research/research/consumer-assessment-healthcare-providers-systems/outpatient-and-ambulatory-surgery-cahps.

A.9. Intraoperative Hypotension (IOH) Among Non-Emergent Noncardiac Surgical Cases

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	Percentage of general, neuraxial, or regional anesthesia care cases performed during the performance period in which the mean arterial pressure (MAP) fell below 65 mmHg for a cumulative total of 15 minutes or more.
Measure Steward:	Anesthesia Quality Registry (AQR QCDR) in Collaboration with Anesthesia Quality Institute (AQI) and American Society of Anesthesiologists (ASA)
Numerator:	Patients who have a MAP below 65 mmHg that exceeds the cumulative length of 15 minutes during the performance period.
Denominator:	All cases in which adults (ages 18 and older) with non-cardiac, non-emergency surgery require general, neuraxial, or regional anesthesia care during the performance period.
Exclusions:	Patients with a baseline MAP below 65 mmHg Patients with surgeries where anesthesia is complicated by utilization of controlled hypotension during the primary anesthesia procedure American Society of Anesthesiologists (ASA) Physical Status Classification of 1, 5 or 6[432] Emergency cases Cardiac procedures Obstetric non-operative procedures Liver or lung transplant procedures Cataract procedures
Measure Type:	Intermediate Outcome
MIPS Core Measure:	Yes
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A
Rationale:	We are proposing this current QCDR measure as it fills a gap in the Anesthesiology specialty set. This inverse, intermediate outcome measure ensures mean arterial pressure (MAP) does not fall below 65mmHg for greater than 15 minutes during a procedure as it could be associated with adverse outcomes, such as acute kidney injury (AKI) or myocardial injury.[433] Evidence indicates a MAP below absolute thresholds of 65 mmHg or relative thresholds of 20 percent was progressively related to both myocardial and kidney injury. Prolonged exposure below the threshold was also associated with increased risk. Noncardiac surgery patients are at increased risk of AKI when their cumulative time below a MAP of 65 mmHg reaches or exceeds 13 minutes. When patients fall further below 65 mmHg, even shorter durations are associated with increased risk of AKI.[434] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. This measure may be added to the Patient Safety and Support of Positive Experiences with Anesthesia MVP. We are proposing to add this measure to the Anesthesiology specialty set based on available coding and because the clinical quality action is within the scope of care for anesthesiologists.

[432] ASA Physical Status 1 is defined as a normal healthy patient. Physical Status 5 is defined as a moribund patient who is not expected to survive without the operation. Physical Status 6 is defined as a declared brain-dead patient whose organs are being removed for donor purposes.

Category	Description
Measure Proposed for Addition to the Following Specialty Sets:	Anesthesiology

A.10. SGLT2 Inhibitors for Patients with Chronic Kidney Disease (CKD) With or Without Type 2 Diabetes Mellitus

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality #:	TBD
Description:	The percentage of patients aged 18 years and older with chronic kidney disease (CKD) stages 2 and 3 who are prescribed an SGLT2 inhibitor during the measurement period.
Measure Steward:	A Value-Based Care Registry
Numerator:	Patients who were prescribed or were currently taking an SGLT2 inhibitor during the performance period.
Denominator:	All patients aged 18 years and older diagnosed with chronic kidney disease (CKD) stages 2-3 during the measurement period.
Exclusions:	Patients with Type 1 Diabetes Mellitus Diabetic Ketoacidosis
Measure Type:	Process
MIPS Core Measure:	No
Collection Type:	MIPS CQM
Measure-Specific Case Minimum/Performance Period:	N/A

Category	Description
Rationale:	We are proposing this current QCDR measure as it fills a gap in the MIPS quality measure inventory, ensuring the appropriate, evidence-based treatment of patients diagnosed with CKD with SGLT2 inhibitors. Evidence demonstrates that SGLT2 inhibitors slow the progression of CKD and reduce cardiovascular events in this patient population.[435] [436] [437] As a result, SGLT2 inhibitors have become a key disease-modifying therapy to prevent CKD progression. These medications prevent decline in kidney function through reduction in glomerular hypertension, independent of their effect on glycemic control. This has expanded the approved clinical indications for these medications beyond patients with diabetes.[438] Current clinical and practice guidelines also recommend use of SGLT2 inhibitors to slow CKD progression in patients with or without type 2 diabetes.[439] [440] Under section 1848(q) of the Act, a QCDR measure may only become reportable as a MIPS quality measure if the Secretary formerly adopts it through rulemaking and includes it in the MIPS quality measure inventory. We have the authority to establish quality measures under MIPS. This authority is not dependent upon the pre-rulemaking process used to develop measures. Beginning with the CY 2024 performance period/2026 MIPS payment year, all QCDR measures are required to be fully developed and tested at the clinician level by their second year in MIPS, as finalized in the CY 2023 PFS final rule (87 FR 70104 through 70106) and codified at § 414.1400(b)(4)(iii)(A)(3). As a current QCDR measure, this measure has demonstrated feasibility, reliability, and validity in accordance with § 414.1400(b)(4)(iii)(A)(3). The measure is evidence-based and is fully developed and tested. We are proposing to add this measure to multiple applicable specialty sets based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.

Table Group AA: New MIPS Quality Measures Proposed for the CY 2028 Performance Period/2030 MIPS Payment Year and Future Years

In addition to the new quality measures proposed in Table Group A of this Appendix, we are proposing to add one eCQM measure for the 2028 performance period/2030 MIPS payment year and future years to allow clinicians sufficient time to adapt their workflows prior to implementation within MIPS. We request comments on this new measure.

AA.1. Rate of Timely Follow-up on Abnormal Screening Mammograms for Breast Cancer Detection

Category	Description
CBE # / eCQM CBE #:	N/A / 4700e
Quality #:	TBD
Description:	This electronic clinical quality measure (eCQM) reports the percentage of female patients aged 40 to 75 years with at least one abnormal screening (BI-RADS 0) or screening-to-diagnostic (BI-RADS 4, 5) mammogram during the measurement period (i.e., calendar year) who received timely diagnostic resolution defined as either follow-up imaging with negative/benign/probably benign results or a breast biopsy within 60 days after their index (i.e., first) abnormal screening mammogram.
Measure Steward:	Brigham and Women's Hospital
Numerator:	Patients in the denominator population who received timely diagnostic resolution defined as negative/benign/probably benign follow-up imaging (BI-RADS 1, 2, 3) or breast biopsy within 60 days after the date of their index (i.e., first) abnormal screening (BI-RADS 0) or screening-to-diagnostic (BI-RADS 4, 5) mammogram.
Denominator:	Female patients aged 40 to 75 years with an abnormal screening (BI-RADS 0) or screening-to-diagnostic (BI-RADS 4, 5) mammogram during the measurement period (i.e., calendar year). Only the first abnormal screening or screening-to-diagnostic mammogram (i.e., index screening test) is included in the measure calculation.
Exclusions:	N/A
Measure Type:	Process
MIPS Core Measure	No
Collection Type:	eCQM
Measure-Specific Case Minimum/Performance Period:	N/A

Category	Description
Rationale:	We are proposing this eCQM because it addresses timely follow up of diagnostic testing for patients with an abnormal mammogram. Additionally, it fills a gap in the Diagnostic Radiology specialty set with potential for inclusion in an MVP. Breast cancer is the second most common cause of cancer deaths among women in the United States[441] and survival is dependent upon cancer stage at diagnosis. Breast cancer mainly occurs in middle-aged and older women, with the median age at the time of diagnosis being 62 years.[442] Noninvasive mammographic screening is the primary screening modality used to detect breast cancer. Studies show that between 27 to 72 percent of women did not receive appropriate follow-up within 6 months of an abnormal mammogram.[443] Delays in diagnostic follow-up after abnormal mammographic screening results increase the risk of diagnosing cancer at a more advanced stage.[444] Timely follow-up is essential to facilitate early-stage detection and improve overall survival outcomes. The Pre-Rulemaking Measure Review (PRMR) Clinician Recommendation Committee did not reach consensus on this measure; however, the majority (71 percent) of the committee expressed support for use of the measure. The measure is CBE endorsed with conditions of continued monitoring of performance and additional data element validity testing of other electronic health records (EHRs). We are proposing this measure with a one-year delay in implementation to allow time for clinicians to adapt their workflows and therefore ensure greater feasibility of reporting within MIPS. If finalized as proposed, this measure would be available for reporting for the CY 2028 performance period/2030 MIPS payment year. We are proposing to add this measure to the Diagnostic Radiology specialty set for the CY 2028 performance period/2030 MIPS payment year based on available coding and because the clinical quality action is within the scope of care for clinicians in these specialties.
Measure Proposed for Addition to the Following Specialty Sets:	Diagnostic Radiology

Table Group B: Modifications to Previously Finalized Specialty Sets Proposed for the CY 2027 Performance Period/2029 MIPS Payment Year and Future Years

We are proposing to modify the previously finalized specialty sets based upon review of updates made to existing quality measure specifications, the proposed addition of new measures for inclusion in MIPS, and feedback provided by specialty societies and other interested parties. There may be instances where the quality measures within a specialty set remain static, but the individual measures have proposed substantive changes in Table Group D of this Appendix.

We use the following symbols in the Indicator column in the Table Group B tables below:

- Existing quality measures with substantive changes described in Table Group D of this Appendix are identified with an asterisk (*).
- Quality measures designated as MIPS core measures are identified with an exclamation point (!). As discussed in section IV.A.4.d.(1)(c)(i) of this proposed rule, we are proposing to implement the MIPS core measure designation for traditional MIPS and MVP reporting.
- Quality measures proposed for addition to a proposed specialty set are identified with a plus sign (+).

Additionally, measures that are endorsed by a CBE are shown in Table Group B of this Appendix as follows: CBE # / eCQM CBE #.

Note: We updated the format of the specialty set tables to reflect what the specialty set would be for the CY 2027 performance period, if finalized as proposed. Measures proposed for addition to the specialty sets have been added to applicable tables and are noted with a plus sign (+) in the Indicator column. See Table Group A of this Appendix for rationales for proposed new measures. Existing measures proposed for addition to a specific specialty set are also indicated with a plus sign (+) and are included in the introductory paragraphs of the specialty set, as applicable.

Measures proposed for removal have been removed from each specialty set, as applicable. See Table Group C of this Appendix for rationales for proposed measure removals from MIPS. Specialty-specific measure additions and/or removals would be noted under applicable specialty sets. If a measure is not finalized for addition, it would be removed from the specialty set(s) in the final rule. If a measure is not finalized for removal, it would be added back to the specialty set(s) in the final rule.

We request comments on proposed measure additions and/or proposed measure removals under applicable specialty sets in Table Group B of this Appendix. New measures proposed for addition to applicable specialty sets are open for comment under Table Group A of this Appendix. Measures proposed for removal from MIPS are open for comment under Table Group C of this Appendix. Previously finalized measures that have proposed substantive changes are open for comment under Table Group D of this Appendix. Previously finalized measures that have no substantive changes are not open for comment under this proposed rule.

The following specialty set is not open for comment as it has no proposed modifications for the CY 2027 performance period/2029 MIPS payment year: Diagnostic Radiology.

B.1. Allergy/Immunology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Allergy/Immunology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.1. Allergy/Immunology

PROPOSED MEASURES IN THE ALLERGY/IMMUNOLOGY SPECIALTY SET							
Indicator	**CBE # / eCQM CBE #**	**Quality #**	**CMS eCQM ID**	**Collection Type**	**Measure Type**	**Measure Title**	**Measure Steward**

B.3. Audiology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Audiology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.3. Audiology

B.4a. Cardiology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Cardiology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.4a. Cardiology

PROPOSED MEASURES IN THE CARDIOLOGY SPECIALTY SET							
Indicator	**CBE # / eCQM CBE #**	**Quality #**	**CMS eCQM ID**	**Collection Type**	**Measure Type**	**Measure Title**	**Measure Steward**

B.4b. Electrophysiology Cardiac Specialist

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Electrophysiology Cardiac Specialist specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.4b. Electrophysiology Cardiac Specialist

PROPOSED MEASURES IN THE ELECTROPHYSIOLOGY CARDIAC SPECIALIST SPECIALTY SET							
Indicator	**CBE # / eCQM CBE #**	**Quality #**	**CMS eCQM ID**	**Collection Type**	**Measure Type**	**Measure Title**	**Measure Steward**
*	2474 / N/A	392	N/A	MIPS CQM	Outcome	Cardiac Tamponade and/or Pericardiocentesis Following Atrial Fibrillation Ablation	American College of Cardiology Foundation
*	N/A / N/A	393	N/A	MIPS CQM	Outcome	Infection within 180 Days of Cardiac Implantable Electronic Device (CIED) Implantation, Replacement, or Revision	American College of Cardiology Foundation

B.5. Certified Nurse Midwife

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Certified Nurse Midwife specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable.

We are also proposing to add one existing MIPS quality measure to this specialty set:

- **Q493:** Adult Immunization Status: This MIPS quality measure assesses whether adult patients are up-to-date with recommended routine immunizations. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type. Certified Nurse Midwives are advanced practice clinicians uniquely qualified to deliver comprehensive primary care, pregnancy care, and gynecological care. Their scope of practice often includes primary care services such as immunizations, especially in alignment with their focus on preventive care and wellness for women.[445] [446] Adding this measure would align the Certified Nurse Midwife specialty set with the Obstetrics and Gynecology specialty set, recognizing the similarities in care delivery between these specialties and ensuring consistency across specialty sets. Including this measure in the Certified Nursing Midwife specialty set acknowledges the important role they play in preventive care and primary health maintenance, as well as promoting consistent, high quality care delivery across patient populations. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.

Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.5. Certified Nurse Midwife

PROPOSED MEASURES IN THE CERTIFIED NURSE MIDWIFE SPECIALTY SET

B.6. Chiropractic Medicine

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Chiropractic Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.6. Chiropractic Medicine

+	N/A / N/A	TBD	N/A	MIPS CQM	Process	SGLT2 Inhibitors for Patients with Chronic Kidney Disease (CKD) With or Without Type 2 Diabetes Mellitus	A Value-Based Care Registry

B.13. Family Medicine

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Family Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable.

We are also proposing to add two existing MIPS quality measures to this specialty set:

- **Q205**: Sexually Transmitted Infection (STI) Testing for People with HIV: This MIPS quality measure assesses appropriate screening of STIs for patients with HIV. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and propose adding this measure to the Family Medicine specialty set. Clinical guidelines, such as those from the Centers for Disease Control and Prevention (CDC), recommend regular screening for STIs in individuals with HIV.[447] Despite the high incidence of STIs among people with HIV, screening rates remain suboptimal.[448] Including this measure emphasizes adherence to established best practices in care provision within family medicine. This measure would allow clinicians and health systems to track and benchmark their performance in meeting preventive care goals for patients with HIV. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.
- **Q340**: HIV Annual Retention in Care: This MIPS quality measure promotes routine monitoring to track patient progress and ensure treatment efficacy. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and propose adding this measure to the Family Medicine specialty set. Incorporating this measure aligns with national goals such as the Ending the HIV Epidemic initiative, led by the CDC, which highlights retention and viral suppression as cornerstones for reducing transmission and new infections.[449] A study from the Centers for AIDS Research Network of Integrated Clinical Systems revealed that patients who missed more than two clinic visits over a two-year period had significantly higher mortality risks, even if they otherwise met institutional retention metrics.[450] These findings underscore the life-saving importance of retention in improving survival rates. By measuring and promoting retention in HIV care, the addition of this measure could drive system-wide improvements, support better patient outcomes, reduce preventable mortality, and contribute to public health efforts to end the HIV epidemic. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.

Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.14. Gastroenterology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Gastroenterology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable.

We are also proposing to add two existing MIPS quality measures to this specialty set:

- **Q205**: Sexually Transmitted Infection (STI) Testing for People with HIV: This MIPS quality measure assesses appropriate screening of STIs for patients with HIV. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and propose adding this measure to the Internal Medicine specialty set. Clinical guidelines, such as those from the CDC, recommend regular screening for STIs in individuals with HIV.[451] Despite the high incidence of STIs among people with HIV, screening rates remain suboptimal.[452] Including this measure emphasizes adherence to established best practices in care provision within family medicine. This measure would allow clinicians and health systems to track and benchmark their performance in meeting preventive care goals for patients with HIV. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.
- **Q340**: HIV Annual Retention in Care: This MIPS quality measure promotes routine monitoring to track patient progress and ensure treatment efficacy. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and propose adding this measure to the Internal Medicine specialty set. Incorporating this measure aligns with national goals such as the Ending the HIV Epidemic initiative, led by the CDC, which highlights retention and viral suppression as cornerstones for reducing transmission and new infections.[453] A study from the Centers for AIDS Research Network of Integrated Clinical Systems revealed that patients who missed more than two clinic visits over a two-year period had significantly higher mortality risks, even if they otherwise met institutional retention metrics.[454] These findings underscore the life-saving importance of retention in improving survival rates. By measuring and promoting retention in HIV care, the addition of this measure could drive system-wide improvements, support better patient outcomes, reduce preventable mortality, and contribute to public health efforts to end the HIV epidemic. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.

Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.20. Interventional Radiology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Interventional Radiology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.24. Neurosurgical

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Neurosurgical specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.24. Neurosurgical

PROPOSED MEASURES IN THE NEUROSURGICAL SPECIALTY SET

B.25. Nutrition/Dietician

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Nutrition/Dietician specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure

table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable.

We are also proposing to add one existing MIPS quality measure to this specialty set:

- **Q317**: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented: This MIPS quality measure supports screening for high blood pressure. We agree with interested parties' feedback that adding this measure to this specialty set would help empower registered dietician nutritionists (RDNs) to meaningfully participate in quality programs and value-based care, ensuring patients receive high-value nutritional care. Hypertension (HTN) is among the leading global preventable risk factors for cardiovascular disease and premature mortality.[455] Early detection and effective management of HTN have demonstrated significant reductions in mortality, morbidity, and health care costs.[456] RDNs provide medical nutrition therapy, which has demonstrated effectiveness in improving outcomes such as blood pressure control and reducing cardiovascular risks.[457] Including this measure within the Nutrition/Dietician specialty set recognizes the critical role of RDNs in managing HTN and promotes team-based, whole-person care. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.

Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.26. Obstetrics/Gynecology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Obstetrics/Gynecology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable.

We are also proposing to add two existing MIPS quality measures to this specialty set:

- **Q205**: Sexually Transmitted Infection (STI) Testing for People with HIV: This MIPS quality measure assesses appropriate screening of STIs for patients with HIV. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and propose adding this measure to the Obstetrics/Gynecology specialty set. Clinical guidelines, such as those from the CDC, recommend regular screening for STIs in individuals with HIV.[458] Despite the high incidence of STIs among people with HIV, screening rates remain suboptimal.[459] Adding measure Q205 to this specialty set would help address critical screening gaps, ensuring sexual health services are consistently delivered in settings managing patients' reproductive health. This measure would allow clinicians and health systems to track and benchmark their performance in meeting preventive care goals for patients with HIV. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.
- **Q338**: HIV Viral Suppression: This MIPS quality measure promotes effective management of HIV viral load for patients diagnosed with HIV. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and are proposing to add this measure to the Obstetrics/Gynecology specialty set. This specialty plays an essential role in ensuring patients remain actively engaged in HIV care while accessing comprehensive prevention services that improve health outcomes. Viral suppression is widely recognized as the clinical goal of HIV treatment, reflecting successful management of the condition.[460] [461] Measuring viral suppression ensures clinicians are accountable for achieving this outcome across their patient population, which is directly linked to measurable preventive outcomes, such as reducing HIV transmission rates and decreasing HIV-related morbidity and mortality.[462] [463] The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.

Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.28. Ophthalmology

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Ophthalmology specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.28. Ophthalmology

B.36. Plastic Surgery

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Plastic Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.38. Preventive Medicine

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Preventive Medicine specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable.

We are also proposing to add two existing MIPS quality measures to this specialty set:

- **Q205**: Sexually Transmitted Infection (STI) Testing for People with HIV: This MIPS quality measure assesses appropriate screening of STIs for patients with HIV. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and propose adding this measure to the Preventive Medicine specialty set. Clinical guidelines, such as those from the CDC, recommend regular screening for STIs in individuals with HIV.[464] Despite the high incidence of STIs among people with HIV, screening rates remain suboptimal.[465] Including this measure emphasizes adherence to established best practices in care provision within preventive medicine. This measure would allow clinicians and health systems to track and benchmark their performance in meeting preventive care goals for patients with HIV. The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.
- **Q338**: HIV Viral Suppression: This MIPS quality measure promotes effective management of HIV viral load for patients diagnosed with HIV. We agree with interested parties' feedback that this measure is clinically relevant to this clinician type and are proposing to add this measure to the Preventive Medicine specialty set. This specialty plays an essential role in ensuring patients remain actively engaged in HIV care while accessing comprehensive prevention services that improve health outcomes. Viral suppression is widely recognized as the clinical goal of HIV treatment, reflecting successful management of the condition.[466] [467] Measuring viral suppression ensures clinicians are accountable for achieving this outcome across their patient populations, which is directly linked to measurable preventive outcomes, such as reducing HIV transmission rates and decreasing HIV-related morbidity and mortality.[468] [469] The measure being added to this specialty set would be contingent on the inclusion of applicable coding by the time of the CY 2027 PFS final rule publication. In the event appropriate coding is not included in the final specification, this measure would not be finalized for inclusion within this specialty measure set.

Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

	N/A / N/A	386	N/A	MIPS CQM	Process	Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences	American Academy of Neurology

B.43. Thoracic Surgery

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Thoracic Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

B.46. Vascular Surgery

In addition to the considerations discussed in the introductory language of Table Group B of this Appendix to this proposed rule, the Vascular Surgery specialty set takes additional criteria into consideration, which includes, but is not limited to, whether a measure reflects current clinical guidelines and the coding of the measure includes relevant clinician types. We may reassess the appropriateness of individual measures, on a case-by-case basis, to ensure appropriate inclusion in the specialty set. The measure table for this specialty set includes previously finalized measures we are maintaining within the set and modifications proposed for the CY 2027 performance period/2029 MIPS payment year.

Measures proposed for addition to this specialty set under Table Group A of this Appendix, or previously finalized measures proposed for addition, are indicated by a + in the Indicator column, as applicable. Measures proposed for removal under Table Group C of this Appendix have been removed from this specialty set, as applicable. Measures with proposed substantive changes under Table Group D of this Appendix are indicated with a * in the Indicator column, as applicable. Below would be the specialty set for this specialty for the CY 2027 performance period if everything is finalized as proposed. We request comments on these proposals.

Table Group C: Previously Finalized Quality Measures Proposed for Removal for the CY 2027 Performance Period/2029 MIPS Payment Year and Future Years

In this proposed rule, we are proposing to remove 20 previously finalized MIPS quality measures for the CY 2027 performance period/2029 MIPS payment year and future years. These measures are discussed in detail in the removal tables below. Note: Specialty sets impacted by each measure removal are indicated under Table Group C of this Appendix within the last row of each C table.

The CY 2019 PFS final rule (83 FR 59763 through 59765) and CY 2020 PFS final rule (84 FR 62957 through 62959) discuss our incremental approach to removing process measures. Further considerations are given in the evaluation of a measure's performance data to determine whether there is or no longer is variation in performance. As discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763), an additional criterion we use for the removal of measures includes extremely topped-out measures, which refers to measures topped out with an average (mean) performance rate between 98-100 percent. For a measure proposed for removal due to criteria relating to the benchmark and performance data, further information regarding 2025 MIPS benchmarking data can be located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks.*

As codified in the CY 2025 PFS final rule (89 FR 98561) at § 414.1330(c)(1), we list 12 criteria used to determine the removal of a quality measure.

(i) If the Secretary determines that the quality measure is no longer meaningful, such as measures that are topped out.
(ii) If a measure steward is no longer able to maintain the quality measure.
(iii) If the quality measure reached extremely topped out status.
(iv) If the quality measure does not meet case minimum and reporting volumes required for benchmarking after being in the program for 2 consecutive CY performance periods.
(v) If the quality measure is duplicative.
(vi) If the quality measure is not updated to reflect current clinical guidelines, which are not reflective of a clinician's scope of practice.
(vii) If the quality measure is a process measure.
(viii) If the quality measure addresses a measurement gap.
(ix) If the quality measure is a patient-reported outcome.
(x) If the quality measure is not available for MIPS quality reporting by or on behalf of all MIPS eligible clinicians.
(xi) The robustness of the quality measure.
(xii) Consideration of the quality measure in developing MIPS Value Pathways (MVPs).

Additionally, we codified at § 414.1330(c)(2) 6 instances when a quality measure that otherwise meets the criteria for removal in § 414.1330(c)(1) may nonetheless be retained based on the following considerations:

(i) Whether the removal of the process measure impacts the number of measures available for a specific specialty.
(ii) Whether the quality measure addresses a priority area.
(iii) Whether the quality measure promotes positive outcomes in patients.
(iv) Whether the quality measure is designated as high priority or not.
(v) Whether the quality measure has reached extremely topped out status.
(vi) Evaluation of the quality measure's performance data.

However, we would like to note that in section IV.A.4.d.(1)(c)(ii) of this proposed rule we are proposing to update the existing quality measure retention consideration at § 414.1330(c)(1)(iv) to state that we would consider whether the quality measure is designated as high priority or not through the CY 2026 performance period/CY 2028 MIPS payment year.

We request comments on these measure removals and the impacted specialty sets.

C.1 Coronary Artery Disease (CAD): Antiplatelet Therapy

Category	Description
CBE # / eCQM CBE #:	0067 / N/A
Quality#:	006
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease (CAD) seen within a 12-month period who were prescribed aspirin or clopidogrel.
Measure Steward:	American Heart Association
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), at the measure steward's request because it would no longer be maintained for inclusion.
In the Circumstance the Measure Is Retained:	There are no substantive changes for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Cardiology, Family Medicine, Internal Medicine, Skilled Nursing Facility

C.2 Coronary Artery Disease (CAD): Beta-Blocker Therapy – Prior Myocardial Infarction (MI) or Left Ventricular Systolic Dysfunction (LVEF ≤ 40%)

Category	Description
CBE # / eCQM CBE #:	0070 / 0070e
Quality#:	007
CMS eCQM ID:	CMS145v15
Collection Type:	eCQM / MIPS CQM
Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of coronary artery disease seen within a 12-month period who also have a prior MI or a current or prior LVEF ≤ 40% who were prescribed beta-blocker therapy.
Measure Steward:	American Heart Association
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), at the measure steward's request because it would no longer be maintained for inclusion.
In the Circumstance the Measure Is Retained:	There are no substantive changes for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Cardiology, Family Medicine, Internal Medicine, Skilled Nursing Facility

C.3 Oncology: Medical and Radiation – Pain Intensity Quantified

Category	Description
CBE # / eCQM CBE #:	0384 / 0384e
Quality#:	143
CMS eCQM ID:	CMS157v15
Collection Type:	eCQM / MIPS CQM
Measure Description:	Percentage of patient visits, regardless of patient age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy in which pain intensity is quantified.
Measure Steward:	American Society of Clinical Oncology
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure has reached the end of the topped-out lifecycle (82 FR 53640) and has a limited opportunity to improve clinical outcomes. Topped-out process measures are those with a median performance rate of 95 percent or higher (81 FR 77286). This measure's continued topped-out status is based on the current 2026 MIPS benchmarking data located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks*, in addition to previous years MIPS benchmarking data. For more information on benchmarks, see the MIPS 2026 Quality Benchmarks User Guide at *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3611/2026-Quality-Benchmarks-User-Guide.pdf*.
In the Circumstance the Measure Is Retained:	There are no substantive changes for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Oncology/Hematology, Radiation Oncology

C.4 Functional Status Change for Patients with Knee Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	217
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	A patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients 14 years+ with knee impairments. The change in FS is assessed using the FOTO Lower Extremity Physical Function (LEPF) PROM. The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk-adjusted) and used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.
Measure Steward:	Focus on Therapeutic Outcomes, Inc.
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure is duplicative of the Functional Improvement for Patients with Knee Impairments measure being proposed in Table A.6 of this Appendix. Measure Q217 is specific to knee impairments and restricts clinicians to using the proprietary tool FOTO LEPF PROM or a manual crosswalk for numerator assessment. The new measure proposed in Table A.6 of this Appendix is a more comprehensive patient-reported outcome-based performance measure. The new measure allows the use of various validated assessments tools, including the Knee Outcome Survey, Patient-Reported Outcomes Measurement Information System (PROMIS) Physical Function, or equivalent tools. The new measure focuses on clinically meaningful outcomes by assessing improvement against the Predicted Moderate Clinical Improvement (P-MCI), a patient-specific, risk-adjusted threshold. This measure incorporates a risk adjustment model that would improve feasibility of reporting as all information to calculate performance would be provided by the measure steward.
In the Circumstance the Measure Is Retained:	There are no substantive changes for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Chiropractic Medicine, Orthopedic Surgery, Physical Therapy/Occupational Therapy

C.5 Functional Status Change for Patients with Hip Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	218
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	A patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients 14 years+ with hip impairments. The change in FS is assessed using the FOTO Lower Extremity Physical Function (LEPF) PROM. The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.
Measure Steward:	Focus on Therapeutic Outcomes, Inc.
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure is duplicative of the Functional Improvement for Patients with Lower Extremity Impairments measure being proposed in Table A.5 of this Appendix. Measure Q218 is specific to hip impairments and restricts clinicians to using the proprietary tool FOTO LEPF PROM or a manual crosswalk for numerator assessment. The new measure proposed in Table A.5 of this Appendix is a more comprehensive patient-reported outcome-based performance measure that includes all lower extremity injuries. The new measure allows the use of various validated assessments tools, including the Lower Extremity Functional Scale (LEFS), PROMIS Physical Function, or equivalent tools. The new measure focuses on clinically meaningful outcomes by assessing improvement against the P-MCI, a patient-specific, risk-adjusted threshold. This measure incorporates a risk adjustment model that would improve feasibility of reporting as all information to calculate performance would be provided by the measure steward.
In the Circumstance the Measure Is Retained:	There are no substantive changes for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Chiropractic Medicine, Orthopedic Surgery, Physical Therapy/Occupational Therapy

C.6 Functional Status Change for Patients with Lower Leg, Foot or Ankle Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	219
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	A patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients 14 years+ with foot, ankle or lower leg impairments. The change in FS is assessed using the FOTO Lower Extremity Physical Function (LEPF) PROM. The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk-adjusted) and used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.
Measure Steward:	Focus on Therapeutic Outcomes, Inc.
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure is duplicative of the Functional Improvement for Patients with Lower Extremity Impairments measure being proposed in Table A.5 of this Appendix. Measure Q219 is specific to lower leg, foot and ankle impairments and restricts clinicians to the use of the proprietary tool FOTO LEPF PROM or a manual crosswalk for numerator assessment. The new measure proposed in Table A.5 of this Appendix is a more comprehensive patient-reported outcome-based performance measure that includes all lower extremity injuries. The new measure allows the use of various validated assessments tools, including the LEFS, PROMIS Physical Function, or equivalent tools. The new measure focuses on clinically meaningful outcomes by assessing improvement against the P-MCI, a patient-specific, risk-adjusted threshold. This measure incorporates a risk adjustment model that would improve feasibility of reporting as all information to calculate performance would be provided by the measure steward.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Chiropractic Medicine, Orthopedic Surgery, Physical Therapy/Occupational Therapy, Podiatry

C.7 Functional Status Change for Patients with Low Back Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	220
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	A patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients 14 years+ with low back impairments. The change in FS is assessed using the FOTO Low Back FS PROM. The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.
Measure Steward:	Focus on Therapeutic Outcomes, Inc.
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure is duplicative of the Functional Improvement for Patients with Back Impairments measure being proposed in Table A.4 of this Appendix. Measure Q220 is specific to low back impairments and restricts clinicians to the use of the proprietary tool FOTO Low Back FS PROM or a manual crosswalk for numerator assessment. The new measure proposed in Table A.4 of this Appendix is a more comprehensive patient-reported outcome-based performance measure that includes all back impairments. The new measure allows the use of various validated assessment tools, such as the Modified Low Back Disability Questionnaire, PROMIS Pain Interference, or equivalent tools. The new measure focuses on clinically meaningful outcomes by assessing improvement against the P-MCI, a patient-specific, risk-adjusted threshold. This measure incorporates a risk adjustment model that would improve feasibility of reporting as all information to calculate performance would be provided by the measure steward.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Chiropractic Medicine, Orthopedic Surgery, Physical Therapy/Occupational Therapy

C.8 Functional Status Change for Patients with Shoulder Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	221
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	A patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients 14 years+ with shoulder impairments. The change in FS is assessed using the FOTO Shoulder FS PROM. The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.
Measure Steward:	Focus on Therapeutic Outcomes, Inc.
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure is duplicative of the Functional Improvement for Patients with Upper Extremity Impairments measure being proposed in Table A.3 of this Appendix. Measure Q221 is specific to shoulder impairments and restricts clinicians to the use of the proprietary tool FOTO Shoulder FS PROM or a manual crosswalk for numerator assessment. The new measure proposed in Table A.3 of this Appendix is a more comprehensive patient-reported outcome-based performance measure that includes all upper extremity injuries. The new measure allows the use of various validated assessment tools, such as the Quick Disabilities of the Arm, Shoulder, & Hand (QDASH) and PROMIS Upper Extremity, or equivalent tools. The new measure focuses on clinically meaningful outcomes by assessing improvement against the P-MCI, a patient-specific, risk-adjusted threshold. This measure incorporates a risk adjustment model that would improve feasibility of reporting as all information to calculate performance would be provided by the measure steward.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Chiropractic Medicine, Orthopedic Surgery, Physical Therapy/Occupational Therapy

C.9 Functional Status Change for Patients with Elbow, Wrist or Hand Impairments

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	222
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	A patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients 14 years+ with elbow, wrist, or hand impairments. The change in FS is assessed using the FOTO Elbow/Wrist/Hand FS PROM. The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk adjusted) and used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.
Measure Steward:	Focus on Therapeutic Outcomes, Inc.
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure is duplicative of the Functional Improvement for Patients with Upper Extremity Impairments measure being proposed in Table A.3 of this Appendix. Measure Q222 is specific to elbow, wrist and hand impairments and restricts clinicians to the use of the proprietary tool FOTO Elbow/Wrist/Hand FS PROM or a manual crosswalk for numerator assessment. The new measure proposed in Table A.3 of this Appendix is a more comprehensive patient-reported outcome-based performance measure that includes all upper extremity injuries. The new measure allows the use of various validated assessment tools, such as QDASH and PROMIS Upper Extremity, or equivalent tools. The new measure focuses on clinically meaningful outcomes by assessing improvement against the P-MCI, a patient-specific, risk-adjusted threshold. This measure incorporates a risk adjustment model that would improve feasibility of reporting as all information to calculate performance would be provided by the measure steward.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Chiropractic Medicine, Orthopedic Surgery, Physical Therapy/Occupational Therapy

C.10 Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients

Category	Description
CBE # / eCQM CBE #:	0658 / N/A
Quality#:	320
CMS eCQM ID:	N/A
Collection Type:	Medicare Part B Claims Measure / MIPS CQM
Measure Description:	Percentage of patients aged 45 to 75 years of age receiving a screening colonoscopy without biopsy or polypectomy who had a recommended follow-up interval of 10 years for repeat colonoscopy documented in their colonoscopy report.
Measure Steward	American Gastroenterological Association
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure has reached the end of the topped-out lifecycle (82 FR 53640) and has a limited opportunity to improve clinical outcomes. Topped-out process measures are those with a median performance rate of 95 percent or higher (81 FR 77286). This measure's continued topped-out status is based on the current 2026 MIPS benchmarking data located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks*, in addition to previous years MIPS benchmarking data. For more information on benchmarks, see the MIPS 2026 Quality Benchmarks User Guide at *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3611/2026-Quality-Benchmarks-User-Guide.pdf.*
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Gastroenterology

C.11 Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	326
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM

Category	Description
Measure Description:	Percentage of patients aged 18 years and older with atrial fibrillation (AF) or atrial flutter who were prescribed an FDA-approved oral anticoagulant drug for the prevention of thromboembolism during the measurement period.
Measure Steward	American Heart Association
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), at the measure steward's request because it would no longer be maintained for inclusion.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Cardiology, Family Medicine, Internal Medicine, Skilled Nursing Facility

C.12 Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin With or Without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis (Appropriate Use)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	332
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of acute bacterial sinusitis that were prescribed amoxicillin, with or without clavulanate, as a first line antibiotic at the time of diagnosis.
Measure Steward	American Academy of Otolaryngology – Head and Neck Surgery Foundation
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure is duplicative in clinical topic of measure Q331: Adult Sinusitis: Antibiotic Prescribed for Acute Viral Sinusitis (Overuse). Measure Q331 assesses patients with a diagnosis of acute viral sinusitis for receipt of antibiotics within 10 days of symptoms onset, highlighting inappropriate use of antibiotics in eligible patients. Measure Q331 is broader than measure Q332 as it encourages avoidance of prescribing any antibiotic for viral illnesses, capturing the patient populations found in both measures. Measure Q332 is narrower in scope, focusing only on patients with bacterial sinusitis appropriately receiving an antibiotic, impacting a smaller proportion of sinusitis cases.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Allergy/Immunology, Emergency Medicine, Family Medicine, Internal Medicine, Otolaryngology, Urgent Care

C.13 Total Knee or Hip Replacement: Shared Decision-Making: Trial of Conservative (Non-surgical) Therapy

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	350
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	Percentage of patients regardless of age undergoing a total knee or total hip replacement with documented shared decision-making with discussion of conservative (non-surgical) therapy (e.g., non-steroidal anti-inflammatory drug (NSAIDs), analgesics, weight loss, exercise, injections) prior to the procedure.
Measure Steward	American Association of Hip and Knee Surgeons
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because it is a process measure. Removing this process measure would support the goal of prioritizing measures that improve patient outcomes and have meaningful impact. Additionally, this measure is not prescriptive to conservative therapy utilization; therefore, it only assesses for informed consent, which is a standard of care for any clinician. In the CY 2019 (83 FR 59763 through 59765) and CY 2020 (84 FR 62957) PFS final rules, we communicated to interested parties our desire to reduce the number of process measures within the MIPS quality measure set. In the CY 2017 QPP final rule (81 FR 77101), we explained that outcome measures are more valuable than clinical process measures and are instrumental to improving the quality-of-care patients receive. In the CY 2025 PFS final rule (89 FR 98561), we codified under § 414.1330(c)(1)(vii) that CMS uses the following criteria to determine the removal of a quality measure: If the quality measure is a process measure.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Orthopedic Surgery

C.14 Children Who Have Dental Decay or Cavities

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	378
CMS eCQM ID:	CMS75v15
Collection Type:	eCQM
Measure Description:	Percentage of children, 1 - 20 years of age at the start of the measurement period, who have had tooth decay or cavities during the measurement period as determined by a dentist.
Measure Steward:	Centers for Medicare & Medicaid Services
Measure Type:	Outcome
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), due to the robustness of the measure. This measure lacks a quality action that can be attributed to the clinicians reporting it, and as a result, the current scoring methodology for determination of measure achievement points for this measure is not a reflection of the quality of care provided. This measure focuses on incidence of tooth decay or cavities rather than the quality of care delivered, as patients would be attributed to clinicians based on encounter and not whether they have been involved in the patient's care. Therefore, it would be likely they would have had no impact on the outcome being assessed. While tracking the incidence of tooth decay or cavities identifies the prevalence of the issue, it is not a reflection of the quality of care given, as currently specified, and does not promote meaningful dental care interventions that would drive improvements in oral health outcomes. The lack of an actionable quality assessment reduces the overall robustness of the measure.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Dentistry

C.15 Adult Primary Rhegmatogenous Retinal Detachment Surgery: No Return to the Operating Room Within 90 Days of Surgery

Category	Description
CBE # / eCQM CBE #:	N/A / N/A

Category	Description
Quality#:	384
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	Patients aged 18 years and older who had surgery for primary rhegmatogenous retinal detachment who did not require a return to the operating room within 90 days of surgery.
Measure Steward:	American Academy of Ophthalmology
Measure Type:	Outcome
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure has reached the end of the topped-out lifecycle (82 FR 53640) and has a limited opportunity to improve clinical outcomes. This measure's continued topped-out status is based on the current 2026 MIPS benchmarking data located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks*, in addition to previous years MIPS benchmarking data. For more information on benchmarks, see the MIPS 2026 Quality Benchmarks User Guide at *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3611/2026-Quality-Benchmarks-User-Guide.pdf.*
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Ophthalmology

C.16 Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 18 Years and Older

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	415
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	Percentage of emergency department visits for patients aged 18 years and older who presented with a minor blunt head trauma who had a head CT for trauma ordered by an emergency care provider who have an indication for a head CT.
Measure Steward:	American College of Emergency Physicians
Measure Type:	Efficiency
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because this measure has reached the end of the topped-out lifecycle (82 FR 53640) and has a limited opportunity to improve clinical outcomes. This measure's continued topped-out status is based on the current 2026 MIPS benchmarking data located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks*, in addition to previous years MIPS benchmarking data. For more information on benchmarks, see the MIPS 2026 Quality Benchmarks User Guide at *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3611/2026-Quality-Benchmarks-User-Guide.pdf.*
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Emergency Medicine

C.17 Prevention of Post-Operative Nausea and Vomiting (PONV) – Combination Therapy

Category	Description
CBE # / eCQM CBE #:	N/A /N/A
Quality#:	430
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	Percentage of patients, aged 18 years and older, who undergo a procedure under an inhalational general anesthetic, AND who have three or more risk factors for post-operative nausea and vomiting (PONV), who receive combination therapy consisting of at least two prophylactic pharmacologic antiemetic agents of different classes preoperatively and/or intraoperatively.
Measure Steward:	American Society of Anesthesiologists
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77675), because the quality action being measured has become a standard of care, based upon MIPS performance data, and thus has limited opportunity to improve clinical outcomes. The average performance for this measure, 99.34 percent, is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance rate is based on the current 2026 MIPS benchmarking data located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks.* For more information on benchmarks, see the MIPS 2026 Quality Benchmarks User Guide at *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3611/2026-Quality-Benchmarks-User-Guide.pdf.*
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Anesthesiology

C.18 Prevention of Post-Operative Vomiting (POV) – Combination Therapy (Pediatrics)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	463
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	Percentage of patients aged 3 through 17 years, who undergo a procedure under general anesthesia in which an inhalational anesthetic is used for maintenance AND who have two or more risk factors for post-operative vomiting (POV), who receive combination therapy consisting of at least two prophylactic pharmacologic anti-emetic agents of different classes preoperatively and/or intraoperatively.
Measure Steward:	American Society of Anesthesiologists
Measure Type:	Process
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2018 Quality Payment Program final rule (82 FR 53966 through 53975), because the quality action being measured has become a standard of care, based upon MIPS performance data, and thus has limited opportunity to improve clinical outcomes. The average performance for this measure, 98.99 percent, is extremely high and unvarying, making this measure extremely topped out as discussed in the CY 2019 PFS final rule (83 FR 59761 through 59763). The average performance rate is based on the current 2026 MIPS benchmarking data located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks.* For more information on benchmarks, see the MIPS 2026 Quality Benchmarks User Guide at *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3611/2026-Quality-Benchmarks-User-Guide.pdf.*
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Anesthesiology

C.19 Functional Status Change for Patients with Neck Impairments

Category	Description
CBE # / eCQM CBE #:	3461 / N/A
Quality#:	478
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	A patient-reported outcome measure (PROM) of risk-adjusted change in functional status (FS) for patients 14 years+ with neck impairments. The change in FS is assessed using the FOTO Neck FS PROM. The measure is adjusted to patient characteristics known to be associated with FS outcomes (risk-adjusted) and used as a performance measure at the patient, individual clinician, and clinic levels to assess quality.
Measure Steward:	Focus on Therapeutic Outcomes, Inc.
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2020 Quality Payment Program final rule (84 FR 63205 through 63213), because this measure is duplicative of the Functional Improvement for Patients with Neck Impairments measure being proposed in Table A.2 of this Appendix. Measure Q478 is specific to neck impairments and restricts clinicians to the use of the proprietary tool FOTO Neck FS PROM or a manual crosswalk for numerator assessment. The new measure proposed in Table A.2 of this Appendix is a more comprehensive patient-reported outcome-based performance measure. The new measure allows the use of various validated assessment tools, such as the Neck Disability Index, PROMIS Pain Interference, or equivalent tools. The new measure focuses on clinically meaningful outcomes by assessing improvement against the P-MCI, a patient-specific, risk-adjusted threshold. This measure incorporates a risk adjustment model that would improve feasibility of reporting as all information to calculate performance would be provided by the measure steward.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Chiropractic Medicine, Orthopedic Surgery, Physical Therapy/Occupational Therapy

C.20 Person-Centered Primary Care Measure Patient Reported Outcome Performance Measure (PCPCM PRO-PM)

Category	Description
CBE # / eCQM CBE #:	3568 / N/A
Quality#:	483
CMS eCQM ID:	N/A
Collection Type:	MIPS CQM
Measure Description:	The Person-Centered Primary Care Measure Patient Reported Outcome Performance Measure (PCPCM PRO-PM) uses the PCPCM Patient Reported Outcome Measure (PROM) a comprehensive and parsimonious set of 11 patient-reported items - to assess the broad scope of primary care. Unlike other primary care measures, the PCPCM PRO-PM measures the high value aspects of primary care based on a patient's relationship with the clinician or practice.
Measure Steward:	The American Board of Family Medicine
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale for Removal:	We are proposing the removal of this quality measure from MIPS, finalized in the CY 2020 Quality Payment Program final rule (84 FR 63205 through 63213), because the limited adoption of this quality measure does not allow for the creation of a benchmark after being in the program for two consecutive CY performance periods. For more information on benchmarks, see the MIPS 2026 Quality Benchmarks User Guide at *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3611/2026-Quality-Benchmarks-User-Guide.pdf*. The current 2026 MIPS benchmarking data is located at *https://qpp.cms.gov/reporting-requirements/measures-activities/benchmarks*.
In the Circumstance the Measure Is Retained:	There are no substantive changes proposed for this measure. If the measure is not finalized for removal in the CY 2027 PFS final rule, it would be added back into the applicable previously finalized specialty set(s) under Table Group B of this Appendix and the reason for its retention would be addressed under Table Group C of this Appendix.
Proposed for Removal from the Following Specialty Sets:	Family Medicine, Internal Medicine

Table Group D: Proposed Substantive Changes to Previously Finalized MIPS Quality Measures for the CY 2027 Performance Period/2029 MIPS Payment Year and Future Years

The D Tables within this proposed rule provide the substantive changes proposed for the MIPS quality measures for CY 2027. Two measures have proposed substantive changes that would result in a new benchmark. All measures with substantive changes

are discussed in detail in the tables below. In addition, measures that are endorsed by a CBE are shown in Table D of this Appendix as follows: CBE # / eCQM CBE #.

We note that some MIPS quality measures available in traditional MIPS and MVPs are adopted by the Medicare Shared Savings Program for utilization in the Alternative Payment Model (APM) Performance Pathway (APP), specifically the inclusion of such measures in the APP measure set and/or APP Plus measure set, as finalized in the CY 2025 PFS final rule (89 FR 98363 through 98371). For such measures, the collection types solely applicable for purposes of the APP measure set and/or APP Plus measure set (Medicare Clinical Quality Measures for Accountable Care Organizations (ACOs) Participating in the Medicare Shared Savings Program (Medicare CQMs) collection type and newly proposed Medicare Electronic Clinical Quality Measures for ACOs Participating in the Medicare Shared Savings Program (Medicare eCQMs) collection type as described in section IV.A.4.d.(1)(c)(v) of this proposed rule) are also specified as a collection type available for such relevant measures described in Table Group D.

Changes made to denominator code sets are generalizations of the revisions communicated from the measure stewards to CMS. Additionally, International Classification of Diseases Tenth Edition (ICD-10) and Current Procedural Terminology (CPT) codes that are identified as invalid for CY 2027 may not be identified within this proposed rule due to their later publication. Coding revisions to the denominator may be postponed until CY 2028, if measure steward review and their ability to implement the coding changes are impacted due to the timing of 2027 CPT and ICD-10 updates. The 2027 Quality Measure Release Notes provide a comprehensive, detailed reference of exact code changes to the denominators of the quality measures. The Quality Measure Release Notes are available for each of the collection types on the Quality Payment Program website at *https://qpp.cms.gov*.

In addition to the proposed substantive changes, there may be changes to the coding utilized within the denominator that are not considered substantive in nature, but they are important to communicate to interested parties. These changes align with the scope of the current coding; however, though not substantive in nature, these changes would expand or contract the measure's current eligible population. Therefore, please refer to the current year measure specification and the 2027 Quality Measure Release Notes or the eCQM Technical Release Notes once posted to review all coding changes to ensure correct implementation. Language has been added to all quality measure specifications in the form of a revised 'Instructions Note' to clearly identify if telehealth encounters are allowed for denominator eligibility regardless of changes in coding or billing practices that may occur. Eligibility of telehealth encounters would be based on the intent of the measure and those settings that are appropriate for inclusion.

The eCQM Technical Release Notes should also be carefully reviewed for revisions within the logic portion of the measure. In addition to the proposed substantive changes, there may be revisions within the logic that are not considered substantive in nature; however, it is important to review to ensure proper implementation of the measure. As not all systems and clinical workflows are the same, it is important to review these changes in the context of a specific system and/or clinical workflow for the most accurate implementation.

We request comments on these substantive changes.

D.1 Diabetes: Glycemic Status Assessment Greater Than 9%

Category	**Description**
CBE # / eCQM CBE #:	0059 / N/A
Quality#:	001
CMS eCQM ID:	CMS122v15
Current Collection Type:	Medicare Part B Claims Measure / eCQM / Medicare CQM / MIPS CQM
Current Measure Description:	Percentage of patients 18-75 years of age with diabetes who had a glycemic status assessment (hemoglobin A1c [HbA1c] or glucose management indicator [GMI]) > 9.0% during the measurement period.
Substantive Change:	**Modified collection type:** Medicare Part B Claims Measure, eCQM, Medicare CQM, MIPS CQM, Medicare eCQM collection types. **Updated logic: For the eCQM collection type: Revised:** to prioritize identifying numerical glycemic status results over null values.
Measure Steward:	National Committee for Quality Assurance
MIPS Core Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale:	We are proposing to update the logic of the eCQM collection type to ensure clinically meaningful data is prioritized for inclusion in the measure, better aligning with the measure intent. We are also proposing to update the collection types available for this measure to include the Medicare eCQM collection type to allow choice in submission method for Medicare Shared Savings Program ACOs reporting the APP Plus measure set. See section IV.A.4.d.(1)(c)(v) of this proposed rule for further information on the Medicare eCQM collection type.

D.2 Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	102
CMS eCQM ID:	CMS129v16
Current Collection Type:	eCQM / MIPS CQM
Current Measure Description:	Percentage of patients, regardless of age, with a diagnosis of prostate cancer at low (or very low) risk of recurrence receiving interstitial prostate brachytherapy, OR external beam radiotherapy to the prostate, OR radical prostatectomy who did not have a bone scan performed at any time since diagnosis of prostate cancer.
Substantive Change:	**Updated measure logic and logic definitions: For the eCQM collection type: Added:** Gleason Grade Group and anatomical site specificity for tumor staging. **Updated value set/coding: For the eCQM collection type: Added:** two direct reference codes representing Gleason Grade Group and value set 'Prostate Anatomical Site' (2.16.840.1.113762.1.4.1248.411). **Updated definition: For the MIPS CQM collection type**: **Added:** PET/CT, Ga-68 PSMA-11, F-18 flotufolastat PSMA PET/CT, PET/MRI (full body imaging) to 'Bone Scan'.
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	For the eCQM collection type, we are proposing the addition of Gleason Grade Group and anatomical site specificity for tumor staging to facilitate the capture of low or very low risk of prostate cancer. With this addition to the eCQM, we also propose revising the measure logic to include coding that would capture Gleason Grade Group as an option for assessing prostate cancer risk, as well as the addition of value set 'Prostate Anatomical Site,' which would ensure anatomical site specificity for tumor staging. For the MIPS CQM collection type, we are proposing the addition of PET/CT, Ga-68 PSMA-11, F-18 flotufolastat PSMA PET/CT imaging, and PET/MRI (full body imaging). By incorporating PET/CT, Ga-68 PSMA-11, F-18 flotufolastat PSMA PET/CT imaging, and PET/MRI (full body imaging) into the measure, to align with guideline-directed avoidance of advanced imaging related to low or very low risk prostate cancer.

D.3 Documentation of Current Medications in the Medical Record

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	130
CMS eCQM ID:	CMS68v16
Current Collection Type:	eCQM / MIPS CQM
Current Measure Description:	Percentage of visits for which the eligible clinician attests to documenting a list of current medications using all immediate resources available on the date of the encounter.
Substantive Change:	**Updated value set/coding**: **For the eCQM collection type: Revised:** Direct Reference Code (DRC) "Acute health crisis (finding)" (SNOMEDCT Code (705016005)) to value set 'Acute Health Crisis' (OID: 2.16.840.1.113762.1.4.1248.429) to allow for additional conditions to qualify for the exception. **Updated value set/coding**: **For the eCQM collection type: Revised:** 'Encounter to Document Medications' (2.16.840.1.113883.3.600.1.1609) to remove CPT code 99211 and add CPT code 92622 as outlined in the previous EKI.[470]
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to update the coding for the eCQM collection type to ensure the measure includes additional coding for the denominator exception, aligning with measure intent and allowing for mapping to equivalent appropriate clinical circumstances. Additionally, the encounter coding has been revised to ensure the appropriate patient population is being captured in the denominator for assessment.

[470] See eCQM Known Issue (EKI) #39 at https://oncprojectracking.healthit.gov/support/browse/EKI-39.

D.4 Preventive Care and Screening: Screening for Depression and Follow-Up Plan

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	134
CMS eCQM ID:	CMS2v16
Current Collection Type:	Medicare Part B Claims Measure / eCQM / Medicare CQM / MIPS CQM
Current Measure Description:	Percentage of patients aged 12 years and older screened for depression on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan is documented on the date of or up to two days after the date of the qualifying encounter.
Substantive Change:	**Modified collection type:** Medicare Part B Claims Measure, eCQM, Medicare CQM, MIPS CQM, Medicare eCQM collection types. **The measure description is revised to read: For the eCQM collection type:** Percentage of patients aged 12 years and older screened for depression on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan is documented from the date of the screening to two days after the date of the qualifying encounter or an active depression medication or active depression management intervention was active or prescribed at any time on the date of qualifying encounter. **Updated definition: For the eCQM collection type: Added:** Active Depression Medication or Active Depression Management Intervention Documentation that patient is actively receiving interventions designed to treat depression such as behavioral health evaluation, psychotherapy, pharmacological interventions, or additional treatment options. **Updated guidance: For the eCQM collection type: Added:** clarifying language on screening tool to be used for screening a 17-year-old, and which screening should be used to satisfy the numerator. **The measure numerator is revised to read: For the eCQM collection type:** Patients screened for depression on the date of the encounter or up to 14 days prior to the date of the encounter using an age-appropriate standardized depression screening tool AND if positive, a follow-up plan is documented from the date of the screening to two days after the date of the qualifying encounter or an active depression medication or active depression management intervention was active or prescribed at any time during the qualifying encounter. **Updated numerator definition: For the MIPS CQM, Medicare CQM, and the Medicare Part B Claims Measure collection types: Added:** Prior screening within performance period: Patient previously screened by another clinician using an age-appropriate standardized depression screening tool with documented results within the performance period AND if positive, a follow-up plan is documented. **Updated denominator exception: For the MIPS CQM, Medicare CQM, and the Medicare Part B Claims Measure collection types: Added:** Screening for depression not completed, previous patient screening with results documented within performance period.
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	For the eCQM collection type, we are proposing to expand the numerator so that an active depression medication or depression management intervention that is prescribed or in place at any time on the date of the qualifying encounter may meet the numerator quality action.[471] We propose to revise the language in the description, definitions, and numerator statement to reflect the proposed revision and align with measure logic. We are also proposing to clarify the screening tools that may be used to satisfy the measure for patients who are 17 years old at the start of the measurement period, as this age group may fall into a transitional category requiring unique considerations for tool selection. For the MIPS CQM, Medicare CQM, and Medicare Part B Claims Measure collection types, we are proposing to add a new denominator exception for patients with documentation of being previously screened, with a follow-up care plan documented if appropriate, in accordance with the measure requirements, by another clinician within the performance period to enhance team-based, coordinated, and patient-centered care processes between clinicians.[472]

[471] Zuckerbrot, R. A., Cheung, A., Jensen, P. S., Stein, R. E. K., Laraque, D., GLAD-PC Steering Group, Levitt, A., Birmaher, B., Campo, J., Clarke, G., Emslie, G., Kaufman, M., Kelleher, K. J., Kutcher, S., Malus, M., Sacks, D., Waslick, B., & Sarvet, B. (2018). Guidelines for Adolescent Depression in Primary Care (GLAD-PC): Part I. Practice Preparation, Identification, Assessment, and Initial Management. *Pediatrics*, *141*(3), e20174081. https://doi.org/10.1542/peds.2017-4081.

[472] Department of Veterans Affairs, & Department of Defense. (2022). VA/DoD Clinical Practice Guideline for the Management of Major Depressive Disorder (Version 4.0). https://www.healthquality.va.gov/guidelines/MH/mdd/VADODMDDCPGFinal508.pdf.

Category	Description
	We are also proposing to update the collection types available for this measure to include the Medicare eCQM collection type to allow choice in submission method for Medicare Shared Savings Program ACOs reporting the APP Plus measure set. See section IV.A.4.d.(1)(c)(v) of this proposed rule for further information on the Medicare eCQM collection type.

D.5 Primary Open-Angle Glaucoma (POAG): Reduction of Intraocular Pressure (IOP) by 20% OR Documentation of a Plan of Care

Category	Description
CBE # / eCQM CBE #:	0563 / N/A
Quality#:	141
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure / MIPS CQM
Current Measure Description:	Percentage of patients aged 18 years and older with a diagnosis of primary open-angle glaucoma (POAG) whose glaucoma treatment has not failed (the most recent IOP was reduced by at least 20% from the pre-intervention level) OR if the most recent IOP was not reduced by at least 20% from the pre-intervention level, a plan of care was documented within the 12 month performance period.
Substantive Change:	**Measure description revised to read: For all collection types:** Percentage of patients aged 18 years and older with a diagnosis of primary open-angle glaucoma (POAG) whose glaucoma treatment has not failed (the most recent IOP was reduced by at least 20% from the pre-intervention level) OR if the most recent IOP was not reduced by at least 20% from the pre-intervention level, a plan of care was documented within 7 days after the patient encounter when IOP was assessed. **Updated denominator exclusions: For all collection types: Added:** 1. Eyes with absolute glaucoma blindness 2. Pre-existing visual acuity findings include: Count fingers (CF or FC), Hand motion (HM), Light perception (LP), No light perception (NLP) **Updated numerator: For all collection types: Added:** a plan of care was documented within 7 days after the patient encounter when IOP was assessed. **Updated numerator definition**: **For all collection types: Revised:** definition for Plan of Care to include: The plan of care must be documented within 7 days after the patient encounter when IOP was assessed. **Updated numerator options: For all collection types: Revised:** **Performance Met:** Glaucoma plan of care documented within 7 days after the patient encounter when IOP was assessed
Measure Steward:	American Academy of Ophthalmology
MIPS Core Measure:	Yes
Measure Type:	Outcome
Rationale:	We are proposing to update multiple components of the measure for all collection types to align with the added numerator definition that specifies the timing of when the plan of care must be documented in the patient's medical record after the IOP is assessed. This would ensure timely and optimal patient care across clinicians for measure performance, as well as reduce variability in how the measure is applied. We are proposing to add denominator exclusions for patients with absolute glaucoma blindness or specific visual acuity findings because they represent end-stage clinical conditions characterized by absolute blindness or profound vision loss, in which further IOP reduction is unlikely to provide meaningful benefit in preserving visual function or slowing glaucoma progression. The exclusions would align with the intent of the measure to assess IOP management in support of preserving remaining visual function and limiting disease progression, and would refine the denominator to reflect patients who may reasonably benefit from vision-preserving IOP management and related care planning.[473]

[473] Kastner, A., & King, A. J. (2020). Advanced Glaucoma at Diagnosis: Current Perspectives. *Eye (London, England)*, *34*(1), 116–128. https://doi.org/10.1038/s41433-019-0637-2.

D.6 Oncology: Medical and Radiation - Plan of Care for Pain

Category	Description
CBE # / eCQM CBE #:	0383 / N/A
Quality#:	144
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of visits for patients, regardless of age, with a diagnosis of cancer currently receiving chemotherapy or radiation therapy who report having pain with a documented plan of care to address pain.
Substantive Change:	**Updated denominator note: For Submission Criteria 2: Added:** definition for lookback period in the instance a code has a billing date different from the face-to-face encounter.
Measure Steward:	American Society of Clinical Oncology
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to add a defined look-back window to identify the encounter at which the plan of care to address pain should be documented for numerator assessment. This would clarify implementation of the numerator assessment, which would ensure reporting is appropriate and consistent across clinician submissions. Addressing treatment-induced pain improves patients' health, quality of life, and long-term survival,[474] and reduces interruption in radiation therapy due to pain, thereby ensuring treatment compliance.

[474] Konopka-Filippow, M., Polityńska, B., Wojtukiewicz, A. M., & Wojtukiewicz, M. Z. (2025). Cancer Pain: Radiotherapy as a Double-Edged Sword. *International Journal of Molecular Sciences*, *26*(11), 5223. https://doi.org/10.3390/ijms26115223.

D.7 Coronary Artery Bypass Graft (CABG): Postoperative Renal Failure

Category	Description
CBE # / eCQM CBE #:	0114 / N/A
Quality#:	167
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients aged 18 years and older undergoing isolated coronary artery bypass graft (CABG) surgery (without pre-existing renal failure) who develop postoperative renal failure or require dialysis.
Substantive Change:	**Updated definitions: Added:** **Denominator:** **Baseline serum creatinine** – Most recent creatinine level obtained prior to the operating room entry **Numerator:** **Postoperative period** – Period begins upon operating room exit and continues to discharge from the hospital after cardiac surgery.
Measure Steward:	Society of Thoracic Surgeons
MIPS Core Measure:	No
Measure Type:	Outcome
Rationale:	We are proposing to add two definitions to clarify implementation of the denominator exclusion for documented history of baseline serum creatinine and the numerator assessment timeframe for patients who develop postoperative renal failure or require dialysis. The first definition (baseline serum creatinine) would ensure the denominator eligible patient population is appropriately identified, and the second definition (postoperative period) would clarify the numerator assessment timeframe. These additions would ensure appropriate and consistent implementation across clinician submissions.

D.8 Coronary Artery Bypass Graft (CABG): Surgical Re-Exploration

Category	Description
CBE # / eCQM CBE #:	0115 / N/A
Quality#:	168
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients aged 18 years and older undergoing isolated coronary artery bypass graft (CABG) surgery who require a return to the operating room (OR) for mediastinal bleeding with or without tamponade, unplanned coronary artery intervention (native vessel, graft or both), valve dysfunction, aortic reintervention or other cardiac reason during the current hospitalization.
Substantive Change:	**Updated definition: Added:** **Postoperative period** – Period for surgical re-exploration begins upon OR exit and continues to discharge from the hospital after cardiac surgery.
Measure Steward:	Society of Thoracic Surgeons
MIPS Core Measure:	No
Measure Type:	Outcome
Rationale:	We are proposing to add a definition of postoperative period to clarify the numerator assessment timeframe, which would ensure appropriate and consistent implementation across clinician submissions.

D.9 Tuberculosis Screening Prior to First Course of Biologic and/or Immune Response Modifier Therapy

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	176
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	If a patient has been newly prescribed a biologic and/or immune response modifier that includes a warning for potential reactivation of a latent infection, then the medical record should indicate TB testing in the preceding 12-month period.
Substantive Change:	**The measure numerator is revised to read:** Patients for whom any record of TB testing is documented or performed (PPD, Tspot or QuantiFERON-TB Gold Plus) in the medical record in the 12 months preceding the biologic and/or immune response modifier prescription.
Measure Steward:	American College of Rheumatology
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing changes to the measure numerator to clarify the appropriate tests for TB screening to meet the numerator quality action. This revision would ensure the intent of the measure was met and numerator compliance is consistently assessed across all clinician submissions.

D.10 Rheumatoid Arthritis (RA): Functional Status Assessment

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	178
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients aged 18 years and older with two or more diagnoses of rheumatoid arthritis (RA) at least 90 days apart for whom a functional status assessment was performed at least once during the performance period.
Substantive Change:	**The measure title is revised from Rheumatoid Arthritis (RA): Functional Status Assessment to:** Rheumatic Disease: Functional Status Assessment. **The measure description is revised to read:** Percentage of patients aged 18 years and older with two or more encounters with a diagnosis of rheumatoid arthritis (RA), psoriatic arthritis (PsA), or systemic lupus erythematosus (SLE) at least 90 days apart for whom a functional status assessment was performed at least once during the performance period. **Updated intent and clinical applicability: Revised:** to include PsA and SLE. **The measure denominator is revised to read:** Patients aged 18 years and older with two or more RA, PsA, or SLE diagnoses documented at least 90 days apart with at least one encounter with an RA, PsA, or SLE diagnosis occurring during the performance period and an additional encounter with an RA, PsA or SLE diagnosis occurring in the performance period or prior performance period. **Updated denominator criteria: Revised:** to include diagnosis coding for PsA and SLE. Added PsA and SLE to the additional encounter criteria. **Updated denominator definition: Revised:** definition for additional encounter to include PsA and SLE. **Updated numerator definition: Revised:** definition for functional status assessment to include PsA and SLE.
Measure Steward:	American College of Rheumatology
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to revise multiple components of this measure by adding psoriatic arthritis (PsA) or systemic lupus erythematosus (SLE) to ensure that all patients diagnosed with rheumatic disease are included in the measure's denominator. The addition of PsA and SLE to the RA measure improves the comprehensiveness of the measure, aligns with shared disease characteristics and treatment approaches, and ensures appropriate care across rheumatic diseases. In the event the proposed substantive change(s) are finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes. As such, if the performance data submitted meets the criteria for the creation of a performance period benchmark, a new benchmark would be used for scoring.

D.11 Cataracts: 20/40 or Better Visual Acuity within 90 Days Following Cataract Surgery

Category	Description
CBE # / eCQM CBE #:	0565 / 0565e
Quality#:	191
CMS eCQM ID:	CMS133v15
Current Collection Type:	eCQM / MIPS CQM
Current Measure Description:	Percentage of cataract surgeries for patients aged 18 years and older with a diagnosis of uncomplicated cataract and no significant ocular conditions impacting the visual outcome of surgery and had best-corrected visual acuity of 20/40 or better (distance or near) achieved in the operative eye within 90 days following the cataract surgery.
Substantive Change:	**Updated value set/coding**: **For the eCQM collection type: Updated:** to a single value set for significant ocular conditions denominator exclusion.
Measure Steward:	American Academy of Ophthalmology
MIPS Core Measure:	No
Measure Type:	Outcome
Rationale:	We are proposing to replace the individual condition specific value sets for the ocular conditions denominator exclusion with a single value set of significant ocular conditions to streamline implementation.

D.12 Controlling High Blood Pressure

Category	Description
CBE # / eCQM CBE #:	NA / N/A
Quality#:	236
CMS eCQM ID:	CMS165v15
Current Collection Type:	Medicare Part B Claims Measure / eCQM / Medicare CQM / MIPS CQM
Current Measure Description:	Percentage of patients 18-85 years of age who had a diagnosis of essential hypertension starting before and continuing into, or starting during the first six months of the measurement period, and whose most recent blood pressure was adequately controlled (<140/90mmHg) during the measurement period.
Substantive Change:	**Modified collection type:** Medicare Part B Claims Measure, eCQM, Medicare CQM, MIPS CQM, Medicare eCQM collection types.
Measure Steward:	National Committee for Quality Assurance
MIPS Core Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale:	We are proposing to update the collection types available for this measure to include the Medicare eCQM collection type to allow choice in submission method for Medicare Shared Savings Program ACOs reporting the APP Plus measure set. See section IV.A.4.d.(1)(c)(v) of this proposed rule for further information on the Medicare eCQM collection type.

D.13 Radical Prostatectomy Pathology Reporting

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	250
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure / MIPS CQM
Current Measure Description:	Percentage of radical prostatectomy pathology reports that include the pT category, the pN category, the Gleason score and a statement about margin status.
Substantive Change:	**Updated denominator exclusion**: **For all collection types: Removed:** Specimen site other than anatomic location of prostate. **Updated denominator exception: For all collection types: Added:** Specimen site other than anatomic location of prostate.
Measure Steward:	College of American Pathologists
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to move the denominator exclusion for "Specimen site other than anatomic location of prostate" to the numerator options as a denominator exception. Moving this criteria from a denominator exclusion to a denominator exception would allow for more automated capture of the relevant cases for the measure with less manual intervention required for measure reporting.

D.14 Dementia: Education and Support of Caregivers for Patients with Dementia

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	288
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients with dementia whose caregiver(s) were provided with education on dementia disease management and health behavior changes AND were referred to additional resources for support in the last 12 months.
Substantive Change:	**The measure description is revised to read:** Percentage of patients with dementia whose caregiver(s), who are not part of the licensed care team, were provided with education on dementia disease management and health behavior changes AND were referred to additional resources for support in the last 12 months. **Updated intent and clinician applicability: Added:** whose caregiver(s), who are not part of the licensed care team, were provided with education on dementia disease. **The measure numerator is revised to read:** Patients with dementia whose caregiver(s), who are not part of the licensed care team, were provided with education on dementia disease management and health behavior changes AND were referred to additional resources for support in the last 12 months.
Measure Steward:	American Academy of Neurology
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to update multiple components of this measure to clarify that the education and support required as part of the numerator quality action is intended for caregivers who are not part of the licensed clinical care team. Consistent with the measure's intent, educating caregivers that are not part of the licensed care team recognizes their essential role in patient care, improves patient-centered care outcomes, enhances caregiver well-being, and strengthens the overall continuity of care across both formal and informal settings.

D.15 Assessment of Cognitive Impairment or Dysfunction for Patients with Parkinson's Disease

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	291
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of all patients with a diagnosis of Parkinson's Disease (PD) who were assessed for cognitive impairment or dysfunction once during the measurement period.
Substantive Change:	**Updated denominator criteria: Added:** coding for physical therapy.
Measure Steward:	American Academy of Neurology
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to add physical therapy coding as part of the denominator criteria for this measure as it is clinically appropriate for this clinician type to assess patients with a diagnosis of PD for cognitive impairment or dysfunction. Physical therapists play a critical role in identifying functional limitations linked to cognitive decline and tailoring interventions accordingly. These codes recognize that cognitive dysfunction significantly influences physical function and safety, and they integrate the expertise of physical therapists into the multidisciplinary care of PD.

D.16 Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	317
CMS eCQM ID:	CMS22v15
Current Collection Type:	Medicare Part B Claims Measure / eCQM / MIPS CQM
Current Measure Description:	Percentage of patient visits for patients aged 18 years and older seen during the measurement period who were screened for high blood pressure AND a recommended follow-up plan is documented, as indicated, if blood pressure is elevated or hypertensive.
Substantive Change:	**Updated denominator criteria: For all collection types: Added:** coding for physical and occupational therapy.
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to update the denominator criteria to include coding for physical and occupational therapy (PT/OT) as it is clinically appropriate for these clinician types to assess for high blood pressure. By adding PT/OT professionals in this measure, healthcare organizations can help ensure a more inclusive, proactive, and effective approach to managing cardiovascular health in patients aged 18 and older, while also capitalizing on all patient touchpoints to achieve comprehensive wellness and improved health outcomes.

D.17 Maternity Care: Postpartum Follow-up and Care Coordination

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	336
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients, regardless of age, who gave birth during a 12-month period who were seen for postpartum care before or at 12 weeks of giving birth and received the following at a postpartum visit: breastfeeding evaluation and education, postpartum depression screening, intimate partner violence screening, postpartum glucose screening for gestational diabetes patients, family and contraceptive planning counseling, tobacco use screening and cessation education, healthy lifestyle behavioral advice, and an immunization review and update.
Substantive Change:	**The measure numerator is revised to read:** Patients receiving the following at a postpartum visit: • Evaluating the physical recovery from birth, including pain and incontinence • Evaluating and counseling for sleep hygiene and fatigue • Breastfeeding evaluation and education, including patient-reported breastfeeding • Postpartum depression and anxiety screening • Intimate partner violence screening • Postpartum glucose screening for gestational diabetes patients • Family and contraceptive planning counseling, including same-day placement of a long-acting reversible contraceptive (LARC) if desired • Tobacco use screening and cessation education • Substance use disorder /opioid use disorder screening • Physical activity and exercise counseling • Immunization review and update **Updated definitions: Added:** **Evaluating Physical Recovery From Birth –** Patients who were evaluated for physical recovery from birth, including pain and incontinence, with referral as indicated (e.g., to physical therapy, urogynecology). **Evaluating and Counseling for Sleep Hygiene and Fatigue –** Patients were evaluated for sleep hygiene and fatigue and clinicians discussed coping options for fatigue and sleep disruption. **Substance Use Disorder/Opioid Use Disorder Screening –** Patients were screened for substance use/opioid use and referred to postpartum psychosocial support services, including substance use disorder treatment and relapse prevention programs. **Revised:** **Physical Activity and Exercise Counseling –** Patients with uncomplicated pregnancies who were encouraged to undertake regular physical activity and/or to engage in aerobic and strength-conditioning exercises (of any intensity) after pregnancy, as part of efforts to recommend and reinforce a healthy lifestyle. **Postpartum Depression and Anxiety Screening –** added anxiety screening via a self-reported validated anxiety tool. **Updated Numerator Instructions: Revised:** to include evaluating for physical recovery from birth, including pain and incontinence; evaluating and counseling for sleep hygiene and fatigue; postpartum anxiety screening; same-day placement of a long-acting reversible contraceptive (LARC) if desired; substance use disorder /opioid use disorder screening; and physical activity and exercise counseling..
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to revise the measure numerator by adding evaluations for physical recovery from birth, including pain and incontinence; evaluations and counseling for sleep hygiene and fatigue; postpartum anxiety screening; same-day placement of a long-acting reversible contraceptive (LARC) if desired; substance use disorder /opioid use disorder screening; and physical activity and exercise counseling as recommended by The American College of Obstetricians and Gynecologists (ACOG).[475] The additional evaluations provide significant added value to postpartum care by addressing broader aspects of maternal health that may impact recovery, well-being, and long-term outcomes. Additionally, we are proposing to reflect this revision in the definitions and numerator instructions sections of the measure to ensure appropriate assessment of quality actions and consistent implementation across clinician submissions.

D.18 Closing the Referral Loop: Receipt of Specialist Report

Category	Description
CBE # / eCQM CBE #:	N/A / N/A

[475] American College of Obstetricians and Gynecologists. (2018). ACOG Committee Opinion No. 736: Optimizing Postpartum Care. *Obstetrics & Gynecology, 131*(5), e140–e150. https://doi.org/10.1097/AOG.0000000000002633.

Category	Description
Quality#:	374
CMS eCQM ID:	CMS50v15
Current Collection Type:	eCQM / MIPS CQM
Current Measure Description:	Percentage of patients with referrals, regardless of age, for which the referring clinician receives a report from the clinician to whom the patient was referred.
Substantive Change:	**Updated guidance: For the eCQM collection type: Added:** If two or more referrals have the same date/time stamp and are captured in the denominator as "first" referral, a consultant report for any of these "first" referrals will qualify the patient for the numerator. **Updated denominator criteria: For all collection types: Added:** coding for audiology visits. **Updated logic: For the eCQM collection type: Revised:** numerator logic to capture the 'first referral' when multiple instances of a "first referral" with the same date/time stamp are present.
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to update the denominator criteria to include audiology visits as this measure is applicable to their scope of care. By including audiology visits in the measure, it would ensure that referrals made by audiologists are tracked, especially as specialization continues to increase in the provision of patient care, facilitating better coordination of care. Additionally, we are proposing to update the measure guidance and logic for the eCQM collection type to clarify implementation when multiple referrals are received and ensure the logic is aligned. This would ensure consistent reporting across clinician submitters.

D.19 Adherence to Antipsychotic Medications For Individuals with Schizophrenia

Category	Description
CBE # / eCQM CBE #:	1879 / N/A
Quality#:	383
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of individuals at least 18 years of age as of the beginning of the performance period with schizophrenia or schizoaffective disorder who had at least two prescriptions filled for any antipsychotic medication and who had a Proportion of Days Covered (PDC) of at least 0.8 for antipsychotic medications during the performance period.
Substantive Change:	**Updated denominator: Revised:** (Table 1) added oral antipsychotic medications: - pimavanserin - pimozide - olanzapine-fluoxetine - xanomeline-tropisum chloride
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale:	We are proposing to update the list of medications used to identify denominator eligible patients by adding four oral antipsychotic medications to the existing list in the denominator. This expansion would provide an up-to-date list of appropriate oral antipsychotic medications that clinicians may have prescribed for their patients, thereby ensuring that as many of the appropriate patients are identified in the denominator of this measure as possible.

D.20 Cardiac Tamponade and/or Pericardiocentesis Following Atrial Fibrillation Ablation

Category	Description
CBE # / eCQM CBE #:	2474 / N/A
Quality#:	392
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Rate of cardiac tamponade and/or pericardiocentesis following atrial fibrillation ablation. This measure is submitted as four rates stratified by age and sex. • Submission Age Criteria 1: Females 18-64 years of age • Submission Age Criteria 2: Males 18-64 years of age • Submission Age Criteria 3: Females 65 years of age and older • Submission Age Criteria 4: Males 65 years of age and older
Substantive Change:	**Updated reporting frequency and implementation considerations: Revised:** measure is to be submitted each time a denominator eligible procedure is performed.
Measure Steward:	American College of Cardiology Foundation
MIPS Core Measure:	No
Measure Type:	Outcome
Rationale:	We are proposing to update the measure submission frequency to each time a denominator eligible procedure is performed as cardiac tamponade is a life-threatening emergency.[476] Requiring this measure to be submitted for each procedure would ensure MIPS eligible clinicians are monitoring and assessing patients for all instances of cardiac tamponade and/or pericardiocentesis occurring within 30 days following atrial fibrillation ablation, as well as adhering to evidence-based practices, which will improve clinical outcomes for patients. This change reflects a transition towards higher standards of care, increased accountability, and greater alignment with the goals of modern healthcare delivery systems.

[476] Khan Z. (2023). Cardiac Tamponade During Catheter Atrial Fibrillation Ablation: A Life-Threatening Complication. *Cureus*, *15*(9), e44989. https://doi.org/10.7759/cureus.44989.

D.21 Infection within 180 Days of Cardiac Implantable Electronic Device (CIED) Implantation, Replacement, or Revision

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	393
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Infection rate following CIED device implantation, replacement, or revision.
Substantive Change:	**Updated reporting frequency and implementation considerations: Revised:** measure is to be submitted each time a denominator eligible procedure is performed. **The measure denominator is revised to read:** **For Submission Criteria 1:** All patients with a new CIED from January July 1, 2026, through June 30, 2027, of the performance period. **For Submission Criteria 2:** All patients with replacement or revision of a CIED from July 1, 2026, through June 30, 2027, of the performance period. **Updated denominator definition: Added:** Denominator Identification Period – The twelve month period in which eligible patients have a procedure. The "denominator identification period" includes dates of procedure 7/1/2026 to 6/30/2027.
Measure Steward:	American College of Cardiology Foundation
MIPS Core Measure:	No
Measure Type:	Outcome
Rationale:	We are proposing to update the measure submission frequency to each time a denominator eligible procedure is performed as infections resulting from implantable cardiac devices are associated with substantial morbidity. Requiring this measure to be submitted for each procedure would ensure MIPS eligible clinicians are monitoring and assessing patients for all instances of an infection requiring device removal or surgical revision within 180 days following CIED implantation, replacement, or revision, as well as adhering to evidence-based practices, which will improve clinical outcomes for patient. This change reflects a transition towards higher standards of care, increased accountability, and greater alignment with the goals of modern healthcare delivery systems.[477] We are also proposing to lengthen the denominator identification period from July of the previous year through June of the measurement period to allow for a full year of denominator eligibility, ensuring the denominator eligible patient population being assessed for the numerator action is complete.

[477] Lakkireddy, D. R., Rao, A., Theriot, P., Darden, D., Pothineni, N. V. K., Ram, R., Gao, Y. R., Cheung, J. W., & Birgersdotter-Green, U. (2023). Contemporary Management of Cardiac Implantable Electronic Device Infection: The American College of Cardiology COGNITO Survey. *JACC. Advances*, *3*(2), 100773. https://doi.org/10.1016/j.jacadv.2023.100773.

D.22 Lung Cancer Reporting (Biopsy/Cytology Specimens)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	395
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure / MIPS CQM
Current Measure Description:	Pathology reports based on lung biopsy and/or cytology specimens with a diagnosis of primary non-small cell lung cancer classified into specific histologic type following the International Association for the Study of Lung Cancer (IASLC) guidance or classified as non-small cell lung cancer not otherwise specified (NSCLC-NOS) with an explanation included in the pathology report.
Substantive Change:	**Updated denominator exclusion: For all collection types: Removed:** Specimen site other than anatomic location of lung or is not classified as primary non-small cell lung cancer. **Updated denominator exception: For all collection types: Added:** Specimen site other than anatomic location of lung or is not classified as primary non-small cell lung cancer.
Measure Steward:	College of American Pathologists
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to move the denominator exclusion for "specimen site other than anatomic location of lung or is not classified as primary non-small cell lung cancer" to the numerator options as a denominator exception. Moving this criteria from a denominator exclusion to a denominator exception would allow for more automated capture of the relevant cases for the measure with less manual intervention required for measure reporting.

D.23 Lung Cancer Reporting (Resection Specimens)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	396
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure / MIPS CQM
Current Measure Description:	Pathology reports based on lung resection specimens with a diagnosis of primary lung carcinoma that include the pT category, pN category and for non-small cell lung cancer (NSCLC), histologic type.
Substantive Change:	**Updated denominator exclusion: For all collection types: Removed:** Specimen site other than anatomic location of lung OR classified as non-small cell lung cancer, not otherwise specified (NSCLC-NOS). **Updated denominator exception: For all collection types: Added:** Specimen site other than anatomic location of lung OR classified as NSCLC-NOS.
Measure Steward:	College of American Pathologists
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to move the denominator exclusion for "Specimen site other than anatomic location of lung OR classified as NSCLC-NOS" to the numerator options as a denominator exception. Moving this criteria from a denominator exclusion to a denominator exception would allow for more automated capture of the relevant cases for the measure with less manual intervention required for measure reporting.

D.24 Melanoma Reporting

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	397
CMS eCQM ID:	N/A
Current Collection Type:	Medicare Part B Claims Measure / MIPS CQM
Current Measure Description:	Pathology reports for primary malignant cutaneous melanoma that include the pT category, thickness, ulceration and mitotic rate, peripheral and deep margin status and presence or absence of microsatellitosis for invasive tumors.
Substantive Change:	**The measure description is revised to read**: **For all collection types:** Pathology reports for primary malignant cutaneous melanoma that include the thickness, ulceration and mitotic rate, peripheral and deep margin status and presence or absence of microsatellitosis for invasive tumors, and for excisions, pT category. **Updated intent and applicability: For all collection types: Revised:** to clarify pT category reporting is only required for excisions. **Updated denominator instructions: For the MIPS CQM collection type: Removed**: instructions moved to the numerator. **Updated denominator exclusion: For all collection types: Removed:** Specimen site other than anatomic cutaneous location. **The measure numerator is revised to read: For all collection types:** Pathology reports for primary malignant cutaneous melanoma that include the thickness, ulceration and mitotic rate, peripheral and deep margin status and presence or absence of microsatellitosis for invasive tumors, and in excisions, pT Category. **Updated numerator instructions: For all collection types: Revised:** to clarify pT category reporting is only required for excisions. **Updated numerator options: For all collection types: Revised:** to clarify pT category reporting is only required for excisions. **Updated denominator exception: For all collection types: Added:** Specimen site other than anatomic cutaneous location.
Measure Steward:	College of American Pathologists
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to revise multiple components of the measure to align with the College of American Pathologists 2025 Protocols[478] [479] and improve the quality of care for melanoma patients by mandating the inclusion of specific, evidence-based pathological parameters in all reports. We are specifically requiring pT category reporting for excisions only. By standardizing and ensuring completeness in pathology reporting, clinicians would significantly enhance diagnostic accuracy, treatment planning, and patient outcomes. Additionally, we are proposing to move the denominator exclusion for "Specimen site other than anatomic cutaneous location" to the numerator options as a denominator exception. Moving this criteria from a denominator exclusion to a denominator exception would allow for more automated capture of the relevant cases for the measure with less manual intervention required for measure reporting.

[479] College of American Pathologists. (2025). Protocol for the Examination of Biopsy Specimens from Patients with Invasive Melanoma of the Skin. https://documents.cap.org/documents/New-Cancer-Protocols-March-2025/Skin.Inv_Melanoma.Bx_1.1.0.0.REL.CAPCP.pdf.

D.25 Optimal Asthma Control

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	398
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Composite measure of the percentage of pediatric and adult patients whose asthma is well-controlled as demonstrated by one of three age appropriate patient reported outcome tools and not at risk for exacerbation.
Substantive Change:	**Updated numerator and component options: For Submission Criteria 1: Component 1: Removed:** Asthma control Questionnaire (ACQ) **Added:** Asthma Impairment and Risk Questionnaire (AIRQ) and Pediatric Asthma Impairment and Risk Questionnaire (Peds-AIRQ) **Updated numerator note: For Submission Criteria 1: Component 2: Revised:** to base exacerbation on one of two methods. **Added:** Method 2: Asthma Impairment and Risk Questionnaire (AIRQ) result of 0 or 1 – ages 12 and older Pediatric Asthma Impairment and Risk Questionnaire (Peds-AIRQ) result of 0 or 1 – ages 5 – 11 **Updated component options: For Submission Criteria 1: Component 2: Added:** **Performance Met:** Not at elevated risk of exacerbation based on AIRQ or Peds-AIRQ score and results documented **Performance Not Met:** At elevated risk of exacerbation based on AIRQ or Peds-AIRQ score and results documented OR specified asthma control tool not used, reason not given **Updated numerator and component options: For Submission Criteria 2: Component 1: Removed:** Asthma control Questionnaire (ACQ) **Added:** Asthma Impairment and Risk Questionnaire (AIRQ) **Updated numerator note: For Submission Criteria 2: Component 2: Revised:** to base exacerbation on one of two methods. **Added:** Method 2: Asthma Impairment and Risk Questionnaire (AIRQ) result of 0 or 1 – ages 12 and older **Updated component options: For Submission Criteria 2: Component 2: Added:** **Performance Met:** Not at elevated risk of exacerbation based on AIRQ score and results documented **Performance Not Met:** At elevated risk of exacerbation based on AIRQ score and results documented OR specified asthma control tool not used, reason not given
Measure Steward:	Minnesota Community Measurement
MIPS Core Measure:	Yes
Measure Type:	Outcome
Rationale:	We are proposing to remove ACQ tools from the list of acceptable patient-reported outcome tools for all submission criteria. We are proposing to add the AIRQ (both submission criteria) and Peds-AIRQ (Submission Criteria 1 only) tools for COMPONENT 1: Asthma well-controlled. Additionally, we are proposing to add the AIRQ (both submission criteria) and Peds-AIRQ (Submission Criteria 1 only) tools as a second method for determining exacerbation risk for COMPONENT 2: Patient not at elevated risk of exacerbation. These changes would ensure that the tools used are better suited to current evidence-based practices for asthma management.[480] The AIRQ and Peds-AIRQ tools support the shift toward standardization, accuracy, and relevance in clinical decision-making.[481]

D.26 Statin Therapy for the Prevention and Treatment of Cardiovascular Disease

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	438
CMS eCQM ID:	CMS347v10
Current Collection Type:	eCQM / MIPS CQM
Current Measure Description:	Percentage of the following patients - all considered at high risk of cardiovascular events - who were prescribed or were on statin therapy during the performance period: • All patients who were previously diagnosed with or currently have a diagnosis of clinical atherosclerotic cardiovascular disease (ASCVD), including an ASCVD procedure; OR • Patients aged 20 to 75 years who have ever had a low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL or were previously diagnosed with or currently have an active diagnosis of familial hypercholesterolemia; OR • Patients aged 40 to 75 years with a diagnosis of diabetes; OR • Patients aged 40 to 75 with a 10-year ASCVD risk score of ≥ 20 percent.
Substantive Change:	**The measure description is revised to read: For all collection types:** Percentage of the following patients - all considered at high risk of cardiovascular events - who were prescribed or were on statin therapy during the performance period: • Patients ≥18 years of age who were previously diagnosed with or currently have a diagnosis of clinical atherosclerotic cardiovascular disease (ASCVD), including an ASCVD procedure; OR • Patients aged 20 to 75 years who have ever had a low-density lipoprotein cholesterol (LDL-C) level ≥ 190 mg/dL or were previously diagnosed with or currently have an active diagnosis of familial hypercholesterolemia; OR • Patients aged 40 to 75 years with a diagnosis of diabetes; OR • Patients aged 40 to 75 with a 10-year ASCVD risk score of ≥ 20 percent. **Updated rate aggregation: For eCQM collection type: Revised: For Population 1:** Patients greater than or equal to 18 years of age at the beginning of the measurement period were previously diagnosed with or currently have a diagnosis of clinical ASCVD, including an ASCVD procedure before the end of the measurement period. **Updated measure strata and performance rates: For MIPS CQM collection type: Revised: For Submission Criteria 1**: Patients ≥ 18 years of age at the beginning of the performance period and reporting timeframe for diagnosis of clinical ASCVD, including ASCVD procedure. **Updated guidance: For the eCQM collection type: Revised:** age for initial patient population 1 to greater than or equal to 18 years. **Updated initial patient population: For the eCQM collection type: Revised: For population 1:** age greater than or equal to 18 years. **The measure denominator is revised to read: For the MIPS CQM collection type: For Submission Criteria 1:** Patients ≥18 years of age who were previously diagnosed with or currently have a diagnosis of clinical ASCVD, including an ASCVD procedure. **Updated denominator criteria: For the MIPS CQM collection type:** **Revised: For Submission Criteria 1:** age ≥ 18 years at the beginning of the performance period and reporting timeframe for diagnosis of clinical ASCVD, including ASCVD procedure. **Removed**: **For Submission Criteria 3:** presymptomatic diabetes codes. **Updated denominator exclusion: For all collection types: Added: For all Submission Criteria:** Patients who are pregnant at any time during the performance period.
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to revise Patient Population 1 / Submission Criteria 1 for the eCQM and MIPS CQM collection types, to include patients 18 years of age and older who were previously diagnosed with or currently have a diagnosis of clinical ASCVD, including an ASCVD procedure before the end of the performance period to align with the intent of the measure and current guidelines for adults.[482] [483] In addition, we are proposing to

[482] de Ferranti, S. D., Steinberger, J., Ameduri, R., Baker, A., Gooding, H., Kelly, A. S., Mietus-Snyder, M., et al. (2019). Cardiovascular Risk Reduction in High-Risk Pediatric Patients: A Scientific Statement From the American Heart Association. *Circulation, 139*(13). https://doi.org/10.1161/CIR.0000000000000618.

Category	Description
	update the rate aggregation and guidance for the eCQM collection type to align with the updated Patient Population 1. For the MIPS CQM collection type, we are updating the denominator criteria for Submission Criteria 1 with the updated age criteria. These updates aim to refine the population targeted by the measure and enhance alignment with clinical guidelines.[484] Additionally, we are proposing to remove patients with presymptomatic diabetes from the denominator of Patient Population 3 / Submission Criteria 3 to focus on patients with established clinical diagnoses rather than those at risk or presymptomatic. Evidence suggests that use of statins may increase the risk of progression of prediabetes to type 2 diabetes.[485] Excluding these patients from Submission Criteria 3 would allow clinicians to use their clinical judgement and appropriately prescribe statin therapy to those patients who would benefit most without affecting their performance on the measure. We are also proposing to add patients who are pregnant to the denominator exclusions, for all collection types, to align with current recommendations. It is recommended that patients stop statin therapy as soon as pregnancy is discovered.[486] Excluding pregnant patients would allow clinicians to align with evidence-based practices, ensuring safe and appropriate care for this patient population, without affecting their performance on the measure. We are proposing to revise the measure description for all collection types, to improve the clarity, clinical utility, and applicability of the measure by explicitly defining high-risk patient populations. These enhancements aim to ensure more accurate identification of eligible patients, assess appropriate use of statin therapy, and ultimately drive improvements in cardiovascular health outcomes.

Clinical Practice Guidelines. *Journal of the American College of Cardiology*, 0(0). https://doi.org/10.1016/j.jacc.2025.11.016.

D.27 Skin Cancer: Biopsy Reporting Time – Pathologist to Clinician

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	440
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of biopsies with a diagnosis of cutaneous basal cell carcinoma (BCC) and squamous cell carcinoma (SCC), or melanoma (including in situ disease) in which the pathologist communicates results to the clinician within 7 days from the time when the tissue specimen was received by the pathologist.
Substantive Change:	**The measure description is revised to read:** Percentage of biopsies with a diagnosis of cutaneous basal cell carcinoma (BCC) and squamous cell carcinoma (SCC), or melanoma (including in situ disease) in which the pathologist communicates results to the clinician within 5 business days from the time when the tissue specimen was received by the pathologist. **The measure numerator is revised to read:** Number of final pathology reports diagnosing cutaneous basal cell carcinoma or squamous cell carcinoma or melanoma (to include in situ disease) sent from the Pathologist/Dermatopathologist to the biopsying clinician for review within 5 business days from the time when the tissue specimen was received by the pathologist. **Updated the numerator option**: **Revised:** to within 5 business days.
Measure Steward:	American Academy of Dermatology
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to revise multiple components of this measure to clarify the timing of when a pathologist must communicate the results to the biopsying clinician. Reporting the results within 5 business days would enable clinicians to make timely decisions regarding patient management, scheduling surgeries or therapies, and planning follow-up consultations.

D.28 Ischemic Vascular Disease (IVD) All or None Outcome Measure (Optimal Control)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	441
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	The IVD All-or-None Measure is one outcome measure (optimal control). The measure contains four goals. All four goals within a measure must be reached in order to meet that measure. The numerator for the all-or-none measure should be collected from the organization's total IVD denominator. All-or-None Outcome Measure (Optimal Control) - Using the IVD denominator optimal results include: • Most recent blood pressure (BP) measurement is less than or equal to 130/80 mm Hg -- AND • Most recent tobacco status is Tobacco Free -- AND • Daily Aspirin or Other Antiplatelet Unless Contraindicated – AND • High Intensity Statin Use Unless Contraindicated
Substantive Change:	**Updated the measure strata and performance rates: Revised:** a patient will only be included in Submission Criteria 2 of the measure if they meet the denominator criteria for both Submission Criteria 1 and Submission Criteria 2.
Measure Steward:	Wisconsin Collaborative for Healthcare Quality
MIPS Core Measure:	Yes
Measure Type:	Intermediate Outcome
Rationale:	We are proposing to revise the measure strata and performance rates to clarify how to handle scenarios in which the patient meets denominator criteria for both Submission Criteria 1 and Submission Criteria 2. This change would ensure consistency in the abstraction of the measure's elements that support rigorous data for the calculation of MIPS performance rates.

D.29 Percentage of Patients Who Died from Cancer Receiving Systemic Cancer-Directed Therapy in the Last 14 Days of Life (lower score – better)

Category	Description
CBE # / eCQM CBE #:	0210 / N/A
Quality#:	453
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients who died from cancer receiving systemic cancer-directed therapy in the last 14 days of life.
Substantive Change:	**The measure title is revised from 'Percentage of Patients who Died from Cancer Receiving Systemic Cancer-Directed Therapy in the Last 14 Days of Life (lower score – better)' to:** Percentage of Patients who Died with Cancer Receiving Systemic Cancer-Directed Therapy in the Last 14 Days of Life (lower score – better) **The measure description is revised to read:** Percentage of patients, aged 18 years and older, who died with cancer receiving systemic cancer-directed therapy in the last 14 days of life. **Updated intent and clinician applicability: Revised:** patients aged 18 years and older. **Updated Implementation Considerations: Revised:** Measure type revised to Intermediate Outcome. **Updated denominator note: Revised:** The patient must have two encounters during the performance period and both eligible encounters must include a diagnosis of cancer. **The measure denominator is revised to read:** Patients, aged 18 years and older, who died with cancer. **Updated denominator criteria:** **Revised:** Patients aged ≥ 18 years and Diagnosis for cancer during the encounter. **Added:** Patients who died during performance period. **Removed:** Patients who died from cancer. **Updated denominator exclusion: Added:** Patients given hydroxyurea or bruton tyrosine kinase (BTK) inhibitors. **Updated numerator definition: Revised:** **Systemic Cancer-directed Therapy** – Includes: ▪ Cytotoxic chemotherapy ▪ Drugs and biologics which activate or inhibit the hallmarks of cancer (e.g., kinase inhibitors) ▪ Antineoplastic Agents • Alkylating agents (id: L01A) • Antimetabolites (id: L01B) • Cytotoxic antibiotics and related substances (id: L01D) • Monoclonal antibodies and antibody drug conjugates (id: L01F) • Other antineoplastic agents (id: L01X) • Plant alkaloids and other natural products (id: L01C) • Protein kinase inhibitors (id: L01E) o Exclude: Cyclin-dependent kinase (CDK) inhibitors (id: L01EF) ▪ Immunostimulants (Includes only those that apply to cancer) • Interferons (id: L03AB) o Include only: interferon alfa-2b, ropeginterferon alfa-2b, and ropeginterferon alfa-2b-njft • Interleukins (id: L03AC) o Include only: aldesleukin • Other immunostimulants (id: L03AX) o Include only: sipuleucel-T ▪ Immunosuppressants (Includes only those that apply to cancer) • Selective immunosuppressants (id: L04AA) o Include only: alemtuzumab, everolimus, and sirolimus • Other immunosuppressants (id: L04AX) o Include only: lenalidomide, pomalidomide, and thalidomide Excludes: • Hormones and hormone antagonists • Red Blood Cell (RBC) growth factors used to treat chemotherapy-induced anemia • White Blood Cell (WBC) growth factors used to treat chemotherapy-induced neutropenia • Bisphosphonates and biologics used to treat osteopenia or osteoporosis • Antiemetics and antinauseants • Pain medications Example: Drugs and biologics under the World Health Organization's (WHO) Anatomical Therapeutic Chemical (ATC) classification "Antineoplastic Agents" and select "Immunostimulants" and "Immunosuppressants".

Category	Description
	"Antineoplastic and Immunomodulating Agents" Drug Classes and Identifiers: Note: To find the drug members under each class, go to https://mor.nlm.nih.gov/RxClass/ and enter the class name or ID on the "Search" field of the RxClass browser. **Updated numerator instructions: Added:** • Receipt of systemic cancer-directed therapy in the last 14 days of life can be calculated as follows: • (Date of death minus Most Recent Systemic cancer-directed therapy Administration Date or Date Filled) < 14 days. **Updated numerator note: Added:** The measure includes intramuscular, intravenous, oral, and subcutaneous routes of administration of systemic cancer-directed therapy. Oral systemic cancer-directed therapy is oral prescription of extension of same oral drug or prescription of new oral drug. The measure is limited to medications approved by the United States Food and Drug Administration (FDA). Patients that are given bridging chemotherapy and other cancer-directed therapies while awaiting transplant or chimeric antigen receptor T-cell therapy (CAR T-cell therapy) should be reported as a denominator exception. For patients given Hydroxyurea and bruton tyrosine kinase (BTK) inhibitors, it may be inappropriate to withdraw at the end of life and/or are used for palliative purposes. For the purposes of reporting this inverse quality measure, this scenario is considered "performance not met" only in the absence of other systemic therapies. **Updated denominator exception: Added:** Patient received systemic cancer-directed therapy due to 1) receipt or in process of receipt of bone marrow or peripheral blood stem cell transplant (transplant status) in the last 60 days of life, or 2) receipt or in process of receipt of CAR T-cell therapy in the last 60 days of life. **Updated numerator options: Added:** **Performance Not Met:** Patients given hydroxyurea or BTK inhibitors.
Measure Steward:	American Society of Clinical Oncology
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to update multiple components of this measure to ensure the appropriate patient population is identified by including an age, defined encounter eligibility, and additional guidance for defining the eligible patient population. We are proposing to revise the measure type to intermediate outcome to be reflective of the quality action. Additionally, we propose to add a denominator exclusion for common drugs given for palliation or to prevent rapid disease acceleration at the end of life as recommended by ASCO's End of Life Technical Expert Panel as this conflicts with the measure's intent. We are proposing to add further clarification and granularity to the numerator definition of systemic cancer-directed therapy to ensure numerator assessment is consistent across clinician submissions. Additionally, we are proposing to add a denominator exception to remove patients receiving bone marrow or peripheral blood stem cell transplant, or CAR T-cell therapy as these patients are appropriately given bridging chemotherapy and other types of cancer-directed therapy beforehand. We are proposing these changes to better align with the intent of the measure and to ensure consistent implementation across submissions. In the event the proposed substantive change(s) are finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes. As such, if the performance data submitted meets the criteria for the creation of a performance period benchmark, a new benchmark would be used for scoring.

D.30 Percentage of Patients Who Died from Cancer Admitted to Hospice for Less than 3 days (lower score – better)

Category	Description
CBE # / eCQM CBE #:	0216 / N/A
Quality#:	457
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients who died from cancer, and admitted to hospice and spent less than 3 days there.
Substantive Change:	**The measure title is revised from Percentage of Patients who Died from Cancer Admitted to Hospice for Less than 3 Days (lower score – better) to:** Percentage of Patients who Died with Cancer Enrolled in Hospice for At Least 3 Days Immediately Before Death. **The measure description is revised to read:** Percentage of patients, aged 18 years and older, who died with cancer and were enrolled in hospice for at least 3 days immediately before and on date of death. **Updated Implementation Considerations: Revised:** Measure analytic to no longer be inverse and measure type to Intermediate Outcome. **The measure denominator is revised to read:** Patients, aged 18 years and older, who died with cancer. **Updated denominator note: Revised:** The patient must have two encounters during the performance period and both eligible encounters must include a diagnosis of cancer. **Updated denominator criteria:** **Revised:** Patients aged ≥ 18 years and Diagnosis for cancer during the encounter. **Removed:** Patients enrolled in hospice and Patients who died from cancer. **Added:** Patients who died during performance period. **The measure numerator is revised to read:** Patients enrolled in hospice for at least 3 days immediately before and on the date of death. **Updated numerator instructions: Removed:** Inverse measure analytic **Added:** • Patients should be currently enrolled in hospice on date of death to meet the numerator. • Enrolled in hospice for at least 3 days immediately before death can be calculated as follows: • (Date of death minus Most Recent Date of Hospice Admission) ≥ 3 days **Updated numerator note: Added:** • Receipt of or in the process of receipt of bone marrow transplant, peripheral blood stem cell transplant, or CAR T-cell therapy are typically not covered in hospice but may be appropriate for select patients at the end of life. In these scenarios, the denominator exception should be reported. • It may be inappropriate to withdraw Hydroxyurea and bruton tyrosine kinase (BTK) inhibitors at the end of life and/or are used for palliative purposes, however these treatments are not covered by hospice. In this situation, the denominator exception should be reported. **The measure numerator options are revised to read**: **Performance Met:** Patient enrolled in hospice for at least 3 days immediately before and on the date of death. **Denominator Exception:** Patient not enrolled in hospice due to 1) receipt or in process of receipt of bone marrow or peripheral blood stem cell transplant (transplant status) in the last 60 days of life, or 2) receipt or in process of receipt of CAR T-cell therapy in the last 60 days of life. **Denominator Exception:** Patients given hydroxyurea or BTK inhibitors. **Performance Not Met:** Patient enrolled in hospice less than 3 days immediately before death or on date of death.
Measure Steward:	American Society of Clinical Oncology
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to revise the measure type to intermediate outcome and to allow for a proportional non-inverse analytic for the purpose of determining measure performance. We are proposing these changes to better align with the intent of the measure and to provide a performance rate reflective of appropriate resource utilization. We are proposing to update multiple components of this measure to ensure the appropriate patient population is identified by including an age, defined encounter eligibility, and additional guidance for defining the eligible patient population. We are also proposing to update the numerator options to align with a proportional non-inverse measure analytic such that a higher score indicates better quality care; and add denominator exceptions to remove patients 1) receiving bone marrow or peripheral blood stem cell transplant, or CAR T-cell therapy or 2) receiving drugs for palliation or to prevent rapid disease acceleration at the end of life as recommended by ASCO's End Of Life Technical Expert Panel. We are proposing these changes to better align with the intent of the measure and to ensure consistent implementation across clinician submissions.

Category	Description
	In the event the proposed substantive change(s) are finalized, the substantive changes would not allow for a direct comparison of performance data from prior years to performance data submitted after the implementation of these substantive changes. As such, if the performance data submitted meets the criteria for the creation of a performance period benchmark, a new benchmark would be used for scoring.

D.31 Otitis Media with Effusion: Systemic Antimicrobials - Avoidance of Inappropriate Use

Category	Description
CBE # / eCQM CBE #:	0657 / N/A
Quality#:	464
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients aged 2 months through 12 years with a diagnosis of OME who were not prescribed systemic antimicrobials.
Substantive Change:	**The measure description is revised to read**: Percentage of patients aged 2 months through 12 years with a diagnosis of otitis media with effusion (OME) who were not prescribed systemic antimicrobials within 3 months of diagnosis. **Updated implementation and considerations: Revised:** 90 days to 3 months. **The measure numerator is revised to read:** Patients who were not prescribed systemic antimicrobials within 3 months of diagnosis. **Updated numerator options**: **Revised:** to include timeframe of within 3 months of diagnosis.
Measure Steward:	American Academy of Otolaryngology – Head and Neck Surgery Foundation
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to update multiple components of the measure by adding "within 3 months of diagnosis" to clarify the timeframe during which systemic antimicrobials were not prescribed to patients. This clarification, based on AAO-HNS's Clinical Practice Guideline on Otitis Media with Effusion (Update),[487] would ensure the numerator quality action is appropriately and consistently assessed.

[487] Rosenfeld, R. M., Shin, J. J., Schwartz, S. R., Coggins, R., Gagnon, L., Hackell, J. M., Hoelting, D., Hunter, L. L., Kummer, A. W., Payne, S. C., Poe, D. S., Veling, M., Vila, P. M., Walsh, S. A., & Corrigan, M. D. (2016). Clinical Practice Guideline: Otitis Media with Effusion (Update). *Otolaryngology--Head and Neck Surgery: Official Journal of American Academy of Otolaryngology-Head and Neck Surgery*, *154*(1 Suppl), S1–S41. https://doi.org/10.1177/0194599815623467.

D.32 HIV Screening

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	475
CMS eCQM ID:	CMS349v9
Current Collection Type:	eCQM
Current Measure Description:	Percentage of patients aged 15-65 at the start of the measurement period who were between 15-65 years old when tested for Human immunodeficiency virus (HIV).
Substantive Change:	**Updated initial patient population: Removed:** without an HIV diagnosis prior to the start of the measurement period.
Measure Steward:	Centers for Disease Control and Prevention
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to revise the initial patient population language to better align with the logic of the measure as this patient population is removed by the denominator exclusion: Patients diagnosed with HIV prior to the day of the start of the measurement period.

D.33 Urinary Symptom Score Change 6-12 Months After Diagnosis of Benign Prostatic Hyperplasia

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	476
CMS eCQM ID:	CMS771v8
Current Collection Type:	eCQM
Current Measure Description:	Percentage of patients with an office visit within the measurement period and with a new diagnosis of clinically significant Benign Prostatic Hyperplasia who have International Prostate Symptoms Score (IPSS) or American Urological Association (AUA) Symptom Index (SI) documented at time of diagnosis and again 6-12 months later with an improvement of 3 points.
Substantive Change:	**The measure description is revised to read:** Percentage of patients with an office visit during the measurement period and a new diagnosis of clinically significant benign prostatic hyperplasia (BPH) who have International Prostate Symptom Score (IPSS) or American Urological Association Symptom Index (AUA-SI) documented within one month of diagnosis and again 6-12 months after diagnosis, with an improvement of at least 3 points. **The measure numerator is revised to read:** Patients with an improvement of at least 3 points in their IPSS or AUA-SI urinary symptom score from baseline to the 6-12 month follow-up assessment.
Measure Steward:	Large Urology Group Practice Association and Oregon Urology Institute
MIPS Core Measure:	No
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale:	We are proposing to revise both the description of the measure and the numerator to include specific timeframes for completion of the assessments. By explicitly detailing timeframes (baseline within one month of diagnosis and follow-up assessment within 6–12 months) and the outcome metric (3-point improvement), the measure reduces ambiguity in performance measurement and ensures consistency in reporting.

D.34 Hospital-wide, 30-day, All-cause Unplanned Readmission (HWR) Rate for the Merit-based Incentive Payment System (MIPS) Groups

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	479
CMS eCQM ID:	N/A
Current Collection Type:	Administrative Claims
Current Measure Description:	This measure is a re-specified version of the measure, "Risk-adjusted readmission rate (RARR) of unplanned readmission within 30 days of hospital discharge for any condition" (NQF 1789), which was developed for patients 65 years and older using Medicare claims. This re-specified measure attributes outcomes to MIPS participating clinician groups and assesses each group's readmission rate. The measure comprises a single summary score, derived from the results of five models, one for each of the following specialty cohorts (groups of discharge condition categories or procedure categories): medicine, surgery/gynecology, cardio-respiratory, cardiovascular, and neurology.
Substantive Change:	**Updated denominator exclusion: Removed:** With a principal or a secondary diagnosis code of COVID-19 coded as present on admission (POA) on the index admission claim.
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	No
Measure Type:	Outcome
Rationale:	We are proposing to remove the exclusion for admissions with either a principal or secondary diagnosis of COVID–19 present on admission from the measure denominator due to the end of the public health emergency. This proposed change would align this measure with language finalized under the Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals (IPPS) and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year (FY) 2026 Rates; Changes to the FY 2025 IPPS Rates Due to Court Decision; Requirements for Quality Programs; and Other Policy Changes; Health Data, Technology, and Interoperability: Electronic Prescribing, Real-Time Prescription Benefit and Electronic Prior Authorization final rule (90 FR 36948 through 36950).

D.35 Intravesical Bacillus-Calmette-Guerin for Non-Muscle Invasive Bladder Cancer

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	481
CMS eCQM ID:	CMS646v7
Current Collection Type:	eCQM
Current Measure Description:	Percentage of patients initially diagnosed with non-muscle invasive bladder cancer and who received intravesical Bacillus-Calmette-Guerin (BCG) within 6 months of bladder cancer staging.
Substantive Change:	**Measure description is revised to read:** Percentage of patients initially diagnosed with non-muscle invasive bladder cancer and who received intravesical Bacillus-Calmette-Guerin (BCG) within 6 months of initial diagnosis of bladder cancer. **Updated denominator exclusion: Revised:** timing is centered around diagnosis. **Updated numerator: Revised:** timing is centered around diagnosis. **Updated denominator exception: Revised:** timing is centered around diagnosis. **Updated logic and logic definitions: Revised:** timing is centered around diagnosis.
Measure Steward:	Oregon Urology
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to update multiple components of the measure to clarify that the timing for receipt of intravesical BCG is based on the initial diagnosis of bladder cancer and not staging. The revision to base the timing of intravesical BCG administration on the initial diagnosis of bladder cancer enhances clinical clarity, promotes consistency in care measurement and measure reporting, and encourages more timely treatment, all of which contributes to improved patient care.

D.36 Mismatch Repair (MMR) or Microsatellite Instability (MSI) Biomarker Testing Status

Category	Description
CBE # / eCQM CBE #:	3661 / N/A
Quality#:	491
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of surgical pathology reports for primary colorectal, endometrial, gastroesophageal or small bowel carcinoma, biopsy or resection, that contain impression or conclusion of or recommendation for testing of mismatch repair (MMR) by immunohistochemistry (biomarkers MLH1, MSH2, MSH6, and PMS2), or microsatellite instability (MSI) by DNA-based testing status, or both.
Substantive Change:	**Updated denominator criteria: Added:** coding to diagnosis criteria for genetic susceptibility.
Measure Steward:	College of American Pathologists
MIPS Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to add additional codes to the denominator criteria for genetic susceptibility as it would ensure better targeting of high-risk populations, optimize resources, and contribute to improved patient outcomes and data reliability for cancer care.[488]

[488] Robson, M. E., Storm, C. D., Weitzel, J., Wollins, D. S., & Offit, K. (2015). American Society of Clinical Oncology Policy Statement Update: Genetic and Genomic Testing for Cancer Susceptibility. *Journal of Clinical Oncology, 33*, 3660–3667. https://doi.org/10.1200/JCO.2015.63.0996.

D.37 Preventive Care and Wellness (composite)

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	497
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients who received age- and sex-appropriate preventive screenings and wellness services. This measure is a composite of seven component measures that are based on recommendations for preventive care by the U.S. Preventive Services Task Force (USPSTF), Advisory Committee on Immunization Practices (ACIP), American Association of Clinical Endocrinology (AACE), and American College of Endocrinology (ACE).
Substantive Change:	**Updated numerator definition: For Submission Criteria 3: Added: Reviewed –** to meet the quality action, there must be documentation in the medical record that the clinician reviewed the mammography report. The mammography report may also be provided by the patient for the clinician's review during the visit and should be documented in the medical record. **Updated numerator definition: For Submission Criteria 4: Added: Reviewed** – to meet the quality action, there must be documentation in the medical record that the clinician reviewed the colorectal screening report. The colorectal screening report may also be provided by the patient for the clinician's review during the visit and should be documented in the medical record. **Updated denominator criteria: For Submission Criteria 7: Added:** coding for physical and occupational therapy.
Measure Steward:	Centers for Medicare & Medicaid Services
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to revise the measure numerator definition for Submission Criteria 3 and 4, the medical record must document the clinician's review of the mammography or colorectal screening report, whether obtained directly or provided by the patient, during the visit. By specifying that the review should be documented in the medical record, the measure ensures clinicians are confirming review of mammography and colorectal screening results, not just receipt, and the measure encourages standardization in documentation practices across different clinical settings, which promotes care coordination and appropriate patient follow-up if needed. We are also proposing to update the denominator criteria for Submission Criteria 7 with physical and occupational therapy codes to align with the eCQM measure specifications. By adding PT/OT coding in this measure, healthcare organizations can help ensure a more inclusive, proactive, and effective approach to managing cardiovascular health, while also capitalizing on all patient touchpoints to achieve comprehensive wellness and improve health outcomes.

D.38 Reduction in Suicidal Ideation or Behavior Symptoms

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	505
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	The percentage of patients aged 18 and older with a mental and/or substance use disorder AND suicidal thoughts, behaviors or risk symptoms who demonstrated a reduction in suicidal ideation and/or behavior symptoms based on results from the Columbia-Suicide Severity Rating Scale (C-SSRS) 'Screen Version' or 'Since Last Visit' within 120 days after an index assessment.
Substantive Change:	**The measure description is revised to read**: The percentage of patients aged 12 years and older with a mental and/or substance use disorder AND suicidal thoughts, behaviors or risk symptoms who demonstrated a reduction in suicidal ideation and/or behavior symptoms based on results from the Columbia-Suicide Severity Rating Scale 'Screen Version' or 'Since Last Visit' (C-SSRS), or other clinician rating tools such as the Clinician Rating of Potential Suicide Risk (CRPSR) or the Suicide Assessment Five-step Evaluation & Triage (SAFE-T) protocol with C-SSRS, within 120 days after an index assessment. **The measure denominator is revised to read**: Patients aged 12 and older with a mental and/or substance use disorder with an index assessment completed who were identified as having suicidal ideation and/or behavior symptoms as determined by a non-zero score on the patient-rated C-SSRS OR deemed a suicide risk based on their clinician's evaluation using a clinician rating tool such as the CRPSR or the SAFE-T protocol with C-SSRS during the denominator identification period. **Updated denominator definitions: Revised:** **Suicide risk based on clinician rating tool** – clarified suicide risk to be based on a clinician-rating tool, which may be C-SSRS or other. **Denominator Identification Period** and **Index Assessment** – updated to reflect use of other clinician-rating tools. **Updated the denominator criteria: Revised:** age to 12 **Removed:** 'Suicidal Ideation and/or Behavior Symptoms based on the C-SSRS' and 'Suicide risk based on their clinician's evaluation or a clinician-rated tool' **Revised:** index assessment criteria to reflect use of other clinician-rating tools. **The measure numerator is revised to read**: Patients who demonstrated a reduction in suicidal ideation and/or behavior symptoms as demonstrated by results of a follow-up assessment using the patient-rated C-SSRS OR reduction in suicide risk based on their clinician's evaluation using a clinician rating tool such as the CRPSR or the SAFE-T protocol with C-SSRS, within 120 days after the index assessment during the measurement period. **Updated numerator definitions: Revised:** **Reduction** – to account for use of other clinician-rating tools. **Follow-up Assessment** – to account for use of other clinician-rating tools and require consistency in index and follow-up assessment.
Measure Steward:	American Psychiatric Association
MIPS Core Measure:	No
Measure Type:	Patient-Reported Outcome-Based Performance Measure
Rationale:	We are proposing to update multiple components of the measure to lower the denominator eligible age to 12 years and older and expand the denominator requirements to allow use of other clinician-rating tools for the index assessment and follow-up, to ensure inclusion of a critical demographic group in suicide prevention and substance use disorder interventions. This measure enhances alignment with CMS' mental health priorities, leverages validated tools like the C-SSRS and promotes actionable insights into improved care outcomes for a vulnerable population. We are also proposing to update the numerator definition to clarify that the same patient-rated C-SSRS or clinician rating tool must be used at a follow-up encounter after the index assessment. This would ensure consistent implementation and ensure direct comparability of data between assessments.

D.39 Appropriate Germline Testing for Ovarian Cancer Patients

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	507
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients, aged 18 and older, diagnosed with epithelial ovarian, fallopian tube, or primary peritoneal cancer who undergo germline testing within 6 months of diagnosis.
Substantive Change:	**Updated denominator criteria**: **Removed:** Audio only Telehealth codes.
Measure Steward:	American Society of Clinical Oncology
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to remove audio only visits from the denominator criteria because they lack the visual assessment necessary to confirm a patient's physical condition (e.g., performance status; physical signs of toxicity, pain, and distress) and the physical assessment required by the clinician providing the care and responsible for conducting germline testing.

D.40 Melanoma: Tracking and Evaluation of Recurrence

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	509
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients who had an excisional surgery for melanoma or melanoma in situ with initial American Joint Committee on Cancer (AJCC) staging of 0, I, or II, in the past 5 years in which the operating provider examines and/or diagnoses the patient for recurrence of melanoma.
Substantive Change:	**The measure description is revised to read**: Percentage of patients who had an excisional surgery for melanoma or melanoma in situ with initial American Joint Committee on Cancer (AJCC) staging of 0, I, or II, in the past 5 years for whom the clinician or practice responsible for longitudinal care documents examination and/or diagnosis for recurrence of melanoma during the performance period. **Updated intent and clinician applicability: Revised:** The examination for recurrence may be performed by any qualified clinician, provided that the clinician or practice reporting the measure documents that the examination occurred in the medical record. **Updated denominator note**: **Added**: The excisional surgery may have been performed by any clinician or practice, provided documentation of the qualifying procedure and staging is present in the medical record of the clinician or practice reporting the measure.
Measure Steward:	American Academy of Dermatology
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to revise this measure to address instances where one clinician may perform the excision and another performs the subsequent skin examinations. This measure revision would ensure inclusiveness, continuity, and accuracy in reporting excisional surgery outcomes by allowing documentation from any qualified clinician or practice, as is common in clinical practice.

D.41 Patient Reported Falls and Plan of Care

Category	Description
CBE # / eCQM CBE #:	N/A / N/A
Quality#:	513
CMS eCQM ID:	N/A
Current Collection Type:	MIPS CQM
Current Measure Description:	Percentage of patients (or caregivers as appropriate) with an active diagnosis of a movement disorder, multiple sclerosis, a neuromuscular disorder, dementia, or stroke who reported a fall occurred and those that fell had a plan of care for falls documented at every visit.
Substantive Change:	**Updated denominator criteria: Removed: For all Submission Criteria:** diagnosis coding not specific to an active diagnosis of a movement disorder, multiple sclerosis, a neuromuscular disorder, dementia, or stroke. **Updated definitions: For all Submission Criteria: Added:** **Last Visit –** if the patient is established, this would be since the last visit with the same clinician/group. If the patient is new, it would be since the patient's last visit with any clinician. **Updated denominator**: **For Submission Criteria 2: Added**: Patient reported a fall since last visit OR Accidental Fall **Updated numerator note: For Submission Criteria 1: Added:** Denominator Exception medical reason(s) should be documented at the time of the denominator eligible encounter. **Updated numerator options: For Submission Criteria 2: Revised:** **Performance Met:** Patients that reported a fall occurred who had a plan of care for falls documented **Performance Not Met:** Patients that had a fall who did not have a plan of care for falls documented **Removed:** Denominator Exception
Measure Steward:	American Academy of Neurology
MIPS Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to revise multiple components of this measure to ensure alignment with intent and clinical workflow. We are proposing to remove coding that is broad in nature and not specific to the diagnosis of a movement disorder, multiple sclerosis, a neuromuscular disorder, dementia, or stroke. Removal will ensure the denominator does not include patients beyond those in neurology with symptomology who would not be appropriate for assessment of the quality action. While patient safety in context of falls is important in all patients, the quality action for this measure is specific for the patient population intended and may not be appropriate for any falls patient. For clarity we are proposing to add a definition for 'Last Visit' so that all clinicians reporting are following the same timeline, ensuring consistent implementation across clinician submissions. Additionally, we are proposing to add to the Submission Criteria 1 numerator note to clarify that the medical reason should be documented as active or present on the day of the denominator eligible encounter. This will ensure that regardless of condition, whether it be chronic or acute, active or historical, it will be attributable to that interaction. Finally, we are proposing to revise Submission Criteria 2 to focus on those patients who reported a fall since their last visit as this is the at-risk patient population requiring the quality action; plan of care for falls. This revision aligns with measure intent as well as the structure of other screening measures in MIPS for better consistency.

Table Group DD: Proposed Substantive Changes to Previously Finalized MIPS Quality Measures Available Only for Use in Relevant MVPs for the CY 2027 Performance Period/2029 MIPS Payment Year and Future Years

As finalized for the CY 2024 performance period/2026 MIPS payment year and future years, the following three MIPS quality measures were retained for utilization in MVPs only while removed from traditional MIPS: Q112: Breast Cancer Screening, Q113: Colorectal Cancer Screening, and Q128: Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan (88 FR 79897 through 79902). We note that measures Q112: Breast Cancer Screening and Q113: Colorectal Cancer Screening available only in MVPs are adopted by the Medicare Shared Savings Program for utilization in the Alternative Payment Model (APM) Performance Pathway (APP), specifically for inclusion in the APP Plus measure set, as finalized in the CY 2025 PFS final rule (89 FR 98363 through 98371). For such measures, the collection types solely applicable for purposes of the APP Plus measure set (Medicare Clinical Quality Measures for Accountable Care Organizations (ACOs) Participating in the Medicare Shared Savings Program (Medicare CQMs) collection type and newly proposed Medicare Electronic Clinical Quality Measures for ACOs Participating in the Medicare Shared Savings Program (Medicare eCQMs) collection type as described in section IV.A.4.d.(1)(c)(v) of this proposed rule) are also specified as a collection type available for such relevant measures described in Table Group DD of this Appendix.

Table Group DD within this proposed rule provides substantive changes proposed for the CY 2027 performance period/2029 MIPS payment year for MIPS quality measures available only in a relevant MVP. The changes that are made to the denominator codes sets are generalizations of the revisions communicated from the measure stewards to CMS. Additionally, International Classification of Diseases Tenth Edition (ICD-10) and Current Procedural Terminology (CPT) codes that are identified as invalid for CY 2025 may not be identified within this proposed rule due to the availability of these changes to the public. If coding revisions to the denominator are impacted due to the timing of 2027 CPT and ICD-10 updates and assessment of these codes' inclusion by the Measure Steward, these changes may be postponed until CY 2028. The 2026 Quality Measure Release Notes provide a comprehensive, detailed reference of exact codes changes to the denominators of the quality measures. The Quality Measure Release Notes are available for each of the collection types in the Quality Payment Program website at *https://qpp.cms.gov*.

Measures that are endorsed by a CBE are shown in Table DD of this Appendix as follows: CBE # / eCQM CBE #.

In addition to the proposed substantive changes, there may be changes to the coding utilized within the denominator that are not considered substantive in nature, but it is important to communicate to interested parties. These changes align with the scope of the current coding; however, though not substantive in nature, these changes would expand or contract the measure's current eligible patient population. Therefore, please refer to the current year measure specification and the 2027 Quality Measure Release Notes or the eCQM Technical Release Notes once posted to review all coding changes to ensure correct implementation.

The eCQM Technical Release Notes should also be carefully reviewed for revisions within the logic portion of the measure. In addition to the proposed substantive changes, there may be revisions within the logic that are not considered substantive in nature; however, it is important to review to ensure proper implementation of the measure. As not all systems and clinical workflows are the same, it is important to review these changes in the context of a specific system and/or clinical workflow.

There are no proposed substantive changes for measure Q128. We request comments on the substantive changes for the other measures outlined below.

DD.1 Breast Cancer Screening

Category	Description
CBE # / eCQM CBE #:	2372 / N/A
Quality#:	112
CMS eCQM ID:	CMS125v15
Current Collection Type:	Medicare Part B Claims Measure / eCQM / Medicare CQM / MIPS CQM
Current Measure Description:	Percentage of women 40-74 years of age who had a mammogram to screen for breast cancer in the 27 months prior to the end of the measurement period.
Substantive Change:	**Modified collection type:** Medicare Part B Claims Measure, eCQM, Medicare CQM, MIPS CQM, Medicare eCQM collection types.
Measure Steward:	National Committee for Quality Assurance
Core Measure:	Yes
Measure Type:	Process
Rationale:	We are proposing to update the collection types available for this measure to include the Medicare eCQM collection type to allow choice in submission method for Medicare Shared Savings Program ACOs reporting the APP Plus measure set. See section IV.A.4.d.(1)(c)(v) of this proposed rule for further information on the Medicare eCQM collection type.

DD.2 Colorectal Cancer Screening

Category	Description
CBE # / eCQM CBE #:	0034 / N/A
Quality#:	113
CMS eCQM ID:	CMS130v15
Current Collection Type:	Medicare Part B Claims Measure / eCQM / Medicare CQM / MIPS CQM
Current Measure Description:	Percentage of patients 45-75 years of age who had appropriate screening for colorectal cancer.
Substantive Change:	**Modified collection type:** Medicare Part B Claims Measure, eCQM, Medicare CQM, MIPS CQM, Medicare eCQM collection types.
Measure Steward:	National Committee for Quality Assurance
Core Measure:	No
Measure Type:	Process
Rationale:	We are proposing to update the collection types available for this measure to include the Medicare eCQM collection type to allow choice in submission method for Medicare Shared Savings Program ACOs reporting the APP Plus measure set. See section IV.A.4.d.(1)(c)(v) of this proposed rule for further information on the Medicare eCQM collection type.

Appendix 2—Improvement Activities

In this proposed rule, for the CY 2027 performance period/2029 MIPS payment year and future years, we are proposing to add 6 new improvement activities, modify 5 previously finalized improvement activities, and remove 11 previously finalized improvement activities. These proposals are discussed in section IV.A.4.d.(3)(b) of this proposed rule and in more detail below. We request comment on our proposals.

TABLE F-B1: New Improvement Activities

New Improvement Activity	
Proposed Activity ID:	**IA_CC_XX**
Proposed Subcategory:	Care Coordination
Proposed Activity Title:	Use of Data to Improve Practice Workflows
Proposed Activity Description:	MIPS-eligible clinicians collaborate to design, implement, and continuously refine evidence based utilization pathways and clinical workflows that support the integration of current research and clinical guidelines into everyday practice. Eligible activities include the creation or maintenance of any algorithm, clinical pathway, process, or order set that is grounded in established clinical practice guidelines and/or peer reviewed literature. Actions that fulfill this activity may include: • Collecting and analyzing clinical data to identify the need for a new or revised pathway, order set, or process • Developing and deploying the updated pathway, order set, or process within clinical operations • Evaluating adoption, effectiveness, and clinical impact through ongoing monitoring and feedback. Additional qualifying activities may include, for example, conducting annual reviews of existing pathways or algorithms by a pathology group and/or in collaboration with ordering clinician, developing and disseminating educational materials, and identifying or engaging new stakeholders to support pathway improvement and implementation.
Rationale:	Promoting uptake of best clinical practices from guidelines and other resources is critical for improving quality of patient care. However, translating recommendation statements into action can be challenging for individual practices due to resource constraints. Clinical pathways and algorithms are effective ways to encourage implementation of guidelines.[489] Development of such pathways requires clinical expertise and time, although a 10-step process has been established by other organizations.[490] By including a multi-disciplinary team in pathway development, care coordination can be maximized and all stakeholders can ensure that the pathway is feasible to implement. Such guidance requires regular review as new clinical practice statements become available, especially if the pathway includes multiple specialties (e.g., oncology, radiology, pathology, pain management, etc.). Therefore, the effort involved in this activity is ongoing and requires input from many members of the care team.
New Improvement Activity	
Proposed Activity ID:	**IA_CC_XX**
Proposed Subcategory:	Care Coordination

Difficile treatment to facilitate the translation of research findings into practice. The Joint Commission Journal on Quality and Patient Safety, 45(12), 822-828. doi: 10.1016/j.jcjq.2019.10.002.

Proposed Activity Title:	Understand and Improve Diagnostic Performance
Proposed Activity Description:	This activity aims to improve patient safety by reducing diagnostic safety events, including delayed, inaccurate, or missed diagnoses, as well as failures to communicate correct diagnoses to patients and their families. This activity should support diagnostic transparency, build staff competency through training, and improve the completeness and accuracy of patient data. Understanding and improving diagnostic performance includes establishing a standardized process to monitor diagnostic discrepancies, diagnostic safety events, near misses, and miscommunications. Key components of this activity may include: • Identifying a metric to track (e.g., frozen section discrepancy rate) • Implementing a consistent tracking mechanism • Conducting ongoing monitoring • Initiating mitigation or education efforts when needed. Processes must incorporate both routine tracking and root cause analysis, followed by appropriate corrective actions such as workflow changes, education, and/or targeted training for individuals and/or groups.
Rationale:	Accurate and timely diagnosis is the cornerstone of effective patient care. Diagnostic performance directly influences treatment decisions, patient outcomes, and healthcare resource utilization. Recent studies have emphasized the importance of addressing diagnostic safety events in clinical settings.[491] A deeper understanding of diagnostic processes--including cognitive, systemic, and technological factors--enables healthcare providers to identify gaps, implement targeted interventions, and promote a culture of continuous learning and accountability. As healthcare becomes increasingly data-driven, integrating diagnostic improvement efforts with quality metrics, patient feedback, and interdisciplinary collaboration ensures that care is not only clinically sound but also patient-centered.
New Improvement Activity	
Proposed Activity ID:	**IA_AHW_XX**
Proposed Subcategory:	Advancing Health and Wellness
Proposed Activity Title:	Systematic Screening and Intervention for Nutrition and other Health-Impacting, Non-Clinical Issues
Proposed Activity Description:	This activity supports the implementation of standardized health-related, non-clinical issues screening tools and workflows to identify and address wellness-impacting factors such as poor nutrition, housing instability, transportation barriers, and financial strain. It may include: • Training staff on screening protocols • Embedding validated screening tools into the electronic health record (EHR) • Establishing referral pathways to community-based resources • Tracking follow-up and resolution of identified needs.
Rationale:	This activity addresses a gap for a nutrition-focused improvement activity. It aligns with CMS's focus on wellness and whole-person care, and supports Enhancing Oncology Model (EOM) and MVP efforts by integrating health-related, non-clinical issues into quality improvement strategies. This activity builds on existing patient navigation and care coordination activities but focuses specifically on upstream factors.
New Improvement Activity	
Proposed Activity ID:	**IA_AHW_XX**
Proposed Subcategory:	Advancing Health and Wellness
Proposed Activity Title:	Advance Care Planning Conversations to Support Patient Wellness and Care Preferences

[491] Auerbach, A. D., Lee, T. M., Hubbard, C. C., Ranji, S. R., Raffel, K., Valdes, G., ... & Schnipper, J. L. (2024). Diagnostic errors in hospitalized adults who died or were transferred to intensive care. JAMA Internal Medicine, 184(2), 164-173.

Proposed Activity Description:	MIPS-eligible clinicians engage patients and their caregivers in structured, proactive discussions about end-of-life preferences, advance care planning, and palliative care options as part of comprehensive wellness and care management. This activity integrates conversations about goals of care, symptom management, and quality of life into routine encounters with patients who have serious or life limiting illness.CMS reminds clinicians that they must not, under any circumstances, attempt to influence the ACP-related decisions of their patients. Participating clinicians must document: • Use of standardized communication tools or frameworks (e.g., Serious Illness Conversation Guide, Practitioner Orders for Life Sustaining Treatment (POLST)) to support consistent, high quality discussions; • Inclusion of wellness oriented topics, such as symptom relief, emotional wellbeing, social supports, and patient identified priorities; • Coordination and alignment of care plans across specialties, including primary care, palliative care, behavioral health, and other involved clinicians; and • Regular review and updates of advance directives or care preferences to ensure they remain accurate and reflective of the patient's evolving goals and clinical status.
Rationale:	End-of-life care planning discussions contribute to improved patient and caregiver well-being by reducing stress, enhancing understanding of care options, and ensuring treatment aligns with patient goals. Integrating these conversations into wellness and/or chronic care management visits supports a holistic approach to health, one that prioritizes quality of life, emotional and physical comfort, and patient autonomy. Evidence indicates that patients who engage in structured end-of-life care planning experience better symptom control, higher satisfaction, and reduced hospitalizations, aligning with MIPS goals of improved care coordination and patient-centered outcomes.
New Improvement Activity	
Proposed Activity ID:	**IA_AHW_XX**
Proposed Subcategory:	Advancing Health and Wellness
Proposed Activity Title:	Clinician Use of Artificial Intelligence (AI) to Improve Patient Care
Proposed Activity Description:	MIPS-eligible clinicians implement and participate in structured organizational initiatives that improve patient care through the responsible and transparent use of artificial intelligence (AI) in clinical and operational workflows. This activity supports the safe adoption of AI-enabled technologies while encouraging the development, evaluation, and refinement of AI resources designed to improve patient outcomes, care-team efficiency, and population health management. As part of this activity, participating clinicians and organizations must: • Establish and maintain organizational policies and procedures for AI use in healthcare settings that guide the evaluation, deployment, and monitoring of AI-enabled tools ○ These policies incorporate key AI model characteristics including fairness, appropriateness, validity, and effectiveness as foundational criteria for assessing model performance, identifying event patterns, and determining appropriate risk-mitigation and escalation actions and/or • Engage in or support innovative initiatives that encourage the creation, piloting, and/or enhancement of AI-enabled tools, workflows, and/or resources ○ Examples include developing risk-stratification models, AI-supported clinical decision support (CDS), predictive analytics for chronic-disease management, and/or tools that expand patient access, wellness interventions, and/or care-coordination capabilities. Additional examples include using AI tools to summarize medical literature for clinical decision making, support documentation (e.g., generate notes with AI for clinician review), and/or support population health management by identifying care gaps, determining patient eligibility for clinical trials, or generating draft responses to patient questions for clinician review.
Rationale:	The rapid expansion of artificial intelligence (AI) in healthcare presents significant opportunities to improve clinical outcomes, reduce clinician burden, and enhance population health management. However, realizing these benefits requires deliberate,

	responsible, and transparent implementation practices that ensure AI tools are safe, fair, reliable, and aligned with evidence-based care. This improvement activity encourages MIPS-eligible clinicians to adopt AI in a structured, governance-driven manner that promotes innovation while safeguarding patient well-being. Establishing organizational policies and procedures for AI use provides an essential foundation for ensuring that deployed tools are evaluated using key model characteristics (fairness, appropriateness, validity, and effectiveness). By incentivizing participation in innovation initiatives such as developing or piloting new AI-enabled tools and workflows, this activity further advances the field of applied clinical AI, encouraging clinicians and practices to collaborate in the creation and refinement of AI resources. This activity also aligns with the AI-related goals of the CMS ACCESS (Advancing Chronic Care with Effective, Scalable Solutions) Model, a 10-year voluntary Medicare program testing outcome-aligned payments to expand technology-supported chronic care for common conditions.[492]
New Improvement Activity	
Proposed Activity ID:	**IA_AHW_XX**
Proposed Subcategory:	Advancing Health and Wellness
Proposed Activity Title:	Lifestyle Approaches to Diabetes Remediation
Proposed Activity Description:	MIPS-eligible clinicians engage patients and their caregivers in structured, evidence-based lifestyle interventions to support the treatment and management of diabetes. Clinicians use the American College of Lifestyle Medicine's (ACLM) Lifestyle Empowerment Approach for Diabetes Remission (LEADR) or a similar diabetes-focused lifestyle program to help patients address modifiable behavioral factors and improve overall health status. These programs provide education, coaching, and support across key lifestyle domains such as nutrition, physical activity, sleep, stress management, and reducing harmful behaviors. Participating clinicians may use one or more of the following evidence-based programs and resources: • ACLM Lifestyle Empowerment Approach for Diabetes Remission (LEADR)[493] • CDC Diabetes Self-Management Education and Support (DSMES)[494] • American Diabetes Association Institute of Learning – Hands On Webinar: Diet, Lifestyle, Medicine, and Beyond—CardioKidneyMetabolic Strategies for Managing Obesity in People with Type 2 Diabetes[495]
Rationale:	This activity aligns with CMS's focus on wellness and whole-person care and supports MVP efforts by integrating health-related, non-clinical issues into quality improvement strategies.

In this proposed rule, we are proposing to modify **5** previously finalized improvement activities for the CY 2027 performance period/2029 MIPS payment year and future years. These proposed

[492] https://www.cms.gov/priorities/innovation/innovation-models/access.

[493] American College of Lifestyle Medicine. (n.d.). Research and innovation. https://lifestylemedicine.org/about-aclm/research-innovation/.

[494] Centers for Disease Control and Prevention. (n.d.). Diabetes self-management education and support. https://www.cdc.gov/diabetes/education-support-programs/index.html.

changes are discussed in section IV.A.4.d.(3)(b)(IV) of this proposed rule and in more detail below.

TABLE F-B2: Modifications to Previously Finalized Improvement Activities

Current Improvement Activity	
Current Activity ID:	**IA_PSPA_16**
Current Subcategory:	Patient Safety and Practice Assessment
Current Activity Title:	Use decision support—ideally platform-agnostic, interoperable clinical decision support (CDS) tools —and standardized treatment protocols to manage workflow on the care team to meet patient needs
Current Activity Description:	Use decision support—ideally platform-agnostic, interoperable clinical decision support (CDS) tools—and standardized treatment protocols to manage workflow on the care team to meet patient needs. Clinicians should focus on utilizing open-source, freely available, interoperable CDS in completing the requirements of this activity.
Proposed Change and Rationale:	Stakeholder comments on the CY 2026 PFS NPRM supported stronger oversight of clinical AI, including monitoring, root cause analysis, and mitigation of AI-related diagnostic safety events and near-misses. This activity, IA_PSPA_16, already contains core patient safety elements, making it a strong candidate for modification to explicitly include AI-enabled decision support, aligned with the Office of the National Coordinator for Health Information Technology (ONC) definition of predictive decision-support interventions in 45 CFR 170.102 and stakeholder concerns about safety, liability, and governance.
Proposed Revised Activity Title:	Use decision support—ideally platform-agnostic, interoperable clinical decision support (CDS) tools, including AI-enabled predictive decision-support interventions—and standardized treatment protocols to manage workflow on the care team to meet patient needs
Proposed Revised Activity Description:	MIPS-eligible clinicians use platform-agnostic, interoperable clinical decision support (CDS) tools—including artificial intelligence (AI)-enabled predictive decision-support interventions—to guide care-team workflow and support evidence-based, patient-centered decision-making. As part of this activity, clinicians prioritize open-source or freely available CDS tools where feasible and implement organizational policies to ensure the safe, appropriate, and effective use of these technologies. This activity may include: • Use of interoperable CDS tools, including AI-enabled technologies that meet the ONC definition of predictive decision-support interventions in 45 CFR 170.102: "technology that supports decision-making based on algorithms or models that derive relationships from training data and then produce an output that results in prediction, classification, recommendation, evaluation, or analysis"[7] • Organizational policies for safe CDS and AI use, including processes to identify, review, and mitigate AI-related adverse events or near-misses, and to address clinician concerns about liability, model reliability, and appropriate use • Evaluation of AI-enabled CDS tools using the following quality principles: ○ Fairness: outputs free from bias or undue risk ○ Appropriateness: relevance to the clinical context ○ Validity: accurate and reliable predictions or recommendations ○ Effectiveness: demonstrated benefit in real-world use • Workflow integration practices showing that CDS recommendations—whether originally human-curated or AI-generated—are applied consistently in treatment planning, patient counseling, and follow-up • Periodic review and updating of CDS tools and related protocols to maintain alignment with best practices, organizational policies, and patient-safety standards.
Current Improvement Activity	
Current Activity ID:	**IA_BMH_4**
Current Subcategory:	Behavioral And Mental Health
Current Activity Title:	Depression screening
Current Activity	Depression screening and follow-up plan: Regular engagement of MIPS eligible

Description:	clinicians or groups in integrated prevention and treatment interventions, including depression screening and follow-up plan (refer to NQF #0418) for patients with co-occurring conditions of behavioral or mental health conditions
Proposed Change and Rationale:	IA_BMH_4 and IA_BMH_5 contain similar elements that could be combined into one, more robust activity.
Proposed Revised Activity Title:	Depression Screening, Treatment, and Prevention
Proposed Revised Activity Description:	MIPS-eligible clinicians or groups regularly engage in integrated screening, treatment, and/or prevention interventions for patients with behavioral or mental health conditions, with a focus on early identification and coordinated management of major depressive disorder and associated risks. This activity includes systematic depression screening and follow-up planning, along with suicide risk assessment for individuals at elevated risk. Clinicians participating in this activity should implement and document: • Use of validated depression screening tools administered at appropriate intervals for patients • Completion of suicide risk assessments when clinically indicated, using standardized tools for patients who screen positive for depression or exhibit mental-illness warning signs • Development and execution of evidence-based follow-up plans, including safety planning, symptom management, referral to behavioral health specialists, and monitoring of treatment response • Integrated, team-based coordination of care between primary care, behavioral health, psychiatry, and other relevant specialties to support continuity, patient safety, and positive patient outcomes • Routine monitoring and reassessment, including documentation of treatment adjustments, patient (and/or family/caregiver) engagement, and adherence to follow-up intervals consistent with clinical guidelines.
Current Improvement Activity	
Current Activity ID:	**IA_CC_8**
Current Subcategory:	Care Coordination
Current Activity Title:	Implementation of documentation improvements for practice/process improvements
Current Activity Description:	Implementation of practices/processes that document care coordination activities (e.g., a documented care coordination encounter that tracks all clinical staff involved and communications from date patient is scheduled for outpatient procedure through day of procedure).
Proposed Change and Rationale:	IA_CC_8, IA_CC_10, IA_CC_11, and IA_CC_12 all contain similar elements that could be combined into one, more robust activity.
Proposed Revised Activity Title:	Implementation of Documentation and/or Operational Improvements for Practice/Process Improvements
Proposed Revised Activity Description:	This activity aims to strengthen communication, transparency, and patient-centered care across all transitions—outpatient, inpatient, specialty, and community settings. It seeks to promote clinicians' proactively coordinating care, tracking patient progress, documenting actions taken, and maintaining clear, structured processes that reduce fragmentation and improve clinical outcomes. This activity may include: • Documentation of care coordination encounters that track all clinical staff involved, communication steps, and handoffs from the time a patient is scheduled for an outpatient procedure or referral through completion of the episode of care • Systematic tracking of patients referred to consultants or specialists, including confirmation that the referral was received, appointments were completed, and recommendations were integrated into the plan of care • Documentation of care transition practices reflecting a patient-centered action plan aligned with the patient's values, preferences, and social context • Implementation of care coordination agreements with frequently used consultants or facilities that set expectations for timely, bidirectional information sharing and clearly define responsibilities across settings.
Current Improvement Activity	
Current Activity ID:	**IA_CC_9**
Current Subcategory:	Care Coordination
Current Activity Title:	Implementation of practices/processes for developing regular individual care plans

Current Activity Description:	Implementation of practices/processes, including a discussion on care, to develop regularly updated individual care plans for at-risk patients that are shared with the beneficiary or caregiver(s). Individual care plans should include consideration of a patient's goals and priorities, as well as desired outcomes of care.
Proposed Change and Rationale:	IA_CC_9 and IA_BE_15 contain similar elements that could be combined into one, more robust activity.
Proposed Activity Title:	Implementation of Practices/Processes for Developing Regular Individual Care Plans
Proposed Revised Activity Description:	Implementation of practices/processes, including a discussion about care goals and preferences, to develop regularly updated individual care plans for at-risk patients that are developed and shared with the beneficiary and family and/or caregiver(s). Individual care plans should include consideration of a patient's (and family/caregiver's, as appropriate) goals and priorities, as well as desired outcomes of care.
Current Improvement Activity	
Current Activity ID:	**IA_PM_4**
Current Subcategory:	Population Management
Current Activity Title:	Glycemic management services
Current Activity Description:	For outpatient Medicare beneficiaries with diabetes and who are prescribed antidiabetic agents (e.g., insulin, sulfonylureas), MIPS eligible clinicians and groups must attest to having: For the first performance year, at least 60 percent of medical records with documentation of an individualized glycemic treatment goal that: a) Considers patient-specific factors, including, at least 1) age, 2) comorbidities, and 3) risk for hypoglycemia, and b) Is reassessed at least annually. The performance threshold will increase to 75 percent for the second performance year and onward. Clinician would attest that, 60 percent for first year, or 75 percent for the second year, of their medical records that document individualized glycemic treatment represent patients who are being treated for at least 90 days during the performance period.
Proposed Change and Rationale:	IA_PM_4, IA_PM_19, and IA_PM_20 all contain similar elements that could be combined into one, more robust activity.
Proposed Revised Activity Title:	Glycemic Screening, Referral, and Management
Proposed Revised Activity Description:	For outpatient Medicare beneficiaries, MIPS-eligible clinicians and groups must attest to having: For the first performance year, at least 60 percent of medical records with documentation of screening patients for abnormal blood glucose, referring eligible patients with prediabetes to a CDC-recognized diabetes prevention program, and developing individualized glycemic treatment plans that: a) Consider patient-specific factors, including, at least 1) age, 2) comorbidities, and 3) risk for hypoglycemia, and b) Are reassessed at least annually. The performance threshold will increase to 75 percent for the second performance year and onward. Clinicians must attest that 60 percent (for the first year) and 75 percent (for the second year and beyond) of their medical records include documentation of screening patients for abnormal blood glucose according to current US Preventive Services Task Force (USPSTF) and/or American Diabetes Association (ADA) guidelines. Clinicians must attest that 60 percent (for the first year) and 75 percent (for the second year and beyond) of their medical records include documentation of referring eligible

	patients with prediabetes to a CDC-recognized diabetes prevention program operating under the framework of the National Diabetes Prevention Program. Clinicians must attest that 60 percent (for the first year) and 75 percent (for the second year and beyond) of their medical records document individualized glycemic treatment plans representing patients who are being seen for at least 90 days during the performance period.

In this proposed rule, we are proposing to remove **11** previously finalized improvement activities beginning with the CY 2027 performance period/2029 MIPS payment year. These changes are discussed in section IV.A.4.d.(3)(b)(V) of this proposed rule and in more detail below; activity removal factors are discussed in the CY 2020 PFS final rule (84 FR 62568 through 63563).

TABLE F-B3: Improvement Activities Being Removed

Current Improvement Activity	
Current Activity ID:	**IA_BMH_5**
Current Subcategory:	Behavioral And Mental Health
Current Activity Title:	MDD prevention and treatment interventions
Current Activity Description:	Major depressive disorder: Regular engagement of MIPS eligible clinicians or groups in integrated prevention and treatment interventions, including suicide risk assessment (refer to NQF #0104) for mental health patients with co-occurring conditions of behavioral or mental health conditions.
Removal Rationale:	Proposed removal to combine with IA_BMH_4; Factor 1, activity is duplicative
Current Improvement Activity	
Current Activity ID:	**IA_CC_10**
Current Subcategory:	Care Coordination
Current Activity Title:	Care transition documentation practice improvements
Current Activity Description:	In order to receive credit for this activity, a MIPS eligible clinician must document practices/processes for care transition with documentation of how a MIPS eligible clinician or group carried out an action plan for the patient with the patient's preferences in mind (that is, a "patient-centered" plan) during the first 30 days following a discharge. Examples of these practices/processes for care transition include: staff involved in the care transition; phone calls conducted in support of transition; accompaniments of patients to appointments or other navigation actions; home visits; patient information access to their medical records; real time communication between PCP and consulting clinicians; PCP included on specialist follow-up or transition communications.
Removal Rationale:	Proposed removal to combine with IA_CC_8; Factor 1, activity is duplicative
Current Improvement Activity	
Current Activity ID:	**IA_CC_11**
Current Subcategory:	Care Coordination
Current Activity Title:	Care transition standard operational improvements
Current Activity Description:	Establish standard operations to manage transitions of care that could include one or more of the following: • Establish formalized lines of communication with local settings in which empaneled patients receive care to ensure documented flow of information and seamless transitions in care; and/or • Partner with community or hospital-based transitional care services.
Removal Rationale:	Proposed removal to combine with IA_CC_8; Factor 1, activity is duplicative
Current Improvement Activity	

Current Activity ID:	**IA_CC_12**
Current Subcategory:	Care Coordination
Current Activity Title:	Care coordination agreements that promote improvements in patient tracking across settings
Current Activity Description:	Establish effective care coordination and active referral management that could include one or more of the following: • Establish care coordination agreements with frequently used consultants that set expectations for documented flow of information and MIPS eligible clinician or MIPS eligible clinician group expectations between settings. Provide patients with information that sets their expectations consistently with the care coordination agreements; • Track patients referred to specialist through the entire process; and/or • Systematically integrate information from referrals into the plan of care.
Removal Rationale:	Proposed removal to combine with IA_CC_8; Factor 1, activity is duplicative
Current Improvement Activity	
Current Activity ID:	**IA_PSPA_2**
Current Subcategory:	Patient Safety and Practice Assessment
Current Activity Title:	Participation in MOC Part IV
Current Activity Description:	In order to receive credit for this activity, a MIPS eligible clinician must participate in Maintenance of Certification (MOC) Part IV. Maintenance of Certification (MOC) Part IV requires clinicians to perform monthly activities across practice to regularly assess performance by reviewing outcomes addressing identified areas for improvement and evaluating the results. Some examples of activities that can be completed to receive MOC Part IV credit are: the American Board of Internal Medicine (ABIM) Approved Quality Improvement (AQI) Program, National Cardiovascular Data Registry (NCDR) Clinical Quality Coach, Quality Practice Initiative Certification Program, American Board of Medical Specialties Practice Performance Improvement Module or American Society of Anesthesiologists (ASA) Simulation Education Network, for improving professional practice including participation in a local, regional or national outcomes registry or quality assessment program; specialty- specific activities including Safety Certification in Outpatient Practice Excellence (SCOPE); American Psychiatric Association (APA) Performance in Practice modules.
Removal Rationale:	Many physicians are already required (e.g., by states) to participate in MOC; therefore, this activity is not likely to be driving additional meaningful clinical care improvement; Factors 1 & 7, activity is duplicative and/or obsolete
Current Improvement Activity	
Current Activity ID:	**IA_CC_16**
Current Subcategory:	Care Coordination
Current Activity Title:	Primary Care Physician and Behavioral Health Bilateral Electronic Exchange of Information for Shared Patients
Current Activity Description:	The primary care and behavioral health practices use the same electronic health record system for shared patients or have an established bidirectional flow of primary care and behavioral health records.
Removal Rationale:	Given advancements in EHR adoption and data-sharing practices, this activity is no longer likely driving additional meaningful clinical care improvement; Factor 7, activity is obsolete.
Current Improvement Activity	
Current Activity ID:	**IA_BE_15**

Current Subcategory:	Beneficiary Engagement
Current Activity Title:	Engagement of Patients, Family, and Caregivers in Developing a Plan of Care
Current Activity Description:	Engage patients, family, and caregivers in developing a plan of care and prioritizing their goals for action, documented in the electronic health record (EHR) technology.
Removal Rationale:	Proposed removal to combine with IA_CC_9; Factor 1, activity is duplicative
Current Improvement Activity	
Current Activity ID:	**IA_PM_19**
Current Subcategory:	Population Management
Current Activity Title:	Glycemic Screening Services
Current Activity Description:	For at-risk outpatient Medicare beneficiaries, individual MIPS eligible clinicians and groups must attest to implementation of systematic preventive approaches in clinical practice for at least 60 percent for the 2018 performance period and 75 percent in future years, of electronic medical records with documentation of screening patients for abnormal blood glucose according to current US Preventive Services Task Force (USPSTF) and/or American Diabetes Association (ADA) guidelines.
Removal Rationale:	Proposed removal to be combined with IA_PM_4; Factor 1, activity is duplicative
Current Improvement Activity	
Current Activity ID:	**IA_PM_20**
Current Subcategory:	Population Management
Current Activity Title:	Glycemic Referring Services
Current Activity Description:	For at-risk outpatient Medicare beneficiaries, individual MIPS eligible clinicians and groups must attest to implementation of systematic preventive approaches in clinical practice for at least 60 percent for the CY 2018 performance period and 75 percent in future years, of medical records with documentation of referring eligible patients with prediabetes to a CDC-recognized diabetes prevention program operating under the framework of the National Diabetes Prevention Program.
Removal Rationale:	Proposed removal to be combined with IA_PM_4; Factor 1, activity is duplicative
Current Improvement Activity	
Current Activity ID:	**IA_EPA_4**
Current Subcategory:	Expanded Practice Access
Current Activity Title:	Additional improvements in access as a result of QIN/QIO TA
Current Activity Description:	As a result of Quality Innovation Network(QIN)-Quality Improvement Organization (QIO) technical assistance, performance of additional activities that improve access to services or improve care coordination (for example, investment of on-site diabetes educator).
Removal Rationale:	This activity is one of several focused on improvements that can be supported and/or driven by QIN/QIOs. This particular activity could be attested to with relatively low levels of effort and without a need to measure specific outcomes. If this concept is important to eligible clinicians, they can attest to IA_PSPA_19. Other QIN/QIO-relevant activities will remain in the Inventory. Factor 2; There is an alternative activity with a stronger relationship to quality care or improvements in clinical practice.

Current Improvement Activity	
Current Activity ID:	**IA_PM_2**
Current Subcategory:	Population Management
Current Activity Title:	Anticoagulant management improvements
Current Activity Description:	Individual MIPS eligible clinicians and groups who prescribe anti-coagulation medications (including, but not limited to oral Vitamin K antagonist therapy, including warfarin or other coagulation cascade inhibitors) must attest that for 75 percent of their ambulatory care patients receiving these medications are being managed with support from one or more of the following improvement activities: • Participation in a systematic anticoagulation program (coagulation clinic, patient self-reporting program, or patient self-management program); • Patients are being managed by an anticoagulant management service, that involves systematic and coordinated care, incorporating comprehensive patient education, systematic prothrombin time (PT-INR) testing, tracking, follow-up, and patient communication of results and dosing decisions; • Patients are being managed according to validated electronic decision support and clinical management tools that involve systematic and coordinated care, incorporating comprehensive patient education, systematic PT-INR testing, tracking, follow-up, and patient communication of results and dosing decisions; • For rural or remote patients, patients are managed using remote monitoring or telehealth options that involve systematic and coordinated care, incorporating comprehensive patient education, systematic PT-INR testing, tracking, follow-up, and patient communication of results and dosing decisions; or • For patients who demonstrate motivation, competency, and adherence, patients are managed using either a patient self-testing (PST) or patient-self-management (PSM) program.
Removal Rationale:	Direct oral anticoagulant medications (DOACs) have dramatically changed clinical practice, with significantly decreased use of warfarin over the last decade. Despite these changes, there are still specific circumstances that require use of warfarin, including the presence of prosthetic valves, antiphospholipid syndrome, and a high risk of bleeding complications, particularly gastrointestinal bleeding. This activity drives 'classic' quality actions related to the use of warfarin. Given the transition away from warfarin's common use, removing this activity is likely appropriate. We acknowledge the ongoing importance of medication management and will work to ensure that, going forward, improvement activities that support continued enhancement and maintenance of anticoagulation medication management are reflected in MIPS. Factor 7; activity is obsolete.

</EXTRACT><HD1>APPENDIX 3: MVP INVENTORY<EXTRACT>

MVP Development: Background

In the CY 2021 PFS final rule (85 FR 84849 through 84854), the CY 2022 PFS final rule (86 FR 65998 through 66031), and the CY 2023 PFS final rule (87 FR 70210 through 70211) we finalized a set of criteria to use in the development of MVPs. These criteria include MVP reporting requirements, MVP maintenance, and the selection of measures and activities within an MVP.

This appendix includes three groups of proposed MVP tables: Table 1 covers the MVP Foundational Layer, Group A presents 3 proposed new MVPs, and Group B outlines proposed modifications to 27 previously finalized MVPs.

Each MVP is composed of measures and activities from the quality, improvement activities, and cost performance categories relevant to the clinical specialty of the MVP. Additionally, every MVP includes a foundational layer which consists of population health measures and Promoting Interoperability performance category objectives and measures. The foundational layer is consistent across all MVPs and is detailed in Table 1: MVP Foundational Layer.

When applicable and substantive, we include a brief overview of the planned modifications to QCDR measures within relevant MVPs. Although QCDR measures are exempt from public notice and comment, providing this overview ensures transparency and offers interested parties an opportunity to provide comment on all aspects of each MVP prior to finalization. Final decisions regarding modifications to QCDR measure specifications are made by QCDR measure stewards independently of the rulemaking process, though these modifications may influence the finalized decisions in the final rule.

IA_PCMH: Electronic submission of Patient Centered Medical Home Accreditation is not listed in the newly proposed or previously finalized MVP tables. In accordance with § 414.1380(b)(3)(ii), MIPS eligible clinicians in practices certified or recognized as a patient-centered medical home or comparable specialty practice, as determined by the Secretary, may attest to this activity and receive an improvement activities performance category score of 100 percent (81 FR 77179 through 77180).

MVP Development: Performance Category Sources

Table 1, Group A, and Group B MVP tables include foundational measures and sets of MIPS quality measures, QCDR measures (as applicable), improvement activities, and cost measures organized around clinical topics. For further reference, the sources for the measures and activities included in the MVP tables can be found on the Quality Payment Program website, as detailed below:

- Existing MIPS quality measures are included in the 2026 MIPS Quality Measures List.[496] For details on proposed changes, refer to Appendix 1: MIPS Quality Measures in this proposed rule, which outlines the following: proposed additions (Table Group A), proposed removals (Table Group C), and proposed modifications to existing quality measures (Table Groups D and DD).

[496] See the 2026 MIPS Quality Measures List: *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3570/2026-MIPS-Quality-Measures-List.xlsx.*

- Existing QCDR measures are derived from the latest publication of the 2026 QCDR Measure Specification file.[497] We anticipate updating the list of 2027 QCDR measures in December 2026.
- Existing improvement activities are included in the 2026 Improvement Activities Inventory and the 2026 MIPS Data Validation Criteria.[498] For details on proposed changes, refer to proposed changes Appendix 2: Improvement Activities in this proposed rule, which outlines the following: proposed additions (Table Group A), proposed modifications to existing improvement activities (Table Group B), and proposed removals (Table Group C).
- Existing cost measures are included in the 2026 Cost Measures Inventory.[499] There are no proposed changes to cost measures included in the proposed CY 2027 MVPs.
- Existing Promoting Interoperability measures and attestations, adopted in prior rulemaking and included in the foundational layer, can be found on the Quality Payment Program website.[500] For details on Promoting Interoperability performance category proposals, we refer readers to section IV.A.4.d.(4) of this proposed rule. Proposals include a modification to the definition of CEHRT, a reduction in requirements, and the following: A modification to the PI_HIE_7: Electronic Prior Authorization measure, which would change the measure from being a required measure to an optional measure for the CY 2027 performance period/2029 MIPS payment year (measure was previously finalized as a required measure in the CMS Interoperability and Prior Authorization final rule (89 FR 8915 through 8927); and the addition of a new measure, Electronic Prior Authorization for Prescription Drugs (PI_HIE_8), which would be a required measure starting with the CY 2028 performance period/2030 MIPS payment year.
- For more information on the population health measures, attributed to the quality performance category and included in the foundational layer, refer to the CY 2022 PFS final rule (86 FR 65408 through 65409).

MVP Development: Measure and Improvement Activity Updates

- Group A and Group B MVPs include an additional table to identify the proposed MIPS core measures within each MVP. For details on the MIPS core measure proposal and selection criteria for MVPs refer to section IV.A.4.d.(1)(c) of this proposed rule.
- Refer to Appendix 1: MIPS Quality Measures (Table Group C) in this proposed rule for details on the proposed removal of MIPS quality measures.
- Refer to Appendix 2: Improvement Activities (Table Group C) in this proposed rule for details on the proposed removal of improvement activities.
- Refer to section IV.A.4.d.(4) Promoting Interoperability Performance Category measures in this proposed rule for details on the proposed removal of Promoting Interoperability Performance Category measures. The following Promoting Interoperability measures, previously included in the foundational layer of MVPs, are now proposed for removal from MIPS: **PI_PPHI_1:** Security Risk Analysis, **PI_ONCDIR_1:** ONC Direct Review Attestation, and **PI_ONCACB_1:** ONC-ACB Surveillance Attestation (Optional).

MVP Symbol Information and Definitions

Please note the following symbols and definitions used within the MVP tables in this appendix:

- Quality measures proposed as MIPS core measures in an MVP are identified with a single exclamation point (!).
- Quality measures, improvement activities, cost measures, and Promoting Interoperability measures proposed for addition to a previously finalized MVP are identified with a plus sign (+).
- Proposed new MIPS quality measures, improvement activities, and Promoting Interoperability measures proposed for inclusion in an MVP beginning with the CY 2027 performance period/2029 MIPS payment year and future years are identified with a caret symbol (^). See Appendix 1: MIPS Quality Measures: Table Group A, Appendix 2: Improvement Activities: Table Group A, and section IV.A.4.d.(4) of this proposed rule for further information regarding new MIPS quality measures, improvement activities and Promoting Interoperability measures.
- Existing measures and improvement activities with proposed revisions are identified with a single asterisk (*). For further information regarding proposed revisions see Appendix 1: MIPS Quality Measures: Tables Group D and DD for revisions to MIPS quality measures, Appendix 2: Improvement Activities: Table Group B for revisions to improvement activities, and section IV.A.4.d.(4) for revisions to Promoting Interoperability measures. Unless changes were required to continue to meet programmatic standards for inclusion, we intend to include existing measures or activities with proposed revisions in MVPs (as applicable) regardless of whether the proposed revisions are finalized beginning with the CY 2027 performance period/2029 MIPS payment year.
- QCDR measures undergoing modifications planned by the QCDR measure stewards are identified in this appendix with a single asterisk (*). When applicable and substantive in nature, we provide a brief overview of the planned modifications within applicable MVPs. Since QCDR measures are exempt from public notice and comment, this overview allows for transparency with interested parties and an opportunity to comment on all aspects of each MVP prior to finalization. Final decisions to modify QCDR measure specifications are determined by QCDR measure stewards, separate from rulemaking, but may impact decisions as finalized in the final rule.
- Quality measures and improvement activities identified with a double asterisk (**) can only be submitted when included in an MVP.
- Improvement activities that include an advancing health and wellness component are identified with a double exclamation point (!!).
- Quality measure collection types are identified in parentheses after each quality measure title.

Foundational Layer

Each MVP contains a foundational layer, which includes the entire set of Promoting Interoperability performance category measures and two population health measures. The foundational layer is the same for all MVPs, as listed in Table 1.

Symbol Key:

Single asterisk (*): existing measures and improvement activities with proposed revisions.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.

TABLE 1: MVP Foundational Layer

Population Health Measures	Promoting Interoperability Measures

Group A: New MVPs Proposed for the CY 2027 Performance Period/2029 MIPS Payment Year and Future Years

A.1 Diabetic Disease MVP

The proposed Diabetic Disease MVP assesses meaningful outcomes in diabetic disease care. This MVP would be most applicable to clinicians who provide diabetic disease patient care, including primary care, endocrinology, ophthalmology, podiatry, and nonphysician practitioners (NPPs) such as nurse practitioners, clinical nurse specialists, and physician assistants. We request public comment on this proposal.

Quality Measures

We are proposing to include 11 MIPS quality measures and 2 QCDR measures within the quality performance category of this MVP, which are relevant to the clinical topic of diabetic disease care. We reviewed the MIPS quality measure inventory and considered feedback received during the 2026 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

For the reasons stated in the introduction of this appendix[501], we are proposing the following measures as MIPS core measures for the Diabetic Disease MVP:

- **Q001**: Diabetes: Glycemic Status Assessment Greater Than 9%
- **Q128:** Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan
- **Q317**: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented
- **Q488**: Kidney Health Evaluation

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in diabetic disease care:

- **Q001**: Diabetes: Glycemic Status Assessment Greater Than 9%: This inverse outcome MIPS quality measure assesses patients diagnosed with diabetes mellitus for poor control of their HbA1c.
- **Q019**: Diabetic Retinopathy: Communication with the Physician Managing Ongoing Diabetes Care: This MIPS quality measure focuses on the communication between the primary physician managing ongoing care and the physician performing the dilated macular or fundus exam on patients with diabetic retinopathy.
- **Q117**: Diabetes: Eye Exam: This MIPS quality measure supports eye screening for diabetic retinal disease.
- **Q126**: Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy – Neurological Evaluation: This MIPS quality measure ensures patients diagnosed with diabetes mellitus have a lower extremity neurological exam performed at least once every 12 months.
- **Q127**: Diabetes Mellitus: Diabetic Foot and Ankle Care, Ulcer Prevention – Evaluation of Footwear: Outcome Survey: This MIPS quality measure ensures patients diagnosed with diabetes mellitus are evaluated for proper footwear and sizing at least once every 12 months.
- **Q128:** Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan: This MIPS quality measure assesses patients for a documented BMI with a follow-up plan documented if their most recent documented BMI was outside of normal parameters

[501] See MVP Development: Quality Measure and Improvement Activity Updates

- **Q317**: Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented: This MIPS quality measure ensures all adult patients are screened for high blood pressure at each visit and have a recommended follow-up plan if blood pressure is elevated or hypertensive.
- **Q438**: Statin Therapy for the Prevention and Treatment of Cardiovascular Disease: This MIPS quality measure identifies patients at high risk of cardiovascular events and ensures they are prescribed or currently on a statin therapy.
- **Q488**: Kidney Health Evaluation: This MIPS quality measure ensures patients with diabetes receive a kidney health evaluation including both an estimated glomerular filtration rate (eGFR) and a urine albumin-creatinine ratio (uACR).
- **IRIS58**: Improved Visual Acuity after Vitrectomy for Complications of Diabetic Retinopathy within 120 Days: This QCDR measure assesses success of vitrectomy procedures in patients with diabetic retinopathy by reviewing patients for complications within 120 days of the procedure.
- **USWR35**: Adequate Off-loading of Diabetic Foot Ulcers performed at each visit, appropriate to location of ulcer: This QCDR measure assesses for adequate off-loading for diabetic foot ulcers during patient visits, which supports positive outcomes of Diabetic Foot Ulcer (DFU) healing.

The following broadly applicable MIPS quality measures are relevant to clinicians who specialize in diabetic disease care. The quality measures below assess for screenings and follow-up actions for select measures:

- **Q134:** Preventive Care and Screening: Screening for Depression and Follow-Up Plan: This MIPS quality measure ensures all patients are screened for depression with a follow-up plan documented for those patients who screen positive.
- **Q226**: Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: This MIPS quality measure screens patients for tobacco use. Any patients that are found to be tobacco users should receive tobacco cessation intervention.

Improvement Activities

We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We are proposing to include 13 improvement activities that reflect actions and processes undertaken by clinicians who specialize in diabetic disease care, as well as activities that promote advancing health and wellness, patient engagement and patient-centeredness, shared decision-making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- **IA_AHW_1:** Chronic Care and Preventative Care Management for Empaneled Patients
- **IA_AHW_X:** Lifestyle Approaches to Diabetes Remediation
- **IA_BE_1:** Use of certified EHR to capture patient reported outcomes
- **IA_BE_3:** Engagement with QIN-QIO to implement self-management training programs
- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **IA_BE_16:** Promote Self-management in Usual Care
- **IA_BE_19:** Use group visits for common chronic conditions (e.g., diabetes)
- **IA_BE_23:** Integration of patient coaching practices between visits
- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_4:** Glycemic management services

- **IA_PM_16:** Implementation of medication management practice improvements
- **IA_PM_25:** Save a Million Hearts: Standardization of Approach to Screening and Treatment for Cardiovascular Disease Risk

Cost Measures

We are proposing to include two MIPS cost measures within the cost performance category of this MVP, which apply to the clinical topic of diabetes. We reviewed the MIPS cost measure inventory and considered feedback received during the 2026 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measures provide a meaningful assessment of the clinical care for clinicians who specialize in interventional radiology and aligns with other measures and activities within this MVP:

- **COST_D_1**: Diabetes: This MIPS cost measure applies to clinicians providing diabetic care.
- **TPCC_1:** Total Per Capita Cost (TPCC): This MIPS cost measure assesses the overall cost of care delivered to a Medicare patient with a focus on the primary care the patient receives from their providers.

Symbol Key:

Single exclamation point (!): MIPS core measure within an MVP.
Caret symbol (^): proposed new measure or improvement activity.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

A.2 Hospitalist MVP

The proposed Hospitalist MVP assesses meaningful outcomes for patients receiving care provided by hospitalists. This MVP would be most applicable to hospitalists, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We request public comment on this proposal.

Quality Measures

We are proposing to include four MIPS quality measures and five QCDR measures within the quality performance category of this MVP, which are relevant to care provided by hospitalists. We reviewed the MIPS quality measure inventory and considered feedback received during the 2026 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

For the reasons stated in the introduction of this appendix[502], we are proposing the following measures as MIPS core measures for the Hospitalist MVP:

- **Q005:** Heart Failure (HF): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) or Angiotensin Receptor-Neprilysin Inhibitor (ARNI) Therapy for Left Ventricular Systolic Dysfunction (LVSD)
- **Q008:** Heart Failure (HF): Beta-Blocker Therapy for Left Ventricular Systolic Dysfunction (LVSD)
- **Q047:** Advance Care Plan

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for hospitalists:

- **Q005:** Heart Failure (HF): Angiotensin-Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) or Angiotensin Receptor-Neprilysin Inhibitor (ARNI) Therapy for Left Ventricular Systolic Dysfunction (LVSD): This MIPS quality measure ensures patients diagnosed with heart failure and a left ventricular ejection fraction of less than or equal to 40% are prescribed an ACE inhibitor, ARB or ARNI therapy.
- **Q008:** Heart Failure (HF): Beta-Blocker Therapy for Left Ventricular Systolic Dysfunction (LVSD): This MIPS quality measure ensures patients diagnosed with heart failure and a left ventricular ejection fraction of less than or equal to 40% are prescribed beta-blocker therapy.
- **Q238:** Use of High-Risk Medications in Older Adults: This inverse MIPS quality measure supports patient safety by assessing high-risk medication utilization in the older adult population.
- **ECPR51:** Discharge Prescription of Naloxone after Opioid Poisoning or Overdose: This QCDR measure ensures patients treated for opioid poisoning in the acute care setting are prescribed naloxone and receive education on its proper use before discharge.
- **HCPR24:** Appropriate Utilization of Vancomycin for Cellulitis: This QCDR measure ensures the appropriate use of vancomycin for patients diagnosed with cellulitis in the hospital setting, whether admitted or under observation.
- **HCPR25:** Physician's Orders for Life-Sustaining Treatment (POLST) Form: This QCDR measure ensures patients with advanced illness have a completed POLST form during their hospitalization.
- **HCPR27:** Point-of-Care Ultrasound: Evaluation for Pneumothorax after Central Venous Catheter (CVC) Placement: This QCDR measure ensures patients undergoing CVC placement receive appropriate pneumothorax evaluation using point-of-care ultrasound.
- **HCPR30**: Avoidance of Sliding-Scale Insulin Monotherapy for Admitted Diabetic Patients: This QCDR measure ensures patients admitted to the hospital with a diagnosis of diabetes mellitus receive an order for basal insulin therapy.

The following broadly applicable MIPS quality measure is relevant to clinicians who specialize in hospitalist care.

---

[502] See MVP Development: Quality Measure and Improvement Activity Updates

- **Q047:** Advance Care Plan: This MIPS quality measure assesses for medical record documentation of an advance care plan or surrogate decisions maker.

Modifications are being considered for the following QCDR measure:

- **ECPR51:** Discharge Prescription of Naloxone after Opioid Poisoning or Overdose: This QCDR measure is undergoing modifications to expand the measure to include the treatment for opioid withdrawal in additional care settings.

Improvement Activities

We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We are proposing to include 12 improvement activities that reflect actions and processes undertaken by hospitalists, as well as activities that promote advancing health and wellness, patient engagement and patient-centeredness, shared decision-making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities are proposed for inclusion in this MVP:

- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **IA_BMH_12:** Promoting Clinician Well-Being
- **IA_BMH_15:** Behavioral/Mental Health and Substance Use Screening & Referral for Older Adults
- **IA_CC_8:** Implementation of documentation improvements for practice/process improvements
- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_CC_13:** Practice improvements to align with OpenNotes principles
- **IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_16:** Implementation of medication management practice improvements
- **IA_PM_21:** Advance Care Planning
- **IA_PSPA_8:** Use of patient safety tools
- **IA_PSPA_15:** Implementation of an ASP
- **IA_PSPA_21:** Implementation of fall screening and assessment programs

Cost Measures

We are proposing to include one MIPS cost measure within the cost performance category of this MVP, which applies to hospitalists. We reviewed the MIPS cost measure inventory and considered feedback received during the 2026 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measure provides a meaningful assessment of the clinical care for hospitalists and aligns with other measures and activities within this MVP:

- **MSPB_1:** Medicare Spending Per Beneficiary (MSPB) Clinician: This MIPS cost measure applies to hospitalists.

Symbol Key:

Single exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

A.3 Hypertension MVP

The proposed Hypertension MVP assesses meaningful outcomes for patients receiving care for hypertension and appropriate preventive interventions for those considered high-risk. This MVP would be most applicable to clinicians who treat patients at risk for hypertension and with a hypertension diagnosis, including cardiology, family medicine, geriatrics, internal medicine,

nutrition and dietician, preventive medicine, and NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We request public comment on this proposal.

Quality Measures

We are proposing to include 13 MIPS quality measures within the quality performance category of this MVP, which are specific to the clinical topic of hypertension. We reviewed the MIPS quality measure inventory and considered feedback received during the 2026 MVP candidate feedback period to determine which quality measures best represent the clinical topic of this MVP.

For the reasons stated in the introduction of this appendix[503], we are proposing the following measures as MIPS core measures for the Hypertension MVP:

- **Q128:** Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan
- **Q226:** Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention
- **Q236:** Controlling High Blood Pressure

The following quality measures provide a meaningful and comprehensive assessment of the clinical care for clinicians who specialize in the treatment of hypertension:

- **Q128:** Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan: This MIPS quality measure assesses patients for a documented BMI with a follow-up plan documented if their most recent documented BMI was outside of normal parameters.
- **Q236:** Controlling High Blood Pressure: This intermediate outcome MIPS quality measure assesses patients diagnosed with hypertension for adequately controlled blood pressure.
- **Q239:** Weight Assessment and Counseling for Nutrition and Physical Activity for Children/Adolescents: This MIPS quality measure ensures that patients aged 3-17 years have a BMI recorded with appropriate nutrition and physical activity counseling.
- **Q317:** Preventive Care and Screening: Screening for High Blood Pressure and Follow-Up Documented: This MIPS quality measure ensures all adult patients are screened for high blood pressure at each visit and have a recommended follow-up plan if blood pressure is elevated or hypertensive.
- **Q441:** Ischemic Vascular Disease (IVD) All or None Outcome Measure (Optimal Control): This intermediate outcome MIPS quality measure ensures optimal control of patients with IVD by assessing goals for blood pressure management, smoking cessation, antiplatelet use, and high intensity statin use.
- **Q489:** Adult Kidney Disease: Angiotensin Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) Therapy: This MIPS quality measure ensures patients diagnosed with chronic kidney disease and proteinuria are prescribed and ACE inhibitor or ARB therapy.
- **TBD:** Low Density Lipoprotein Cholesterol (LDL-C) Monitoring and Management: This proposed intermediate outcome MIPS quality measure ensures lipid monitoring in patients with atherosclerotic cardiovascular disease (ASCVD) and achieving the target goal of an LDL-C less than 70mg/dL.

The following broadly applicable MIPS quality measures are relevant to clinicians who specialize in the treatment of hypertension. The quality measures below assess for age-specific screenings and follow-up actions for select measures:

---

[503] See MVP Development: Quality Measure and Improvement Activity Updates

- **Q047:** Advance Care Plan: This MIPS quality measure assesses for medical record documentation of an advance care plan or surrogate decision maker.
- **Q130:** Documentation of Current Medications in the Medical Record: This MIPS quality measure assesses for review and documentation of all current medications at each visit.
- **Q226:** Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention: This MIPS quality measure screens patients for tobacco use. Any patients that are found to be tobacco users should receive tobacco cessation intervention.
- **Q374:** Closing the Referral Loop: Receipt of Specialist Report: This MIPS quality measure is attributable to the clinician referring the patient and ensures that the referring clinician receives a report from the clinician to whom the patient was referred, therefore closing the communication loop.
- **Q431:** Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling: This MIPS quality measure screens patients for unhealthy alcohol use. Any patients that screen positive for unhealthy alcohol use should receive brief counseling.
- **Q503:** Gains in Patient Activation Measure (PAM®) Scores at 12 Months: This MIPS quality measure ensures capture of the patient voice and experience of care related to the patient's understanding and confidence in the clinician's ability to manage their health and be an active partner in the health care journey.

Improvement Activities

We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP candidate feedback period to determine the set of improvement activities to include in this MVP. We are proposing to include 11 improvement activities that reflect actions and processes undertaken by clinicians who specialize in the treatment of hypertension, as well as activities that promote advancing health and wellness, engagement and patient-centeredness, shared decision-making, and care coordination. These improvement activities provide opportunities for clinicians, in collaboration with patients, to drive outcomes and improve quality of care. The following improvement activities were proposed for inclusion in this MVP:

- **IA_AHW_1:** Chronic care and preventative care management for empaneled patients
- **IA_AHW_X:** Lifestyle Approaches to Diabetes Remediation
- **IA_BE_16:** Promote Self-management in Usual Care
- **IA_BMH_2:** Tobacco use
- **IA_CC_8:** Implementation of documentation improvements for practice/process improvements
- **IA_MVP:** Practice-Wide Quality Improvement in the MIPS Value Pathways Program
- **IA_PM_4:** Glycemic management services
- **IA_PM_5:** Engagement of community for health status improvement
- **IA_PM_25:** Save a Million Hearts: Standardization of Approach to Screening and Treatment for Cardiovascular Disease Risk
- **IA_PSPA_16:** Use of decision support —ideally platform-agnostic, interoperable clinical decision support (CDS) tools —and standardized treatment protocols to manage workflow on the care team to meet patient needs
- **IA_PSPA_28:** Completion of an Accredited Safety or Quality Improvement Program

Cost Measures

We are proposing to include one MIPS cost measure within the cost performance category of this MVP, which applies to the clinical topic of hypertension. We reviewed the MIPS cost measure inventory and considered feedback received during the 2025 MVP candidate feedback period to determine the set of cost measures to include in this MVP. The following cost measure provides

a meaningful assessment of the clinical care for clinicians who care for patients with hypertension:

- **TPCC_1:** Total Per Capita Cost (TPCC): This MIPS cost measure assesses the overall cost of care delivered to a Medicare patient with a focus on the primary care the patient receives from their providers.

Symbol Key:
Single exclamation point (!): MIPS core measure within an MVP.
Caret symbol (^): proposed new measure or improvement activity.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

	Q503: Gains in Patient Activation Measure (PAM®) Scores at 12 Months (Collection Type: MIPS CQM)	

Hypertension Improvement Activities

- **(!!) IA_AHW_1:** Chronic care and preventative care management for empaneled patients
- **(^)(!!) IA_AHW_X:** Lifestyle Approaches to Diabetes Remediation
- **(!!) IA_BE_16:** Promote Self-management in Usual Care
- **(!!) IA_BMH_2:** Tobacco use
- **(*) IA_CC_8:** Implementation of documentation improvements for practice/process improvements
- **(**) IA_MVP:** Practice-Wide Quality Improvement in the MIPS Value Pathways Program
- **(*)(!!) IA_PM_4:** Glycemic management services
- **(!!) IA_PM_5:** Engagement of community for health status improvement
- **(!!) IA_PM_25:** Save a Million Hearts: Standardization of Approach to Screening and Treatment for Cardiovascular Disease Risk

- **(*) IA_PSPA_16:** Use of decision support —ideally platform-agnostic, interoperable clinical decision support (CDS) tools —and standardized treatment protocols to manage workflow on the care team to meet patient needs
- **IA_PSPA_28:** Completion of an Accredited Safety or Quality Improvement Program

Group B: Modifications to Previously Finalized MVPs for the CY 2027 Performance Period/2029 MIPS Payment Year and Future Years

B.1: Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP

Table B.1a represents the proposed MIPS core measures for the Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP. The B.1b table, followed by a list of improvement activities, represents the measures and activities finalized within the Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP (90 FR 50406 through 50408) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP focuses on important assessors of the care emergency clinicians provide to patients. By focusing on these specific measures and activities, emergency clinicians can reduce clinical variability, improve the quality of emergency care and potentially lower costs. This MVP would be most applicable to clinicians who treat patients within the practice of emergency medicine, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[504], we are proposing the following measures as MIPS core measures for the Adopting Best Practices and Promoting Patient Safety within Emergency Medicine MVP:

- **Q116:** Avoidance of Antibiotic Treatment for Acute Bronchitis/Bronchiolitis
- **Q331:** Adult Sinusitis: Antibiotic Prescribed for Acute Viral Sinusitis (Overuse)
- **Q416:** Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 2 Through 17 Years

We are proposing to add one MIPS quality measure:

- **Q066:** Appropriate Testing for Pharyngitis: This appropriate use MIPS quality measure assesses for completion of a group A streptococcus test for patients diagnosed with pharyngitis or tonsilitis who were prescribed an antibiotic.

For the reasons stated in the introduction of this appendix[505], we are proposing to remove **Q415:** Emergency Medicine: Emergency Department Utilization of CT for Minor Blunt Head Trauma for Patients Aged 18 Years and Older. We are proposing to remove one QCDR measure due to low adoption, no benchmark after 2 consecutive years in MIPS and one high performing QCDR measure:

- **ACEP52:** Appropriate Emergency Department Utilization of Lumbar Spine Imaging for Acute Atraumatic Low Back Pain (low adoption, no benchmark after 2 consecutive years in MIPS)
- **ECPR46:** Avoidance of Opiates for Low Back Pain or Migraines (high performing)

[504] See MVP Development: Quality Measure and Improvement Activity Updates
[505] Ibid.

Modifications are being considered for the following QCDR measure:

- **ACEP52:** Appropriate Emergency Department Utilization of Lumbar Spine Imaging for Acute Atraumatic Low Back Pain: If the measure is not finalized for removal in the CY 2027 PFS final rule, this QCDR measure would undergo modifications to the denominator to exclude patients aged 65 and older, as they experience higher rates of osteoporosis-related vertebral fractures during routine activities and have higher rates of malignancies with spinal metastases compared to patients under 65 years old.

Symbol Key:
Single exclamation point (!): MIPS core measure within an MVP.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

Experience of Care	**Q321:** CAHPS for MIPS Clinician/Group Survey (Collection Type: CMS-approved Survey Vendor)	**COST_EDV_1:** Emergency Medicine
	ACEP50: ED Median Time from ED arrival to ED departure for all Adult Patients (Collection Type: QCDR)	

Adopting Best Practices and Promoting Patient Safety within Emergency Medicine Improvement Activities

- **IA_BE_4:** Engagement of Patients through Implementation of New Patient Portal
- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **(!!) IA_BMH_12:** Promoting Clinician Wellbeing
- **(**) IA_MVP:** Practice-Wide Quality Improvement in the MIPS Value Pathways Program
- **IA_PSPA_1:** Participation in an AHRQ-listed patient safety organization
- **IA_PSPA_7:** Use of QCDR data for ongoing practice assessment and improvements
- **(!!) IA_PSPA_15:** Implementation of an ASP

B.2: Advancing Cancer Care MVP

Table B.2a represents the proposed MIPS core measures for the Advancing Cancer Care MVP. The B.2b table, followed by a list of improvement activities, represents the measures and activities finalized within the Advancing Cancer Care MVP (90 FR 50408 through 50411) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Advancing Cancer Care MVP focuses on the clinical specialty of providing fundamental treatment and management of cancer care. This MVP would be most applicable to clinicians who treat patients within the practices of oncology and hematology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[506], we are proposing the following measures as MIPS core measures for the Advancing Cancer Care MVP:

- **Q102:** Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients
- **Q144:** Oncology: Medical and Radiation - Plan of Care for Pain
- **Q451:** RAS (KRAS and NRAS) Gene Mutation Testing Performed for Patients with Metastatic Colorectal Cancer who receive Anti-epidermal Growth Factor Receptor (EGFR) Monoclonal Antibody Therapy
- **Q457:** Percentage of Patients Who Died from Cancer Admitted to Hospice for Less than 3 days (lower score – better)
- **Q495:** Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood
- **Q506:** Positive PD-L1 Biomarker Expression Test Result Prior to First-Line Immune Checkpoint Inhibitor Therapy

We are proposing to add two QCDR measures:

- **PIMSH19:** Antiemetic Therapy for Low- and Minimal-Emetic-Risk Antineoplastic Agents - Avoidance of Overuse (Lower Score - Better): This QCDR measure is an inverse measure (lower score is better) that ensures clinicians follow clinical guidelines for patients treated with low- or minimal-emetic-risk antineoplastic agents by assessing for inappropriate pre-treatment antiemetic therapy.
- **PIMSH20:** Appropriate Antiemetic Therapy for High- and Moderate-Emetic-Risk Antineoplastic Agents: This QCDR measure ensures clinicians follow clinical guidelines for patients treated with high- or moderate-emetic-risk antineoplastic agents by ensuring they receive the appropriate pre-treatment antiemetic therapy, which could result in improved control of nausea and vomiting in patients.

For the reasons stated in the introduction of this appendix[507], we are proposing to remove **Q143:** Oncology: Medical and Radiation – Pain Intensity Quantified.

Modifications are being considered for the following QCDR measure:

- **PIMSH13:** Oncology: Mutation Testing for Stage IV Lung Cancer Completed Prior to the Start of Targeted Therapy: This QCDR measure is undergoing modifications to provide additional clarification and to emphasize its focus on first-line treatment. Updates are being made to the description, denominator, denominator exclusions, and numerator, along with the addition of a numerator note.

Improvement Activities

We are proposing to add one improvement activity that is relevant to this MVP and includes an advancing health and wellness component:

- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans

For the reasons stated in the introduction of this appendix[508], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Symbol Key:

Single exclamation point (!): MIPS core measure within an MVP.

Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.

Single asterisk (*): existing measures and improvement activities with proposed revisions.

B.3: Advancing Care for Heart Disease MVP

Table B.3a represents the proposed MIPS core measures for the Advancing Care for Heart Disease MVP. The B.3b table, followed by a list of improvement activities, represents the measures and activities finalized within the Advancing Care for Heart Disease MVP (90 FR 50411 through 50415) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Advancing Care for Heart Disease MVP focuses on the clinical theme of providing fundamental treatment and management of costly clinical conditions that contribute to, or may result from, heart disease. This MVP would be most applicable to clinicians who treat patients within the practices of cardiology, internal medicine and family medicine, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[509], we are proposing the following measures as MIPS core measures for the Advancing Care for Heart Disease MVP:

- **Q441:** Ischemic Vascular Disease (IVD) All or None Outcome Measure (Optimal Control)
- **Q492:** Risk-standardized Acute Cardiovascular-related Hospital Admission Rates for Patients with Heart Failure under the Merit-based Incentive Payment System
- **TBD:** Low Density Lipoprotein Cholesterol (LDL-C) Monitoring and Management

We are proposing to add one MIPS quality measure:

- **TBD:** Low Density Lipoprotein Cholesterol (LDL-C) Monitoring and Management: This proposed intermediate outcome MIPS quality measure ensures lipid monitoring in patients with atherosclerotic cardiovascular disease (ASCVD) and achieving the target goal of an LDL-C less than 70mg/dL.

For the reasons stated in the introduction of this appendix[510], we are proposing to remove **Q006:** Coronary Artery Disease (CAD): Antiplatelet Therapy, **Q007:** Coronary Artery Disease (CAD): Beta-Blocker Therapy – Prior Myocardial Infarction (MI) or Left Ventricular Systolic Dysfunction (LVEF < 40%), and **Q326:** Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy.

Improvement Activities

For the reasons stated in the introduction of this appendix[511], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Symbol Key:

- **IA_PSPA_7:** Use of QCDR data for ongoing practice assessment and improvements

B.4: Advancing Rheumatology Patient Care MVP

Table B.4a represents the proposed MIPS core measures for the Advancing Rheumatology Patient Care MVP. The B.4b table, followed by a list of improvement activities, represents the measures and activities finalized within the Advancing Rheumatology Patient Care MVP (90 FR 50415 through 50418) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Advancing Rheumatology Patient Care MVP focuses on the clinical theme of providing fundamental treatment and management of rheumatological conditions. This MVP would be most applicable to clinicians who treat patients within the practice of rheumatology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[512], we are proposing the following measures as MIPS core measures for the Advancing Rheumatology Patient Care MVP:

- **Q039:** Screening for Osteoporosis for Women Aged 65-85 Years of Age
- **Q178:** Rheumatoid Arthritis (RA): Functional Status Assessment
- **Q180:** Rheumatoid Arthritis (RA): Glucocorticoid Management

We are proposing to add one QCDR measure:

- **UREQA8:** Vitamin D level: Effective Control of Low Bone Mass/Osteopenia and Osteoporosis: Therapeutic Level Of 25 OH Vitamin D Level Achieved: This QCDR measure ensures that patients diagnosed with osteopenia or osteoporosis maintain a hydroxy-vitamin D level at or above the targeted threshold.

We are proposing to remove one process QCDR measure that does not include a quality action:

- **ACR12:** Disease Activity Measurement for Patients with PsA

Modifications are being considered for the following QCDR measures:

- **ACR10:** Hepatitis B Safety Screening: This QCDR measure is undergoing modifications to add denominator instructions that provide clearer guidance on what qualifies as a 'newly initiated' biologic.
- **ACR12:** Disease Activity Measurement for Patients with PsA: If the measure is not finalized for removal in the CY 2027 PFS final rule, this QCDR measure would undergo modifications to the denominator to add a specific age-related timeframe and clarify the required timeframe for the additional face-to-face encounter.
- **ACR14:** Gout: Serum Urate Target: This QCDR measure is undergoing modifications to the denominator to include a specific age-related timeframe. There would also be updates to the denominator exceptions to align with the American College of Rheumatology (ACR) clinical guidelines.
- **ACR15:** Safe Hydroxychloroquine Dosing: This QCDR measure is undergoing modifications to the description and numerator to add a second option for meeting numerator compliance. An alternative criterion, allowing completion and documentation

[512] See MVP Development: Quality Measure and Improvement Activity Updates

of an Hydroxychloroquine (HCQ) whole blood level measurement would satisfy numerator requirements.

Improvement Activities

We are proposing to add one improvement activity that is relevant to this MVP and includes an advancing health and wellness component:

- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans

For the reasons stated in the introduction of this appendix[513], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.

	(*) Q176: Tuberculosis Screening Prior to First Course of Biologic and/or Immune Response Modifier Therapy (Collection Type: MIPS CQM)	
	(*) ACR10: Hepatitis B Safety Screening (Collection Type: QCDR)	
	(+) UREQA8: Vitamin D level: Effective Control of Low Bone Mass/Osteopenia and Osteoporosis: Therapeutic Level Of 25 OH Vitamin D Level Achieved (Collection Type: QCDR)	
	UREQA9: Screening for Osteoporosis for Men Aged 70 Years and Older (Collection Type: QCDR)	
	Q493: Adult Immunization Status (Collection Type: MIPS CQM)	
Experience of Care	**Q503:** Gains in Patient Activation Measure (PAM®) Scores at 12 Months (Collection Type: MIPS CQM)	**COST_RA_1:** Rheumatoid Arthritis **TPCC_1:** Total Per Capita Cost

Advancing Rheumatology Improvement Activities

- **IA_BE_1:** Use of certified EHR to capture patient reported outcomes
- **IA_BE_4:** Engagement of Patients through Implementation of New Patient Portal
- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **IA_BE_24:** Financial Navigation Program
- **IA_BE_25:** Drug Cost Transparency
- **(!!) IA_BE_26:** Promote Use of Patient-Reported Outcome Tools

- **(!!) IA_BMH_2:** Tobacco use
- **(+)(*)(!!) IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_EPA_2:** Use of telehealth services that expand practice access
- **(**) IA_MVP:** Practice-Wide Quality Improvement in the MIPS Value Pathways Program
- **IA_PM_16:** Implementation of medication management practice improvements
- **IA_PSPA_28:** Completion of an Accredited Safety or Quality Improvement Program

B.5 Complete Ophthalmologic Care MVP

Table B.5a represents the proposed MIPS core measures for the Complete Ophthalmologic Care MVP. The B.5b table, followed by a list of improvement activities, represents the measures and activities finalized within the Complete Ophthalmologic Care MVP (90 FR 50418 through 50421) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. This MVP would be most applicable to clinicians who treat patients within the practices of ophthalmology and optometry, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[514], we are proposing the following measures as MIPS core measures for the Complete Ophthalmologic Care MVP:

- **Q012:** Primary Open-Angle Glaucoma (POAG): Optic Nerve Evaluation
- **Q141:** Primary Open-Angle Glaucoma (POAG): Reduction of Intraocular Pressure (IOP) by 20% OR Documentation of a Plan of Care
- **Q304:** Cataracts: Patient Satisfaction within 90 Days Following Cataract Surgery
- **Q385:** Adult Primary Rhegmatogenous Retinal Detachment Surgery: Visual Acuity Improvement Within 90 Days of Surgery
- **Q501:** Acute posterior vitreous detachment and acute vitreous hemorrhage appropriate examination and follow-up

Modifications are being considered for the following QCDR measure:

- **IRIS2:** Glaucoma – Intraocular Pressure Reduction: This QCDR measure is undergoing modifications to ensure compliance is based upon assessment of intraocular pressure for each eye effected.

For the reasons stated in the introduction of this appendix[515], we are proposing to remove **Q384:** Adult Primary Rhegmatogenous Retinal Detachment Surgery: No Return to the Operating Room Within 90 Days of Surgery. We are proposing to remove two high performing QCDR measures:

- **IRIS13:** Diabetic Macular Edema - Loss of Visual Acuity
- **IRIS54:** Complications After Cataract Surgery

Improvement Activities

We are proposing to add one improvement activity relevant to this MVP, which includes elements of an activity that is proposed for removal from MIPS:

- **IA_CC_8:** Implementation of documentation improvements for practice/process improvements.

---

[514] See MVP Development: Quality Measure and Improvement Activity Updates

[515] Ibid.

For the reasons stated in the introduction of this appendix[516], we are proposing to remove **IA_CC_10:** Care transition documentation practice improvements.

- **IA_PSPA_7:** Use of QCDR data for ongoing practice assessment and improvements

B.6: Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP

Table B.6a represents the proposed MIPS core measures for the Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP. The B.6b table, followed by a list of improvement activities, represents the measures and activities finalized within the Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP (90 FR 50422 through 50424) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP focuses on the clinical theme of providing fundamental prevention and treatment of those patients at risk for or have had a stroke. This MVP would be most applicable to clinicians who treat patients within the practices of neurology, neurosurgical, and vascular surgery, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[517], we are proposing the following measures as MIPS core measures for the Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes MVP:

- **Q047:** Advance Care Plan
- **Q236:** Controlling High Blood Pressure
- **Q441:** Ischemic Vascular Disease (IVD) All or None Outcome Measure (Optimal Control).

For the reasons stated in the introduction of this appendix[518], we are proposing to remove **Q326:** Atrial Fibrillation and Atrial Flutter: Chronic Anticoagulation Therapy.

Symbol Key:

Exclamation point (!): MIPS core measures within MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes Improvement Activities

- **(!!) IA_AHW_1:** Chronic Care and Preventative Care Management for Empaneled Patients
- **IA_BE_1:** Use of certified EHR to capture patient reported outcomes
- **IA_BE_4:** Engagement of Patients through Implementation of New Patient Portal
- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **IA_BE_24:** Financial Navigation Program
- **IA_BMH_l5:** Behavioral/Mental Health and Substance Use Screening and Referral for Older Adults
- **IA_CC_13:** Practice improvements to align with OpenNotes principles
- **IA_CC_17:** Patient Navigator Program
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_l5:** Implementation of episodic care management practice improvements

B.7: Dermatological Care MVP

Table B.7a represents the proposed MIPS core measures for the Dermatological MVP. The B.7b table, followed by a list of improvement activities, represents the measures and activities finalized within the Dermatological MVP (90 FR 50424 through 50428) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Dermatological Care MVP focuses on the clinical theme of providing treatment and management of dermatologic care. This MVP would be most applicable to clinicians who treat patients within the practice of dermatology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP

maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[519], we are proposing the following measures as MIPS core measures for the Dermatological Care MVP:

- **Q176:** Tuberculosis Screening Prior to First Course of Biologic and/or Immune Response Modifier Therapy
- **Q410:** Psoriasis: Clinical Response to Systemic Medications
- **Q486:** Dermatitis – Improvement in Patient-Reported Itch Severity

We are proposing to remove one high performing QCDR measure:

- **AAD16:** Avoidance of Post-operative Systemic Antibiotics for Office-based Closures and Reconstruction After Skin Cancer Procedures

Modifications are being considered for the following QCDR measures:

- **AAD6:** Skin Cancer: Biopsy Reporting Time - Clinician to Patient: This QCDR measure is undergoing modifications to update the description and numerator to reflect a shortened timeframe for clinician notification of final pathology findings, reducing the requirement from 8 days to 7 days.
- **AAD12:** Melanoma: - Appropriate Surgical Margins: This QCDR measure is undergoing modifications to update the title, description, denominator, and numerator to reflect a broader measure that would include additional skin cancers, specifically squamous cell carcinoma and basal cell carcinoma.

Improvement Activities

We are proposing to add one improvement activity that is relevant to this MVP and includes an advancing health and wellness component:

- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans

For the reasons stated in the introduction of this appendix[520], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

Dermatological Care Improvement Activities

- **IA_BE_4:** Engagement of Patients through Implementation of New Patient Portal
- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **(+)(*)(!) IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_EPA_2:** Use of telehealth services that expand practice access
- **IA_EPA_7:** Enhance Engagement of Medicaid and Other Underserved Populations
- **(!!) IA_EPA_8:** Provide Education Opportunities for New Clinicians

- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_16:** Implementation of medication management practice improvements
- **IA_PSPA_8:** Use of Patient Safety Tools

B.8 Diagnostic Radiology MVP

Table B.8a represents the proposed MIPS core measures for the Diagnostic Radiology MVP. The B.8b table, followed by a list of improvement activities, represents the measures and activities finalized within the Diagnostic Radiology MVP (90 FR 50376 through 50381) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Diagnostic Radiology MVP assesses meaningful outcomes in diagnostic radiology. This MVP would be most applicable to clinicians who treat patients within the practices of diagnostic radiology and nuclear medicine. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[521], we are proposing the following measures as MIPS core measures for the Diagnostic Radiology MVP:

- **Q145:** Radiology: Exposure Dose Indices Reported for Procedures Using Fluoroscopy
- **Q360:** Optimizing Patient Exposure to Ionizing Radiation: Count of Potential High Dose Radiation Imaging Studies: Computed Tomography (CT) and Cardiac Nuclear Medicine Studies
- **Q405:** Appropriate Follow-up Imaging for Incidental Abdominal Lesions

We are proposing to add four MIPS quality measures to the new Nuclear Medicine clinical grouping:

- **Q282:** Dementia: Functional Status Assessment: This MIPS quality measure focuses on the importance of ensuring that patients diagnosed with dementia receive a comprehensive functional assessment annually.
- **Q286:** Dementia: Safety Concern Screening and Follow-Up for Patients with Dementia: This MIPS quality measure aims to address safety concerns in patients diagnosed with dementia by ensuring that appropriate screening and follow-up actions are conducted.
- **Q288:** Dementia: Education and Support of Caregivers for Patients with Dementia: This MIPS quality measure focuses on the importance of providing education and support to caregivers of patients with Dementia.
- **Q386:** Amyotrophic Lateral Sclerosis (ALS) Patient Care Preferences: This MIPS quality measure focuses on the importance of addressing end-of-life care preferences for patients diagnosed with ALS.

We are proposing to add one QCDR measure:

- **ACRAD34:** Multi-strata weighted average for 3 CT Exam Types: Overall Percent of CT exams for which Dose Length Product is at or below the size-specific diagnostic reference level (for CT abdomen-pelvis with contrast/single-phase scan, CT chest without contrast/single-phase scan, and CT head/brain without contrast/single-phase scan): This QCDR measure ensures that all CT scans—abdomen-pelvis with contrast, chest without contrast, and head/brain single-phase—maintain a Dose Length Product at or below the established threshold to help manage patient radiation exposure.

[521] See MVP Development: Quality Measure and Improvement Activity Updates

Improvement Activities

For the reasons stated in the introduction of this appendix[522], we are proposing to remove **IA_CC_12:** Care coordination agreements that promote improvements in patient tracking across settings and **IA_PSPA_2:** Participation in MOC Part IV.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

- **IA_PSPA_7**: Use of QCDR data for ongoing practice assessment and improvements
- **IA_PSPA_12**: Participation in private payer CPIA

B.9: Focusing on Women's Health MVP

Table B.9a represents the proposed MIPS core measures for the Focusing on Women's Health MVP. The B.9b table, followed by a list of improvement activities, represents the measures and activities finalized within the Women's Health MVP (90 FR 50428 through 50430) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Focusing on Women's Health MVP focuses on the clinical specialty of providing treatment and management of women's health. This MVP would be most applicable to clinicians who treat patients within the practices of gynecology, obstetrics, and urogynecology, including NPPs such as certified nurse-midwives, nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which

measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[523], we are proposing the following measures as MIPS core measures for the Focusing on Women's Health MVP:

- **Q039:** Screening for Osteoporosis for Women Aged 65-85 Years of Age
- **Q112:** Breast Cancer Screening
- **Q432:** Proportion of Patients Sustaining a Bladder or Bowel Injury at the Time of any Pelvic Organ Prolapse Repair

Symbol Key:

	Q431: Preventive Care and Screening: Unhealthy Alcohol Use: Screening & Brief Counseling (Collection Type: MIPS CQM)	
	(*) Q475: HIV Screening (Collection Type: eCQM)	
	Q493: Adult Immunization Status (Collection Type: MIPS CQM)	
	UREQA8: Vitamin D level: Effective Control of Low Bone Mass/Osteopenia and Osteoporosis: Therapeutic Level Of 25 OH Vitamin D Level Achieved (Collection Type: QCDR)	

Focusing on Women's Health Improvement Activities

- **IA_BE_4:** Engagement of Patients through Implementation of New Patient Portal
- **(!!) IA_BE_16:** Promote Self-management in Usual Care
- **(!!) IA_BE_26:** Promote Use of Patient-Reported Outcome Tools
- **IA_BMH_11:** Implementation of a Trauma-Informed Care (TIC) Approach to Clinical Practice
- **(!!) IA_BMH_14:** Behavioral/Mental Health and Substance Use Screening and Referral for Pregnant and Postpartum Women
- **(*)(!!) IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_EPA_2:** Use of telehealth services that expand practice access
- **IA_EPA_7:** Enhance Engagement of Medicaid and Other Underserved Populations

- **(**) IA_MVP:** Practice-Wide Quality Improvement in the MIPS Value Pathways Program
- **(!!) IA_PM_23:** Use of Computable Guidelines and Clinical Decision Support to Improve Adherence for Cervical Cancer Screening and Management Guidelines

B.10: Gastroenterology Care MVP

Table B.10a represents the proposed MIPS core measures for the Gastroenterology Care MVP. The B.10b table, followed by a list of improvement activities, represents the measures and activities finalized within the Gastroenterology Care MVP (90 FR 50430 through 50434) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Gastroenterology Care MVP focuses on the clinical theme of providing treatment and management of the digestive system and the liver. This MVP would be most applicable to clinicians who treat patients within the practice of gastroenterology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality and cost measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[524], we are proposing the following measures as MIPS core measures for the Gastroenterology Care MVP:

- **Q226:** Preventive Care and Screening: Tobacco Use: Screening and Cessation Intervention
- **Q275:** Inflammatory Bowel Disease (IBD): Assessment of Hepatitis B Virus (HBV) Status Before Initiating Anti-TNF (Tumor Necrosis Factor) Therapy
- **Q516:** Hepatitis C Virus (HCV): Sustained Virological Response (SVR)

For the reasons stated in the introduction of this appendix[525], we are proposing to remove **Q320:** Appropriate Follow-Up Interval for Normal Colonoscopy in Average Risk Patients. We are proposing to remove one high performing QCDR measure:

- **NHCR4:** Repeat screening or surveillance colonoscopy recommended within one year due to inadequate bowel preparation.

Modifications are being considered for the following QCDR measures:

- **GIQIC23:** Appropriate follow-up interval based on pathology findings in screening colonoscopy: This QCDR measure is undergoing modifications to ensure patients are receiving appropriate follow up within the recommended timeframe.

Improvement Activities

We are proposing to add one improvement activity relevant to this MVP:

- **IA_CC_8:** Implementation of documentation improvements for practice/process improvements.

For the reasons stated in the introduction of this appendix[526], we are proposing to remove **IA_CC_10:** Care transition documentation practice improvements.

B.11: Improving Care for Lower Extremity Joint Repair MVP

Table B.11a represents the proposed MIPS core measures for the Improving Care for Lower Extremity Joint Repair MVP. The B.11b table, followed by a list of improvement activities, represents the measures and activities finalized within the Improving Care for Lower Extremity Joint Repair MVP (90 FR 50434 through 50435) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Improving Care for Lower Extremity Joint Repair MVP focuses on the clinical theme of providing fundamental treatment and management of patients with osteoarthritis and lower extremity surgical repair, such as fracture and total joint replacement, to ensure appropriate care and reduce costs. This MVP would be most applicable to clinicians who treat patients within the practice of orthopedic surgery, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[527], we are proposing the following measures as MIPS core measures for the Improving Care for Lower Extremity Joint Repair

[527] See MVP Development: Quality Measure and Improvement Activity Updates

MVP:

- **Q351:** Total Knee or Hip Replacement: Venous Thromboembolic and Cardiovascular Risk Evaluation
- **Q470:** Functional Status After Primary Total Knee Replacement
- **Q480:** Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) for Merit-based Incentive Payment System (MIPS)

For the reasons stated in the introduction of this appendix[528], we are proposing to remove **Q350:** Total Knee or Hip Replacement: Shared Decision-Making: Trial of Conservative (Non-surgical) Therapy.

Symbol Key:
Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

TABLE B.11a: Improving Care for Lower Extremity Joint Repair MVP MIPS Core Measures

Advancing Health and Wellness	**(**) Q128:** Preventive Care and Screening: Body Mass Index (BMI) Screening and Follow-Up Plan (Collection Type: Medicare Part B Claims, eCQM, MIPS CQM)	**COST_PHA_1:** Elective Primary Hip Arthroplasty **COST_KA_1:** Knee Arthroplasty

Improving Care for Lower Extremity Joint Repair Improvement Activities

- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **IA_BE_12:** Use evidence-based decision aids to support shared decision-making
- **(!!) IA_BE_26:** Promote Use of Patient-Reported Outcome Tools
- **IA_CC_7:** Regular training in care coordination
- **(*)(!!) IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_CC_13:** Practice Improvements to Align with OpenNotes Principles
- **IA_CC_15:** PSH Care Coordination
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PSPA_7:** Use of QCDR data for ongoing practice assessment and improvements
- **IA_PSPA_18:** Measurement and improvement at the practice and panel level

B.12 Interventional Radiology MVP

Table B.12a represents the proposed MIPS core measures for the Interventional Radiology MVP. The B.12b table, followed by a list of improvement activities, represents the measures and activities finalized within the Interventional Radiology MVP (90 FR 50381 through 50386) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Interventional Radiology MVP assesses meaningful outcomes in interventional radiology. This MVP would be most applicable to clinicians who treat patients within the practice of interventional radiology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance

period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[529], we are proposing the following measures as MIPS core measures for the Interventional Radiology MVP:

- **Q145:** Radiology: Exposure Dose Indices Reported for Procedures Using Fluoroscopy
- **Q413:** Door to Puncture Time for Endovascular Stroke Treatment
- **Q420:** Varicose Vein Treatment with Saphenous Ablation: Outcome Survey

Improvement Activities

We are proposing to remove one improvement activity as the activity is more relevant to general surgery and surgical subspecialties:

- **IA_CC_15:** PSH Care Coordination

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

- **IA_PSPA_25:** Cost Display for Laboratory and Radiographic Orders

B.13 Neuropsychology MVP

Table B.13a represents the proposed MIPS core measures for the Neuropsychology MVP. The B.13b table, followed by a list of improvement activities, represents the measures and activities finalized within the Neuropsychology MVP (90 FR 50386 through 50390) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Neuropsychology MVP focuses on the clinical specialty of providing treatment and management of neuropsychological care. This MVP would be most applicable to clinicians who treat patients within the practice of neuropsychology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[530], we are proposing the following measures as MIPS core measures for the Neuropsychology MVP:

- **Q134:** Preventive Care and Screening: Screening for Depression and Follow-Up Plan
- **Q181:** Elder Maltreatment Screen and Follow-up Plan
- **Q282:** Dementia: Functional Status Assessment

Improvement Activities

For the reasons stated in the introduction of this appendix[531], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family and Caregivers in Developing a Plan of Care.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

B.14: Optimal Care for Kidney Health MVP

Table B.14a represents the proposed MIPS core measures for the Optimal Care for Kidney Health MVP. The B.14b table, followed by a list of improvement activities, represents the measures and activities finalized within the Optimal Care for Kidney Health MVP (90 FR 50435 through 50438) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Optimal Care for Kidney Health MVP focuses on the clinical specialty of providing fundamental treatment and management of costly clinical conditions that contribute to, or may result from, kidney disease. This MVP would be most applicable to clinicians who treat patients within the practice of nephrology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[532], we are proposing the following measures as MIPS core measures for the Optimal Care for Kidney Health MVP:

- **Q236:** Controlling High Blood Pressure

[532] See MVP Development: Quality Measure and Improvement Activity Updates

- **Q482:** Hemodialysis Vascular Access: Practitioner Level Long-term Catheter Rate
- **Q489:** Adult Kidney Disease: Angiotensin Converting Enzyme (ACE) Inhibitor or Angiotensin Receptor Blocker (ARB) Therapy

Improvement Activities

We are proposing to add one improvement activity that is relevant to this MVP and includes an advancing health and wellness component:

- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans

For the reasons stated in the introduction of this appendix[533], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_11:** Regular Review Practices in Place on Targeted Patient Population Needs
- **IA_PM_16:** Implementation of medication management practice improvements
- **(*) IA_PSPA_16:** Use of decision support —ideally platform-agnostic, interoperable clinical decision support (CDS) tools —and standardized treatment protocols to manage workflow on the care team to meet patient needs

B.15: Optimal Care for Patients with Urologic Conditions MVP

Table B.15a represents the proposed MIPS core measures for the Optimal Care for Patients with Urologic Conditions MVP. The B.15b table, followed by a list of improvement activities, represents the measures and activities finalized within the Optimal Care for Patients with Urologic Conditions MVP (90 FR 50438 through 50441) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Optimal Care for Patients with Urologic Conditions MVP focuses on assessing optimal care for patients treated for a broad range of urologic conditions, including kidney stones, urinary incontinence, bladder cancer, and prostate cancer. This MVP would be most applicable to clinicians who treat patients within the practices of urology, general urologists, urology oncologists, and urogynecology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[534], we are proposing the following measures as MIPS core measures for the Optimal Care for Patients with Urologic Conditions MVP:

- **Q050:** Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older
- **Q358:** Patient-Centered Surgical Risk Assessment and Communication
- **Q462:** Bone Density Evaluation for Patients with Prostate Cancer and Receiving Androgen Deprivation Therapy

We are proposing to remove two high performance QCDR measures, one process QCDR measure, and one QCDR measure due to low adoption, no benchmark after 2 consecutive years in MIPS:

- **AQUA8:** Hospital Admissions or Infectious Complications Within 30 days of Prostate Biopsy (high performing)
- **AQUA14:** Stones: Repeat Shock Wave Lithotripsy (SWL) Within 6 Months of Initial Treatment (high performing)
- **AQUA15:** Stones: Urinalysis or Urine Culture Performed Before Surgical Stone Procedures (process measure)
- **AQUA16:** Non-Muscle Invasive Bladder Cancer: Repeat Transurethral Resection of Bladder Tumor (TURBT) for T1 Disease (low adoption, no benchmark after 2 consecutive years in MIPS)

Modifications are being considered for the following QCDR measures:

- **AQUA14:** Stones: Repeat Shock Wave Lithotripsy (SWL) Within 6 Months of Initial Treatment: If the measure is not finalized for removal in the CY 2027 PFS final rule, this QCDR measure would undergo modifications to the title, description, and numerator to align with the American Urological Association (AUA) updated clinical guidelines, which recommend a second SWL or ureteroscopy (URS) when the initial SWL does not achieve complete clearance.
- **AQUA15:** Stones: Urinalysis or Urine Culture Performed Before Surgical Stone Procedures: If the measure is not finalized for removal in the CY 2027 PFS final rule, this QCDR measure would undergo modifications to add a quality action to the numerator to ensure abnormal results are appropriately addressed.
- **MUSIC4:** Prostate Cancer: Active Surveillance/Watchful Waiting for Newly Diagnosed Low Risk Prostate Cancer Patients: This QCDR measure is undergoing modifications to ensure patients newly diagnosed with low-risk prostate cancer on active surveillance undergo a confirmation biopsy within 24 months of their diagnosis.

Improvement Activities

We are proposing to add two improvement activities relevant to this MVP, both of which include an advancing health and wellness component:

- **IA_BE_16:** Promote Self-management in Usual Care
- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans

For the reasons stated in the introduction of this appendix[535], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Optimal Care for Patients with Urologic Conditions Improvement Activities

- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **(+)(!!) IA_BE_16:** Promote Self-management in Usual Care
- **(!!) IA_BE_26:** Promote Use of Patient-Reported Outcome Tools
- **IA_CC_7**: Regular training in care coordination
- **(+)(*)(!!) IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_CC_13:** Practice improvements to align with OpenNotes principles
- **IA_CC_17:** Patient Navigator Program
- **IA_EPA_2:** Use of telehealth services that expand practice access
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_17:** Participation in Population Health Research
- **IA_PM_21:** Advance Care Planning

- **IA_PSPA_7:** Use of QCDR data for ongoing practice assessment and improvements
- **IA_PSPA_12:** Participation in private payer CPIA
- **IA_PSPA_21:** Implementation of fall screening and assessment programs

B.16 Pathology MVP

Table B.16a represents the proposed MIPS core measures for the Pathology MVP. The B.16b table, followed by a list of improvement activities, represents the measures and activities finalized within the Pathology MVP (90 FR 50390 through 50395) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Pathology MVP focuses on assessing meaningful outcomes in pathology. This MVP would be most applicable to pathology clinicians. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[536], we are proposing the following measures as MIPS core measures for the Pathology MVP:

- **Q396:** Lung Cancer Reporting (Resection Specimens)
- **Q440:** Skin Cancer: Biopsy Reporting Time – Pathologist to Clinician
- **Q491:** Mismatch Repair (MMR) or Microsatellite Instability (MSI) Biomarker Testing Status

We are proposing to add one QCDR measure that is relevant to this MVP:

- **QMM33:** Immunohistochemistry (IHC) and/or Molecular BRAF Testing Status in Metastatic Melanoma: This QCDR measure ensures that pathologists include a recommendation for BRAF testing, documentation of current or prior BRAF test results, or confirmation that BRAF testing is pending in all final immunohistochemical staining reports for patients with an initial diagnosis of metastatic melanoma.

We are proposing to remove one QCDR measure due to low adoption, no benchmark after 2 consecutive years in MIPS:

- **QMM25:** Use of Structured Reporting for Urine Cytology Specimens

Modifications are being considered for the following QCDR measures:

- **CAP30:** Urinary Bladder Cancer: Complete Analysis and Timely Reporting: This QCDR measure is undergoing modifications to the title and description to clarify the quality action in relation to patient outcomes and the overarching goal of supporting informed treatment decisions.

Improvement Activities

We are proposing to add four additional improvement activities relevant to this MVP, all of which include an advancing health and wellness component:

- **IA_CC_8:** Implementation of documentation improvements for practice/process improvements
- **IA_CC_XX:** Use of Data to Improve Practice Workflows
- **IA_CC_XX:** Understand and Improve Diagnostic Performance
- **IA_ EPA_8:** Provide Education Opportunities for New Clinicians

[536] See MVP Development: Quality Measure and Improvement Activity Updates

For the reasons stated in the introduction of this appendix[537], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care, **IA_CC_12:** Care coordination agreements that promote improvements in patient tracking across settings and **IA_PSPA_2:** Participation in MOC Part IV.

Symbol Key:
Exclamation point (!): MIPS core measure within an MVP.
Caret symbol (^): proposed new measure or improvement activity.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

	(!)(*) Q491: Mismatch Repair (MMR) or Microsatellite Instability (MSI) Biomarker Testing Status (Collection Type: MIPS CQM)	
	(*) CAP30: Urinary Bladder Cancer: Complete Analysis and Timely Reporting (Collection Type: QCDR)	
	CAP34: Molecular Assessment: Biomarkers in Non-Small Cell Lung Cancer (Collection Type: QCDR)	
	CAP40: Squamous Cell Skin Cancer: Complete Reporting (Collection Type: QCDR)	
	QMM21: Incorporating results of concurrent studies into Final Reports for Bone Marrow Aspirate of patients with Leukemia, Myelodysplastic syndrome, or Chronic Anemia (Collection Type: QCDR)	
	QMM29: Use of Appropriate Classification System for Lymphoma Specimen (Collection Type: QCDR)	
	QMM30: Appropriate Use of Bethesda System for Reporting Thyroid Cytopathology on Fine Needle Aspirations (FNA) of Thyroid Nodule(s) (Collection Type: QCDR)	
	(+) QMM33: Immunohistochemistry (IHC) and/or Molecular BRAF Testing Status in Metastatic Melanoma (Collection Type: QCDR)	

Pathology Improvement Activities

- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **(!!) IA_BE_26:** Promote Use of Patient-Reported Outcome Tools
- **(!!) IA_BMH_12:** Promoting Clinician Well-Being
- **(+)(*)(!!) IA_CC_8:** Implementation of documentation improvements for practice/process improvements
- **(*)(!!) IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_CC_19:** Tracking of clinician's relationship to and responsibility for a patient by reporting MACRA patient relationship codes
- **(^)(+) IA_CC_XX:** Use of Data to Improve Practice Workflows

- **(^)(+) IA_CC_XX:** Understand and Improve Diagnostic Performance
- **(+) IA_ EPA_8:** Provide Education Opportunities for New Clinicians
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PSPA_1:** Participation in an AHRQ-listed patient safety organization
- **IA_PSPA_12:** Participation in private payer CPIA
- **IA_PSPA_13:** Participation in Joint Commission Evaluation Initiative
- **IA_PSPA_35:** Adopt Certified Health Information Technology for Security Tags for Electronic Health Record Data

B.17: Patient Safety and Support of Positive Experiences with Anesthesia MVP

Table B.17a represents the proposed MIPS core measures for the Patient Safety and Support of Positive Experiences with Anesthesia MVP. The B.17b table, followed by a list of improvement activities, represents the measures and activities finalized within the Patient Safety and Support of Positive Experiences with Anesthesia MVP (90 FR 50441 through 50444) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Patient Safety and Support of Positive Experiences with Anesthesia MVP focuses on increasing the quality of anesthesia care, improving postoperative outcomes, promoting patient safety, and enhancing satisfaction for patients receiving anesthesia. The measures are used for a variety of surgical procedures that anesthesiologists deliver care for, and are broadly applicable to anesthesiologists practicing within ambulatory, outpatient, and inpatient hospital settings, including NPPs such as certified registered nurse anesthetists (CRNAs), nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[538], we are proposing the following measures as MIPS core measures for the Patient Safety and Support of Positive Experiences with Anesthesia MVP:

- **Q404:** Anesthesiology Smoking Abstinence
- **Q477:** Multimodal Pain Management
- **TBD:** Intraoperative Hypotension (IOH) among Non-Emergent Noncardiac Surgical Cases

We are proposing to add two new MIPS quality measures and two QCDR measures:

- **TBD:** Intraoperative Hypotension (IOH) among Non-Emergent Noncardiac Surgical Cases: This proposed MIPS quality measure assesses the mean arterial pressure (MAP) of patients undergoing noncardiac, non-emergency surgery that requires general anesthesia or monitored anesthesia.
- **TBD:** Patient-Reported Experience with Anesthesia: This proposed MIPS quality measure assesses patient experience and satisfaction with anesthesia care.
- **AQI65:** Avoidance of Cerebral Hyperthermia for Procedures Involving Cardiopulmonary Bypass: This QCDR measure ensures patients receive appropriate intraoperative temperature monitoring during cardiopulmonary bypass, with documentation that pulmonary artery, oropharyngeal, or nasopharyngeal temperatures are maintained at or above 37.0 degrees Celsius.

[538] See MVP Development: Quality Measure and Improvement Activity Updates

- **AQI71:** Ambulatory Glucose Management: This QCDR measure ensures patients with diabetes undergoing office-based or ambulatory surgery receive appropriate blood glucose monitoring and intervention throughout the entire anesthesia care episode.

For the reasons stated in the introduction of this appendix[539], we are proposing to remove **Q430:** Prevention of Post-Operative Nausea and Vomiting (PONV) – Combination Therapy and **Q463:** Prevention of Post-Operative Vomiting (POV) – Combination Therapy (Pediatrics). We are proposing to remove one high performing QCDR measure and two QCDR measures proposed to transition to MIPS measures:

- **ABG44:** Low Flow Inhalational General Anesthesia (high performing)
- **AQI48:** Patient-Reported Experience with Anesthesia (proposed as a MIPS measure)
- **EPREOP31:** Intraoperative Hypotension (IOH) among Non-Emergent Noncardiac Surgical Cases (proposed as a MIPS measure)

Symbol Key:
Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

Patient Safety and Support of Positive Experiences with Anesthesia MVP		
Clinical Grouping	**Quality**	**Cost**
Sedation/General Anesthesia	**(!) Q404:** Anesthesiology Smoking Abstinence (Collection Type: MIPS CQM)	**MSPB_1:** Medicare Spending Per Beneficiary (MSPB) Clinician
	(!)(^)(+) TBD: Intraoperative Hypotension (IOH) among Non-Emergent Noncardiac Surgical Cases (Collection Type: MIPS CQM)	
	(+) AQI65: Avoidance of Cerebral Hyperthermia for Procedures Involving Cardiopulmonary Bypass (Collection Type: QCDR)	
	(+) AQI71: Ambulatory Glucose Management (Collection Type: QCDR)	
Pain Management	**(!) Q477**: Multimodal Pain Management (Collection Type: MIPS CQM)	**MSPB_1:** Medicare Spending Per Beneficiary (MSPB) Clinician
Experience of Care	**(^)(+) TBD:** Patient-Reported Experience with Anesthesia (Collection Type: MIPS CQM)	**MSPB_1:** Medicare Spending Per Beneficiary (MSPB) Clinician

Patient Safety and Support of Positive Experiences with Anesthesia Improvement Activities

- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **IA_BE_22:** Improved practices that engage patients pre-visit
- **(!!) IA_BMH_2:** Tobacco use
- **IA_CC_15:** PSH Care Coordination
- **IA_CC_19:** Tracking of clinician's relationship to and responsibility for a patient by reporting MACRA patient relationship codes
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PSPA_1:** Participation in an AHRQ-listed patient safety organization
- **IA_PSPA_7:** Use of QCDR data for ongoing practice assessment and improvements
- **(*) IA_PSPA_16:** Use decision support—ideally platform-agnostic, interoperable clinical decision support (CDS) tools —and standardized treatment protocols to manage workflow on the care team to meet patient needs

B.18 Podiatry MVP

Table B.18a represents the proposed MIPS core measures for the Podiatry MVP. The B.18b table, followed by a list of improvement activities, represents the measures and activities finalized within the Podiatry MVP (90 FR 50395 through 50400) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Podiatry MVP focuses on assessing meaningful outcomes in foot and ankle care for patients with chronic conditions, wound/ulcers, and general care for the podiatry patient. This MVP would be most applicable to podiatry clinicians, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[540], we are proposing the following measures as MIPS core measures for the Podiatry MVP:

[540] See MVP Development: Quality Measure and Improvement Activity Updates

- **Q126:** Diabetes Mellitus: Diabetic Foot and Ankle Care, Peripheral Neuropathy – Neurological Evaluation
- **Q155:** Falls: Plan of Care
- **Q358:** Patient-Centered Surgical Risk Assessment and Communication

We are proposing to remove two QCDR measures due to low adoption, no benchmark after 2 consecutive years in MIPS:

- **REGCLR5:** Offloading with Remote Monitoring
- **REGCLR8:** Monitor and Improve Treatment Outcomes in Chronic Wound Healing

Symbol Key:
Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

Podiatry Improvement Activities

- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **(!!) IA_BMH_12:** Promoting Clinician Well-Being
- **IA_CC_19:** Tracking of clinician's relationship to and responsibility for a patient by reporting MACRA patient relationship codes
- **IA_EPA_7:** Enhance Engagement of Medicaid and Other Underserved Populations
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_14:** Implementation of methodologies for improvements in longitudinal care management for high risk patients
- **IA_PSPA_7:** Use of QCDR data for ongoing practice assessment and improvements
- **IA_PSPA_18:** Measurement and improvement at the practice and panel level
- **IA_PSPA_22:** CDC Training on CDC's Guideline for Prescribing Opioids for Chronic Pain
- **IA_PSPA_23:** Completion of CDC Training on Antibiotic Stewardship

B.19: Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP

Table B.18a represents the proposed MIPS core measures for the Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP. The B.18b table, followed by a list of improvement activities, represents the measures and activities finalized within the Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP (90 FR 50444 through 50447) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP focuses on promoting quality care for patients suffering from infectious disorders. This MVP would be most applicable to clinicians who treat patients within the practices of infectious disease and immunology, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality and cost measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[541], we are proposing the following measures as MIPS core measures for the Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV MVP:

- **Q205:** Sexually Transmitted Infection (STI) Testing for People with HIV
- **Q338:** HIV Viral Suppression
- **Q516:** Hepatitis C Virus (HCV): Sustained Virological Response (SVR)

Improvement Activities

We are proposing to add one improvement activity that is relevant to this MVP and includes an advancing health and wellness component:

- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans

For the reasons stated in the introduction of this appendix[542], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.

Prevention and Treatment of Infectious Disorders Including Hepatitis C and HIV Improvement Activities

- **IA_BE_4:** Engagement of Patients through Implementation of New Patient Portal
- **(+)(*)(!!) IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_EPA_7:** Enhance Engagement of Medicaid and Other Underserved Populations
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways

- **IA_PM_11:** Regular review practices in place on targeted patient population needs
- **IA_PM_14:** Implementation of methodologies for improvements in longitudinal care management for high risk patients
- **(!!) IA_PM_22:** Improving Practice Capacity for Human Immunodeficiency Virus (HIV) Prevention Services
- **IA_PSPA_23:** Completion of CDC Training on Antibiotic Stewardship
- **(!!) IA_PSPA_32:** Use of CDC Guideline for Clinical Decision Support to Prescribe Opioids for Chronic Pain via Clinical Decision Support

B.20: Pulmonology Care MVP

Table B.20a represents the proposed MIPS core measures for the Pulmonology Care MVP. The B.20b table, followed by a list of improvement activities, represents the measures and activities finalized within the Pulmonology Care MVP (90 FR 50447 through 50449) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Pulmonology Care MVP focuses on assessing optimal care for patients treated for a broad range of pulmonology conditions including COPD, asthma, sleep apnea, and general pulmonology. This MVP would be most applicable to clinicians who specialize in pulmonology and sleep medicine, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[543], we are proposing the following measures as MIPS core measures for the Pulmonology Care MVP:

- **Q052:** Chronic Obstructive Pulmonary Disease (COPD): Spirometry Evaluation and Long-Acting Inhaled Bronchodilator Therapy
- **Q279:** Sleep Apnea: Assessment of Adherence to Obstructive Sleep Apnea (OSA) Therapy
- **Q398:** Optimal Asthma Control

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_16:** Implementation of medication management practice improvements

B.21: Quality Care for Patients with Neurological Conditions MVP

Table B.21a represents the proposed MIPS core measures for the Quality Care for Patients with Neurological Conditions MVP. The B.21b table, followed by a list of improvement activities, represents the measures and activities finalized within the Quality Care for Patients with Neurological Conditions MVP (90 FR 50449 through 50451) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Quality Care for Patients with Neurological Conditions MVP focuses on the clinical theme of promoting quality care for patients suffering from neurological conditions. This MVP would be most applicable to clinicians who specialize in neurology care, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP maintenance period to determine which

measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[544], we are proposing the following measures as MIPS core measures for the Quality Care for Patients with Neurological Conditions MVP:

- **Q238:** Use of High-Risk Medications in Older Adults
- **Q282:** Dementia: Functional Status Assessment
- **Q495:** Ambulatory Palliative Care Patients' Experience of Feeling Heard and Understood

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

Quality Care for Patients with Neurological Conditions Improvement Activities

- **IA_BE_4:** Engagement of Patients through Implementation of New Patient Portal
- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **(!!) IA_BE_16:** Promote Self-management in Usual Care
- **IA_BE_24:** Financial Navigation Program
- **(!!) IA_BE_26:** Promote Use of Patient-Reported Outcome Tools
- **(*)(!!) IA_BMH_4:** Depression screening
- **IA_EPA_2:** Use of telehealth services that expand practice access
- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **IA_PM_11:** Regular review practices in place on targeted patient population needs
- **IA_ PM_16:** Implementation of medication management practice improvements
- **IA_PM_21:** Advance Care Planning
- **(!!) IA_PSPA_21:** Implementation of fall screening and assessment programs

B.22: Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP

Table B.22a represents the proposed MIPS core measures for the Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP. The B.22b table, followed by a list of improvement activities, represents the measures and activities finalized within the Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP (90 FR 50451 through 50453) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP focuses on providing care for patients experiencing some of the most common otolaryngology conditions such as, but not limited to: otologic conditions, chronic rhinosinusitis (CRS), age-related hearing loss (ARHL), and otitis media. This MVP would be most applicable to clinicians who treat patients within the practice of otolaryngology, including NPPs such as audiologists, nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the improvement

activities inventory and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[545], we are proposing the following measures as MIPS core measures for the Quality Care for the Treatment of Ear, Nose, and Throat Disorders MVP:

- **Q331:** Adult Sinusitis: Antibiotic Prescribed for Acute Viral Sinusitis (Overuse)
- **Q357:** Surgical Site Infection (SSI)
- **TBD:** Age-Related Hearing Loss: Comprehensive Audiometric Evaluation

We are proposing to add one new MIPS quality measure that is relevant to this MVP:

- **TBD:** Age-Related Hearing Loss: Comprehensive Audiometric Evaluation: This proposed MIPS quality measure assesses patients with hearing loss or tinnitus for completion of a comprehensive audiometric evaluation.

For the reasons stated in the introduction of this appendix[546], we are proposing to remove **Q332:** Adult Sinusitis: Appropriate Choice of Antibiotic: Amoxicillin With or Without Clavulanate Prescribed for Patients with Acute Bacterial Sinusitis (Appropriate Use). We are proposing to remove one duplicative QCDR measure and one QCDR measure proposed to transition to a MIPS measure:

- **AAO16:** Age-Related Hearing Loss: Audiometric Evaluation (proposed as a MIPS measure)
- **AAO21:** Otitis Media with Effusion (OME): Comprehensive Audiometric Evaluation for Chronic OME > or = 3 months (duplicative measure)

Modifications are being considered for the following QCDR measures:

- **AAO16:** Age-Related Hearing Loss: Audiometric Evaluation: If the measure is not finalized for removal in the CY 2027 PFS final rule, this QCDR measure would undergo modifications to update the description, denominator, and numerator to reflect the addition of a tinnitus diagnosis and clarifying that a hearing screening does not meet the measure's intent. Expanding the measure to include patients diagnosed with tinnitus will help capture a broader group of individuals who may have underlying or undiagnosed hearing loss.
- **AAO20:** Tympanostomy Tubes: Comprehensive Audiometric Evaluation: This QCDR measure is undergoing modifications to update the description, denominator, and instructions to remove the otitis media with effusion (OME) diagnosis and expand the eligible population to include all patients undergoing tympanostomy tube insertion. This would increase the measure's applicability and case volume. This change reflects that preoperative hearing evaluation is an important component of care for any patient receiving tubes, not just those with OME.

Improvement Activities

We are proposing to add eight improvement activities relevant to this MVP, several of which include an advancing health and wellness component:

- **IA_BE_6:** Regularly Assess Patient Experience of Care and Follow Up on Findings
- **IA_CC_7:** Regular training in care coordination
- **IA_CC_8:** Implementation of documentation improvements for practice/process

---

[545] See MVP Development: Quality Measure and Improvement Activity Updates

[546] Ibid.

improvements
- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans
- **IA_CC_17:** Patient Navigator Program
- **IA_PM_14:** Implementation of methodologies for improvements in longitudinal care management for high risk patients
- **IA_PM_17:** Participation in Population Health Research
- **IA_PSPA_12:** Participation in private payer CPIA

For the reasons stated in the introduction of this appendix[547], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.

Symbol Key:
Exclamation point (!): MIPS core measure within an MVP.
Caret symbol (^): proposed new measure or improvement activity.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

B.23: Quality Care in Mental Health and Substance Use Disorders MVP

Table B.23a represents the proposed MIPS core measures for the Quality Care in Mental Health and Substance Use Disorders MVP. The B.23b table, followed by a list of improvement activities, represents the measures and activities finalized within the Quality Care in Mental Health and Substance Use Disorders MVP (90 FR 50453 through 50456) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Quality Care in Mental Health and Substance Use Disorders MVP focuses on clinical actions promoting prevention of and quality care in behavioral health, including mental health and substance use disorders (SUD). This MVP would be most applicable to clinicians who treat patients with mental health and substance use disorders within the practices of mental/behavioral health and psychiatry, including NPPs such as clinical social workers, nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[548], we are proposing the following measures as MIPS core measures for the Quality Care in Mental Health and Substance Use Disorders MVP:

- **Q305:** Initiation and Engagement of Substance Use Disorder Treatment
- **Q370:** Depression Remission at Twelve Months
- **Q383:** Adherence to Antipsychotic Medications For Individuals with Schizophrenia

Improvement Activities

We are proposing to add one improvement activity that is relevant to this MVP and includes an advancing health and wellness component:

- **IA_BMH_4:** Depression screening, treatment, and prevention.

For the reasons stated in the introduction of this appendix[549], we are proposing to remove **IA_BMH_5:** MDD prevention and treatment interventions.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

- **IA_EPA_7:** Enhance Engagement of Medicaid and Other Underserved Populations

- **(**) IA_MVP:** Practice-Wide Quality Improvement in MIPS Value Pathways
- **(!!) IA_PSPA_32:** Use of CDC Guideline for Clinical Decision Support to Prescribe Opioids for Chronic Pain via Clinical Decision Support

B.24: Rehabilitative Support MVP

Table B.24a represents the proposed MIPS core measures for the Rehabilitative Support MVP. The B.24b table, followed by a list of improvement activities, represents the measures and activities finalized within the Rehabilitative Support for Musculoskeletal Care MVP (90 FR 50457 through 50461) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years, including an MVP title update to Rehabilitative Support MVP to more closely reflect the measures and activities included in the MVP. The Rehabilitative Support MVP focuses on clinical actions promoting quality rehabilitative care for patients. This MVP would be most applicable to clinicians who specialize in providing rehabilitative support such as chiropractic, physiatry, physical therapy and occupational therapy, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[550], we are proposing the following measures as MIPS core measures for the Rehabilitative Support MVP:

- **Q050:** Urinary Incontinence: Plan of Care for Urinary Incontinence in Women Aged 65 Years and Older
- **Q155:** Falls: Plan of Care
- **TBD:** Functional Improvement for Patients with Back Impairments

We are proposing to add five new MIPS quality measures relevant to this MVP:

- **TBD:** Functional Improvement for Patients with Neck Impairments: This proposed MIPS quality measure assesses functional improvement for patients with neck impairments after completing an episode of care, excluding surgical interventions. This measure is proposed to replace Q478: Functional Status Change for Patients with Neck Impairments.
- **TBD:** Functional Improvement for Patients with Upper Extremity Impairments: This proposed MIPS quality measure assesses functional improvement for patients with upper extremity impairments after completing an episode of care, excluding surgical interventions. This measure is proposed to replace Q222: Functional Status Change for Patients with Elbow, Wrist or Hand Impairments.
- **TBD:** Functional Improvement for Patients with Lower Extremity Impairments: This MIPS quality measure assesses functional improvement for patients with lower extremity impairments after completing an episode of care, excluding surgical interventions. This measure is proposed to replace Q218 Functional Status Change for Patients with Hip Impairments and Q219: Functional Status Change for Patients with Lower Leg, Foot or Ankle Impairments.
- **TBD:** Functional Improvement for Patients with Knee Impairments: This proposed MIPS quality measure assesses functional improvement for patients with knee impairments after completing an episode of care, excluding surgical interventions. This measure is proposed to replace Q217: Functional Status Change for Patients with Knee Impairments.
- **TBD:** Functional Improvement for Patients with Back Impairments: This proposed MIPS

[550] See MVP Development: Quality Measure and Improvement Activity Updates

quality measure assesses functional improvement for patients with back impairments after completing an episode of care, excluding surgical interventions. This measure is proposed to replace Q220: Functional Status Change for Patients with Low Back Impairments.

For the reasons stated in the introduction of this appendix[551], we are proposing to remove **Q217:** Functional Status Change for Patients with Knee Impairments, **Q218:** Functional Status Change for Patients with Hip Impairments, **Q219:** Functional Status Change with Lower Leg, Foot or Ankle Impairments, **Q220:** Functional Status Change for Patients with Low Back Impairments, **Q221:** Functional Status Change for Patients with Shoulder Impairments, **Q222:** Functional Status Change for Patients with Elbow, Wrist or Hand Impairments, and **Q478:** Functional Status Change for Patients with Neck Impairments.

Improvement Activities

We are proposing to add one improvement activity that is relevant to this MVP and includes an advancing health and wellness component:

- **IA_CC_9:** Implementation of practices/processes for developing regular individual care plans

For the reasons stated in the introduction of this appendix[552], we are proposing to remove **IA_BE_15:** Engagement of Patients, Family and Caregivers in Developing a Plan of Care and **IA_CC_12:** Care coordination agreements that promote improvements in patient tracking across settings.

B.25: Surgical Care MVP

Table B.25a represents the proposed MIPS core measures for the Surgical Care MVP. The B.25b table, followed by a list of improvement activities, represents the measures and activities finalized within the Surgical Care MVP (90 FR 50461 through 50464) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Surgical Care MVP focuses on the clinical theme of surgery. This MVP would be most applicable to clinicians who specialize in general surgery, neurosurgery, and cardiothoracic surgery, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the improvement activities inventory and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[553], we are proposing the following measures as MIPS core measures for the Surgical Care MVP:

- **Q047:** Advance Care Plan
- **Q164:** Coronary Artery Bypass Graft (CABG): Prolonged Intubation
- **Q354:** Anastomotic Leak Intervention
- **Q357:** Surgical Site Infection (SSI)
- **Q358:** Patient-Centered Surgical Risk Assessment and Communication
- **Q459:** Back Pain After Lumbar Surgery

Symbol Key:

B.26: Value in Primary Care MVP

Table B.26a represents the proposed MIPS core measures for the Value in Primary Care MVP. The B.26b table, followed by a list of improvement activities, represents the measures and activities finalized within the Value in Primary Care MVP (90 FR 50465 through 50467) with modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Value in Primary Care MVP focuses on the clinical theme of promoting quality care for patients to reduce the risk of diseases, disabilities, and death. This MVP would be most

applicable to clinicians who specialize in preventive medicine, internal medicine, family medicine, and geriatrics, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[554], we are proposing the following measures as MIPS core measures for the Value in Primary Care MVP:

- **Q001:** Diabetes: Glycemic Status Assessment Greater Than 9%
- **Q134:** Preventive Care and Screening: Screening for Depression and Follow-up Plan
- **Q236:** Controlling High Blood Pressure

We are proposing to add one new MIPS quality measure:

- **TBD:** Low Density Lipoprotein Cholesterol (LDL-C) Monitoring and Management: This proposed intermediate outcome MIPS quality measure ensures lipid monitoring in patients with atherosclerotic cardiovascular disease (ASCVD) and assesses target goal achievement of an LDL-C less than 70mg/dl.

For the reasons stated in the introduction of this appendix[555], we are proposing to remove **Q483:** Person-Centered Primary Care Measure Patient Reported Outcome Performance Measure (PCPCM PRO-PM).

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Caret symbol (^): proposed new measure or improvement activity.
Plus sign (+): measures and improvement activities proposed for addition to a previously finalized MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

B.27 Vascular Surgery MVP

Table B.27a represents the proposed MIPS core measures for the Vascular Surgery MVP. The B.27b table, followed by a list of improvement activities, represents the measures and activities finalized within the Vascular Surgery MVP (90 FR 50400 through 50405) with proposed modifications for the CY 2027 performance period/2029 MIPS payment year and future years. The Vascular Surgery MVP focuses on the clinical theme of providing high quality care for patients treated under vascular surgery. This MVP would be most applicable to clinicians who treat patients within the surgical setting of vascular surgery, including NPPs such as nurse practitioners, clinical nurse specialists, and physician assistants. We reviewed the MIPS quality measure and improvement activities inventories and considered feedback received during the 2026 MVP maintenance period to determine which measures and activities to include in this MVP. We request public comment on the proposed modifications included in this MVP.

Quality Measures

For the reasons stated in the introduction of this appendix[556], we are proposing the following measures as MIPS core measures for the Vascular Surgery MVP:

- **Q344:** Rate of Carotid Endarterectomy (CEA) or Carotid Artery Stenting (CAS) for Asymptomatic Patients, Without Major Complications (Discharged to Home by Post-Operative Day #2)
- **Q356:** Unplanned Hospital Readmission within 30 Days of Principal Procedure
- **Q358:** Patient-Centered Surgical Risk Assessment and Communication

Improvement Activities

For the reasons stated in the introduction of this appendix[557], we are proposing to remove **IA_PM_2:** Anticoagulant Management Improvements.

Symbol Key:

Exclamation point (!): MIPS core measure within an MVP.
Single asterisk (*): existing measures and improvement activities with proposed revisions.
Double asterisk (**): measures and improvement activities only available when included in an MVP.
Double exclamation point (!!): improvement activities with an advancing health and wellness component.

Nuclear Regulatory Commission

10 CFR Parts 2, 50, 51 et al.
Modernizing Reactor Licensing, Safety Oversight, and Siting Practices; Proposed Rule

NUCLEAR REGULATORY COMMISSION

10 CFR Parts 2, 50, 51, 52, 53, 54, 71, and 100

[NRC–2025–0975]

RIN 3150–AL44

Modernizing Reactor Licensing, Safety Oversight, and Siting Practices

AGENCY: Nuclear Regulatory Commission.

ACTION: Proposed rule and guidance; request for comment.

SUMMARY: Consistent with Executive Order 14300, ''Ordering the Reform of the Nuclear Regulatory Commission,'' the U.S. Nuclear Regulatory Commission (NRC) is conducting a review and wholesale revision of its regulations. This proposed rule aims to modernize reactor licensing, safety oversight, and siting practices addressing sections 5(f), 5(h), and 5(i) of Executive Order 14300, and additional items that contribute to adding additional generation to the electrical grid. Additionally, as part of the NRC's overarching review of all of its regulations, the agency identified a number of further changes to the NRC's regulations that will improve the efficiency and efficacy of its licensing process that are also included in this rulemaking.

DATES: Comments must be submitted electronically using *https://www.regulations.gov* by 11:59 p.m. eastern time on August 31, 2026. Comments received after this date will be considered if it is practical to do so, but the Commission is able to ensure consideration of only comments received before this date.

ADDRESSES: Submit your comments, identified by Docket ID NRC–2025–0975, at *https://www.regulations.gov.* If your material cannot be submitted using *https://www.regulations.gov,* call or email the individuals listed in the **FOR FURTHER INFORMATION CONTACT** section of this document for alternate instructions.

Do not include any personally identifiable information (such as name, address, or other contact information) or confidential business information that you do not want publicly disclosed. All comments are public records; they are publicly displayed exactly as received, and will not be deleted, modified, or redacted. Comments may be submitted anonymously.

Follow the search instructions on *https://www.regulations.gov* to view public comments.

You can read a plain language description of this proposed rule at *https://www.regulations.gov/docket/NRC-2025-0975.* For additional direction on obtaining information and submitting comments, see ''Obtaining Information and Submitting Comments'' in the **SUPPLEMENTARY INFORMATION** section of this document.

FOR FURTHER INFORMATION CONTACT: Daniel Doyle, U.S. Nuclear Regulatory Commission, Washington, DC 20555–0001, telephone: 301–415–3748, email: *Daniel.Doyle@nrc.gov.*

SUPPLEMENTARY INFORMATION:

Executive Summary

A. Need for the Regulatory Action

On May 23, 2025, President Donald J. Trump signed Executive Order (E.O.) 14300, ''Ordering the Reform of the Nuclear Regulatory Commission.'' Section 5, ''Reforming and Modernizing the NRC's Regulations,'' requires the NRC to undertake a review and wholesale revision of its regulations in title 10 of the *Code of Federal Regulations* (10 CFR) and guidance documents as guided by the policies set forth in section 2 of the E.O. This rulemaking addresses section 5(f) of E.O. 14300, which directs the NRC to ''[e]stablish stringent thresholds for circumstances in which the NRC may demand changes to reactor design once construction is underway''; section 5(h) of E.O. 14300, which directs the NRC to ''[a]dopt revised and, where feasible, determinate and data-backed thresholds to ensure that reactor safety assessments focus on credible, realistic risks''; and section 5(i) of E.O. 14300, which directs the NRC to ''[r]econsider the regulations governing the time period for which a renewed license remains effective, and extend that period as appropriate based on available technological and safety data.'' Additionally, as part of the NRC's overarching review of all of its regulations, the agency identified a number of additional changes to the NRC's regulations that will improve the efficiency and efficacy of its licensing process that are also included in this rulemaking.

These changes are the culmination of decades of combined experience, feedback from nuclear experts, lessons learned by the NRC and industry, international experience, and prior efforts to modernize the regulatory framework. They have undergone thoughtful preparation and internal vetting by the NRC technical experts. While some changes in this rule had not been advanced as regulatory priorities, the direction in the E.O. catalyzed agency efforts to accelerate modernization of 10 CFR part 50, ''Domestic Licensing of Production and Utilization Facilities,'' and 10 CFR part 52, ''Licenses, Certifications, and Approvals for Nuclear Power Plants,'' and make conforming changes to 10 CFR part 53, ''Risk-Informed, Technology-Inclusive Regulatory Framework for Commercial Nuclear Plants.'' Therefore, this proposed rule aims to modernize reactor licensing, safety oversight, and siting practices addressing sections 5(f), 5(h), and 5(i) of E.O. 14300 and additional items that would contribute to adding generation to the electrical grid. In developing the proposed changes, the NRC has considered the benefits of increased availability of, and innovation in, nuclear power to our economic and national security consistent with section 501(a) of the Accelerating Deployment of Versatile, Advanced Nuclear for Clean Energy Act of 2024 (ADVANCE Act) and section 3 of E.O. 14300.

B. Major Provisions

Major provisions of this proposed rule include changes in the following areas:

Expedited Construction of Certain Structures, Systems, and Components

The NRC is proposing to amend its regulations applicable to the definition of construction in 10 CFR 50.10, ''License required; limited work authorization,'' 10 CFR 51.4, ''Definitions,'' and 10 CFR 53.020, ''Definitions,'' in order to focus the scope of activities that are considered construction on structures, systems, and components (SSCs) for which construction can affect attributes of the SSC material to the SSC's capability to perform a safety-significant function and thereby reduce the cost impact of the current definition of construction. Additionally, the NRC proposes to include new paragraphs in 10 CFR 50.10(h) and 53.1130(e), which would issue a general license for beginning construction upon docketing an application for a license that would authorize construction of a nuclear plant, subject to conditions that ensure safety, security, and appropriate environmental review.

Determinate and Data-Backed Thresholds for Reactor Safety Assessments

The NRC is proposing to amend its regulations by revising 10 CFR 50.2, ''Definitions,'' to add the terms ''design basis event'' (DBE) and ''beyond design basis event'' (BDBE). The proposed changes also include a conforming revision to the definition of DBE in 10 CFR 50.49, ''Environmental

qualification of electric equipment important to safety for nuclear power plants.'' In parallel with the proposed changes, the NRC has developed draft regulatory guidance (DG)-1454, ''Implementation of Determinate and Data-Backed Thresholds for Reactor Safety Assessments,'' which (1) establishes determinate and data-backed thresholds for categorizing events into defined bins, (2) outlines graded assessment approaches for DBEs and BDBEs, and (3) clarifies the process for selecting ''design bases'' controlling parameters used as reference bounds in the design of SSCs.

Removal of IEEE–323–1974 Reference in Footnote 3 of 10 CFR 50.49

The NRC is proposing to revise the regulations in 10 CFR 50.49 to delete footnote 3, which clarifies that safety-related electric equipment is referred to as Class 1E equipment in Institute of Electrical and Electronics Engineers (IEEE) Standard 323–1974. The reference in this footnote is now unnecessary because the NRC has established the connection between ''safety-related'' electric equipment and ''Class 1E'' equipment elsewhere.

Expanded Alternative Requests Under 10 CFR 50.55a(z)

The NRC is proposing to amend its regulations to allow licensees to request a broader scope of alternatives to the requirements in 10 CFR 50.55a, ''Codes and standards.'' Currently, alternatives under 10 CFR 50.55a(z), ''Alternatives to codes and standards requirements,'' are limited to the requirements in 10 CFR 50.55a(b), ''Use and conditions on the use of standards,'' through (h), ''Protection and safety systems.'' Expanding the scope of alternatives permitted under 10 CFR 50.55a to all requirements in 10 CFR 50.55a would allow for added flexibility without requiring exemptions, while relying on the well-understood existing criteria of acceptable level of quality and safety (10 CFR 50.55a(z)(1)) and hardship without a compensating increase in quality or safety (10 CFR 50.55a(z)(2)) for consistent and predictable regulatory outcomes. This proposed action would allow nuclear power plant licensees and applicants for construction permits (CP), operating licenses (OL), combined licenses (COL), standard design certifications, standard design approvals, and manufacturing licenses (ML) to request authorization of voluntary alternatives to a broader scope of requirements in 10 CFR 50.55a.

Risk-Informing 10 CFR 50.59 and Allowing Flexibility for Changes to Methods

There are two proposed changes to 10 CFR 50.59, ''Changes, tests, and experiments.'' The first proposed change to the regulation would allow the use of quantitative risk results to demonstrate a change to the facility does not result in a ''more than minimal increase'' as the phrase is used in 10 CFR 50.59(c)(2)(i) and (ii). The second proposed change would allow licensees to make changes to methods that would previously have required NRC review under 10 CFR 50.59(c)(2)(viii) or 53.1550(a)(2)(iv), provided the licensee adopts an acceptable verification, validation, and uncertainty quantification (VVUQ) program in accordance with a proposed new 10 CFR 50.221, ''Credibility requirements for modeling and simulation.'' This shift would enable licensee-led evaluations and allow for the evaluation of advanced modeling methods through structured processes rather than fixed requirements.

Minimum Decommissioning Funding Assurance for Non-Large Light-Water Reactors

The NRC is proposing rule changes in 10 CFR 50.75, ''Reporting and recordkeeping for decommissioning planning,'' to allow certain new reactor applicants and licensees to submit a design-specific decommissioning cost estimate that is less than the approved table of minimum amounts (*i.e.,* ''formula'') values in 10 CFR 50.75(c). The current regulations restrict minimum funding assurance for decommissioning to the table of minimum amounts values or greater. The NRC is proposing similar changes to 10 CFR part 53, which currently only allows for a site-specific decommissioning cost estimate as the certification amount. These changes would more broadly accommodate new reactor technologies.

Incorporation of Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants

This proposed rule would incorporate an appendix T, ''Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' to 10 CFR part 50. The proposed appendix T to 10 CFR part 50 would provide a voluntary alternative to appendix B, ''Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' to 10 CFR part 50 that applicants, who meet certain conditions, could use in their respective applications. This action would support implementation of E.O. 14300, section 5, through (1) the establishment of performance-based quality assurance (QA) criteria that provide explicit direction on the use of a graded approach for applying QA requirements to SSCs relative to their safety and risk contributions to the overall nuclear facility; (2) the incorporation of QA terminology and methodologies used across various industries; (3) enhanced regulatory certainty during the application process; and (4) the removal, when appropriate, of NRC oversight of suppliers and vendors of products and services related to nuclear power plant and fuel reprocessing plant SSCs subject to this proposed rule.

Updates to Construction Permit Requirements and Related Licenses

The proposed rule would revise the content of applications relevant to technical information required for CPs in 10 CFR 50.34, ''Contents of applications; technical information,'' to remove some overly-prescriptive wording; clarify that the level of detail provided in a preliminary safety analysis report should be sufficient to permit the NRC to make the findings in 10 CFR 50.35(a), 10 CFR 50.40, ''Common standards,'' and 10 CFR 50.50, ''Issuance of licenses and construction permits''; and adjust some of the light-water reactor (LWR)-centric language to be more technology-inclusive. Conforming changes to parallel sections in 10 CFR part 52 are also proposed.

Alternative Risk-Informed and Performance-Based Acceptance Criteria for 10 CFR Parts 50 and 52

The NRC is proposing to amend its regulations by adding new, standalone provisions in 10 CFR 50.220 and 10 CFR 52.220, entitled ''Use of risk-informed and performance-based alternatives to acceptance criteria.'' These provisions would allow licensees and applicants to voluntarily submit and use technology-inclusive, risk-informed or performance-based acceptance criteria as alternatives to existing prescriptive requirements.

In addition, the NRC is proposing revisions to appendix A to 10 CFR part 50 to update and clarify its regulations for General Design Criteria (GDC). The proposed changes would explicitly allow deviations from the GDCs without requiring exemptions and would revise GDC 28, ''Reactivity limits,'' to remove the prescriptive requirement to evaluate control rod ejection and drop accidents. Instead, applicants would be permitted to propose an alternative design basis accident for reactivity control systems.

Establishing Thresholds for Changes to Reactor Designs During Construction and Operation Under 10 CFR Parts 52 and 53

In response to E.O. 14300, section 5(f), the NRC is proposing to amend its regulations related to reactor design changes made during construction and operation under the 10 CFR parts 52 and 53 licensing approaches. These changes would impact licensees that reference a certified design or manufacturing license under 10 CFR part 52 or 53. The objectives of these proposed changes are to establish appropriate thresholds for NRC-initiated changes as well as provide additional flexibility and reduce unnecessary regulatory burden for licensee-initiated changes.

Revision of the Emergency Preparedness Regulations for Nuclear Power Reactors

The NRC is proposing to amend its regulations to create adaptable licensing pathways for emergency preparedness (EP). Consistent with E.O. 14300, the NRC's objectives for this proposed rule are to streamline the licensing process, provide regulatory certainty for the deployment of new reactor technologies, and remove prescriptive language of lesser safety significance for licensed facilities. Central to these proposed changes is a strengthened, more risk-informed approach to EP for providing reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency.

Optional Submittal of Operational Programs

This rulemaking would allow a developer the option to voluntarily submit operational programs for NRC review and approval with an ML application. The intent is to allow construction permit/operating license (CP/OL) and COL applicants the flexibility to reference the standardized programs approved in the ML, use their own approved programs, or use a combination of both. Early review of these programs would support streamlined CP/OL or COL reviews.

Early Site Permit for Nuclear Power Plants

The NRC is proposing to amend its regulations by revising the provisions applicable to early site permit (ESP) licensing and approval processes for nuclear power plants. These amendments would eliminate the requirement for an ESP expiration date, clarify the applicability of various requirements to ESPs, and propose necessary conforming amendments throughout the NRC's regulations to enhance the NRC's necessary regulatory effectiveness and efficiency in implementing its licensing and approval processes.

Manufacturing License Term Extension

The NRC is proposing to amend the regulations in 10 CFR 52.173, ''Duration of manufacturing license,'' and 52.181, ''Duration of renewal,'' to change the duration of an ML to 40 years and the duration of the renewed ML to 40 years. By amending the regulations with these proposed changes, the ML would be consistent with the durations for certified designs, thereby increasing efficiency in building new reactors.

Nuclear Power Plant License Renewal

The NRC is proposing to amend its regulations for renewing nuclear power plant OLs. The revisions would extend the duration of renewed licenses, allow applicants to voluntarily propose alternative risk-informed and performance-based criteria, and remove several prescriptive requirements related to the application process and post-approval recordkeeping. These changes would enhance regulatory flexibility and efficiency to facilitate operational extensions for the current nuclear fleet.

Enhancing Flexibility of Reactor Site Criteria

The existing regulatory framework requires all stationary power reactor applications submitted after January 10, 1997, to follow the siting criteria in subpart B to 10 CFR part 100, ''Evaluation Factors for Stationary Power Reactor Site Applications on or After January 10, 1997,'' without consideration of reactor type, size, output, radiological consequence, or other factors that can widely vary given the breadth of power reactor designs considered for future construction and deployment in the United States. Subpart A, ''Evaluation Factors for Stationary Power Reactor Site Applications Before January 10, 1997 and for Testing Reactors,'' to 10 CFR part 100, ''Reactor Site Criteria,'' provides less prescriptive regulatory requirements for reactor siting but only applies to power reactor applications submitted prior to January 10, 1997, or an application for a testing reactor, as defined in 10 CFR 50.2. To increase the flexibility of regulatory requirements for the full spectrum of prospective reactor technologies, including non-stationary reactors, this proposed change would (1) revise subpart A to 10 CFR part 100 to include Tier 1 power reactors, as defined in proposed 10 CFR 100.3, ''Definitions,'' and DG–4036, ''Graded Approach to Site Characterization for New Reactor Applications,'' in addition to testing reactors; (2) remove appendix A to 10 CFR part 100 that applies to subpart A to 10 CFR part 100; and (3) revise subpart B to 10 CFR part 100 to include Tier 2 power reactors, which are those reactors that do not meet the entry criteria for subpart A to 10 CFR part 100. This proposed change will be accompanied by draft guidance on application content, including the entry criteria for subpart A to 10 CFR part 100, a clarification on site parameters to be included in a site parameter envelope, and an explanation of a graded approach to site characterization for all external hazards to be considered under both subparts A and B to 10 CFR part 100. In addition, the NRC proposes to revise 10 CFR part 100 to maintain the agency's long-standing preference for siting reactors in areas of low population density, while providing flexibility to allow siting reactors in areas of greater population density when justified by an assessment comparing the societal risks and societal benefits of siting reactors in those areas. Implementing guidance for these assessments will be developed.

Increased Enrichment of Conventional and Accident Tolerant Fuel Designs for Light-Water Reactors

The NRC is proposing to amend its regulations related to the use of conventional and accident tolerant LWR fuel designs. The NRC's goal is to establish effective and efficient licensing of the use of fuels enriched to greater than 5.0 weight percent uranium-235 while continuing to provide reasonable assurance of adequate protection of public health and safety. The new requirements also would address fuel fragmentation, relocation, and dispersal in relation to the key accident tolerant fuel components of increased enrichment and burnup limits.

C. Cost and Benefits

The NRC prepared a draft regulatory analysis to determine the expected quantitative and qualitative costs of the proposed rule and associated guidance. The draft regulatory analysis concluded that the proposed rule and associated guidance would result in undiscounted total net savings of $1.86 billion to the NRC and industry ($802.10 million using a 7 percent discount rate and $1.26 billion using a 3 percent discount rate).

The draft regulatory analysis also considers qualitative factors to be considered in the NRC's rulemaking decision. Qualitative factors include

regulatory efficiency. The proposed rule would enable the NRC to better maintain and administer the new reactor licensing process and ensure that the requirements for the licensing of new reactors are clear and appropriate.

For more information, the draft regulatory analysis is available as indicated in the ''Availability of Documents'' section of this document.

I. Obtaining Information and Submitting Comments

A. Obtaining Information

Please refer to Docket ID NRC–2025–0975 when contacting the NRC about the availability of information for this action. You may obtain publicly available information related to this action by any of the following methods:

• *Federal Rulemaking Website:* Go to *https://www.regulations.gov* and search for Docket ID NRC–2025–0975.

• *NRC's Agencywide Documents Access and Management System (ADAMS):* You may obtain publicly available documents online in the ADAMS Public Documents collection at *https://www.nrc.gov/reading-rm/adams.html.* To begin the search, select ''Begin ADAMS Public Search.'' For problems with ADAMS, please contact the NRC's Public Document Room (PDR) reference staff at 1–800–397–4209, at 301–415–4737, or by email to *PDR.Resource@nrc.gov.* For the convenience of the reader, instructions about obtaining materials referenced in this document are provided in the ''Availability of Documents'' section of this document.

• *NRC's PDR:* The PDR, where you may examine and order copies of publicly available documents, is open by appointment. To make an appointment to visit the PDR, please send an email to *PDR.Resource@nrc.gov* or call 1–800–397–4209 or 301–415–4737, between 8 a.m. and 4 p.m. Eastern Time, Monday through Friday, except Federal holidays.

• *Technical Library:* The Technical Library, which is located at Two White Flint North, 11545 Rockville Pike, Rockville, Maryland 20852, is open by appointment only. Interested parties may make appointments to examine documents by contacting the NRC Technical Library by email at *Library.Resource@nrc.gov* between 8 a.m. and 4 p.m. Eastern Time, Monday through Friday, except Federal holidays.

• *Public Meeting:* The NRC will conduct public meetings to describe the proposed amendments and answer questions from the public on the proposed rule. The NRC will publish a notice of the location, time, and agenda of the meetings on the NRC's public meeting website within 10 calendar days of the meetings. Stakeholders should monitor the NRC's public meeting website for information about the public meetings at: *https://www.nrc.gov/public-involve/public-meetings/index.cfm.*

B. Submitting Comments

Comments must be submitted using *https://www.regulations.gov* by 11:59 p.m. Eastern Time on August 31, 2026. Please include Docket ID NRC–2025–0975 in your comment submission.

The NRC cautions you not to include identifying or contact information that you do not want to be publicly disclosed in your comment submission. The NRC will post all comment submissions at *https://www.regulations.gov* as well as enter the comment submissions into ADAMS. The NRC does not routinely edit comment submissions to remove identifying or contact information.

If you are requesting or aggregating comments from other persons for submission to the NRC, then you should inform those persons not to include identifying or contact information that they do not want to be publicly disclosed in their comment submission. Your request should state that the NRC does not routinely edit comment submissions to remove such information before making the comment submissions available to the public or entering the comment into ADAMS.

II. Executive Order 14300: Ordering the Reform of the Nuclear Regulatory Commission

On May 23, 2025, President Donald J. Trump signed Executive Order (E.O.) 14300, ''Ordering the Reform of the Nuclear Regulatory Commission.'' Section 5, ''Reforming and Modernizing the NRC's Regulations,'' requires the Nuclear Regulatory Commission (NRC) to undertake a review and wholesale revision of its regulations and guidance documents as guided by the policies set forth in section 2 of the E.O. This rulemaking addresses section 5(f), which directs the NRC to ''[e]stablish stringent thresholds for circumstances in which the NRC may demand changes to reactor design once construction is underway''; section 5(h), which directs the NRC to ''[a]dopt revised and, where feasible, determinate and data-backed thresholds to ensure that reactor safety assessments focus on credible, realistic risks''; and section 5(i), which directs the NRC to ''[r]econsider the regulations governing the time period for which a renewed license remains effective, and extend that period as appropriate based on available technological and safety data.'' Additionally, as part of the NRC's overarching review of all of its regulations, the agency identified a number of additional changes to the NRC's regulations that will improve the efficiency and efficacy of its licensing process that are also included in this rulemaking. In developing the proposed changes, the NRC has considered the benefits of increased availability of, and innovation in, nuclear power to our economic and national security consistent with section 501(a) of the Accelerating Deployment of Versatile, Advanced Nuclear for Clean Energy Act of 2024 (ADVANCE Act) and section 3 of E.O. 14300.

III. Background—Expedited Construction of Certain Structures, Systems, and Components

A. Definition of Construction

Section 185 of the Atomic Energy Act of 1954, as amended (AEA), requires that the NRC grant construction permits (CPs) to applicants for licenses to construct or modify production or utilization facilities, if the applications for such permits are acceptable to the NRC. However, the term ''construction'' is not defined anywhere in the AEA. Instead, construction is defined within section 50.10, ''License required; limited work authorization'' of part 50, ''Domestic Licensing of Production and Utilization Facilities,'' in title 10 of the *Code of Federal Regulations* (10 CFR). The Commission last updated this definition in 2007 as part of the limited work authorization (LWA) final rule, ''Limited Work Authorizations for Nuclear Power Plants'' (72 FR 57416; October 9, 2007).

In developing this definition of construction in the 2007 LWA final rule, the Commission concluded that the definition of construction should parallel the agency's jurisdiction because activities outside the definition of construction would not require prior authorization. Therefore, the Commission ''determined that construction should include all of the activities that have a reasonable nexus to radiological health and safety, or common defense and security'' (72 FR 57429; October 9, 2007). For the 2007 LWA final rule, the scope of structures, systems, and components (SSCs) falling within the definition of construction was derived from the scope of SSCs that are included in the program for monitoring the effectiveness of maintenance at nuclear power plants, as defined in 10 CFR 50.65(b), because ''the definition is well understood and there is good agreement on its implementation'' (72 FR 57429–30; October 9, 2007). The SSCs were supplemented with those necessary to comply with emergency preparedness and security regulations because they also have a reasonable nexus to radiological safety or are required for the common defense and security.

New reactor designs and deployment strategies, as well as lessons learned from previous examples, warrant a fresh look at how application of the 10 CFR 50.10 definition of construction may unnecessarily restrict construction of nuclear power plants using modern construction techniques on optimized schedules. Additionally, some prospective applicants to construct a nuclear power reactor have indicated

the desire to construct portions of the facility, such as permanent materials left in an excavation, or even balance of plant systems, in advance of a CP or combined license (COL), and without an LWA, based on their business needs and the lack of the SSCs' safety significance. The Commission recognizes that the activities undertaken to build or install some facility SSCs will not affect the safety-significant functions of those SSCs, even though the 2007 rule could have been understood to require a license to build or install them, and the NRC need not authorize such activities before they occur. Moreover, the NRC has considered and granted exemptions from the current definition of construction to allow an applicant to build SSCs over which the NRC exercises authority but for which construction is not material to the safety function of the SSC.

B. General Licenses

In regard to general licenses for utilization facilities, section 109 of the AEA, ''Component and Other Parts of Facilities,'' authorizes the Commission to ''issue general licenses for domestic activities required to be licensed under section 101 [of the AEA]'' with respect to those utilization facilities determined by the Commission under section 11cc.(2) of the AEA. Section 11cc.(2) of the AEA defines such facilities as ''any important component part especially designed for [a utilization facility as defined under sec. 11cc.(1) of the AEA] as determined by the Commission.'' Under section 109 of the AEA, the Commission may issue a general license authorizing construction of such ''important component parts'' if it ''determines in writing that such general licensing will not constitute an unreasonable risk to the common defense and security.''

In order to accommodate the business models for new reactor designs some prospective vendors are proposing and to enable rapid deployment strategies for advanced reactor technologies, the NRC plans to revise its regulations to allow the use of general licenses for construction of important component parts of a utilization facility.

IV. Discussion—Expedited Construction of Certain Structures, Systems, and Components

A. Definition of Construction

The NRC is proposing to revise its regulations to update the definition of ''construction'' in 10 CFR 50.10, 10 CFR 51.4, ''Definitions,'' and 10 CFR 53.020, ''Definitions,'' to facilitate the safe construction of nuclear power plants using modern construction techniques on optimized schedules.

Specifically, this proposed rule would revise the definition of construction to include SSCs for which construction can affect the SSC's capability to perform a safety-related or safety-significant function and will, therefore, require NRC approval before commencing construction. An additional purpose of this change is to afford license applicants, when justified, additional flexibility to build or install SSCs whose safety-related or safety-significant functions are not significantly affected by those activities at a site prior to the issuance of a license. Those SSCs that are constructed without NRC authorization may still be subject to additional operational requirements as part of any subsequent operating license (OL) that would be issued.

B. Safety Review

Since the issuance of the 2007 LWA final rule, the NRC has observed that prospective advanced reactor applicants have designed their facilities with separation between nuclear and balance of plant SSCs in mind, such that many of the criteria in the current definition for a construction activity are not met for certain SSCs. Some stakeholders have maintained that such SSCs do not have a reasonable nexus to safety and therefore the unmet criteria are not necessary to provide reasonable assurance of adequate protection to the health and safety of the public; therefore, those unmet criteria are not needed or do not serve the underlying purpose of the rule. Lacking a revision to the definition, the remaining unmet criteria prevent prospective applicants from constructing such components without first obtaining an LWA, CP, a COL, or an exemption.

The proposed construction definition would be limited to those SSCs for which construction activities may have a significant impact on radiological health and safety. For other SSCs, even those that may have a nexus to radiological health and safety during operation, operational requirements should suffice, and the NRC need not license the construction of those SSCs.

The flexibility afforded by this proposed change would rely on an applicant-performed analysis and categorization of the SSCs of the facility to those that do and those that do not meet the definition of construction.

The set of SSCs that would meet the definition of construction should include only those SSCs that perform safety-related functions or that perform safety-significant functions and the successful completion of those functions may be impacted by construction. For those SSCs, prior NRC approval for construction would be required because inadequate design or construction of those SSCs could have a substantial contribution to radiological risk during operation.

Activities undertaken to build onsite emergency facilities necessary to comply with either 10 CFR 50.160, ''Emergency preparedness for small modular reactors, non-light-water reactors, and non-power production or utilization facilities,'' or 10 CFR 50.47, ''Emergency plans,'' and appendix E to 10 CFR part 50, ''Emergency Planning and Preparedness for Production and Utilization Facilities,'' or 10 CFR 53.855, ''Emergency preparedness,'' as applicable, would not be considered SSCs that meet the definition of construction. Historically, emergency response facilities (ERF) were included due to their reasonable nexus to radiological health and safety, but they would not fall under the criteria in proposed 10 CFR 50.10(a)(1)(i) through (iii) or 10 CFR 53.020. Instead, applicants would comply with the requirements of 10 CFR 50.160, or 10 CFR 50.47 and appendix E to 10 CFR part 50, or 10 CFR 53.855, as applicable. The applicant would need to be aware of all functional requirements of 10 CFR 50.160, or 10 CFR 50.47 and appendix E to 10 CFR part 50, or 10 CFR 53.855 for ERFs. These functional requirements would need to be validated in a preoperational exercise, which would satisfy the historical reasons why ERFs were previously included in the construction definition.

For license applicants under 10 CFR parts 50 and 52, ''Licenses, Certifications, and Approvals for Nuclear Power Plants,'' the proposed revisions to the definition of construction would also support use of the SSC categorization methodology for designs licensed under the technology-inclusive, risk-informed, and performance-based methodology described in regulatory guide (RG) 1.233, ''Guidance for a Technology-Inclusive, Risk-Informed, and Performance-Based Methodology to Inform the Licensing Basis and Content of Applications for Licenses, Certifications, and Approvals for Non-Light-Water Reactors,'' dated June 2020. Under this framework, the applicant would use its probabilistic risk assessment (PRA) of the design to analyze the function of the SSCs. As explained in RG 1.233, the applicant's analysis would result in the classification of SSCs into one of four categories: ''safety-related,'' ''non-safety-

related with special treatment,'' ''non-safety-related with no special treatment,'' and ''all other SSCs'' (with no special treatment required). Within the RG 1.233 methodology, ''safety-significant'' SSCs include all those SSCs classified as ''safety-related'' or ''non-safety-related with special treatment.'' Those SSCs whose construction could impact their safety-significant function, and thus would fall under the definition of construction in the amended 10 CFR 50.10(a)(1)(i) and (ii), would likely include only those SSCs that were analyzed and classified as safety-related or non-safety-related with special treatment. It is possible that a subset of some non-safety-related with special treatment SSCs could have no safety functions which would be impacted by the construction of the SSC. For these cases, an applicant could provide further information that justifies the exclusion of the SSC from the definition of construction. All SSCs classified as either ''non-safety-related with no special treatment'' or ''all other SSCs,'' would likely not be included in the definition of construction under those criteria because, as demonstrated in the PRA, their impact on safety as evaluated under the methodology would be negligible. Consequently, the proposed amendments to 10 CFR 50.10 would enable applicants referencing RG 1.233 greater flexibility to undertake preconstruction activities.

Applicants under 10 CFR part 50 or 52, when determining whether SSCs fall under the criteria in proposed 10 CFR 50.10(a)(1)(i) through (iii), would confirm that other considerations do not require that the resulting list of SSCs should otherwise be subject to NRC quality assurance (QA) requirements for design in appendix B to 10 CFR part 50, ''Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants.'' Criterion III of appendix B to 10 CFR part 50 sets forth requirements for design control, and appendix B to 10 CFR part 50 includes other requirements (*e.g.,* for records and audits) that apply to the design of SSCs subject to appendix B to 10 CFR part 50.

In addition, applicants under 10 CFR parts 50 and 52 would also confirm that other considerations would not require that any other SSC should be subject to general design criterion (GDC) 1, ''Quality standards and records,'' in appendix A to 10 CFR part 50. Criterion 1 of appendix A to 10 CFR part 50 also imposes corresponding requirements for SSCs important to safety but not safety-related to the extent such requirements are commensurate with an SSC's importance to safety. Safety-related SSCs are subject to all requirements in appendix B to 10 CFR part 50, including QA requirements applicable to facility operation.

Application of the QA requirements for design in proposed appendix T, ''Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' to 10 CFR part 50 (see section XVI of this document), could also affect the definition of construction for applicants under 10 CFR part 50, 52, or 53, ''Risk-Informed, Technology-Inclusive Regulatory Framework for Commercial Nuclear Plants.'' Specifically, the definition of construction proposed in this rule would include SSCs subject to the requirements of proposed appendix T to 10 CFR part 50, and, in certain instances, the structures built for those SSCs.

Applicants under 10 CFR parts 50 and 52 must comply with criterion 1 of appendix A to 10 CFR part 50. This criterion requires that ''SSCs important to safety be designed, fabricated, erected, and tested'' to QA standards commensurate with the importance of the safety functions to be performed. However, an SSC could be subject to performance requirements for operation but would not warrant the application of QA measures under GDC 1 such as QA for design. Specifically, the SSC could be commercial grade but also subject to specified operational performance requirements. Such an SSC could be constructed without a license. The rationale for the approach rests on the fact that if no NRC QA requirement for design, fabrication, erection, and testing applies to an SSC, then there is nothing uniquely related to nuclear safety for the NRC to approve with respect to construction of the SSC. Further, design limits on the *operation* of the SSCs that do perform safety functions would prevent or mitigate the safety effects of the failure of SSCs not subject to NRC QA requirements applicable to construction. Accordingly, construction of such SSCs would not have a reasonable nexus to nuclear safety, even if operation of the SSC did have a reasonable nexus to nuclear safety.

The failure of an SSC that has an effect on the safety of operation could warrant operational requirements with respect to SSCs that perform safety functions in response to such failures and possibly operational requirements with respect to the SSCs themselves.

An applicant's designation of an SSC as something that does not meet the definition of construction would not restrict the NRC from imposing such operational requirements to address radiological health and safety.

The NRC encourages pre-application engagement when licensees plan to undertake significant preconstruction activities to assist the NRC staff to further understand which SSCs have a reasonable nexus to radiological health and safety at the construction phase. An applicant may communicate its plan to comply with the regulations, including an SSC classification methodology to the NRC as part of preapplication interactions. The NRC staff will provide feedback as appropriate. Alternatively, one or more prospective license applicants could propose a generic SSC classification methodology, which the NRC staff could review and endorse as acceptable guidance outside a particular licensing action. The approved methodology could then be referenced by multiple applicants.

Similar to the existing regulations, if an applicant under the proposed rule determines that an SSC falls within the scope of the definition of construction in the proposed 10 CFR 50.10 or 53.020, an exemption request or an LWA would need to be submitted to the NRC to allow for this construction activity to occur prior to issuance of a CP or COL. Similar to the existing processes, the LWA would be granted if the underlying requirements of 10 CFR 50.10(d) and (e) or 10 CFR 53.1130, ''Limited work authorizations, general licenses,'' as applicable, are met.

C. Environmental Review

As explained in section IV.A., ''Definition of Construction,'' of this document, a CP, COL, or LWA applicant does not need to obtain an NRC license to build SSCs that do not meet the definition of construction in 10 CFR 51.4. As long as there is no other Federal action authorizing these activities, under 10 CFR 51.20 through 51.22, an environmental review under the National Environmental Policy Act (NEPA) is not required. Activities undertaken to build SSCs excluded from the definition of construction are not part of an NRC licensing action because such construction activities do not have a reasonable nexus to nuclear safety, even if operation of a particular SSC does have a reasonable nexus to nuclear safety. An applicant's classification of an SSC as not safety-significant, that is built prior to issuance of a license, would not restrict the NRC from imposing operational requirements on those SSCs through a later action.

For SSCs that do meet the definition of construction where the NRC would authorize construction, the NRC must perform an environmental review in accordance with 10 CFR 50.10 or 53.610, ''Construction,'' as applicable,

and the application requirements of 10 CFR part 51, ''Environmental Protection Regulations for Domestic Licensing and Related Regulatory Functions.''

D. General Licenses and Generic Finality

The NRC proposes to add new 10 CFR 50.10(h) and 53.1130(e), which would implement the authority in section 109 of the AEA to create a general license allowing construction of an important component part of a specified class of commercial nuclear plants. The specified class of plants would be those plants of a design the NRC previously approved in a licensing action in which the NRC also granted ''generic finality,'' as discussed later, and for which operation has been authorized. The important component part defined as a utilization facility under Section 11cc.(2) of the AEA and subject to the general license would be the portion of the plant constructed on site except for the reactor vessel, the reactor coolant system, and associated reactivity control and heat removal systems. The general license would authorize construction of the important component part upon docketing of an application for a license that would authorize construction of the nuclear plant, subject to conditions. The conditions would provide reasonable assurance of adequate protection of the health and safety of the public and common defense and security, and would also ensure an appropriate level of environmental review. The NRC also proposes a conforming change to 10 CFR 50.10(c) and 53.610(b) to provide that construction may occur under the general licenses issued in 10 CFR 50.10(h) and 53.1130(e), respectively.

The construction activities authorized by the general license would be limited to those SSCs for which a previously approved design was provided generic finality, but would not include the reactor vessel, the reactor coolant system, and associated reactivity control and heat removal systems. The NRC expects that the construction of SSCs approved through a general license would be for those SSCs that are not inherently sensitive to the site-specific characteristics of a proposed deployment site. Although construction of many SSCs in a particular design could conceptually be approved through a general license, the NRC cannot approve the construction of an entire utilization facility through this provision.

The proposed new regulations would enable future applicants to reference previously reviewed and approved information only when significant safety and environmental issues related to design, construction, and operation are generically resolved in a manner that applies to the intended use of the information. For example, to qualify for a general license, an applicant would have to reference a nuclear reactor design that was afforded generic finality by the NRC and successfully constructed under NRC oversight and placed into operation. Also, the applicant's proposed site would have to fall within the corresponding site parameter envelope that was provided in the request for generic finality. Therefore, an application that satisfies the proposed new regulation would provide reasonable assurance of adequate protection of public health and safety and common defense and security equivalent to satisfaction of existing regulations, and there would have been a prior hearing opportunity on the reactor design being referenced. Further, the proposed regulation would require the general licensee to allow for NRC inspections that the Commission deems necessary related to activities performed under the general license.

The general license regulation would also include conditions to address environmental considerations. The OL or COL (as applicable) of the plant for which generic finality was approved would either have met the criteria for categorical exclusion or had a finding of no significant impact after preparation of an environmental assessment. Provided that the environmental characteristics of the proposed plant fall within the environmental parameters for the plant for which generic finality was approved, the environmental effects of a subsequent plant would not exceed those of the approved plant and would be acceptable. In addition, the applicant proposing to use the general license would have to propose a plan for redress of any adverse environmental impact from conduct of activities under the general license should such redress be necessary. This proposed requirement would be similar to the requirements in 10 CFR 50.10(d)(3)(iii), which requires a redress plan as part of an application for an LWA, and 10 CFR 50.12(b)(2), which requires the Commission to consider redress of adverse environmental impacts in determining whether to grant an exemption permitting the conduct of construction activities prior to the issuance of a CP.

The proposed general license regulation would also require that the general licensee has notified the NRC that all applicable permits, licenses, approvals, and other entitlements in connection with the proposed action that the general licensee was responsible for obtaining have been obtained. In addition, the proposed general license would require that applicable Federal environmental consultations have been completed. This would ensure that construction activities would not begin unless the NRC has the information it would need to fulfill its obligations for environmental review under the AEA, NEPA, and other relevant laws.

In addition, the proposed general license regulation would clarify that any activities undertaken by the general licensee or on its behalf under the general license would be entirely at the risk of the general licensee and would have no bearing on the issuance of a license with respect to the requirements of the AEA, and rules, regulations, or orders issued under the AEA. However, the general licensee would be able to mitigate this additional regulatory risk through careful site selection to ensure that site characteristics are within the bounds of the postulated site parameters and by performing construction activities following appropriate QA and fitness-for-duty programs.

Based on the proposed general license requirements in 10 CFR 50.10(h) and 53.1130(e), the Commission has determined that such general licensing would be for only parts of utilization facilities, not constitute an unreasonable risk to the common defense and security, and, therefore, be consistent with the authority provided to the Commission by section 109a. of the AEA.

In addition, in order to facilitate the use of the general licensing concept, the NRC proposes to add conforming changes to the following regulations.

The NRC proposes to add new 10 CFR 50.34(b)(14) which would require an OL application for those 10 CFR part 50 applicants that request the NRC to make a finding on generic finality, to include applicable site parameters postulated for the design, including the design-basis external hazard levels for the relevant external hazards, and an analysis and evaluation of the design in terms of those site parameters. Similarly, the NRC proposes to add new paragraph (bb) to 10 CFR 53.1369, ''Contents of applications for operating licenses; technical information,'' for 10 CFR part 53, ''Risk-Informed, Technology-Inclusive Regulatory Framework for Commercial Nuclear Plants,'' OLs for the same purpose. For COL applications under 10 CFR part 52 or 53, this application content requirement would be included in a new 10 CFR 52.79(a)(48) and 53.1416(i), respectively. The site parameters may be the same as or more severe than the site

characteristics established for the site of the reactor proposed in the OL or COL application that proposed generic finality.

The NRC also proposes to add a new 10 CFR 50.58(b)(7), which would require the Commission to include the request for generic finality as a proposed action in the notice of proposed action required by 10 CFR 2.105 for OL applications. Similarly, the NRC also proposes to add a new paragraph (b)(2) to 10 CFR 53.1375, ''Review of applications,'' which would require the Commission to include the request for generic finality as a proposed action in the notice of proposed action for a 10 CFR part 53 OL, required by 10 CFR 2.105. For COL applications, the NRC proposes to add a new 10 CFR 52.85(b) and 53.1422(b)(2), which would require the Commission to include the request for generic finality as a proposed action in the notice of hearing required by 10 CFR 2.104 for COL applications under 10 CFR parts 52 and 53, respectively. These changes would provide a hearing opportunity to the public on the request for generic finality. In addition, the Commission's ruling on a request for hearing or petition for leave to intervene under 10 CFR 2.309(d)(2) would consider that a petitioner may have an interest in the application if matters resolved in the licensing proceeding were to be afforded generic finality. This would enable petitioners whose property, financial, or other interests would not be directly affected by the issuance of the OL or COL for a particular reactor to have an opportunity to intervene on generic aspects of the design that would be afforded finality and would therefore not be subject to hearing if referenced in a later application that would affect the petitioner's property, financial, or other interest.

Consistent with the previous discussion, the NRC proposes to add new 10 CFR 50.57(d), which would permit the Commission to afford generic finality to generic aspects of the design of a utilization facility licensed under 10 CFR part 50, including postulated site parameters submitted pursuant to 10 CFR 50.34(b)(14), if it finds that the proposed generic design can be constructed and operated at sites having characteristics that fall within the site parameters postulated for the design. For the same reason and with the same conditions, the NRC proposes to add new paragraph (e) to 10 CFR 53.1387, ''Issuance of operating licenses,'' which would permit the Commission to afford generic finality to generic aspects of the design of a commercial nuclear plant licensed under 10 CFR part 53, including postulated site parameters submitted pursuant to 10 CFR 53.1369(bb).

Similarly, the NRC proposes to add new 10 CFR 52.97(d) which would permit the Commission to afford generic finality to generic aspects of the design of a utilization facility licensed under 10 CFR part 52, including postulated site parameters submitted pursuant to 10 CFR 52.79(a)(48), if it finds that the proposed generic design can be constructed and operated at sites having characteristics that fall within the site parameters postulated for the design. For the same reason and with the same conditions, the NRC proposes to add new paragraph (d) to 10 CFR 53.1440, ''Issuance of combined licenses,'' which would permit the Commission to afford generic finality to generic aspects of the design of a commercial nuclear plant licensed under 10 CFR part 53, including postulated site parameters submitted pursuant to 10 CFR 53.1416(i).

The regulations in 10 CFR 50.59, ''Changes, tests and experiments,'' that establish requirements for making changes to portions of the facility as described in the final safety analysis report (FSAR) for an OL are applicable to generic aspects of the design of a utilization facility that have been afforded generic finality because that design information would be included in the FSAR for the OL. Similarly, the regulations in 10 CFR 50.59 are applicable to generic aspects of the design of a utilization facility that are described in a COL FSAR and have been afforded generic finality.

Similarly, the regulations in 10 CFR part 53 that establish requirements for making changes to portions of the facility as described in the FSAR are applicable to generic aspects of the design of a utilization facility that have been afforded generic finality.

The NRC proposes to add new 10 CFR 50.58(b)(8) and 52.98(h) to include requirements to address finality for portions of 10 CFR part 50 OLs and 10 CFR part 52 COLs with respect to NRC reviews and hearings. Proposed 10 CFR 50.58(b)(8) would require the Commission to treat as resolved any issues referenced in following proceedings or in enforcement hearings (other than ones under 10 CFR 2.202(e)(1)) that were afforded finality pursuant to 10 CFR 50.57(d). The proposed 10 CFR 50.58(b)(8) would ensure that issues resolved in an approved request for generic finality (including, if applicable, the adequacy of a reactor design) are not re-adjudicated in the license proceedings where such information is referenced in the license applications. The proposed 10 CFR 52.98(h) would include substantially the same provisions for COLs with generic finality.

To address generic finality in 10 CFR part 53, the NRC proposes to add similar provisions to new paragraph (b) to 10 CFR 53.1390, ''Finality of operating licenses,'' and new paragraph (g) to 10 CFR 53.1443, ''Finality of combined licenses.''

Proposed 10 CFR 53.1390(b) would require the Commission, in the proceedings for issuance of a CP, an OL, or a COL or in any enforcement hearing (other than one initiated under 10 CFR 53.1390(a)), to treat as resolved those matters resolved in the proceedings on the application or renewal of the referenced OL, including, if applicable, the adequacy of a reactor design where the referenced OL was afforded finality pursuant to 10 CFR 53.1387(e).

Proposed 10 CFR 53.1443(g) would require the Commission, in the proceedings for issuance of a CP, an OL, or a COL or in any enforcement hearing (other than one initiated under 10 CFR 53.1443(a)), to treat as resolved those matters resolved in the proceedings on the application or renewal of the referenced COL, including, if applicable, the adequacy of a reactor design where the referenced COL was afforded finality pursuant to 10 CFR 53.1440(d).

As written, the proposed generic finality provisions would allow the NRC to take appropriate action under the applicable backfitting or issue finality provision if the NRC determines that the generic finality approval or associated technical information presents safety concerns that warrant NRC action. As stated above, the generic finality that would be afforded under the proposed rule provisions would *not* apply to certain enforcement hearings. For example, proposed 10 CFR 50.58(d)(8) provides that finality would apply, in part, to ''any enforcement hearing *other than one initiated by the Commission under § 2.202(e)(1) of this chapter*'' (emphasis added). Enforcement hearings under 10 CFR 2.202(e)(1) are those which involve a backfit to modify a 10 CFR part 50 license, and 10 CFR 50.109 must be followed for such orders and the associated proceedings. Thus, generic finality would not apply in such cases so that the NRC could take appropriate action if the backfitting requirements in 10 CFR 50.109 are satisfied. Similarly, the proposed generic finality provisions in 10 CFR 52.98(h), 53.1390(b), and 53.1443(g) would provide that generic finality applies except in enforcement hearings initiated under the issue finality

provisions in 10 CFR 52.98(a), 53.1390(a), and 53.1443(a), respectively.

V. Background—Determinate and Data-Backed Thresholds for Reactor Safety Assessments

Section 5(h) of E.O. 14300 directs the NRC to ''[a]dopt revised and, where feasible, determinate and data-backed thresholds to ensure that reactor safety assessments are focused on credible, realistic risks.''

The NRC evaluated ''reactor safety assessments,'' focusing on assessments conducted to (1) demonstrate the capability of safety-related SSCs during design basis events (DBEs) (*e.g.,* as described in Chapter 15, ''Transient and Accident Analysis,'' of NUREG–0800, ''Standard Review Plan for the Review of Safety Analysis Reports for Nuclear Power Plants: LWR Edition''), and (2) verify the ability of SSCs to withstand certain design basis conditions, including natural phenomena and environmental conditions (*e.g.,* high winds, seismic events, and conditions during normal operation and accident scenarios). To effectively address the direction in E.O. 14300, the NRC concluded that the most appropriate approach would be to clarify the terminology in 10 CFR 50.2, ''Definitions,'' to ensure that safety assessments are focused on credible, realistic risks.

The selection of DBEs and associated design basis parameters is a critical prerequisite for determining the safety of a nuclear facility. DBEs serve to identify the subset of SSCs subject to more stringent QA requirements and to establish the performance capabilities those SSCs must demonstrate under normal operation, anticipated operational events, and accident conditions. For example, 10 CFR 50.46, ''Acceptance criteria for emergency core cooling systems for light-water nuclear power reactors,'' requires analysis of postulated loss-of-coolant accidents to verify the adequacy of emergency core cooling system (ECCS) designs. In addition to the general requirement to analyze SSC performance during DBEs, other regulations specify additional, event-specific accident analyses, often referred to as beyond design basis events (BDBEs). For example, 10 CFR 50.63, ''Loss of all alternating current power,'' provides requirements related to plants' abilities to withstand for a specified duration and recover from a station blackout (SBO).

The technical information required in applications for CPs and OLs, including the content of preliminary and FSARs, is outlined in 10 CFR 50.34, ''Contents of applications; technical information.'' Among other requirements, an applicant is required to evaluate siting considerations and the design and performance of SSCs that are intended to prevent accidents and mitigate their consequences. The regulatory processes described in 10 CFR part 52 include similar technical information requirements for the content of applications (*e.g.,* as specified in 10 CFR 52.17, ''Contents of applications; technical information,'' 52.47, ''Contents of applications; technical information,'' 52.79, ''Contents of applications; technical information in final safety analysis report,'' 52.137, ''Contents of applications; technical information,'' and 52.157, ''Contents of applications; technical information in final safety analysis report'').

The technical information associated with the performance of safety assessments is documented in the preliminary or FSAR for CPs or OLs and COLs, respectively. The FSAR describes the evaluation methods used to establish design bases and perform safety analyses, the design and performance requirements for SSCs, and the methods used to demonstrate that those SSCs can perform their intended safety functions. Accordingly, the FSAR serves as an essential component of the licensing basis for a nuclear facility. It is also used to determine the appropriate regulatory process for licensing basis changes, such as those governed by 10 CFR 50.59, ''Changes, tests and experiments,'' or 10 CFR 50.90, ''Application for amendment of license, construction permit, or early site permit.''

Within the power reactor licensing framework, the term ''safety-related'' is used to identify SSCs that require special treatment, including QA controls, environmental qualification, and compliance with applicable industry codes and standards. The current definition of ''safety-related SSCs,'' provided in 10 CFR 50.2, uses the term ''design basis events'' to define the scope of safety assessments needed to identify safety-related SSCs. However, 10 CFR 50.2 does not include a corresponding definition of ''design basis event'' or provide criteria for selecting events to be considered in the design basis. While 10 CFR 50.49, ''Environmental qualification of electric equipment important to safety for nuclear power plants,'' includes a definition of DBEs, that definition does not explicitly apply to the definition of safety-related SSCs in 10 CFR 50.2 and does not reference the use of determinate, data-backed thresholds.

Traditionally, the spectrum of DBEs used to identify safety-related SSCs, as defined in 10 CFR 50.2, has been based on information contained in Chapter 15 of NUREG–0800. While this approach had been effective for licensing large light-water reactors (LWRs) with designs similar to the currently operating power reactor fleet, the DBEs described in NUREG–0800 can have limited applicability to evolutionary LWR designs and non-LWR designs. For example, the lack of a more technology-inclusive definition for the term DBE in the current definition has created challenges with respect to clarity and reliability on the subset of SSCs that warrant special treatment. Furthermore, it has created the potential to require safety assessments that may not be focused on credible, realistic risks. Therefore, clarifying what constitutes a DBE based on determinate, data-backed thresholds would enhance the efficiency and consistency of future power reactor licensing reviews. Consequently, the NRC proposes to provide a definition for DBE in 10 CFR part 50.

Nonetheless, the NRC has not identified a need to propose a corresponding revision to the term ''design bases'' in 10 CFR 50.2. The term ''design bases'' is defined in 10 CFR 50.2 as information which identifies the specific functions to be performed by a structure, system, or component of a facility, and the specific values or ranges of values chosen for controlling parameters as reference bounds for design. The definition further clarifies that design basis values may be (1) constraints derived from generally accepted ''state-of-the-art'' practices for achieving functional goals or (2) requirements based on analyses of the effects of postulated accidents for which an SSC must meet specified functional goals. Design bases are connected to safety assessments in two ways: (1) the performance capabilities of SSCs, as established through evaluations of DBEs and BDBEs, and (2) the design parameters for SSCs, which are derived from the operational context in which the function is to be performed, including considerations of natural phenomena and environmental factors. The NRC has determined that the existing definition of design bases in 10 CFR 50.2 provides sufficient flexibility to support the use of determinate, data-backed thresholds. In practice, the NRC has already applied determinate and data-backed thresholds for the selection of design bases attributes in several areas, including high winds, flooding, and seismic hazards. Therefore, a rulemaking to revise the definition of design bases is not necessary. However, the NRC is issuing draft guidance (DG)

that will provide additional detail within DG–1454, ''Implementation of Determinate and Data-Backed Thresholds for Reactor Safety Assessments,'' to support consistent application in this area.

The term BDBE has not previously been defined in 10 CFR 50.2. However, lessons learned from ongoing studies of nuclear plant risks, as well as operational experience, have historically led the NRC to identify and address plant events and conditions beyond the originally defined set of DBEs that could result in the release of radioactive material sufficient to pose a hazard to public health and safety. Accordingly, the NRC has imposed additional requirements to address such events when risk insights emerged from operational experience (*e.g.,* SBO in 10 CFR 50.63 and anticipated transients without scram (ATWS) in 10 CFR 50.62, ''Requirements for reduction of risk from anticipated transients without scram (ATWS) events for light-water-cooled nuclear power plants''). These requirements extended regulatory attention beyond the traditional scope of DBEs. When developing this proposed rulemaking, the NRC initially considered a framework where these types of events were included in the DBE category. However, experience with regulating events such as SBO and ATWS has demonstrated that these types of events can be adequately addressed without the same regulatory treatment as DBEs. Therefore, the formal inclusion of the BDBE category in this proposed rule would provide a framework for applying graded regulatory treatment to such events. It would enable the NRC to address risks to public health and safety that do not warrant mitigation exclusively through safety-related SSCs or conservative safety assessments. Consequently, the NRC proposes to provide a definition for BDBE in 10 CFR part 50.

VI. Discussion—Determinate and Data-Backed Thresholds for Reactor Safety Assessments

The proposed changes would revise 10 CFR 50.2 to add definitions for the terms ''design basis events'' and ''beyond design basis events.'' The proposed changes would include a conforming revision to the definition of ''design basis event'' in 10 CFR 50.49(b)(1)(ii). These changes would apply to future 10 CFR part 50 and 52 applications submitted on or after the date that would be 180 days after the effective date of a final rule if this proposed rule were issued as a final rule; however, existing applicants, licensees, and approval holders under 10 CFR part 50 or 52 could voluntarily choose to adopt them. In parallel with the proposed changes, the NRC has developed DG–1454, which would (1) describe determinate and data-backed thresholds for categorizing events as DBEs or BDBEs, (2) outline graded assessment approaches for each event category, and (3) clarify the process for selecting design bases controlling parameters used as reference bounds in the design of SSCs. This guidance would use initiating event frequencies and qualitative criteria for categorizing events, maintaining consistency with the current safety assessment framework described in 10 CFR part 50 (and referenced in 10 CFR part 52). In addition, this guidance would describe acceptable approaches for identifying, grouping, and quantifying initiating events to ensure they are binned into appropriate categories. While alternate approaches, such as defining thresholds in terms of event sequences could be used, they would typically require the development of a full risk assessment or other systematic risk evaluation to determine sequence frequencies. To avoid imposing additional requirements not currently included in 10 CFR part 50, anchoring event selection to initiating event frequencies would provide a determinate and data-backed approach without adding regulatory burden.

Adding generally applicable definitions for DBE and BDBE would improve regulatory clarity and enable the use of objective criteria in selecting initiating events. Establishing threshold criteria, graded assessment approaches, and the selection process for design basis parameters within guidance would ensure that applicants and licensees are provided with an approach acceptable to the NRC, while ensuring flexibility for applicants to justify unique approaches, if desired, without the need for an exemption.

The addition of a definition of BDBE and corresponding thresholds would allow a reduction in unnecessary conservatism applied in the safety assessments of lower frequency events. The NRC concluded that reactor safety assessments associated with BDBEs are within the scope of the existing contents of application requirements of 10 CFR 50.34 and analogous sections of 10 CFR part 52. Specifically, requirements related to analysis and evaluation of the design and performance of SSCs of the facility with the objective of assessing the risk to public health and safety include consideration of BDBEs. Several existing regulations already address specific events not originally considered in the licensing basis or considered BDBEs (examples include but are not limited to ATWS, loss of all alternating current power events resulting in SBOs, and combustible gas control). For current applicants, licensees, or approval holders who may opt to adopt the proposed definitions for DBE and BDBE, as well as future applicants who would be mandated to use the proposed definitions, this rulemaking would not change the treatment of BDBEs specifically addressed by regulation such as ATWS and SBO. However, adoption of the BDBE definition could eliminate some events not specifically addressed by regulation from consideration that are determined to be non-credible.

Similarly, evaluations that assume substantial release of fission products would still be performed in accordance with 10 CFR 50.34(a) and 10 CFR 50.67, ''Accident source term.'' For LWRs, the release would be into containment. For other designs, it may be expressed as releases to the environment considering expected demonstrable leakage rates from potential flow paths and any fission product cleanup systems intended to mitigate the consequences of accidents. These evaluations would address the safety features that are engineered into a facility and those barriers that must be breached as a result of an accident before a radiological release to the environment can occur. Evaluations required to comply with 10 CFR 50.34(a) and 10 CFR 50.67 rely on conservative modeling assumptions. For example, as described in RG 1.183, ''Alternative Radiological Source Terms for Evaluating Design Basis Accidents at Nuclear Power Reactors,'' source term fission product release fractions are derived from a set of accident sequences and many physical processes and phenomena are represented by bounding assumptions rather than being modeled directly. In addition, these evaluations credit only safety-related features in providing mitigation capability. Therefore, this evaluation is generally included in the spectrum of DBEs analyzed in Chapter 15 of NUREG–0800 (*e.g.,* Sections 15.0.1 or 15.0.3).

The current definition of design bases in 10 CFR 50.2 provides that controlling parameters may be derived either from accepted ''state-of-the-art'' practices or from analysis (based on calculations or experiments). The NRC has determined that this definition is sufficiently broad to accommodate the use of determinate, data-backed thresholds as implemented through guidance without the need for a rulemaking change. Design bases are identified through two primary means:

(1) the functional performance capabilities required to mitigate DBEs and BDBEs; and (2) the design parameters derived from the operational context in which the function is to be performed, including natural hazards and environmental conditions. The first element is addressed through the addition of proposed definitions of DBE and BDBE in 10 CFR 50.2 that would focus safety assessments on credible and realistic risks. With regard to the second element, the NRC has gained substantial experience in developing appropriate determinate and data-backed thresholds to address protection against natural phenomena and environmental conditions. Examples include assessment of tornado winds (RG 1.76, ''Design-Basis Tornado and Tornado Missiles for Nuclear Power Plants''), hurricane winds (RG 1.221, ''Design-Basis Hurricane and Hurricane Missiles for Nuclear Power Plants''), and seismic hazards (RG 1.208, ''A Performance-Based Approach to Define the Site-Specific Earthquake Ground Motion''). The NRC has developed DG–1454 to leverage existing practices in this area and further clarify the selection of design bases.

VII. Background—Removal of IEEE–323–1974 Reference in Footnote 3 of 10 CFR 50.49

Safety-related structures, systems and components are defined in 10 CFR 50.2, ''Definitions.'' The relationship between safety-related electric equipment and Class 1E equipment was initially established through footnote 3 of 10 CFR 50.49, ''Environmental Qualification of Electric Equipment Important to Safety for Nuclear Power Plants.'' The final rule promulgating 10 CFR 50.49, including footnote 3 of 10 CFR 50.49, (48 FR 2733; January 21, 1983) stated, in part: ''The scope of the final rule covers that portion of equipment important to safety commonly referred to as ''safety-related'' (which the Commission interprets as essentially ''Class 1E'' equipment defined in [Institute of Electrical and Electronics Engineers (IEEE)]–323–1974).''

The connection between ''safety-related'' and ''Class 1E'' is now established in a more up-to-date standard—IEEE Standard 308, ''IEEE Standard Criteria for Class 1E Power Systems for Nuclear Power Generating Stations,'' which the NRC endorsed in RG 1.32, ''Criteria for Power Systems for Nuclear Power Plants.''

VIII. Discussion—Removal of IEEE–323–1974 Reference in Footnote 3 of 10 CFR 50.49

The proposed action would remove footnote 3 of 10 CFR 50.49. Footnote 3 references an old standard that is no longer utilized as the sole means to establish the connection between ''safety-related'' and ''Class 1E.'' Instead, this connection is established in the more up-to-date IEEE Standard 308, which the NRC endorsed in RG 1.32. Removal of this footnote would improve regulatory clarity and would be consistent with the NRC modernizing and improving its regulations to reflect best practices and the maturity of the nuclear industry.

In addition, a minor editorial change is proposed to redesignate the current footnote 4 of 10 CFR 50.49 as footnote 1 given the previous and proposed deletions of the preceding footnotes.

IX. Background—Expanded Alternative Requests Under 10 CFR 50.55a(z)

In 10 CFR 50.55a, ''Codes and standards,'' the NRC incorporates by reference certain parts of editions and addenda of specified codes and standards through rulemaking. Upon incorporation by reference of these specified codes and standards into 10 CFR 50.55a, the provisions of these codes and standards are legally-binding NRC requirements as delineated in 10 CFR 50.55a, subject to the conditions on certain specific provisions that are set forth in 10 CFR 50.55a. Currently, in paragraph (z), ''Alternatives to codes and standards requirements,'' of 10 CFR 50.55a, an applicant or licensee may request authorization of alternatives to the requirements of paragraphs (b), ''Use and conditions on the use of standards,'' through (h), ''Protection and safety systems,'' of 10 CFR 50.55a, if the applicant or licensee demonstrates either that the proposed alternative would provide an acceptable level of quality and safety or that compliance with the specified requirements would result in hardship or unusual difficulty without a compensating increase in the level of quality and safety. Since its initial promulgation in 1971 (36 FR 11423; June 12, 1971), 10 CFR 50.55a has allowed for the consideration of proposed alternatives under these same two criteria. Over the years, 10 CFR 50.55a has been periodically updated to reflect revised and updated codes and standards for nuclear power plants.

On March 15, 1984 (49 FR 9711), the NRC issued a final rule that made procedural changes by, among other things, clarifying the procedures for alternatives, expressly noting that alternatives can be authorized by the Director of the Office of Nuclear Reactor Regulation. In the November 5, 2014, final rule, ''Approval of American Society of Mechanical Engineers' [ASME] Code Cases'' (79 FR 65776), the NRC restructured 10 CFR 50.55a to align with the Office of the Federal Register's guidelines for incorporation by reference and to allow proposed alternatives to NRC-approved Code Cases rather than only to ASME Code provisions. In this restructuring, the proposed alternatives provisions were moved from their prior location in paragraph (a)(3) of 10 CFR 50.55a to a newly designated paragraph (z) of 10 CFR 50.55a. However, these rulemakings addressed only procedural clarifications and a restructuring of existing regulations, not changes in the scope of opportunities for alternatives. In the July 17, 2024, final rule, ''American Society of Mechanical Engineers Code Cases and Update Frequency'' (89 FR 58039), the NRC added paragraph (y), ''Definitions,'' to 10 CFR 50.55a. These definitions provide consistency and clarity throughout 10 CFR 50.55a and accommodate new opportunities to change code of record intervals. However, these definitions were added outside the scope of paragraph (z) of 10 CFR 50.55a because the Commission had not approved the use of 10 CFR 50.55a(z) for definitions or the newly defined intervals.

X. Discussion—Expanded Alternative Requests Under 10 CFR 50.55a(z)

Currently, the proposed alternative provisions of paragraph (z) of 10 CFR 50.55a apply to the codes and standards requirements in paragraphs (b) through (h) of 10 CFR 50.55a. The addition of paragraph (y) to 10 CFR 50.55a in the July 17, 2024, final rule, without an associated expansion of the scope of paragraph (z), has resulted in unanticipated exemptions under 10 CFR 50.12, ''Specific exemptions,'' to use alternate definitions to those included in paragraph (y) of 10 CFR 50.55a. Moreover, the criteria of paragraph (z)(1), ''Acceptable level of quality and safety,'' or (z)(2), ''Hardship without a compensating increase in quality and safety,'' of 10 CFR 50.55a provide appropriate controls for requested alternatives to all requirements in 10 CFR 50.55a, so there is no need to restrict the application of 10 CFR 50.55a(z) to only some paragraphs in 10 CFR 50.55a. Therefore, the NRC proposes to remove the restriction limiting proposed alternatives to paragraphs (b) through (h) of 10 CFR 50.55a so that proposed alternatives

would now be permitted for all regulatory requirements in 10 CFR 50.55a using the existing criteria in paragraphs (z)(1) and (2) of 10 CFR 50.55a. The proposed removal of this scope restriction would also allow for the use of the proposed alternatives provision in paragraph (z) of 10 CFR 50.55a for any future additions or modifications to 10 CFR 50.55a without the need for further revision to paragraph (z).

In addition to creating paragraph (y) of 10 CFR 50.55a, the revisions in the July 17, 2024, final rule provided more flexibility to licensees by expanding the code of record interval from 10 years to two consecutive inservice testing and inservice inspection intervals. In that final rule's preamble, the Commission stated, in part, that licensees may request future alternatives based upon the code of record interval. This revision, coupled with the staff position in SECY–23–0061, ''Clarification of the Staff's Position on Certain American Society of Mechanical Engineers Code Alternatives for More Than One 10-Year Inservice Inspection Interval Under Title 10 of the *Code of Federal Regulations* 50.55a,'' dated July 21, 2023, clarified that, when appropriately justified, the duration of an alternative need not be limited to the length of a single inservice testing or inservice inspection interval. Rather, the NRC may approve specific alternatives for longer durations when the technical bases supporting the requested alternative ensure that an acceptable level of quality and safety will be maintained. These existing flexibilities would be unchanged by this proposed rule.

The proposed change would provide additional flexibility to a licensee or applicant, while maintaining the same requirements for an acceptable level of quality and safety or the presence of a hardship without a compensating increase in quality and safety, which have been foundational to proposed alternatives since their initial promulgation.

XI. Background—Risk-Informing 10 CFR 50.59 and Allowing Flexibility for Changes to Methods

A. Use of Quantitative Risk Results

The AEA requires a licensee to seek an amendment for significant changes to its facility or procedures. The Commission possesses substantial discretion to define, by rule, the threshold that constitutes a change significant enough to require a license amendment.

The current regulation in 10 CFR 50.59 was developed in response to issues involving inconsistency in how licensees applied the previous criteria to determine whether changes, tests, or experiments require prior NRC approval. The NRC is proposing to amend 10 CFR 50.59 to allow licensees to consider risk insights from PRAs when applying the criteria in that provision. The statements of consideration for the 10 CFR 50.59 final rule, ''Changes, Tests, and Experiments'' (64 FR 53582; October 4, 1999), did not allow licensees to use PRA insights at that time, but the Commission recognized the possibility that the NRC could one day develop the regulatory infrastructure to support the use of PRAs in 10 CFR 50.59 analyses.

The NRC now proposes to incorporate the use of quantitative risk results, like Core Damage Frequency (CDF) and Large Early Release Frequency (LERF), to evaluate changes under 10 CFR 50.59(c)(2)(i) and (ii).

The current state of practice in the nuclear fleet for quantitative risk assessment is the use of Level 1/limited Level 2 PRAs. The quantitative risk metrics output by these PRAs are CDF and LERF, and they, along with their changes (*i.e.,* ΔCDF and ΔLERF), are the metrics used as part of risk-informed decision-making processes. As described in RG 1.174, Revision 3, ''An Approach for Using Probabilistic Risk Assessment in Risk-Informed Decisions on Plant-Specific Changes to the Licensing Basis,'' dated January 2018, these risk metrics are based on the Commission's safety goals and the associated quantitative health objectives. Similarly, the NRC proposes to use the small changes in CDF and LERF jointly as means to determine the importance of the effect of the proposed change on accident frequency and SSC malfunction rate under 10 CFR 50.59.

B. Improved Flexibility for Changes to Methods of Evaluation

Currently, 10 CFR 50.59 allows licensees to make certain changes to their facility or procedures without prior NRC approval, provided those changes do not meet specific thresholds that would require a license amendment. One of those thresholds, stated in 10 CFR 50.59(c)(2)(viii), requires NRC review of any change in a methodology that results in a departure from a method of evaluation described in the FSAR (as updated) used in establishing the design bases or in the safety analysis. As explained in the preamble of the 10 CFR 50.59 final rule in 1999, this language was chosen to ensure NRC oversight of the safety margins and conservatisms that form the basis of the NRC's licensing decision. The Commission stated that the language of 10 CFR 50.59(c)(2)(viii) was selected ''to allow licensees only a small degree of flexibility in methods where the results are tending in the non-conservative direction'' (64 FR 53598; October 4, 1999).

In SECY–97–035, ''Proposed Regulatory Guidance Related to Implementation of 10 CFR 50.59 (Changes, Tests, and Experiments),'' dated February 12, 1997, which transmitted proposed 10 CFR 50.59 guidance to the Commission ahead of the proposed rulemaking, the staff recognized that, ''as the knowledge base increases and computing power increases, new methods of analysis will more accurately predict the actual plant response.'' However, the staff found that a comparison of the analytical results from two different methodologies was not valid to make a 10 CFR 50.59 determination. To make the 10 CFR 50.59 determination using a new methodology, the new methodology must be valid (*e.g.,* previously approved by the NRC) and the analysis in question must be performed for the situation before the change and the situation after the change using the same methodology.

In the decades since the original rule was written, there have been substantial advancements in computational capabilities and modeling practices. New data, improved understanding, and increased computing power now allow for faster iteration and refinement of methods used in safety analyses. Due to this substantial increase in computational power and the rapid growth in the use of modeling and simulation, other industries are beginning to shift away from model-by-model reviews and are instead focusing on the processes by which organizations establish the credibility of their models—specifically through verification, validation, and uncertainty quantification (VVUQ) programs. The U.S. Food and Drug Administration has taken the most prominent step in this direction by issuing new guidance centered on credibility assessments (FDA–2021–D–0980; November 17, 2023). The aviation industry is actively developing a VVUQ standard through an industry-led, Federal Aviation Administration-supported initiative.

The existing requirements of 10 CFR 50.59(c)(2)(viii) mandate a license amendment for any departure from a method of evaluation described in the FSAR. As defined in the regulation, a departure is a change to any element of a methodology, unless the results are

''conservative or essentially the same,'' or any change from one method to another method, unless the method has been previously approved by the NRC for the specific application. Paragraph (a)(2)(iv) of 10 CFR 53.1550 limits changes to methods similarly to 10 CFR 50.59, allowing changes without NRC review and approval only when results are conservative or essentially the same, the revised method of evaluation has been previously approved by the NRC for the intended application, or the revised method of evaluation can be used under an NRC-approved consensus code or standard. The rapid advancement in computational modeling and simulation can offer more realistic and accurate safety analyses than the legacy methods documented in many plants' original FSARs. Thus, the current regulations can create an unnecessary regulatory burden by requiring licensees to seek amendments to use superior analytical tools, since these new tools would constitute a departure from a method of evaluation described in the FSAR as contemplated in the existing regulatory frameworks. This can disincentivize the adoption of better technology and expend both licensee and NRC resources on reviewing license amendment requests that ultimately enhance, rather than degrade, safety analysis quality. The purpose of the proposed rule change, therefore, would be to increase regulatory efficiency and flexibility, consistent with the objectives of the 1999 rule revision, the ADVANCE Act, and the Executive orders.

XII. Discussion—Risk-Informing 10 CFR 50.59 and Allowing Flexibility for Changes to Methods

A. Use of Quantitative Risk Results

The NRC proposes rulemaking to establish an alternative pathway that would allow the use of quantitative risk metrics, like CDF and LERF, along with consideration of safety margins and defense in depth, to evaluate a proposed change, test, or experiment against the criteria of 10 CFR 50.59(c)(2)(i) and (ii), while leaving all other criteria in 10 CFR 50.59(c)(2) in place. New proposed 10 CFR 50.59(e) would establish a risk-informed alternative to the existing regulation and would not alter or impede the current practice for evaluating proposed changes against the text of 10 CFR 50.59(c)(2)(i) and (ii), as written. A licensee could continue to use qualitative assessments, engineering judgement, and other existing practices and techniques to evaluate a proposed change, test, or experiment.

Under the proposed 10 CFR 50.59(e), a licensee could demonstrate that a change would not result in a ''more than a minimal increase'' under 10 CFR 50.59(c)(2)(i) and (ii) by using quantitative risk results based on a PRA of appropriate scope and quality that provides appropriate risk metrics. The change would also need to maintain defense-in-depth and safety margins. ''Appropriate scope and quality'' in this context would mean that the licensee's model fully encompasses the proposed change and that the model has been found to be acceptable for use in a previous NRC-approved application. ''Appropriate risk metrics'' in this context would mean quantitative results that demonstrate the effects on the proposed change and can provide a baseline for judging facility risk. For traditional PRAs, these metrics are CDF, LERF, and the changes (Δs) to CDF and LERF. Extensive discussion of maintaining defense in depth and safety margins can be found in RG 1.174, Revision 3. The NRC has proposed guidance for 10 CFR 50.59(e) in DG–1466, draft Revision 4 to RG 1.187, ''Guidance for Implementation of 10CFR50.59, 'Changes, Tests, And Experiments.'''

The use of PRA would not replace or supplant the deterministic licensing basis but would supplement it with a powerful analytical tool. Since the initial licensing of the current fleet, the NRC and the industry have developed and matured PRA methodologies, which provide a holistic, integrated assessment of plant safety. PRA can identify contributors to risk and potential vulnerabilities that may not be apparent from a purely deterministic analysis.

Incorporating CDF and LERF into the 10 CFR 50.59 process would not be an attempt to re-license plants on a probabilistic basis. Instead, it would provide an alternative methodology licensees could voluntarily choose for conducting analyses under 10 CFR 50.59. It would use risk insights to inform the judgment of the safety significance of changes to the existing deterministic design. A change that results in a very small, quantifiable increase in calculated risk could be reasonably judged not to undermine the fundamental safety basis established through deterministic principles. This approach would allow for a more consistent, predictable, and efficient screening process, directly fulfilling the original purpose of 10 CFR 50.59 to differentiate between changes that require prior NRC review and those that do not.

This integration would be consistent with decades of evolving NRC policy and practice. The agency has successfully used risk-informed approaches in many other regulatory applications, including 10 CFR 50.65, ''Requirements for monitoring the effectiveness of maintenance at nuclear power plants''; 10 CFR 50.48(c), ''National Fire Protection Association Standard NFPA 805''; the Reactor Oversight Process; and RG 1.174. Using quantitative risk results, such as from a PRA, in the 10 CFR 50.59 process would be a logical evolution that would enhance the existing framework by leveraging modern analytical tools to better focus licensee and agency resources on issues of genuine safety significance.

B. Improved Flexibility for Changes to Methods of Evaluation

The NRC proposes two regulatory amendments, which would work in concert to allow licensees greater flexibility to implement changes to analytical methods described in the FSAR.

First, the NRC proposes a targeted revision to 10 CFR 50.59(c)(2)(viii) and 53.1550(a)(2)(iv). This change would allow licensees to implement certain changes to analytical methods described in the FSAR (as updated) without prior NRC approval, provided those changes are undertaken pursuant to an NRC-approved VVUQ program under 10 CFR 50.221, ''Credibility requirements for modeling and simulation.'' Proposed guidance for compliance with proposed 10 CFR 50.221 is in DG–1468, ''Guidance for Implementation of 10 CFR 50.221, 'Credibility requirements for modeling and simulation.''' This revision would clarify that appropriate changes made using a risk-informed and graded VVUQ framework would be permissible under 10 CFR 50.59 without prior NRC approval. The proposed rule would allow such changes without prior NRC approval only if the VVUQ program were approved by the NRC for the method of evaluation in question, and the new method of evaluation met the credibility criteria established in the approved VVUQ. These measures would maintain safety and ensure appropriate controls over licensee changes to methods or evaluations while affording flexibility through reliance on the NRC-approved VVUQ program.

Second, the NRC proposes to adopt an optional regulation on VVUQ at 10 CFR 50.221 that would establish the requirements a VVUQ program must meet. The new regulation would establish clear requirements and structure for VVUQ activities used to support regulatory decisions. Specifically, the proposed 10 CFR

50.221 would specify that licensees and applicants could voluntarily establish a VVUQ program and determine the scope of the models and simulations the VVUQ program would cover. Licensees and applicants that establish a VVUQ program would be required to establish a process under the VVUQ program for demonstrating the credibility of models and simulations through VVUQ activities and assessments and could use only models and simulations within the scope of the program for which the licensee or applicant has successfully completed VVUQ activities and assessments. Additionally, the licensee or applicant adopting a VVUQ program would need to ensure that the VVUQ activities and assessments were commensurate with the overall risk from the model or simulation. The NRC has prepared guidance in DG–1468 on an acceptable approach for a VVUQ program that would conform to the proposed regulation. This approach would provide a consistent, technology-neutral framework for demonstrating model credibility across the NRC's regulatory structure.

Via these proposed changes, the NRC would shift focus away from evaluating each individual model or simulation directly and toward evaluating the process by which models are determined to be credible—specifically through structured VVUQ programs. In this context, credibility would refer to the level of trust in a model's ability to produce accurate and appropriate predictions for its intended use. An NRC-approved VVUQ program would establish a new licensing basis that focuses on how methods are selected and applied, rather than the characteristics of the specific method and the inherent conservatisms. Where appropriate, VVUQ-based credibility assessments could serve as a viable alternative to full NRC review of each new or revised model. However, a single generic VVUQ process would not be appropriate due to the significant variability in physical phenomena, modeling assumptions, numerical techniques, and uncertainties across different reactor technologies and methods of evaluation. A tailored VVUQ process approved by the NRC for the intended application would be required for each method of evaluation to provide the necessary specificity to ensure credible, defensible assessments of model performance for each unique application for all possible reactor technologies and their vastly different physical domains.

This approach could be particularly beneficial for new and advanced reactor designs. Unlike the current fleet, which has decades of operational data and analytical stability, advanced reactors often lack extensive experimental databases at the time of initial licensing. Requiring them to demonstrate method maturity at the level of existing plants would demand significant upfront testing and analysis, delaying deployment and increasing cost. Many of these designs are being developed as test reactors specifically to generate such data. A rule change would provide a clear, structured mechanism for these reactors to update their methods over time, based on data collected during operation, without needing to go through repeated full NRC reviews—so long as the updates are made through an approved VVUQ process.

XIII. Background—Minimum Decommissioning Funding Assurance Requirements for Non-Large Light-Water Reactors

The regulation in 10 CFR 50.75, ''Reporting and recordkeeping for decommissioning planning,'' establishes requirements for indicating to the NRC how an applicant or licensee will provide reasonable assurance that funds will be available for the decommissioning process. During the operational phase of a reactor facility, an applicant or licensee must certify that funding is being provided in an amount that may be more, but not less, than the amount described in 10 CFR 50.75(c)(1) and (2) (also known as the table of minimum amounts, minimum funding assurance, or ''formula'' amount). As the NRC stated in the 1988 decommissioning rule (53 FR 24018–24030; June 27, 1988), the ''formula'' amount in 10 CFR 50.75(c) does not represent the actual cost of decommissioning for specific reactors but rather serves as a reference level established to ensure that the bulk of the funds necessary for a safe decommissioning is being considered and planned for early in facility life by licensees. This provides assurance that the facility will not become a risk to public health and safety when it is decommissioned.

The table of minimum amounts and the associated adjustment factors were developed and designed specifically for the large light-water reactor technologies (boiling water reactors and pressurized water reactors) that make up the current commercial power reactor fleet in the U.S. However, new reactors may incorporate different technologies and output capacities that may not require the amount of decommissioning funding assurance described in 10 CFR 50.75(c). In order to address different decommissioning funding needs for these new technologies without requiring an exemption from NRC regulations, the NRC is proposing updates to its regulations to allow certain new reactor applicants and licensees the flexibility to certify adequate decommissioning funding assurance during operations through the use of either the table of minimum amounts or the submission of a design-specific decommissioning cost estimate. Allowing for the use of a design-specific decommissioning cost estimate that may be less than the table of minimum amounts would provide a path for certain new reactor applicants and licensees to demonstrate financial responsibility for safe decommissioning based on factors specific to the reactor facility.

XIV. Discussion—Minimum Decommissioning Funding Assurance Requirements for Non-Large Light-Water Reactors

The NRC proposes an amendment to 10 CFR 50.75 to allow certain new reactor applicants and licensees to submit a design-specific decommissioning cost estimate to demonstrate minimum decommissioning funding assurance during operations that may be less than the table of minimum amounts provided in 10 CFR 50.75(c). The values in the current table of minimum amounts are based on funding assumptions associated with the decommissioning of large light-water reactor facilities. This proposed rule would allow certain new reactor applicants and licensees to certify financial assurance for decommissioning through the use of either the minimum formula amount or through the submission of a design-specific decommissioning cost estimate. Thus, the proposed rule would provide flexibility for new reactor applications that represent smaller output and size considerations than large light-water reactor designs.

Specifically, the NRC is proposing to add a new paragraph (b)(2) to 10 CFR 50.75 that describes the certification amount process and minimum requirements, including reliance on design-specific decommissioning cost estimates, for new reactor applicants and licensees seeking to use the alternative pathway. Additionally, the NRC is proposing to delete language in the table of minimum amounts in 10 CFR 50.75(c)(1) that requires reactors of less than 1200 megawatts thermal (MWt) to use the certification amount for a 1200 MWt reactor. It is conceivable that new LWR designs could have an output less than 1200 MWt. Therefore, requiring a new reactor applicant or

licensee to assure to an amount well above what is needed to establish decommissioning funding assurance could be financially limiting and unnecessary to meet the intent of decommissioning funding assurance regulations.

A certification relying on a design-specific decommissioning cost estimate would be required to include a description of the factors used to develop the design-specific decommissioning cost estimate, including generic activities performed in the major decommissioning phases of a decommissioning project (*e.g.,* pre-decommissioning engineering and planning, reactor deactivation, and dismantlement). Similar to the table of minimum amounts for large light-water reactor designs, design-specific decommissioning cost estimates should represent the bulk of funds necessary to safely decommission a facility, as applicable to the specific reactor technology being utilized and the design of the facility. Additionally, similar to the table of minimum amounts for large light-water reactor designs, the design-specific decommissioning cost estimate would have to be adjusted annually at a rate at least equal to the formula in 10 CFR 50.75(c)(2). This certification process would include NRC review and approval. However, once an initial design-specific decommissioning cost estimate is approved by the agency as a sufficient certification amount for financial assurance for decommissioning, other applicants or licensees using similar technology could reference and justify use of this amount (escalated in accordance with NRC regulations and guidance) as the certification amount required by proposed 10 CFR 50.75(b) for a different application. Once a licensee nears permanent cessation of operations, a site-specific decommissioning cost estimate that encompasses the design-specific cost as well as costs associated with the site and operational period of the facility, would be required for funding assurance purposes, as described in current regulations in 10 CFR 50.82, ''Termination of license.'' Finally, the NRC is proposing to revise 10 CFR 50.75(e)(1)(i) and (ii) to allow reactor licensees that have prepaid or collected funds based on a design-specific estimate to take credit for projected earnings on the prepaid or collected decommissioning funds using up to a 2-percent annual real rate of return up to the time of permanent termination of operations.

The NRC is proposing a similar change to 10 CFR part 53. Currently, 10 CFR part 53 only allows for a site-specific decommissioning cost estimate as the certification amount. Therefore, the NRC is proposing to add conforming language to 10 CFR 53.1010, ''Financial assurance for decommissioning,'' and 53.1020, ''Cost estimates for decommissioning,'' to allow new reactor applicants and licensees to submit a design-specific decommissioning cost estimate to demonstrate minimum decommissioning funding assurance during operations. Finally, the NRC is proposing to add conforming language to 10 CFR 53.1040, ''Methods for providing financial assurance for decommissioning,'' to allow new reactor applicants and licensees that have prepaid or collected funds based on a design-specific estimate to take credit for projected earnings on the prepaid or collected decommissioning funds using up to a 2-percent annual real rate of return up to the time of permanent termination of operations.

Additionally, conforming changes would be made to 10 CFR 50.75(e) to include references to the requirements of proposed 10 CFR 50.75(b)(2), where appropriate. In addition, this proposed rule would revise 10 CFR 50.75(e) to include ''applicant or'' in all appropriate places where currently only ''licensee'' is referenced, as directed by the Commission in staff requirements memorandum (SRM)-SECY–23–0021: Enclosure 4, ''Table of Typographical errors and Inconsistencies,'' dated March 4, 2024. Similar changes are proposed in 10 CFR 53.1040 and 10 CFR 53.1050, ''NRC oversight'' for consistency. Collectively, these changes would clarify that applicants and licensees would be subject to the requirements under 10 CFR 50.75(e), 53.1040, and 53.1050, as applicable.

This proposed rule also would make minor editorial changes in 10 CFR 50.75(e), (g), and (h) by removing errant commas, correcting capitalization errors, correcting references by indicating paragraphs instead of sections, and removing ''of this part,'' where necessary.

XV. Background—Incorporation of Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants

A. Historic Quality Assurance Requirements Perspectives and Emergent Issues

During the early days of nuclear power (1950s-1960s), the Atomic Energy Commission (AEC), the NRC's predecessor agency, focused on developing and licensing nuclear reactors. As the nuclear industry grew, it became clear that systematic quality assurance (QA) was essential to ensure nuclear safety, especially given the complexity and potential hazards of nuclear technology. By the 1960s, nuclear power plants were becoming more complex, and the consequences of failures were more severe. Incidents and near-misses highlighted the need for formalized QA programs to prevent design, fabrication, and construction errors. Appendix B was added to 10 CFR part 50 by the AEC in 1970 (35 FR 10498; June 27, 1970) to (1) establish minimum QA requirements for safety-related structures, systems, and components (SSCs) and (2) ensure that these SSCs are designed, fabricated, constructed, and tested to perform their intended safety functions.

Applicants for CPs, OLs, early site permits (ESPs), COLs, design certifications, standard design approvals, and manufacturing licenses (MLs) must include in their respective application a description of the QA program that discusses how the applicable requirements of appendix B to 10 CFR part 50 are satisfied.

Although appendix B to 10 CFR part 50 is foundational to nuclear safety, commenters have expressed concerns over its implementation, flexibility, and alignment with modern practices. These concerns include the following topics.

- *Inflexibility:* Appendix B to 10 CFR part 50 (1) is prescriptive and has not been substantively updated since 1970; (2) lacks risk-informed or performance-based flexibility, which modern quality systems increasingly emphasize; and (3) does not facilitate tailoring of QA programs to low-risk activities or innovative technologies.
- *Outdated Language:* The language in appendix B to 10 CFR part 50 is reflective of technologies from the 1970s and does not explicitly address digital systems, software QA, and additive manufacturing. As a result, applicants must rely on guidance, which could result in inconsistent implementation across applicants due to applicants interpreting the guidance differently based on their specific technologies.
- *Vendor and Supply Chain Challenges:* Many suppliers, especially non-nuclear vendors, are unfamiliar with appendix B to 10 CFR part 50, and thus applicants and licensees have challenges in procuring products and services for the nuclear power plants.
- *Lack of Harmonization with International Standards:* Appendix B to 10 CFR part 50 is United States-specific and not aligned with international standards and best practices and, thus, creates challenges for international collaboration and global supply chains.

In light of these considerations, commenters have advocated for a modernized, risk-informed QA framework that retains the safety rigor of appendix B to 10 CFR part 50 while allowing for graded application based on safety significance that is integrated with modern quality systems.

B. NRC Responses to These Issues

As a result of these issues, the NRC is proposing to add appendix T to 10 CFR part 50 as a voluntary alternative to appendix B to 10 CFR part 50. The proposed appendix T would draw on international QA standards to incorporate the following elements:

- Performance-based QA criteria that provide explicit direction on use of a graded approach for applying QA requirements to SSCs relative to their safety and risk contributions to the overall nuclear facility.
- Quality assurance requirements specific to software used in digital items and for design and analysis.
- Quality assurance terminology and methodologies used across various safety critical industries and in international standards for quality management, thus allowing applicants to leverage cross-industry and global supply chains.

XVI. Discussion—Incorporation of Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants

This proposed rule would add a new appendix T to 10 CFR part 50 to provide streamlined QA criteria that could be used for applications of COLs, CPs, and OLs under certain eligibility requirements.

A. Introduction and Scope

As discussed in section XV, ''Background—Incorporation of Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' of this document, NRC stakeholders have expressed interest in utilizing a streamlined approach to QA that better aligns with international standards. Therefore, the NRC has developed a proposed appendix T to 10 CFR part 50 that would provide an alternative to the current QA requirements in appendix B to 10 CFR part 50 based on International Standard, ISO 19443, ''Quality management systems—Specific requirements for the application of ISO 9001:2015 by organizations in the supply chain of the nuclear energy sector supplying products and services important to nuclear safety [ITNS],'' (2018–05). The International Standard Organization collaborated closely with the International Atomic Energy Agency in developing ISO 19443.

The proposed section I, ''Introduction and Scope,'' of appendix T to 10 CFR part 50 would provide the eligibility requirements for using appendix T to 10 CFR part 50 as a voluntary alternative to appendix B to 10 CFR part 50. Specifically, applicants for CPs, OLs, and COLs would have the option to use appendix T to 10 CFR part 50 as an alternative to appendix B to 10 CFR part 50, provided that the three conditions in section I are met.

Proposed condition I.A would require that the application is for an nth-of-a-kind (NOAK) plant and would require the application to identify the first-of-a-kind (FOAK) reference plant.

Proposed condition I.B would require that any departures from the FOAK reference plant in the application of the NOAK plant would not result in a change to the classification, design, and method of manufacture, construction, and operation of SSCs identified in licensing basis of the referenced plant.

Proposed condition I.C would require the application to include procedures and work processes for implementing the requirements in proposed appendix T to 10 CFR part 50.

The NRC would define FOAK nuclear power plants and fuel reprocessing plants in proposed appendix T as the initial implementation of a new reactor design or technology or new fuel reprocessing plant design that has not been previously constructed and operated at commercial scale, either within the U.S. or internationally. The FOAK plant would serve as a reference plant for NOAK nuclear power plants and fuel reprocessing plants. The NRC would define NOAK nuclear power plants and fuel reprocessing plants in proposed appendix T to be any subsequent implementation of a FOAK reactor design or technology or fuel reprocessing plant design after the FOAK plant has been designed, constructed, and operated.

Proposed conditions I.A, I.B, and I.C would limit the use of proposed appendix T to 10 CFR part 50 to those applications that could potentially leverage the following:

- the design maturity of the FOAK completed plant design information;
- standardized components and systems to streamline procurement and construction;
- skilled labor and contractors from the FOAK projects;
- FOAK operational data to help NOAK commissioning procedures, standard operating procedures, emergency operating procedures, training, design, and operational programs; and
- established processes and procedures for implementing the requirements in proposed appendix T to 10 CFR part 50, including an established mechanism to ensure deviations from FOAK reliability in NOAK would be identified and promptly corrected.

In recent cases, the NRC has noticed that design details and QA procedures are not available during the licensing review of a CP, OL, or COL for a FOAK plant. Therefore, during licensing and construction for FOAK plants, the NRC conducts vendor inspections to confirm the detailed design and as-built SSCs meet the technical and quality requirements committed to by the applicant. However, because a NOAK applicant could reference design details and QA procedures developed during the FOAK licensing, these additional QA activities, such as vendor inspections, may be unnecessary, especially for vendors previously inspected by the NRC. Therefore, when the conditions I.A, I.B, and I.C are met, the proposed appendix T to 10 CFR part 50 may eliminate the need for NRC oversight of suppliers and vendors who supply applicants with approved appendix T to 10 CFR part 50 compliant QA programs because (1) the list of SSCs that would be governed by proposed appendix T to 10 CFR part 50 would be standardized and verified to be acceptable using information from the reference FOAK plant; (2) the design of these SSCs would be complete and verified to be acceptable using information from the reference FOAK plant; and (3) the manufacturing and construction methods for these SSCs would be established and verified to be acceptable during oversight of manufacturing and construction processes for the referenced FOAK plant.

B. Definitions

The proposed section II, ''Definitions,'' of proposed appendix T to 10 CFR part 50, would include definitions for terms used in the proposed appendix.

The NRC would define ''first-of-a-kind'' nuclear power plants and fuel reprocessing plants as the initial implementation of a new reactor design or technology or new fuel reprocessing plant design that has not been previously constructed and operated at commercial scale.

The NRC would define ''nth-of-a-kind'' nuclear power plants and fuel reprocessing plants as any subsequent implementation of a reactor design or technology or fuel reprocessing plant

design after the FOAK has been designed, constructed, and operated.

The NRC would define ''quality assurance'' as all those planned and systematic actions necessary to provide adequate confidence that a structure, system, or component will perform satisfactorily in service. Quality assurance includes quality control, which comprises those actions related to the physical characteristics of a material, structure, component, or system that provide a means to ensure the material, structure, component, or system meets predetermined requirements. This proposed definition is equivalent to the definition used in appendix B to 10 CFR part 50.

The NRC would define ''quality assurance program'' as the overall program established to assign responsibilities and authorities, define policies and requirements, and provide for the performance and assessment of work necessary to achieve QA.

The NRC would define ''quality management system'' (QMS) as a structured framework that documents an organization's processes, procedures, and responsibilities for ensuring quality. This term and definition are used broadly by other safety-critical industries, nuclear regulatory bodies and industry abroad, and vendors and third-party suppliers to these industries. The QMS is different from the terminology ''quality assurance program description'' (QAPD) used in appendix B to 10 CFR part 50 in that the QMS has a broader scope and is a system framework that includes quality planning, controls, assurance, and improvement; whereas a QAPD is a descriptive document that is narrowly focused on QA.

The NRC would define ''functional design criteria'' as metrics for the performance of SSCs. For safety-related SSCs, these criteria define performance metrics necessary to demonstrate compliance with the safety criteria in 10 CFR 53.210, ''Safety criteria for design-basis accidents.'' For non-safety-related but safety-significant SSCs, these criteria define performance metrics necessary to demonstrate compliance with the safety criteria in 10 CFR 53.220, ''Safety criteria for licensing-basis events other than design-basis accidents.'' This proposed definition would be added to proposed appendix T to 10 CFR part 50 to align with the definition and use of this term in 10 CFR part 53.

The NRC would define ''non-safety-related but safety-significant SSCs'' as those SSCs that are not safety-related but are relied on to achieve adequate defense in depth or perform risk-significant functions and warrant special treatment. This proposed definition would be added to proposed appendix T to 10 CFR part 50 to align with the definition and use of this term in 10 CFR part 53.

C. General Requirements

The proposed section III, ''General Requirements,'' of proposed appendix T to 10 CFR part 50 would provide general requirements for establishing and maintaining a QA program for applicants that choose to meet proposed appendix T.

Proposed section III.A, ''Integrated Quality Assurance Program,'' of proposed appendix T to 10 CFR part 50 would require that the integrated QA program ensures that safety-related and non-safety-related but safety-significant SSCs are designed, fabricated, erected, and tested to quality standards commensurate with the importance of the safety functions those SSCs perform. Proposed section III.A of in proposed appendix T to 10 CFR part 50 would include the following seven items that any application using in proposed appendix T to 10 CFR part 50 would be required to identify and explain in the integrated QA program:

- Responsibilities (1) are properly assigned to specific individuals or teams in charge of executing QA activities and (2) ensure any delegated responsibilities are properly identified and controlled.
- The design requirement of SSCs are sufficiently captured in corresponding documents; the design bases requirements are adequately translated into specifications, drawings, procedures, and instructions; outputs reflect the correct design inputs; the design is properly verified and validated; the as-built and as-operated SSC properly meet the intended function and safety margin.
- Means and methods are established to communicate relevant technical, quality, and regulatory requirements, expectations, and concerns between the applicant and its vendors and third-party suppliers.
- Measures are established to (1) ensure that procured SSCs and related services meet technical and quality requirements and (2) assess the capability of vendors or third-party suppliers that supply the SSCs and related services.
- Measures are established to (1) verify and validate that products and services meet the technical and quality requirements of the procured products and services, and (2) audit the vendors or third-party suppliers that are providing the products and services.
- Processes are implemented to address reoccurrence of issues and failures.
- Recordkeeping and documentation protocols for the QA program are established.

Proposed section III.B.1 of proposed appendix T to 10 CFR part 50 would require the applicant document the QA program in the QMS and submit the QMS to the NRC for review and approval. Proposed section III.B.1 would require the QA program, as documented in the QMS, to contain a graded approach for implementing the requirements of the QA program.

Proposed section III.B.2 of proposed appendix T to 10 CFR part 50 would require the QMS to describe how the requirements in section IV of the appendix would be met. Proposed section IV of appendix T to 10 CFR part 50 would identify general QA criteria and software QA criteria. Proposed section III.B.3 of appendix T to 10 CFR part 50 would require the applicant to invoke the applicant's QA requirements in procurement documents to all relevant contractors, vendors, suppliers, and third-parties.

Proposed section III.B.4 of proposed appendix T to 10 CFR part 50 would require the applicant to select the appropriate industry standards that are used to achieve quality consistent with regulatory requirements and the NRC's policies. This proposed section would state that the applicant would need to document the selection of ASME Nuclear Quality Assurance (NQA)–1, ''Quality Assurance Requirements for Nuclear Facility Applications'' or another appropriate industry standard. Proposed section III.B.4 of appendix T to 10 CFR part 50 would also require that gaps between the selected industry standards and the proposed section IV, ''Quality Assurance Requirements,'' of appendix T to 10 CFR part 50 are addressed within the QMS.

D. Quality Assurance Requirements

Proposed section IV.A, ''Quality Assurance Criteria,'' of proposed appendix T to 10 CFR part 50, identifies QA criteria that would be applicable to all applications that reference proposed appendix T to 10 CFR part 50. This proposed section would include 11 criteria that cover topical areas in management, performance, and assessment. The proposed requirements in these topical areas are consistent with International Standards for QMSs such as ISO 9001, ''Quality Management System—Requirements,'' which are used by many safety-critical industries, and ASME NQA–1, ''Quality Assurance Requirements for Nuclear Facility

Applications,'' which is used by the nuclear industry.

(i) Management

Proposed section IV.A.1, ''Criterion 1—Management: Program,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to define the organizational structure, functional responsibilities, levels of authority, and interfaces for performing the work necessary to implement the QA program, and develop management processes to plan, schedule, and assign resources to perform this work.

Proposed section IV.A.2, ''Criterion 2—Management: Personnel Training and Qualifications,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to develop processes for indoctrination and continuous training of employees for performing the work necessary to implement the QA program.

Proposed section IV.A.3, ''Criterion 3—Management: Quality Improvement,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to establish and implement a process for identifying and controlling issues and failures that could adversely impact quality, safety, and regulatory compliance. The proposed section IV.A.3 would also require applicants to include prevention of recurrence of issues as part of corrective actions and implement processes for continuous improvement of the QA program.

Proposed section IV.A.4, ''Criterion 4—Management: Documents and the Associated Records,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to prepare, review, approve, issue, use, and revise documents that prescribe processes, specify requirements, or establish the design of the SSC, and maintain these documents as records for the QA program.

(ii) Performance

Proposed section IV.A.5, ''Criterion 5—Performance: Work Processes,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to perform work, including hazard controls. Hazard controls are systematic measures designed to prevent, detect, and correct issues that could compromise quality, safety, and regulatory compliance. Examples of hazard controls applicable to QA programs include:

- embedded work processes to ensure quality such as inspection and testing protocols, hold points and witness points, and nonconformance reporting protocols;
- monitoring and detection programs to ensure detection of deviations and malfunctions in real time such as surveillance and audits;
- structured approaches to identify quality issues and implement corrective and preventive actions.

Proposed section IV.A.5 of proposed appendix T to 10 CFR part 50, would also require the applicant to establish and implement work processes for identifying and controlling items to ensure proper use; maintain items to prevent damage, loss, or deterioration; and calibrate and maintain equipment used for activities affecting quality.

Proposed section IV.A.6, ''Criterion 6—Performance: Design,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to establish and implement measures for controlling the design of SSCs, including requirements for controlling design changes, design interfaces, and verifying and validating the adequacy of the design. Verify in the context of design control means to perform the set of activities to demonstrate that design conforms to specifications and occurs during the design and development process. Examples include reviews, inspections, and unit tests. Validate in the context of design control means to perform the set of activities to demonstrate that the as-developed or as-built SSC performs the intended safety-functions and occurs after the development process. Examples include integrated tests, analysis, and simulations.

Proposed section IV.A.7, ''Criterion 7—Performance: Procurement,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to establish and implement processes for procurement of items and services, including processes to verify that procured items and services meet established requirements, evaluate and select prospective suppliers, and verify that the approved suppliers continue to provide acceptable items and services.

Proposed section IV.A.8, ''Criterion 8—Performance: Inspection and Acceptance Testing,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to establish and implement processes for performing inspection and acceptance testing for procured items and services.

Proposed section IV.A.9, ''Criterion 9—Performance: Maintenance of Structures, Systems, and Components,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to establish and implement processes to control the storage of SSCs in accordance with cleanliness and environmental standards. These requirements would ensure that a process is used to prevent foreign material from being introduced to the SSC during storage and to store SSCs in accordance with the required environmental conditions (*e.g.,* humidity, temperature).

(iii) Assessment

Proposed section IV.A.10, ''Criterion 10—Assessment: Management Assessment,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to establish and implement processes for management of the organization to assess the continued effectiveness of the QA program.

Proposed section IV.A.11, ''Criterion 11—Assessment: Independent Assessment,'' of proposed appendix T to 10 CFR part 50, would include requirements for the applicant to establish and implement processes for independent assessment of each aspect of the QA program. These requirements would ensure that those performing these assessments have sufficient authority and freedom from their management and are technically qualified and knowledgeable to perform the assessment.

E. Quality Assurance for Software Used in Design and Analysis, and Digital Items Important to Safety

Proposed section IV.B, ''Quality Assurance for Software Used in Design and Analysis, and Digital Items Important to Safety,'' of proposed appendix T to 10 CFR part 50, would identify QA criteria for software used for design and analysis of SSCs and for digital items important to safety.

Proposed section IV.B.1 of proposed appendix T to 10 CFR part 50, would require that applicants establish and implement processes within the QA program to ensure that (1) software used in digital items that perform a safety function, (2) software used for design verification for any SSC, and (3) software used for design analysis for any SSC, are documented, managed, and controlled throughout the software life cycle to ensure that the related SSCs perform their intended safety function.

Proposed section IV.B.2 would require the applicant to use appropriate national or internal software engineering standards. Examples of such standards include ASME, Institute for Electrical and Electronics Engineers (IEEE), National Institutes of Standards and Technology (NIST), and American Nuclear Society (ANS).

F. Proposed Conforming Changes to 10 CFR 50.4, 50.34, 50.54, 50.55, 52.79, 53.020, 53.040, 53.460, 53.500, 53.865, 53.1309, 53.1369, 53.1416, and 53.1565

Proposed conforming changes to 10 CFR 50.34(a)(7) would allow a CP applicant who meets the eligibility requirements included in proposed section I of appendix T to 10 CFR part 50, to include in its application for a CP, a QMS that meets proposed appendix T to 10 CFR part 50, as an alternative to satisfying the requirement in 10 CFR 50.34(a)(7) for submittal of a description of the QA program that meets appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 50.34(b)(6)(ii) would allow an OL applicant who meets the eligibility requirements included in proposed section I of appendix T to 10 CFR part 50, to include in its application for an OL, a QMS that meets proposed appendix T to 10 CFR part 50, as an alternative to satisfying the requirement in 10 CFR 50.34(b)(6)(ii) for submittal of a description of the QA program that meets appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 50.34(f)(3)(ii) would add a reference to the proposed appendix T to 10 CFR part 50 for the requirement on ensuring all SSCs important to safety are included in the QA list.

Proposed conforming changes to 10 CFR 50.54(a)(1) would incorporate requirements for:

- Each nuclear power plant or fuel reprocessing plant licensee subject to the QA criteria in proposed appendix T of 10 CFR part 50, to implement, under 10 CFR 50.34(b)(6)(ii) or 52.79, the QMS described or referenced in the safety analysis report, including changes to that report.
- For holders of a COL under 10 CFR part 52, to implement the QMS described or referenced in the safety analysis report applicable to operation 30 days prior to the scheduled date for initial loading of the fuel.

The proposed conforming addition of 10 CFR 50.54(a)(5) would include requirements for changes to a QMS to be submitted to the NRC and receive NRC approval prior to implementation.

Proposed conforming changes to 10 CFR 50.55(f)(1) would incorporate requirements for nuclear power plant or fuel reprocessing plant CP holders subject to the QA criteria in proposed appendix T of 10 CFR part 50, to implement, pursuant to 10 CFR 50.34(a)(7), the QMS described or referenced in the safety analysis report, including changes to that report.

The proposed conforming addition of 10 CFR 50.55(f)(5) would add requirements for changes to a QMS to be submitted to the NRC and receive NRC approval prior to implementation.

The proposed conforming addition of paragraph (b)(7)(iii) to 10 CFR 50.4, ''Written communications,'' would require a change to the safety analysis report QMS under the proposed 10 CFR 50.54(a)(5) or 10 CFR 50.55(f)(5), or a change to a licensee's NRC-accepted QMS topical report under 10 CFR 50.54(a)(5) or 10 CFR 50.55(f)(5), to be submitted to the NRC's Document Control Desk, with a copy to appropriate Regional Office, and a copy to the appropriate NRC Resident Inspector if one has been assigned to the site of the facility.

Proposed conforming changes to 10 CFR 52.79(a)(25) and (27) would allow a COL applicant who meets the eligibility requirement included in proposed section I of appendix T to 10 CFR part 50, to include in its application for COL, a QMS that meets proposed appendix T to 10 CFR part 50, as an alternative to satisfying the requirement in 10 CFR 52.79(a)(25) and (27) for submittal of a description of the QA program that meets appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 53.020 would modify the definition of QA to align with the definition of QA in the proposed appendix T to 10 CFR part 50.

The proposed conforming addition of paragraph (b)(7)(iii) to 10 CFR 53.040, ''Written communications,'' would require a change to the safety analysis report QMS under the proposed 10 CFR 53.1565, ''Evaluating changes to programs included in licensing-basis information,'' or a change to a licensee's NRC-accepted QMS topical report under 10 CFR 53.1565, to be submitted to the NRC's Document Control Desk, with a copy to appropriate Regional Office, and a copy to the appropriate NRC Resident Inspector if one has been assigned to the site of the facility.

Proposed conforming changes to paragraphs (b)(1) and (2) of 10 CFR 53.460, ''Safety categorization and special treatments,'' would allow, for applicants that meet the eligibility requirements included in proposed section I of appendix T to 10 CFR part 50, the special treatments for safety-related SSCs (under proposed 10 CFR 53.460(b)(1)), and non-safety-related safety-significant SSCs and safety-related SSCs beyond 10 CFR 53.460(b)(1) (under proposed 10 CFR 53.460(b)(2)), to meet applicable QA requirements from proposed appendix T to 10 CFR part 50, as an alternative to these SSCs having to meet the applicable QA requirement in appendix B to 10 CFR part 50.

Proposed conforming changes to paragraph (b) of 10 CFR 53.500, ''General siting and siting assessment,'' would allow, for applicants that meet the eligibility requirements included in proposed section I of appendix T to 10 CFR part 50, activities performed to identify site characteristics or otherwise needed to determine site-specific contributors to functional design criteria or analysis assumptions under subpart C of 10 CFR part 53 to satisfy the QA requirements from proposed appendix T to 10 CFR part 50, as an alternative for these activities to meet the applicable QA requirement in appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 53.865, ''Quality assurance,'' for holders of an OL or COL under 10 CFR part 53 that meet the eligibility requirements included in proposed section I of appendix T to 10 CFR part 50, to develop, implement, and maintain a QA program in accordance with proposed appendix T to 10 CFR part 50, as an alternative to appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 53.1309(a)(2)(i) would allow a CP applicant under 10 CFR part 53 who meets the eligibility requirement included in proposed section I of appendix T to 10 CFR part 50, to include in its application for a CP, a QMS that meets proposed appendix T to 10 CFR part 50, as an alternative to satisfying the requirement in 10 CFR 53.109(a)(2)(i) for submittal of a description of the QA program that meets appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 53.1369(l) would allow an OL applicant under 10 CFR part 53 who meets the eligibility requirement included in proposed section I of appendix T to 10 CFR part 50, to include in its application for an OL, a QMS that meets proposed appendix T to 10 CFR part 50, as an alternative to satisfying the requirement in 10 CFR 53.1369(l) for submittal of a description of the QA program that meets appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 53.1416(a)(12) would allow a COL applicant under 10 CFR part 53 who meets the eligibility requirement included in proposed section I of appendix T to 10 CFR part 50, to include in its application for a COL, a QMS that meets proposed appendix T to 10 CFR part 50, as an alternative to satisfying the requirement in 10 CFR 53.1416(a)(12) for submittal of a description of the QA program that meets appendix B to 10 CFR part 50.

Proposed conforming changes to 10 CFR 53.1565(d)(1)(i) would clarify the applicability of QA criteria of appendix B of 10 CFR part 50 for each holder of an OL or COL under 10 CFR part 53, after the Commission makes the finding under 10 CFR 53.1452(g).

Proposed conforming addition of 10 CFR 53.1565(d)(1)(iii) would include requirements for changes to a QMS to be submitted to the NRC and receive NRC approval prior to implementation for each holder of an OL or COL under 10 CFR part 53, after the Commission makes the finding under 10 CFR 53.1452(g).

Proposed conforming changes to10 CFR 53.1565(d)(2) would modify the numbering scheme and clarify the applicability of QA criteria of appendix B to 10 CFR part 50 for each holder of a CP or COL under 10 CFR part 53, before the Commission makes the finding under 10 CFR 53.1452(g).

The proposed conforming addition of 10 CFR 53.1565(d)(2)(ii) would include requirements for changes to a QMS to be submitted to the NRC and receive NRC approval prior to implementation for each holder of a CP or COL under 10 CFR part 53, before the Commission makes the finding under 10 CFR 53.1452(g).

XVII. Background—Updates to Construction Permit Requirements and Related Licenses

The regulations in 10 CFR 50.34 specify the requirements for technical information to accompany an application for a CP or an OL. These regulations were amended in 1968 (33 FR 18610; December 17, 1968) to add paragraph (a) of 10 CFR 50.34 to require an applicant for a CP to submit a preliminary safety analysis report. Paragraph (a) of 10 CFR 50.34 specifies the minimum technical information in the preliminary safety analysis report, including preliminary design information and a description and safety assessment of the site on which the facility is to be located. As stated in the 1968 final rule, the preliminary safety analysis report requirement was ''intended to provide early and adequate information which is expected to expedite the processing of CP applications by reducing the time-consuming exchanges between the applicant and the AEC staff required to fill information gaps.'' Subsequent changes to 10 CFR 50.34 from 2007 to the present were additions due to new requirements, as well as clarifications and relaxations, but the majority of 10 CFR 50.34 is unchanged since 1968.

The NRC may issue the CP if the agency makes the findings specific to a CP that are listed in paragraph (a) of 10 CFR 50.35, ''Issuance of construction permits,'' as well as the more general findings for issuance of licenses and permits in 10 CFR 50.40, ''Common standards,'' and 10 CFR 50.50, ''Issuance of licenses and construction permits.'' The findings in 10 CFR 50.35(a) stem from the early practices of the AEC, when a ''provisional'' CP would be issued when an applicant had not submitted all the technical information necessary to complete the application and to approve all proposed design features. Since almost all issued ''provisional'' CPs were never converted to a ''final'' CP, the AEC proposed codifying this practice (34 FR 6540; April 16, 1969). The final amendment to the regulations in 10 CFR 50.35 eliminated the term ''provisional'' CP, but the criteria in 10 CFR 50.35(a) for issuing a CP remained the same as those previously required for a ''provisional'' CP (35 FR 5317; March 31, 1970). The current regulations for issuing a CP in 10 CFR 50.35(a) have not been modified since 1970.

The NRC issued 10 CFR part 52 on April 18, 1989 (54 FR 15372), to reform the NRC's licensing process for future nuclear power plants. The rule established new approval processes in 10 CFR part 52 for ESPs, standard design certifications, and COLs that were additions to the two-step licensing process that already existed in 10 CFR part 50. This 10 CFR part 52 rule also included processes for standard design approvals and MLs. On August 28, 2007 (72 FR 49352), the NRC issued a final rule with changes to 10 CFR part 52 to clarify the applicability of various requirements to each of the 10 CFR part 52 approval processes.

XVIII. Discussion—Updates to Construction Permit Requirements and Related Licenses

This proposed rule would include updates to the language in 10 CFR 50.34(a) to more clearly link the level of detail required to be submitted with a CP application to the findings the NRC is required to make in 10 CFR 50.35(a), 50.40, and 50.50 to issue a CP. During its review of recent CP applications, the NRC has noted that applicants may provide a higher level of detail for some of the technical areas listed in 10 CFR 50.34(a), and a lower level of detail for others, while still providing sufficient information for the NRC to make the findings required by 10 CFR 50.35(a), 50.40, and 50.50 to issue the CP. The proposed revisions to footnote 1 of 10 CFR 50.34(a) would clarify that the level of detail provided in a preliminary safety analysis report to satisfy the minimum technical requirements in 10 CFR 50.34(a) would be deemed sufficient if the provided information allows the NRC to make the findings required by 10 CFR 50.35(a), 50.40, and 50.50.

This proposed rule would also remove a sentence in 10 CFR 50.34(a)(4) specifying in detail the need to perform loss of coolant accident (LOCA) analyses required in 10 CFR 50.46 and the need for high-point vents in proposed 10 CFR 50.46b, ''Acceptance criteria for reactor coolant system venting systems.'' The NRC considers that these requirements are already implicitly included in the preceding sentence of 10 CFR 50.34(a)(4), which specifies the need to include an evaluation of ''the adequacy of structures, systems, and components provided for the prevention of accidents and the mitigation of the consequences of accidents.'' These requirements are also referred to in 10 CFR 50.34(b)(4), and the NRC proposes to remove a sentence from 10 CFR 50.34(b)(4) that similarly specifies in detail the need to perform LOCA analyses required in 10 CFR 50.46.

Conforming changes are also proposed to the similar regulatory text and footnotes in each subpart of 10 CFR part 52 to ensure consistency between the power reactor licensing and approval pathways. These changes would be made in 10 CFR 52.47, which applies to standard design certifications; 10 CFR 52.79, which applies to COLs; 10 CFR 52.137, which applies to standard design approvals; and 10 CFR 52.157, which applies to MLs. This change would reflect a more technology-inclusive approach and remove prescriptive language that could be read to mean that a LOCA analysis methodology is fully developed and validated at the CP stage.

The proposed rule would also adjust the wording in 10 CFR 50.34(a)(1)(ii)(D) to be meaningful for designs with functional containments which are evaluated as a release barrier or series of barriers taken together to perform the containment safety function. Specifically, with the proposed changes, the regulation would no longer prescriptively state that the assumed fission product release be ''from the core into the containment'' and would be replaced with technology-inclusive language that refers to ''leakage rates from potential flow paths'' rather than a ''containment leak rate.'' Light-water reactor designs would continue to use fission product release paths from the core into the containment and containment leak rates. The proposed rule would also revise footnotes 3 and

6—which provide additional information on the fission product release to be used in the analyses described in 10 CFR 50.34(a)(1)(ii)(D) and in several items in 10 CFR 50.34(f)(1)—to be more technology-inclusive and allow for evaluation of designs with mechanistic source terms and functional containments. In addition, the proposed rule would revise footnote 4, which discusses the use of 25 roentgen equivalent man (rem) (0.25 sieverts (Sv)) total effective dose equivalent (TEDE) in 10 CFR 50.34(a)(1)(ii)(D)(*1*) as a reference value to remove outdated information regarding recommendations included in a 1959 National Bureau of Standards handbook.

Conforming changes would be made to the similar regulatory text and footnotes in each subpart of 10 CFR part 52 to ensure consistency between the power reactor licensing and approval pathways. Specifically, these proposed changes would be made in 10 CFR 52.17, which applies to ESPs, 10 CFR 52.47, 52.79, 52.137, and 52.157. These changes would reflect a more technology-inclusive approach, eliminate unnecessary exemptions that may otherwise be needed for some designs, and ensure consistency in power reactor applications.

XIX. Background—Alternative Risk-Informed and Performance-Based Acceptance Criteria for 10 CFR Parts 50 and 52

A. Need for Regulatory Flexibility

Many existing NRC regulations include prescriptive acceptance criteria expressed as specific numerical limits (*e.g.,* temperature, pressure, dose). These criteria were developed based on the state of knowledge and technology at the time the rules were promulgated and do not always reflect the significant advancements in nuclear safety analysis, PRA, and reactor design that have occurred in the decades since. Additionally, the codification of these criteria has limited the ability of licensees and applicants to propose alternative approaches without seeking exemptions, which can introduce cost and regulatory uncertainty.

Licensees and applicants have consistently identified unduly prescriptive requirements as a deterrent to innovation. This has been particularly challenging for U.S. companies developing new reactor designs and seeking to compete in global markets. Nonetheless, the NRC has determined that a top-down approach—modifying individual prescriptive requirements throughout 10 CFR parts 50 and 52—would be resource-intensive and could have unintended consequences, especially for the licensing bases of currently operating reactors. Therefore, instead of a top-down approach, the NRC is proposing to expand the use of risk-informed and performance-based alternatives to existing prescriptive requirements.

B. Enabling Risk-Informed and Performance-Based Alternatives

The NRC has long supported the use of risk-informed and performance-based approaches in its regulatory decision-making, as reflected in the Commission's policy statements and strategic goals, particularly, SRM–SECY–98–144, ''Staff Requirements—SECY–98–144—White Paper on Risk-Informed and Performance-Based Regulation,'' dated March 1, 1999. Since then, the agency has encouraged the use of such approaches to improve regulatory decision-making, enhance safety, and reduce unnecessary regulatory burden.

The proposed rule would build on this foundation by providing a structured pathway for licensees and applicants to propose alternative acceptance criteria that would be tailored to demonstrate the safety of their specific technologies without the need for exemptions. Additionally, the proposed rule would further utilize risk-informed and performance-based methodologies to update appendix A to 10 CFR part 50 to clarify the application of general design criteria (GDCs) during the licensing of new LWR designs.

XX. Discussion—Alternative Risk-Informed and Performance-Based Acceptance Criteria for 10 CFR Parts 50 and 52

The NRC is proposing to add new, standalone regulations, 10 CFR 50.220 and 10 CFR 52.220, entitled ''Use of risk-informed and performance-based alternatives to acceptance criteria,'' to allow licensees and applicants to voluntarily submit and use technology-inclusive, risk-informed, or performance-based acceptance criteria as alternatives to existing prescriptive requirements. These new provisions would support the expanded and accelerated use of acceptance criteria reflective of innovative nuclear technologies without the need for exemptions, while continuing to ensure reasonable assurance of adequate protection of public health and safety.

In addition, the NRC is proposing to update appendix A to 10 CFR part 50 to clarify that (1) deviations from GDCs could be identified and justified within licensing submittals, with no need for a separate exemption request; and (2) demonstrating compliance with Criterion 28, ''Reactivity limits'' (GDC 28), of appendix A to 10 CFR part 50 could be based on a different design basis accident than the control rod ejection or control rod drop accident.

The proposed 10 CFR 50.220 and 10 CFR 52.220 would address regulatory inefficiencies and foster innovation by offering a flexible, voluntary alternative to the current approach, which in many instances relies on prescriptive requirements that applicants must seek exemptions from when proposing to adopt innovative methodologies. The NRC has identified several cases in which this type of framework could have enabled more timely and efficient regulatory decisions. These experiences highlight the value of reducing the number of exemptions and rulemakings required, thereby improving efficiency and supporting the deployment of new technologies. The proposed rule would also provide opportunities for increased operational flexibility at existing facilities that choose to propose and adopt alternative criteria.

The proposed approach would enhance regulatory flexibility, efficiency, and reliability by providing a voluntary pathway for the use of alternative criteria. This approach would maintain the existing licensing basis for currently operating reactors and potential restart units, thereby avoiding unintended impacts associated with a broad, top-down revision of regulatory requirements. Additionally, the proposed rule would establish a more transparent and structured process for NRC review and acceptance of alternative criteria.

This approach would be consistent with the NRC's commitment to enabling the safe use of nuclear technology for the benefit of society, while maintaining reasonable assurance of adequate protection of public health and safety. It would also be consistent with the approach of previous NRC rulemakings that provided voluntary pathways for risk-informed and performance-based alternatives to existing requirements, such as the promulgation of 10 CFR 50.69, ''Risk-informed categorization and treatment of structures, systems and components for nuclear power reactors'' (69 FR 68008; November 22, 2004) and 10 CFR part 53 (91 FR 15696; March 30, 2026).

The NRC recognizes that successful implementation of this proposed approach would require broad and flexible guidance to accommodate the range of potential alternative criteria. As a result, NRC encourages the increased

use of pre-application engagement by applicants and licensees who would wish to exercise the flexibility provided by the proposed 10 CFR 50.220 and 52.220. Draft guidance on the content of applications submitted under this proposed rule is provided in DG–1464, ''Guidance for Content of Applications Under 10 CFR 50.220 and 52.220 Proposing Risk-Informed and Performance-Based Alternative Acceptance Criteria,'' which accompanies this rulemaking.

Looking forward, the NRC would maintain a record of NRC-approved alternative acceptance criteria, along with references to the associated bases for approval to support streamlined use of approved alternative acceptance criteria by potential applicants and serve as a means of regulatory recordkeeping for the agency.

The proposed changes would include revising appendix A to 10 CFR part 50 to clarify that exemptions are not required for deviations from the GDCs. Instead, such deviations could be identified and justified directly within the licensing application. While this clarification would not change the NRC's review of the justification itself, it would reduce regulatory burden for applicants proposing innovative designs in which certain GDCs may be tailored to be better risk-informed.

In addition, the NRC is proposing to revise GDC 28 of appendix A to 10 CFR part 50 to allow applicants to propose and justify alternative design basis accidents for reactivity control, rather than prescriptively requiring evaluation of control rod ejection or control rod drop accidents. Although applicants and licensees may be able to accomplish this through the flexibilities in the proposed 10 CFR 50.220 and 52.220, this change would more explicitly enable the use of design-specific accident scenarios and support removal of unnecessary conservatism in safety analyses without the need to provide the information that would be required in proposed 10 CFR 50.220(b) and 52.220. The NRC is issuing, for public comment along with this proposed rule, DG–1464, ''Guidance for Content of Applications Under 10 CFR 50.220 and 52.220 Proposing Risk-Informed and Performance-Based Alternative Acceptance Criteria,'' which would be used to support applicants in determining appropriate design basis accidents based on credible, realistic risks.

XXI. Background—Establishing Thresholds for Changes to Reactor Designs During Construction and Operation Under 10 CFR Parts 52 and 53

Section 5(f) of E.O. 14300 directs the NRC to establish stringent thresholds for circumstances in which the NRC may demand changes to a reactor design once construction of the reactor is underway. In response, the NRC is proposing to raise the threshold for changes required during construction by eliminating ''increased standardization'' as a criterion for Commission-directed modification of design certification information on either a plant-specific or generic basis. In addition, this proposed rule would provide additional flexibility and reduce unnecessary regulatory burden in the regulations governing licensee-requested changes during construction under 10 CFR parts 52 and 53. The NRC is also proposing changes to 10 CFR parts 52 and 53 to provide flexibility and efficiencies for licensee-requested changes during operation.

A. Development of Tiers of Information and Processes for Changes and Departures in Design Certification Rules

In 1987, the NRC issued a policy statement on nuclear power plant standardization (52 FR 34884; September 15, 1987). In 1989, 10 CFR part 52 was issued (54 FR 15372; April 18, 1989), which established that design certification would be accomplished by rulemaking. The NRC ultimately adopted a two-tiered system for design information. These tiers are designated in a design control document (DCD), which the NRC incorporates by reference into its regulations, and each information tier is subject to a specified process for changes and departures from design certification information.

Tier 1 information is the portion of the DCD that is approved and certified. It includes definitions and general provisions; design descriptions; inspections, tests, analyses, and acceptance criteria (ITAAC); significant site parameters; and significant interface requirements. Tier 1 design descriptions were intended to be applicable for the life of the facility. Tier 2 and Tier 2* information is the portion of the DCD that is approved but not certified. Tier 2 includes information like that found in a final safety analysis report (FSAR) for 10 CFR part 50 licenses. Tier 2* was created to minimize information in Tier 1 while requiring that this information could not be changed without prior NRC approval. If the Tier 2* designation were not available, this information would have been designated Tier 1. While the Tier 2* category was used in the first five design certifications, from the U.S. Advanced Boiling Water Reactor (ABWR) to the Economic Simplified Boiling-Water Reactor (ESBWR), the later APR1400 and NuScale DCDs did not designate any information as Tier 2*.

Each design certification in appendix A, ''Design Certification Rule for the U.S. Advanced Boiling Water Reactor,'' appendix D, ''Design Certification Rule for the AP1000 Design,'' appendix E, ''Design Certification Rule for the ESBWR Design,'' appendix F, ''Design Certification Rule for the APR1400 Design,'' and appendix G, ''Design Certification Rule for NuScale,'' of 10 CFR part 52 includes a section VIII, ''Processes for Changes and Departures,'' that specifies processes to change Tier 1, Tier 2, and, where applicable, Tier 2* information. The requirements in section VIII of these appendices are essentially identical except for certain certified designs that do not have information designated as Tier 2*. Under these section VIII requirements, plant-specific changes or departures from Tier 1 require an exemption. Plant-specific departures from Tier 2* require NRC approval by license amendment. Changes or departures from Tier 2 information are evaluated using a process like the one provided for 10 CFR part 50 licensees in 10 CFR 50.59, which provides criteria for determining whether a licensee-initiated change requires prior NRC approval. This similar departure process for Tier 2 information is, therefore, often described as a 10 CFR 50.59-like process for COL holders referencing a design certification. The change processes in section VIII sought to balance standardization with flexibility and apply during both construction and operation.

For currently certified designs, Tier 2* is defined in section II.F of appendices A, D, and E to 10 CFR part 52. Appendices F and G to 10 CFR part 52 do not contain Tier 2* information. Tier 2* is the portion of Tier 2 information designated with brackets, italicized text, and an asterisk in the generic DCD. Per sections VIII.B.6.b and VIII.B.6.c of appendices A, D, and E to 10 CFR part 52, any licensee who references these appendices may not depart from Tier 2* matters without prior NRC approval and any request for such a departure will be treated as a request for a license amendment under 10 CFR 50.90. Sections VIII.B.6.b and VIII.B.6.c of appendices A, D, and E to 10 CFR part 52 list all of the Tier 2* matters for the respective designs. The Tier 2* matters listed in section

VIII.B.6.b of appendices A, D, and E to 10 CFR part 52 retain this Tier 2* designation for the lifetime of the facility, while the Tier 2* matters listed in section VIII.B.6.c of these appendices revert to Tier 2 after the plant first achieves full power.

Another key aspect of the standard design certification is finality. Issuance of the design certification rule allows the design to be incorporated by reference into a COL application. Issue finality rules limit the types of changes that may be imposed on the certification information. During the COL application review, design information codified by rule is not subject to NRC review, but the NRC staff would review applicant-requested departures from the certified design that require NRC approval. The scope of a hearing for a COL application that references a certified design does not include the design certified by NRC rule but would encompass any departures from the certified design requiring NRC approval.

The final rule promulgating 10 CFR part 53 established a risk-informed, performance-based, and technology-inclusive regulatory framework for commercial nuclear plants, including advanced reactor designs. Part 53 of 10 CFR dispensed with the Tier 1 and Tier 2 terminology. Rather, 10 CFR 53.1525, ''Revising certification information within a design certification rule,'' uses the term ''certification information'' in place of Tier 1. Information that is ''not certification information'' is equivalent to Tier 2 information under 10 CFR part 52. The change control processes for ''certification information'' and ''not certification information'' in 10 CFR part 53 are similar to those for Tier 1 and Tier 2 in 10 CFR part 52.

B. Licensing Experience and Improvement Initiatives Regarding Information Designation and Change Processes for Design Certifications

The NRC has periodically considered improvements to the effectiveness and efficiency of information designations for standard design certifications and associated change processes. Many of these improvements, developed through internal and external reviews and interactions, are addressed in this proposed rule.

The NRC staff internally reviewed and considered improvements to the content of Tier 2* and Tier 1 information. In SECY–17–0075, ''Planned Improvements in Design Certification Tiered Information Designations,'' dated July 24, 2017, the NRC staff examined license amendment requests (LARs) affecting Tier 2* information from AP1000 COL licensees to assess the effectiveness of the Tier 2* designation and the 10 CFR 50.59-like change process. While the NRC staff concluded that there was a benefit to maintaining the use of Tier 2* information in certified designs, it noted that for the AP1000 there were several non-safety significant Tier 2* changes requested in LARs that probably would not have triggered the 10 CFR 50.59-like criteria requiring prior NRC approval of the change. In SECY–19–0034, ''Improving Design Certification Content,'' dated April 8, 2019, the NRC staff refined the general principles for Tier 1 content so that in future design certifications, NRC approval would not be required for design changes of minimal safety significance. These refinements also apply to Tier 2*.

Through the experience from Vogtle Units 3 and 4, the NRC staff has gained insights into the Tier 2* information for the AP1000 design referenced in appendix D to 10 CFR part 52. These insights were summarized in the ''10 CFR part 52 Construction Lessons Learned Report,'' issued January 16, 2024.

The AP1000 design certification contained a significant amount of Tier 2* information, more than would be identified should the process be repeated today. The construction experience at Vogtle Units 3 and 4 showed that, in some cases, LARs were needed to change Tier 2* information that had minimal if any safety significance (*e.g.,* to make edits to a bibliography in a document that was identified as Tier 2* information in its entirety). In these cases, submittal of an LAR to change the information resulted in an inefficient use of resources for both the licensee and the NRC. The use of Tier 2* designations should be consistent with the approaches described in SECY–17–0075 and SECY–19–0034. When this designation is used in future licensing applications, the Tier 2* information should be carefully selected to minimize the potential to require LARs for non-safety-significant changes to this information.

Following the issuance of several 10 CFR part 52 COLs, the NRC engaged with industry representatives and members of the public to consider their perspectives while developing guidance for standardized ITAAC and corresponding Tier 1 information. The NRC considered a draft industry guideline developed by the Nuclear Energy Institute (NEI), dated May 27, 2015, which discussed ''first principles'' for developing Tier 1 information and a set of standard ITAAC that could be used in future design certification applications. While discussions between the NRC and the NEI continued, a final version of the guideline was never endorsed.

The NRC issued COLs to Southern Nuclear Operating Company (SNC) for Vogtle Units 3 and 4 on February 10, 2012. Vogtle Units 3 and 4 are currently the only two nuclear plants to be licensed and constructed and to enter into commercial operation using the 10 CFR part 52 licensing process. In the years following the issuance of the COLs, the NRC and SNC had a series of interactions regarding exemptions related to Tier 1 and Tier 2* information for Vogtle Units 3 and 4, including the challenges, lessons learned, and experience gained during licensing and construction.

During construction, SNC sought adjustments to the Tier 2* process on several occasions. By letter dated August 7, 2014, SNC submitted an amendment and exemption request to apply the existing departure evaluation process for Tier 2 changes to Tier 2* changes. SNC withdrew that request by letter dated December 15, 2014. Subsequently, on February 1, 2016, the NRC granted amendment and exemption requests to reclassify fire-protection related Tier 2* information as Tier 2. On December 21, 2017, SNC submitted LAR–17–037, and an associated exemption request, seeking changes to the Vogtle Units 3 and 4 COLs to add a license condition that would apply the change process for Tier 2 information for a proposed departure from Tier 2* information provided that specific criteria are not met. If one of the criteria were met for the proposed departure, then the proposed departure would continue to require prior NRC approval. In this request, SNC noted that LAR–17–037 ''arises from SNC's nearly six years' experience with the departure evaluation processes outlined in 10 CFR part 52, Appendix D'' and that ''SNC has identified an approach to alleviate some of the administrative burden for both the NRC and the Licensee.'' In addition, SNC stated that this proposal was intended to be in line with the Tier 2* lessons learned in SECY–17–0075. On September 20, 2018, the NRC granted the amendments and exemptions to Vogtle Units 3 and 4 that effectively replaced the Tier 2* change process with an alternative process (reflected in a license condition) that applied the Tier 2 change process along with nine additional criteria to determine whether a license amendment was required.

SNC submitted LARs, both during construction and after the start of commercial operation, proposing to change the contents of Tier 2 and Tier

2* information, and, where applicable, requested exemptions from Tier 1 information in accordance with the change processes specified in the design certification appendix. During construction, there were nearly 200 license amendments, some with related exemptions, and various ASME Code alternatives that required NRC review and approval. For each of the numerous Tier 1 exemption requests approved for Vogtle Units 3 and 4, the NRC determined that the special circumstances outweighed any decrease in safety from the reduction in standardization. Lessons learned from these licensing activities indicate that the need for the submittal and an evaluation of how standardization is maintained do not result in significant insights that support the implementation of the standardization policy; rather, experience shows that the requirement for maintaining standardization as a criterion for allowing changes is often burdensome to a licensee without significant benefit. The NRC has not imposed these changes on the certification information in appendix D of 10 CFR part 52 via rulemaking under 10 CFR 52.63, because these deviations from standardization are not significant reductions in safety. In addition, the NRC never found an exemption request submitted by SNC to be unacceptable based solely on the criterion that the special circumstances did not outweigh the decrease in safety from the reduction in standardization. During construction, SNC also sought efficiencies in the content of both Tier 1 and Tier 2* information. Specifically, SNC requested an amendment to consolidate several ITAAC, with corresponding changes to related Tier 1 information, in the plant-specific DCD to improve the efficiency of the ITAAC completion and closure process.

During a September 20, 2023, public meeting, SNC staff acknowledged that the ''existing Tier 2* requirements are not overly burdensome, but SNC would benefit from being able to implement a similar change process across its fleet of plants.''

After the start of commercial operation, SNC submitted a license amendment and exemption request dated July 25, 2024, for Vogtle Units 3 and 4 to remove all Tier 1 and Tier 2* information and associated requirements from its license. SNC proposed, in part, to convert Tier 1 and Tier 2* information to Tier 2, so that the Tier 2 change process would apply to all this information. At that time, the NRC communicated to SNC that the request contained significant questions of policy more appropriately addressed through the petition for rulemaking process and that revisions to the licensing documents SNC proposed were significant licensing changes that raised policy implications appropriate for Commission consideration. Subsequently, SNC withdrew the license amendment and exemption request on September 25, 2024. This proposed rulemaking would address the issue raised by SNC's request to convert Tier 1 and Tier 2* information to Tier 2.

On January 15, 2025, the NRC held another public meeting to seek feedback on preliminary options to provide regulatory flexibility in 10 CFR part 52 during construction and operational phases, including a change process for Tier 1 and Tier 2* information and the adjustment of tier designations. Members of the public who spoke at the meeting provided no adverse feedback and supported the NRC's approaches presented at the meeting.

In its rulemaking efforts to align the 10 CFR parts 50 and 52 licensing processes, the NRC staff proposed various changes regarding standardization and Tier 1 principles in SECY–22–0052, ''Proposed Rule: Alignment of Licensing Processes and Lessons Learned from New Reactor Licensing (RIN 3150–AI66),'' dated June 6, 2022. In SRM–SECY–22–0052, ''Staff Requirements—SECY–22–0052—Proposed Rule: Alignment of Licensing Processes and Lessons Learned from New Reactor Licensing (RIN 3150–AI66),'' dated November 20, 2024, the Commission approved publication of a revised proposed rule in the **Federal Register** that would eliminate requirements for evaluating the impact on standardization when approving departures from information in a design certification or ML. This proposed rule would incorporate that change.

In SECY–22–0052, the NRC staff also proposed to add a definition in 10 CFR part 52 for Tier 1 information that would have defined Tier 1 information as the qualitative and functional level portion of the design-related information in the generic DCD. This proposed rule also incorporates this change and would further include ITAAC in the definition of Tier 1. Relevant guidance documents would be updated to clarify that Tier 1 information should not include detail that could necessitate NRC approval for departures from certified designs that have minimal safety significance.

This proposed rule would also revise regulations governing licensee-requested changes during construction and operation under 10 CFR part 52 to provide additional flexibility and reduce unnecessary regulatory burden. This would be accomplished through changes in each of the certified designs described in appendices A, D, E, F, and G of 10 CFR part 52. Appendix B (System 80+) and appendix C (AP600) to 10 CFR part 52 have expired.

C. Severe Accidents

In SECY–12–0081, ''Risk-Informed Regulatory Framework for New Reactors,'' dated June 6, 2012, the NRC staff described a potential ''gap'' in the Tier 2 change process regarding severe accident features that are not related to ex-vessel severe accident prevention and mitigation. Unless such non-ex-vessel severe accident design features also happen to have a dual function such as also addressing design basis accidents or aircraft impacts, risk-significant Tier 2 changes (*e.g.,* information in Chapter 19 of Tier 2 of the DCD and FSAR related to prevention and mitigation of severe accidents other than those considered ''ex-vessel'') could be screened out altogether and not receive prior NRC approval. In SECY–12–0081, the NRC staff observed that Tier 1 descriptions usually have sufficient detail that necessitates prior NRC review for major changes to severe accident design features. However, the NRC staff also noted that (1) changes may be screened out or less appropriate criteria applied when determining if prior NRC approval is needed and (2) whether prior NRC approval is obtained may be highly dependent on the degree of detail in Tier 1, if any. The current change process does not address all of the severe accidents defined in 10 CFR 52.47(a)(23) and 52.79(a)(38). The current regulation and its implementation through the guidance in NEI 96–07, Appendix C, ''Guideline for Implementation of Change Processes for New Nuclear Power Plants Licensed under 10 CFR part 52,'' Revision 0-Corrected, issued March 2014, could result in the licensee screening out changes in Chapter 19 (and other sections) of Tier 2 of the DCD and FSAR that do not affect ex-vessel severe accident design features. In a worst-case scenario, significant Tier 2 changes to non-ex-vessel severe accident features, up to and including permanent removal from service, could be made without prior NRC approval.

In SRM–SECY–12–0081, ''Staff Requirements—SECY–12–0081—Risk-Informed Regulatory Framework for New Reactors,'' dated October 22, 2012, the Commission approved the NRC staff's plan to address the potential gap in the Tier 2 change process by (a) ensuring that there are sufficient details

on all key severe accident features in Tier 1 and (b) including a change process in future design certification rulemaking for non-ex-vessel severe accident features similar to the process for ex-vessel severe accident features. While no current certified designs include a change process for non-ex-vessel severe accident features, reverting Tier 1 information to Tier 2 information once the plant first achieves full power (a proposed change discussed in section XXII.B. of this document) may introduce a gap regarding changes to non-ex-vessel severe accident features. To address this potential gap, the proposed rule would revise the 10 CFR 50.59-like process in section VIII of appendices A, D, E, F, and G of 10 CFR part 52 to consider all severe accidents and not just ex-vessel severe accidents.

XXII. Discussion—Establishing Thresholds for Changes to Reactor Designs During Construction and Operation Under 10 CFR Parts 52 and 53

To respond to the direction in E.O. 14300 to ''establish stringent thresholds'' for changes required during construction, this proposed rule would revise the finality provisions for design certifications in 10 CFR 52.63, ''Finality of standard design certifications,'' and 10 CFR 53.1263, ''Finality of standard design certifications,'' to (1) eliminate ''increased standardization'' as a criterion for modifying design certification information on either a generic or plant-specific basis, and (2) eliminate whether special circumstances outweigh any decrease in safety that may result from a reduction in standardization as considerations for plant-specific orders and licensee requests for exemptions. Similarly, the proposed rule would revise finality provisions for MLs in 10 CFR 52.171, ''Finality of manufacturing licenses; information requests,'' and 10 CFR 53.1437, ''Exemptions, departures, and variances,'' to eliminate whether ''special circumstances outweigh any decrease in safety that may result from the reduction in standardization'' as a consideration for requests for departures from the applicant referencing or using the manufactured reactor. Further, the proposed rule would include other rule changes to provide additional flexibility and reduce unnecessary regulatory burden for licensee-initiated changes.

A. Standardization

The NRC is proposing to amend its regulations to remove unnecessary requirements to consider standardization as a criterion to justify generic changes to certified designs, plant-specific orders regarding information from a referenced standard design certification, or requested departures from a standard design certification or ML.

As explained in section XXI.B. of this document, recent reactor licensing experience with Vogtle Units 3 and 4 has shown that the requirement for maintaining standardization as a criterion for allowing requested changes is often burdensome to a licensee without significant offsetting benefit. With regard to changes imposed by the NRC, 10 CFR 52.63(a)(1), 52.63(a)(4), 53.1263(a)(1), and 53.1263(a)(4) set out criteria that must be met before the Commission modifies, rescinds, or imposes new requirements on certification information by rulemaking or plant-specific order. Sections 52.63(a)(1)(vii) and 53.1263(a)(1)(vii) of 10 CFR, which provide that changes contributing to increased standardization of certification information is an exception to finality that the Commission may use as a basis to impose new requirements on the certification information, would be deleted from the NRC's regulations. Before imposing new requirements by plant-specific order, 10 CFR 52.63(a)(4)(ii) and 53.1263(a)(4)(ii) require that special circumstances be present and the Commission consider whether these special circumstances outweigh any decrease in safety that results from the effects of decreased standardization. The criterion of whether the special circumstances outweigh any decrease in safety that results from a reduction in standardization, which apply to the Commission, would be deleted from the NRC's regulations. The criterion that special circumstances are present would remain in the regulations.

With regard to changes proposed by licensees and applicants, 10 CFR 52.63(b)(1) and 53.1263(b) permit an applicant or licensee that references a design certification rule to request an exemption from one or more elements of the certification information. These regulations require the Commission to consider whether the special circumstances that the exemption regulation requires to be present outweigh any decrease in safety that may result from the reduction in standardization caused by the exemption. However, as described in section XXI.B. of this document, experience has shown that for all cases, the required special circumstances outweigh any decrease in safety that may result from the reduction in standardization caused by the requested exemption. Therefore, the NRC is proposing to revise 10 CFR 52.63(b)(1) and 53.1263(b) to eliminate the requirements for the NRC to review the impact of the requested exemption on standardization.

For similar reasons, the NRC is also proposing to revise 10 CFR 52.93(c), 52.171(b)(2), and 53.1437(c) to remove the requirement to discuss the impact of the change on standardization as a criterion for the justification for departures from ML information.

On September 15, 1987, the NRC issued a revised policy statement on nuclear power plant standardization (52 FR 34884). The purpose of this policy statement was for the Commission to encourage standardization by providing a regulatory framework for the certification of nuclear power plant designs that can be referenced in individual plant applications. As stated in this policy, ''[t]he Commission believes that the use of certified standardized designs can benefit the public health and safety by concentrating resources on specific design approaches without stifling ingenuity; by stimulating standardized programs of construction practice, quality assurance, and personnel training; and by fostering more effective maintenance and improved operation.'' The use of certified designs would also improve the efficiency of NRC reviews and reduce uncertainty in the regulatory process.

The proposed rule changes would not be contrary to this policy goal. The policy goal of standardization along with the efficiencies and safety benefits associated with it would be maintained because the overall regulatory framework would still allow for certified designs to be referenced by applicants and licensees in CP applications or COL applications. The deletion of 10 CFR 52.63(a)(1)(vii) and 53.1263(a)(1)(vii) would ensure that changes to certified designs could not be imposed on licensees for the sole purpose of establishing or maintaining standardization among reactors referencing the same design. However, the Commission could still impose new requirements on certification information using one of the six other criteria that would remain in 10 CFR 52.63(a)(1) and 53.1263(a)(1). Since the design certification changes imposed by the NRC for reasons that meet these other criteria would apply to all plants referencing the certified design, standardization would still be achieved.

Regarding the proposed changes to the requirements in 10 CFR 52.63(b)(1), 52.93(c), 52.171(b)(2), 53.1263(b), and 53.1437(c) requiring an analysis of the effects of a change on standardization,

experience has shown that it is challenging for an applicant or the NRC to evaluate whether any one change proposed would decrease safety solely as a result of a reduction in standardization. The NRC recognizes that increased standardization remains a policy goal of 10 CFR parts 52 and 53, and requirements supporting that goal should be maintained when there is an appropriate benefit to doing so. The proposed changes to the NRC's regulations that remove the requirement to justify requested changes to the design, based on the changes' effects on standardization, would eliminate unnecessary burden on applicants and licensees while maintaining beneficial aspects of the NRC's policy on standardization. The proposed changes to 10 CFR 52.63(a)(4) and 53.1263(a)(4) would eliminate similar requirements for the NRC to consider whether special circumstances outweigh any decrease in safety that results from a reduction in standardization before issuing a plant-specific order.

Even though the proposed rule revisions described in section XXII.C, ''Processes for Changes and Departures,'' of this document would provide licensees with additional flexibility to make plant-specific changes to certified designs, the NRC does not expect the scope and extent of plant-specific changes to result in such drastic and significant differences that would negate the advantages and safety benefits of standardization. The regulatory structure and change control processes in 10 CFR parts 52 and 53 would continue to support the policy goal of standardization.

B. Definitions

The NRC is proposing to change its regulations to add the definitions of tier information to 10 CFR 52.1, ''Definitions,'' and to make the definitions consistent with the principles in SECY–19–0034. The terms ''Tier 1,'' ''Tier 2,'' and ''Tier 2*'' are defined in section II, ''Definitions,'' of each design certification in appendices A, D, E, F and G to 10 CFR part 52. A design certification applicant is free to define this information. For example, an application can define no tier information, include more than three tiers of information, or define tiers with definitions that are different than those in current 10 CFR part 52 design certification appendices. This flexibility can lead to inconsistencies and increased burden for design certification and COL applicants in preparing applications and increased burden to the NRC in reviewing applications. Recent reactor licensing experience has shown that some applications have included more information in Tier 1 than is necessary for the purpose of Tier 1. This has resulted in the need for licensees to request NRC review and approval of Tier 1 departures from information that, because of its minimal safety significance, could more appropriately have been handled under the 10 CFR 50.59-like change process currently applicable to Tier 2 information.

To address these problems, the NRC is proposing to change its regulations to add a definition of ''Tier 1'' to 10 CFR 52.1 that would state that Tier 1 information is the qualitative and functional-level portion of the design-related information in the generic DCD and also includes ITAAC. Relevant guidance documents would be updated to clarify that Tier 1 information should not include detail that could necessitate NRC approval for departures from the certified design that have minimal safety significance. The NRC proposes the same refinements to the proposed 10 CFR 52.1 definition of Tier 2* information because information should be designated as Tier 2* only if it qualifies for inclusion in Tier 1.

The NRC also notes the following regarding the definitions of ''Tier 2'' and ''Tier 2*'' proposed to be added to 10 CFR 52.1:

- The definition of ''Tier 2'' in section II of appendices A, D, E, F and G to 10 CFR part 52 goes on to list specific information that is included in Tier 2. The proposed definition of ''Tier 2'' in 10 CFR 52.1 would not contain this listed information.
- The definition of ''Tier 2*'' in section II of appendices A, D, E, F and G to 10 CFR part 52 states, ''This designation expires for some Tier 2* information under paragraph VIII.B.6.'' The proposed definition of ''Tier 2*'' in 10 CFR 52.1 would state, in part, that after the plant first achieves full power, the Tier 2* designation reverts to Tier 2 status for all Tier 2* matters.

These proposed 10 CFR 52.1 definitions of Tier 1, Tier 2, and Tier 2* would apply to design certifications issued after the effective date of the final rule.

For currently certified designs, the NRC is proposing to clarify its definitions of Tier 1 information in section II.D of appendices A, D, E, F, and G to 10 CFR part 52. Currently, section II.D in each of these appendices states that Tier 1 is the portion of the design-related information in the generic DCD that is approved and certified and includes: definitions and general provisions; design descriptions; ITAAC; significant site parameters; and significant interface requirements. The proposed revisions to section II.D would provide further clarification by identifying specific sections and tables within the generic DCD that correspond to each of these categories of Tier 1 information. Since the proposed rule would implement different change control processes for these various categories of Tier 1 information, there would be a need to clearly identify what Tier 1 information in the generic DCD corresponds to each category. For definitions and general provisions (section II.D.1), significant site parameters (section II.D.4), and significant interface requirements (section II.D.5), the specific sections in the generic DCD would be identified. For ITAAC (section II.D.3), the specific tables in the generic DCD would be listed. The proposed rule would also specify that only the inspections, tests, and analyses column and the acceptance criteria column of these tables would be considered ITAAC information. For design descriptions (section II.D.2), the proposed rule would identify the specific sections in the generic DCD and would clarify that figures and non-ITAAC tables referenced in these sections would also be considered design description information. Non-ITAAC tables would be any tables not specifically listed as an ITAAC table in the definition.

C. Processes for Changes and Departures

(i) Tier 1 Design Description Information

The NRC is proposing to change its regulations regarding licensee-requested changes during construction for COL holders referencing a certified design. Several of these proposed rule changes would impact the 10 CFR 50.59-like criteria in the appendices of 10 CFR part 52. These include proposed changes to the 10 CFR 50.59-like criteria themselves as well as their application to design information. The NRC acknowledges that section XII, ''Discussion—Risk-Informing 10 CFR 50.59 and Allowing Flexibility for Changes to Methods,'' of this document describes proposed changes to 10 CFR 50.59 that would allow consideration of risk insights from PRAs and provide increased flexibility for changes to methods of evaluation. As part of the development of the final rule, the NRC will consider the rule revisions to 10 CFR 50.59 and their applicability to the 10 CFR 50.59-like process in 10 CFR part 52.

The NRC proposes to amend section VIII.A, ''Tier 1 Information,'' of

appendices A, D, E, F, and G to 10 CFR part 52 regarding licensee-requested changes to Tier 1 design description information. Currently, exemptions from all Tier 1 information are governed by the requirements in 10 CFR 52.63(b)(1) and 52.98(f). The proposed rule would revise the change process for Tier 1 design descriptions and provide a conforming change in 10 CFR 52.63(b)(1) reflecting that some Tier 1 design description changes within the scope of the new change process would not require an exemption. Licensee-requested exemptions from definitions and general provisions, significant site parameters, and significant interface requirements would be unchanged and any departure from this Tier 1 information would continue to require an exemption. The NRC recognizes that some of the change requests for Tier 1 information based on construction experience from Vogtle Units 3 and 4 may not have been important to safety. Providing flexibility in determining which changes to Tier 1 design description information require NRC approval would reduce burden on licensees and minimize possible construction delays due to licensing reviews without impacting safety.

The NRC proposes to add section VIII.A.5 to appendices A, D, E, F, and G to 10 CFR part 52 to allow an applicant or licensee to depart from Tier 1 design description information without NRC approval if certain criteria are met. The criteria for determining whether a proposed departure from Tier 1 design description information requires an exemption would be listed in the proposed new section VIII.A.6 of appendices A, D, E, F, and G of 10 CFR part 52. These criteria are based upon the 10 CFR 50.59-like criteria currently listed in sections VIII.B.5.b and VIII.B.5.c in appendices A, D, E, F, and G of 10 CFR part 52 for determining whether changes to Tier 2 information require NRC approval. Since Tier 1 design description information is based on Tier 2 information, these criteria would also be appropriate to use for changes to Tier 1 design description information. The criteria in the proposed new section VIII.A.6 would be identical to those in section VIII.B.5.b. The criteria in the proposed new section VIII.A.6 would also include criteria similar to those in current section VIII.B.5.c but these criteria would be revised to consider all severe accident design features and not just ex-vessel severe accident design features, consistent with proposed changes to section VIII.B.5.c that would be made by this proposed rule. Additional discussion for this change is in section XXII.C.(iii), ''Severe Accidents,'' of this document. If any of the criteria in the proposed section VIII.A.6 were met, then the proposed departure from the Tier 1 design description would require an exemption request for NRC approval.

Section VIII.A.2 of appendices A, D, E, F, and G to 10 CFR part 52 states that generic changes to Tier 1 information are applicable to all applicants or licensees who reference the applicable appendix, except those for which the change has been rendered technically irrelevant by plant-specific actions under paragraphs VIII.A.3 or VIII.A.4. Because the NRC proposes to add paragraphs VIII.A.5 and VIII.A.6 as means for making plant-specific changes to Tier 1 design descriptions, the NRC also proposes a conforming change that would amend section VIII.A.2 of appendices A, D, E, F, and G to 10 CFR part 52 to add the new paragraphs VIII.A.5 and VIII.A.6 to the list of plant-specific actions that can render a generic change to Tier 1 information technically irrelevant.

Section VI.B of appendices A, D, E, F, and G to 10 CFR part 52 lists matters the Commission considers resolved in subsequent proceedings for issuance of a COL, amendment of a COL, or renewal of a COL, proceedings held under 10 CFR 52.103, and enforcement proceedings involving plants referencing the applicable appendix. Section VI.B.4 of these appendices identifies one resolved matter as all exemptions under and in compliance with the change processes in paragraphs VIII.A.4 and VIII.B.4 of the applicable appendix. Section VI.B.6 of these appendices identifies another resolved matter as all departures from Tier 2 under and in compliance with the change processes in paragraph VIII.B.5 of the applicable appendix that do not require prior NRC approval. Because the NRC proposes to add paragraphs VIII.A.5 and VIII.A.6 as means for making plant-specific changes to Tier 1 design descriptions, the NRC also proposes a conforming change that would amend section VI.B.4 of appendices A, D, E, F, and G to 10 CFR part 52 to add exemptions under and in compliance with section VIII.A.6 to the list of resolved matters. Another conforming change would amend section VI.B.6 of appendices A, D, E, F, and G to 10 CFR part 52 to add departures from Tier 1 under and in compliance with section VIII.A.5 that do not require NRC approval to the list of resolved matters. In addition, the NRC proposes to make a correction in section VI.B.6 of appendices A and F to 10 CFR part 52 by changing the reference, ''paragraph VIII.B.5.f,'' to ''paragraph VIII.B.5.g,'' of the applicable appendix.

Analogous changes are proposed for 10 CFR part 53. Specifically, the NRC proposes to revise 10 CFR 53.1525(b) to allow a holder of a license that references a design certification issued under 10 CFR part 53 to make changes to certification information that has not been incorporated into the license without requesting an exemption if certain criteria are met. Additional changes are proposed for 10 CFR 53.1535, ''Amendments and exemptions during construction,'' and 10 CFR 53.1550 to reflect the proposed change to 10 CFR 53.1525(b). Paragraph (a) of 10 CFR 53.1535 would be revised to add provisions that holders of a CP or LWA may also request an exemption, if an exemption is required. Paragraph (b) of 10 CFR 53.1535 would be revised to require any COL holders for which the 10 CFR 53.1452(g) finding has not yet been made to submit an exemption request within 45 days from the date the licensee begins the construction to implement a change requiring NRC approval. This requirement currently applies to requested license amendments, and the NRC is proposing to also apply it to exemptions to reflect the proposed change to 10 CFR 53.1525(b) under which certain departures from certification information would require an exemption but not an amendment. The proposed changes to 10 CFR 53.1550 would clarify that the evaluation of changes to the facility applies to certification information as well as FSARs. Finally, the NRC proposes to delete the current requirement in 10 CFR 53.1525(b) that a request for an exemption be included with a LAR since departures under proposed 10 CFR 53.1525(b) that require NRC approval would be subject to exemption requests and not require a license amendment unless the departure would change the license itself. A conforming change is proposed to 10 CFR 53.1530, ''Revising information within a Final Safety Analysis Report associated with a manufacturing license,'' to eliminate the requirement that a holder of an ML referencing a design certification request an exemption from the design certification rule as part of an amendment application. The proposed 10 CFR 53.1530 would state that, in these cases, the provisions of 10 CFR 53.1525 would apply.

(ii) Tier 1 ITAAC and Certification Information

The NRC proposes to amend section VIII.A of appendices A, D, E, F, and G to 10 CFR part 52 regarding licensee-

requested changes to Tier 1 ITAAC information. Under the current change control requirements, any change to generic ITAAC in a COL application referencing a certified design requires the COL holder to submit both an exemption request and a LAR to the NRC for approval. An exemption request is required to modify generic ITAAC because, like other Tier 1 information, ITAAC are certified information. Changes to either generic or plant-specific ITAAC also require a license amendment because section 185b. of the AEA requires the Commission to include the ITAAC within the COL.

The proposed rule would add a new section VIII.A.7 to appendices A, D, E, F, and G to 10 CFR part 52. Proposed section VIII.A.7 in each appendix would require licensees who reference that appendix to request a license amendment under 10 CFR 50.90 for any change to Tier 1 ITAAC information. However, unlike current requirements, licensees requesting a departure from Tier 1 ITAAC information would no longer be required to submit an exemption request in addition to the LAR due to the proposed requirements in section VIII.A.7 of appendices A, D, E, F, and G to 10 CFR part 52. Removing the requirement to submit an exemption request would reduce the unnecessary burden on licensees by eliminating the need to submit both an exemption request and a LAR for the same change. The NRC would still be required to review and approve any ITAAC changes to ensure that the requirements of 10 CFR 52.97(b)—namely, that the COL contains the ITAAC that are necessary and sufficient to provide reasonable assurance that the facility has been constructed and will be operated in conformity with the license, the provisions of the AEA, and the Commission's regulations—continue to be met. Experience from construction of Vogtle Units 3 and 4 demonstrated that there is no enhanced assurance of safety by evaluating these same ITAAC changes against the exemption criteria specified in 10 CFR 52.7 (which reference 10 CFR 50.12), 10 CFR 52.63(b), and section VIII.A.4 of the applicable appendix to 10 CFR part 52. The need for the exemption request for ITAAC information was simply due to the designation of ITAAC as Tier 1 (*e.g.,* certified) information.

Section VIII.A.2 of appendices A, D, E, F, and G to 10 CFR part 52 states that generic changes to Tier 1 information are applicable to all applicants or licensees who reference the applicable appendix, except those for which the change has been rendered technically irrelevant by plant-specific actions under paragraphs VIII.A.3 or VIII.A.4. In a conforming change, the NRC proposes to amend section VIII.A.2 of appendices A, D, E, F, and G to 10 CFR part 52 to add the new paragraph VIII.A.7 to the list of plant-specific actions that can render a generic change to Tier 1 information technically irrelevant.

Analogous changes are proposed for 10 CFR part 53. Specifically, the NRC proposes to amend 10 CFR 53.1525(a) to allow a holder of an OL or COL that references a design certification issued under 10 CFR part 53 to request a license amendment, in lieu of an exemption, if proposing changes to certification information that has been incorporated into the license. A conforming change is also proposed to 10 CFR 53.1550(a)(1) to clarify that changes could be made without a license amendment if the change to certification information incorporated into the license is not required.

The requirements for licensee-requested changes to Tier 1 information in the appendices of 10 CFR part 52 are not identical to those for certified information in 10 CFR part 53 because the Tier 1 definition in the appendices of 10 CFR part 52 states that Tier 1 information includes definitions and general provisions; design descriptions; ITAAC; significant site parameters; and significant interface requirements, whereas 10 CFR part 53 does not specify certification information. The 10 CFR part 52 change control process for Tier 1 ITAAC is similar to that for 10 CFR part 53 certified information that has been incorporated into the license. The 10 CFR part 52 change control process for Tier 1 design descriptions is similar to that for 10 CFR part 53 certified information that has not been incorporated into the license. The NRC proposes to amend section VIII.A.4 of the appendices of 10 CFR part 52 to state that licensee-requested departures from definitions and general provisions, significant site parameters, and significant interface requirements would continue to require an exemption from Tier 1 information. 10 CFR part 53 does not and would not have a similar requirement because it does not define this type of information. Despite this difference, the proposed requirements in 10 CFR parts 52 and 53 would establish appropriate thresholds for licensee-requested changes. During a review of a design certification under 10 CFR part 53, if the NRC determined that certain certification information always warranted prior NRC approval, this information could be designated as information required to be incorporated into a license referencing the certified design.

(iii) Severe Accidents

The NRC proposes to amend the criteria described in section VIII.B.5.c of appendices A, D, E, F, and G to 10 CFR part 52 used to determine if a proposed departure from Tier 2 information affecting the resolution of an ex-vessel severe accident design feature identified in the plant-specific DCD requires a license amendment.

The proposed rule would address the gap described in SECY–12–0081 and section XXI.C. of this document by revising section VIII.B.5.c of appendices A, D, E, F, and G to 10 CFR part 52 by removing the phrase ''ex-vessel'' from the description of severe accidents considered. This change would allow the revised criteria to consider all severe accident design features identified in the DCD, not just ex-vessel severe accident design features.

As discussed in section XXII.C.(i) of this document, another change proposed in this rulemaking would be to add a new section VIII.A.5 to appendices A, D, E, F, and G to 10 CFR part 52. Proposed section VIII.A.5 would allow an applicant or licensee to depart from Tier 1 design description information without NRC approval if certain criteria are met. The criteria for determining whether a proposed departure from Tier 1 design description information requires an exemption would be listed in the proposed section VIII.A.6. These criteria were based upon the 10 CFR 50.59-like criteria currently listed in sections VIII.B.5.b and VIII.B.5.c of appendices A, D, E, F, and G of 10 CFR part 52 for determining whether changes to Tier 2 information require NRC approval. The criteria in the proposed section VIII.A.6 would also include criteria similar to those in current section VIII.B.5.c but these criteria would be revised to consider all severe accident design features and not just ex-vessel severe accident design features.

(iv) Process for Changes and Departures During Commercial Operation

The NRC proposes to amend section VIII.A in appendices A, D, E, F, and G to 10 CFR part 52 regarding the treatment of Tier 1 information during commercial operation. A proposed section VIII.A.8 would be added to each appendix stating that after the plant first achieves full power, licensee-initiated plant-specific departures from Tier 1 information would be subject to the same requirements as licensee-initiated plant-specific departures from Tier 2 information. Per 10 CFR 52.103(h), after

the Commission has made the 10 CFR 52.103(g) finding, ITAAC do not constitute regulatory requirements except for any specific ITAAC for which the Commission has granted a hearing under 10 CFR 52.103(a). Also, all ITAAC expire upon final Commission action in the proceeding under 10 CFR 52.103(a). Therefore, after the 10 CFR 52.103(g) finding and any proceedings held under 10 CFR 52.103(a), the only remaining Tier 1 requirements are the definitions and general provisions, design descriptions, significant site parameters, and significant interface requirements. As discussed in section XXII.C.(i) of this document, proposed section VIII.A.5 would allow an applicant or licensee, even during construction, to depart from Tier 1 design description information without NRC approval if certain criteria are met. Thus, the criteria for determining whether a proposed departure from Tier 1 design description information would require an exemption would be the 10 CFR 50.59-like criteria that apply to departures from Tier 2 information. With the NRC's additional proposal to treat licensee-initiated departures from Tier 1 the same as licensee-initiated departures from Tier 2 after first achieving full power, an exemption would be needed for a plant-specific departure from Tier 1 design description information during construction and start-up testing up to full power if the 10 CFR 50.59-like criteria are met, but a license amendment would be needed for such departures after full power operation is first achieved. The criteria for determining whether the change would need NRC approval would remain the same.

Since plant-specific departures from Tier 2 information are governed by the 10 CFR 50.59-like criteria, the proposed section VIII.A.8 would allow licensees, after first achieving full power, to use the 10 CFR 50.59-like process to determine if changes to definitions and general provisions, design descriptions, significant site parameters, and significant interface requirements would require prior NRC approval. Tier 1 definitions and general provisions, design descriptions, significant site parameters, and significant interface requirements would still remain requirements for the lifetime of the facility, but the proposed rule would provide additional flexibility to 10 CFR part 52 licensees by allowing them to use the 10 CFR 50.59-like process to determine if changes to this information would require prior NRC approval.

(v) Tier 2* Information

The NRC proposes to amend sections II.F and VIII.B of appendices A and E to 10 CFR part 52 to revert all Tier 2* information to Tier 2 status after the plant first achieves full power. Proposed amendments to section II.F of appendices A and E to 10 CFR part 52 would clarify that the Tier 2* designation expires for all Tier 2* matters, not just for those listed in section VIII.B.6.c. In addition, the proposed rule would modify section VIII.B.6.b of appendices A and E to 10 CFR part 52 to add the Tier 2* matters listed in section VIII.B.6.c and correspondingly remove those items from section VIII.B.6.c. Finally, section VIII.B.6.c of appendices A and E to 10 CFR part 52 would be revised to state that after the plant first achieves full power, all Tier 2* matters would revert to Tier 2 status and would thereafter be subject to the departure provisions in section VIII.B.5. These proposed changes would reduce the regulatory burden during operation for COL holders who reference appendix A or E to 10 CFR part 52 by allowing them to use the 10 CFR 50.59-like criteria to determine if a departure from Tier 2* information would require a LAR. This would also provide COL licensees under 10 CFR part 52 the same flexibility afforded to OL licensees under 10 CFR part 50 during plant operation.

The NRC also proposes to amend sections II.F and VIII.B of appendix D to 10 CFR part 52 regarding Tier 2* information. These changes would allow the use of the 10 CFR 50.59-like criteria in sections VIII.B.5.b and B.5.c to determine if licensees who reference appendix D to 10 CFR part 52 may depart from Tier 2* information without prior NRC approval. The proposed rule would revise sections VIII.B.5.a, VIII.B.5.b, and VIII.B.5.c to apply to both Tier 2* information as well as Tier 2 information. Section VIII.B.6 would be deleted in its entirety, along with cross-references to section VIII.B.6 elsewhere in appendix D to 10 CFR part 52. With these proposed changes, the Tier 2* information for the AP1000 design would effectively be treated as Tier 2 information during construction as well as operation. The bases for these proposed rule changes are as follows. First, SNC's experience with the Tier 2* departure evaluation process for Vogtle 3 and 4 during the first six years of construction demonstrated that the Tier 2* change process for the AP1000 design imposed an administrative burden on both the licensee and the NRC because LARs were needed to change Tier 2* information that had minimal safety significance. This was also documented in SECY–17–0075 and the ''10 CFR part 52 Construction Lessons Learned Report,'' issued after the completion of construction of Vogtle units 3 and 4. Second, the 10 CFR 59.59-like process is an acceptable approach to determine which changes are safety significant and require prior NRC approval. The 10 CFR 50.59 process is used successfully by the operating fleet of plants licensed under 10 CFR part 50. In addition, as part of this proposed rule, the NRC is proposing to apply the 10 CFR 59.59-like process to the Tier 1 design description information for existing certified designs.

Section VI.B of appendix D to 10 CFR part 52 lists matters the Commission considers resolved in subsequent proceedings for issuance of a COL, amendment of a COL, or renewal of a COL, proceedings held under 10 CFR 52.103, and enforcement proceedings involving plants referencing appendix D. Section VI.B.6 of appendix D identifies one resolved matter as all departures from Tier 2 under and in compliance with the change processes in paragraph VIII.B.5 of appendix D that do not require prior NRC approval. Because the NRC proposes to amend section VIII.B of appendix D to 10 CFR part 52 to apply the change process in paragraph VIII.B.5 to Tier 2* information, the NRC also proposes a conforming change that would amend section VI.B.6 of appendix D to 10 CFR part 52 to add departures from Tier 2* under and in compliance with section VIII.B.5 that do not require NRC approval to the list of resolved matters.

At this time, the NRC is not proposing that Tier 2* information for the ABWR and ESBWR designs be treated as Tier 2 information during construction. The NRC acknowledges some inconsistency in the treatment of Tier 1 design description and Tier 2* information but wants to provide considerations for the construction and licensing experience from COLs referencing the AP1000. However, the NRC has posed a specific question in section XXXVI, ''Specific Questions,'' of this document asking if the flexibility afforded the AP1000 design should include the ABWR and ESBWR designs and for the basis of a response to that question.

Section VIII.B.2 of appendix A to 10 CFR part 52 states, in part, that generic changes to Tier 2* information are applicable to all applicants or licensees who reference that appendix, except those for which the change has been rendered technically irrelevant by certain plant-specific actions. The NRC proposes to amend section VIII.B.2 of appendix A to 10 CFR part 52 to add

paragraph VIII.B.6 to the list of plant-specific actions that can render a generic change to Tier 2* information technically irrelevant. This proposed addition would make appendix A to 10 CFR part 52 similar in this regard to other appendices in 10 CFR part 52 and avoid an unnecessary imposition of a generic change to a plant for which the underlying issue has already been addressed.

(vi) Section IX of Appendix D to 10 CFR Part 52

The NRC proposes to delete the requirements in section IX, ''Inspections, Tests, Analyses, and Acceptance Criteria (ITAAC),'' of appendix D to 10 CFR part 52 and reserve this section for future use. The ITAAC requirements currently listed in this section were incorporated into 10 CFR 52.99 and 52.103 in a 2007 rulemaking (72 FR 49352; August 28, 2007). Therefore, the language in this section is no longer needed, and removal of it is consistent with previous Commission direction. As stated in the rulemaking for the ESBWR design certification (79 FR 61944; October 15, 2014), ''The language of the ESBWR design certification rule differs from the rule language of other DCRs in two substantive areas. First, paragraph IX was reserved for future use because the substantive requirements in this paragraph (for other DCRs) has since been incorporated into 10 CFR part 52 in a 2007 rulemaking (72 FR 49352; August 28, 2007) and thus are no longer needed in the four existing DCR appendices. The NRC intends to remove these requirements from Section IX of the four existing DCR appendices in future amendment(s) separate from this rulemaking.''

This change would also make appendix D to 10 CFR part 52 similar in this regard to the other appendices in 10 CFR part 52.

(vii) Manufacturing Licenses

The NRC proposes to revise 10 CFR 52.171(b)(1) to allow the holder of an ML to use the regulations in 10 CFR 50.59 to determine whether changes to the facility or procedures as described in the FSAR would require prior Commission approval of an amendment to the ML. If prior Commission approval is required, then the change would need to be submitted in the form of a license amendment per 10 CFR 50.90, 50.91, and 50.92. The NRC also proposes a conforming change to 10 CFR 50.71(f) regarding FSAR updates for ML holders. Instead of requiring FSAR updates that reflect only design modifications approved by the Commission, the revised 10 CFR 50.71(f) would require that FSAR updates reflect safety analyses and evaluations that support approved amendments to the ML or support conclusions that changes did not require a license amendment. This revision would be consistent with the requirements in 10 CFR 53.1530 and would provide additional flexibility to licensees and reduce unnecessary regulatory burden in the regulations governing licensee-requested changes.

(viii) Applicants and Licensees That Reference Manufacturing Licenses

The NRC proposes to revise its regulations to allow licensees who reference an ML license to use the applicable change processes in 10 CFR part 50 to determine whether changes to the facility or procedures as described in the FSAR would require prior Commission approval. This would be accomplished with two proposed revisions to 10 CFR 52.98. The first proposed change would be to delete 10 CFR 52.98(d), which establishes requirements for changes or departures for COLs that reference an ML under subpart F of 10 CFR part 52. The second proposed change would be to revise 10 CFR 52.98(b). The current requirement in 10 CFR 52.98(b) is that only COLs that do not reference either a design certification or an ML may make changes to the facility using the applicable 10 CFR part 50 change processes. The NRC proposes to eliminate the restriction for COLs that reference a reactor manufactured under an ML by deleting the phrase ''or a reactor manufactured under a manufacturing license issued under subpart F of this part.'' The NRC also proposes to modify 10 CFR 52.171(b)(2) so that it would not apply to licensees referencing an ML. These proposed changes would allow a COL that references an ML to make changes to the facility using the applicable 10 CFR part 50 change processes.

The NRC proposes to add a new 10 CFR 50.59(f) that would allow the holder of an OL or COL that references a reactor manufactured under an ML to make changes in the facility or procedures as described in the FSAR without requesting a license amendment if the changes would be the same as changes approved by amendment to the ML and upon a determination that implementing the changes would be consistent with the basis for the Commission's approval of the amendment to the ML and would not involve any additional changes that would require an amendment to the OL or COL. The NRC proposes to add a similar provision as 10 CFR 53.1550(c) for holders of OLs or COLs that reference an ML. These proposed requirements would prevent OL and COL holders and the NRC from having to duplicate the amendment process for each manufactured reactor.

Sections 50.59(d)(1) and 53.1550(d) of 10 CFR would also be revised to require that the licensee maintain records of these changes.

The NRC proposes to amend 10 CFR 52.93(c), 52.171(b)(2), 53.1288(b), and 53.1437(c) to eliminate requirements that the Commission determine that departures from MLs by an applicant referencing the ML comply with the requirements for specific exemptions. Applicants that reference an ML would still request departures from the design characteristics, site parameters, terms and conditions, or approved design of the manufactured reactor. The NRC would review these proposed departures as part of its review of the application. Removing the requirement that approval of these departures also meets the requirements for exemptions would eliminate an unnecessary regulatory burden for applicants.

All of these proposed revisions would provide additional flexibility to licensees and applicants and reduce unnecessary regulatory burden in the regulations governing licensee-requested changes.

XXIII. Background—Revision of the Emergency Preparedness Regulations for Nuclear Power Reactors

A. Existing Emergency Preparedness Frameworks for Nuclear Power Reactors

Before December 18, 2023, appendix E, ''Emergency Planning and Preparedness for Production and Utilization Facilities,'' to 10 CFR part 50 identified the minimum requirements for emergency plans. Additionally, the regulations in 10 CFR 50.47, ''Emergency plans,'' provided emergency preparedness (EP) requirements for nuclear power reactors, including planning standards for onsite and offsite emergency response plans. Other relevant regulations included paragraphs (q), (s), and (t) of 10 CFR 50.54, ''Conditions of licenses.''

Efforts to develop a performance-based approach for EP have been ongoing for over two decades. In SECY–06–0200, ''Results of the Review of Emergency Preparedness Regulations and Guidance,'' dated September 20, 2006, the staff sought Commission approval to begin activities to develop a new voluntary performance-based EP regulatory regimen. On November 16, 2023, the NRC published a final rule creating 10 CFR 50.160, ''Emergency

preparedness for small modular reactors, non-light-water reactors, and non-power production or utilization facilities'' (88 FR 80050) (referred to herein as the ''2023 EP final rule''). Section 50.160 of 10 CFR provides a performance-based, technology-inclusive, risk-informed, and consequence-oriented EP framework as an alternative to 10 CFR 50.47 and appendix E to 10 CFR part 50. The alternative EP framework recognizes advances in reactor design and technology and credits the potential benefits of smaller sized reactors and non-light-water reactors (non-LWRs) associated with postulated accidents, including slower transient response times, and relatively small and slow release of fission products, as compared to large LWRs. The regulations in 10 CFR 50.160 are applicable to small modular reactors (SMRs) of rated power less than 1000 megawatts thermal (MWt), non-LWRs, and certain non-power production or utilization facilities. The NRC did not include large LWRs in the scope of 10 CFR 50.160 because an EP licensing framework already existed for those reactors, and licensees for those plants had not expressed a clear interest in changing that framework during development of the 2023 EP final rule. However, the work underpinning 10 CFR 50.160, originating from the motivations of SECY–06–0200, included considerations of large LWRs. Consistent with Commission direction in SRM–SECY–14–0038, ''Staff Requirements—SECY–14–0038—Performance-Based Framework for Nuclear Power Plant Emergency Preparedness Oversight,'' dated August 2, 2015, which directed the staff to ''be vigilant in continuing to assess the NRC's emergency preparedness program and should not rule out the possibility of moving to a performance-based framework in the future,'' the changes in this proposed rulemaking would expand the voluntary applicability of 10 CFR 50.160 to large LWRs. Part 53 of 10 CFR provided another opportunity to increase the use of performance-based regulation. The regulations in 10 CFR 53.855, ''Emergency preparedness,'' require each holder of an OL or COL under 10 CFR part 53 to have an emergency plan that complies with either the requirements in 10 CFR 50.160 or the requirements in appendix E to 10 CFR part 50 and the planning standards of 10 CFR 50.47(b).

B. Protective Actions and Emergency Planning Zones

EP is an operational safety program that provides reasonable assurance that adequate protective measures can and will be taken in the unlikely event of a radiological emergency. For radiological emergencies, protective actions should be carefully planned to balance protection with other important factors and ensure that actions result in more benefit than harm. The use of precautionary protective action strategies that rely on predetermined, prompt protective measures, including prompt evacuation, should be reserved for only the most severe incidents as protective actions are not without risk (see, for example, NUREG/CR–7285, ''Nonradiological Health Consequences from Evacuation and Relocation,'' issued September 2021). To balance these risks, the NRC applies a graded approach to EP in which the requirements and criteria are based on the relative radiological risks and hazards of the facility, among other considerations. The most detailed level of planning is associated with the implementation of predetermined, prompt protective actions and is reserved for only the most severe events. For less severe events, the level of planning can be scaled commensurately.

The emergency planning zone (EPZ) is a planning tool for implementing predetermined, prompt protective actions. It simplifies decision-making, particularly when such decisions may be time-constrained or require coordination across a large area involving multiple jurisdictions. Currently, protective actions within the EPZ are initiated promptly at the declaration of a General Emergency (*i.e.,* the highest emergency classification level that indicates that events are occurring or have occurred at the facility with the potential for an offsite release) as a precaution. However, a precautionary approach is not the only strategy that can be used for implementing protective measures. Risk-informed strategies, which make use of the best available information in a robust, transparent, and repeatable process to arrive at a decision can also be used to respond to radiological emergencies. Risk-informed protection strategies are particularly useful to reduce or avoid the risk of stochastic effects from radiation or when there is ample time to make a decision based on the actual conditions associated with the emergency event.

Under 10 CFR 50.33(g), 50.47(c)(2), and 53.1109(g), the plume exposure pathway EPZ for a nuclear power reactor consists of an area about 10 miles (16 km) in radius and the ingestion pathway EPZ for such facilities consists of an area about 50 miles (80 km) in radius. These regulations also provide that the size of plume exposure pathway and ingestion pathway EPZs for gas-cooled nuclear reactors and for reactors with an authorized power level less than 250 MWt may be determined on a ''case-by-case basis.''

For small modular reactors, non-LWRs, and other non-power production or utilization facilities, the size of the EPZ can be determined on a case-by-case basis under 10 CFR 50.33(g)(2). Specifically, 10 CFR 50.33(g)(2)(i) provides two criteria for determining whether an EPZ is needed, and if so, the size of the EPZ. The first criterion, located in 10 CFR 50.33(g)(2)(i)(A), is that the plume exposure pathway EPZ is the area within which public dose, as defined in 10 CFR 20.1003, ''Definitions,'' is projected to exceed 1 rem (10 millisieverts (mSv)) TEDE over 96 hours from the release of radioactive materials from the facility considering accident likelihood and source term, timing of the accident sequence, and meteorology. The second criterion, located in 10 CFR 50.33(g)(2)(i)(B), is that the plume exposure pathway EPZ is the area in which predetermined, prompt protective measures are necessary. These criteria were added in the 2023 EP final rule and were based, in part, on the methodology described in NUREG–0396, ''Planning Basis for the Development of State and Local Government Radiological Emergency Response Plans in Support of Light Water Nuclear Power Plants,'' dated December 1978. Similar provisions for a case-by-case EPZ determination are contained in 10 CFR 53.1109(g)(2).

The EPZ is one element of the emergency planning basis, which is operational in nature. The EPZ is not a design feature of the reactor or a part of the ''design bases'' as defined in 10 CFR 50.2 (*i.e.,* the EPZ is not a plant structure, system, or component). The purpose of the EPZ analysis required by 10 CFR 50.33(g)(2) is to arrive at a robust and resilient protection strategy for managing radiological emergencies. The EPZs are scalable in size and commensurate with the planning needs for the facility. However, the EPZ size does not change the requirements for emergency planning; it only sets bounds on the planning for a predetermined, prompt response. The capabilities within the emergency plan can support expanding the response beyond the EPZ during an actual emergency, should that prove necessary.

When an EPZ extends beyond the site boundary, the NRC requires additional findings and determinations on the adequacy of offsite plans to implement a prompt response. In such cases, the

NRC considers Federal Emergency Management Agency (FEMA) findings and determinations on the adequacy of the offsite planning in its overall reasonable assurance determination. FEMA maintains a voluntary offsite radiological emergency preparedness (REP) program to administer EP for the areas surrounding commercial nuclear power plants. The EP rule changes in this proposed rule would not impact the ability of State, local, and Tribal governments to receive support from FEMA or any other Federal agency regardless of whether the NRC requires reasonable assurance of the offsite plans. For current facilities without offsite EPZs (*e.g.,* non-power reactors, decommissioning power reactors, independent spent fuel storage installations), the NRC does not require findings and determinations of the adequacy of the offsite plans as the risks from radiation exposure are manageable under comprehensive emergency management plans and local emergency response. Emergency plans for these types of facilities provide reasonable assurance that adequate protective measures can and will be taken in coordination with offsite response organizations.

XXIV. Discussion—Revision of the Emergency Preparedness Regulations for Nuclear Power Reactors

A. Emergency Plan Licensing Flexibility

(i) Flexible EP Licensing Paths

The proposed rule would provide all applicants and licensees under 10 CFR parts 50, 52, and 53, including power reactor applicants and licensees, with the option to use the performance-based requirements in 10 CFR 50.160. Specifically, the proposed rule would remove the provision in the current rule limiting the applicability of 10 CFR 50.160 to only small modular reactors, non-LWRs, and non-power production or utilization facilities. This proposed change would reduce the need for exemptions to use the performance-based EP regulations. For example, a reactor would not be limited in power to 1000 MWt to meet the definition of ''small modular reactor'' as defined in 10 CFR 50.2 and utilize 10 CFR 50.160. In addition, the proposed rule would revise paragraph I.5 of appendix E to 10 CFR part 50 to provide for a scalable approach for power reactors that choose to comply with the planning standards of 10 CFR 50.47(b). The proposed changes would ensure applicants are not restricted in licensing options for EP and would provide the appropriate regulatory flexibility to support the various licensing pathways.

The planning standards in 10 CFR 50.47(b) and the requirements in appendix E to 10 CFR part 50 were originally developed for the hazards and emergency planning needs of large LWRs. Additionally, the prescriptive planning elements of appendix E to 10 CFR part 50 can be applied to non-power production or utilization facilities on a case-by-case basis. Basic emergency planning functions are similar across NRC licensed facilities, as the operational aspects of EP are well established in regulation and in practice across all hazards. There is no technology-specific language used in the planning standards for required EP functions that limit application to a particular technology. Therefore, the proposed rule would revise the section heading of 10 CFR 50.160 from ''Emergency preparedness for small modular reactors, non-light-water reactors, and non-power production or utilization facilities,'' to ''Performance-based emergency preparedness standards,'' to be applicable to all reactor types. In addition, the proposed rule would amend 10 CFR 50.33(g), 50.34(b)(6), 50.54(q)(2), 50.54(q)(3), 52.79(a)(21), 53.1109(g), and 53.1565(d)(3) to remove the distinction among applicants and licensees of small modular reactors, non-LWRs, and non-power production or utilization facilities in complying with 10 CFR 50.160. The proposed rule would not change the definition of ''small modular reactor'' in 10 CFR 50.2 and 53.020 because the definition would no longer have specific relevance to EP regulations.

The proposed rule would amend paragraph I.5 of appendix E to 10 CFR part 50 to determine the degree to which compliance with the requirements in certain sections of appendix E is necessary on a case-by-case basis for power reactors with a site-boundary EPZ or no EPZ. The proposed revision would reduce the need for exemptions and would provide applicants with the flexibility to propose the planning elements appropriate to their facility. For licensing efficiency, the NRC and specific applicants could achieve agreement on applicable planning elements in pre-application interactions. Alternatively, generic guidelines could be developed and endorsed by the NRC to support the rapid deployment of similar reactor types that wish to apply appendix E to 10 CFR part 50 in lieu of 10 CFR 50.160.

The proposed rule would add new 10 CFR 50.47(h) to allow a licensee to submit a license amendment to comply with the requirements of 10 CFR 50.160 in lieu of 10 CFR 50.47 and appendix E to 10 CFR part 50. Similarly, the proposed rule would add new 10 CFR 50.160(c)(4) to allow a licensee to submit a license amendment to comply with the requirements of appendix E to 10 CFR part 50 and, for nuclear power reactor licensees, the requirements of 10 CFR 50.47 in lieu of 10 CFR 50.160. The proposed rule would also add new 10 CFR 53.855(d) to provide provisions for complying with alternative EP requirements.

(ii) Preoperational Exercises

The NRC is proposing to remove specific time requirements and add flexibility in the performance of preoperational exercises. Prior to initial loading of fuel, or power operations, successful completion of a preoperational exercise is required to ensure that the licensee staff is ready to implement the emergency plan and that the emergency plan, as written, is acceptable. The proposed rule would amend paragraphs IV.F.2.a.(i) through (iii) of appendix E to 10 CFR part 50 and 10 CFR 50.160(c)(1) and (c)(2) by removing the requirement to demonstrate compliance within 2 years before issuance of an OL or the scheduled date of initial loading of fuel. Regulatory flexibility in the performance of this exercise may be desirable for applicants and holders of a COL that are co-located on, or adjacent to, an existing site and that may be able to subsume this demonstration requirement within the emergency plan exercise program that already exists, up to and including offsite exercise requirements. The specificity of the requirement to conduct the initial exercise within 2 years of certain milestones creates the potential to repeat the demonstration if schedules change. The proposed rule would ensure that the initial exercise need only be performed one time. The proposed rule would also provide flexibility to applicants and holders of a COL in the performance of preoperational exercises if they have preexisting licensed power reactors at the same site with similar onsite and offsite emergency plan elements in place. In such cases, the applicant or holder of a COL and the licensee may credit the same exercise as both the preoperational exercise required under proposed paragraphs IV.F.2.a.(i) and IV.F.2.a.(iii) and the onsite exercise required under paragraph IV.F.2.b of appendix E to 10 CFR part 50.

(iii) Alert and Notification System

The proposed rule would provide clarity for when backup alert and notification system (ANS) methods are

required. Traditional ANS strategies typically consist of a single primary method based upon fixed sirens and a single backup method using route-alerting strategies, but alternative methods are available. For example, the Integrated Public Alert & Warning System (IPAWS) is FEMA's national system for local alerting that includes parallel methods of providing authenticated emergency and life-saving information to the public typically through mobile phones using Wireless Emergency Alerts, to radio and television via the Emergency Alert System, and on the National Oceanic and Atmospheric Administration's Weather Radio among others. IPAWS typically provides multiple, simultaneous, primary methods of alerting the public implemented in parallel, and as such, does not require a designated backup. Because of technologies like IPAWS, the proposed rule would amend paragraph IV.D.3 of appendix E to 10 CFR part 50 to provide flexibility in meeting the requirements based upon the ANS chosen by the applicable State as approved in the ANS Design Report.

(iv) Use of Modern Terminology

Certain terminology used in the current regulations is no longer common or does not align with advances in technology. The NRC proposes to revise 10 CFR 50.160(b)(1)(iv)(A)(*2*) to provide clarity and to simplify the language for the requirement to implement the emergency plan in response to a security event. The NRC also proposes to revise paragraph IV.D.2 of appendix E to 10 CFR part 50 to replace ''local broadcast services'' with ''media sources.''

B. Emergency Planning Zone Certainty

The proposed rule would provide greater certainty and a streamlined approach to EPZ determinations for all applicants and licensees. The NRC is proposing to amend the requirements in 10 CFR 50.33(g), 50.47(c)(2), and 53.1109(g) to simplify EPZ determinations for new reactors and to ensure the plume exposure pathway EPZ is no larger than needed to implement predetermined, prompt protective measures. Specifically, the proposed rule would (1) establish the bounds of an EPZ to generally be about 2 to 10 miles (3.2 km to 16 km) in radius; (2) provide certainty for a site-boundary EPZ for facilities with an authorized power level less than 300 MWt; and (3) allow for case-by-case determinations for all facilities. The proposed rule would make conforming changes to 10 CFR 50.160(b)(3) in referring to the requirements in proposed 10 CFR 50.33(g)(1) and 53.1109(g)(1) to determine and describe the boundary and physical characteristics of the EPZ in the emergency plan.

The recommended 10-mile (16-km) plume exposure pathway EPZ is a generic planning distance for pressurized water reactor (PWR) and boiling water reactor (BWR) technologies based on the analyses in NUREG–0396. In the decades since, many studies have provided additional risk insights and analyses that demonstrate the conservatism in the NUREG–0396 analyses. These analyses include insights from the NRC's State-of-the-Art Reactor Consequence Analyses (SOARCA) regarding the magnitude and timing of severe accidents; insights from the NRC's Level 3 Probabilistic Risk Assessment (PRA) Project regarding the margin to quantitative health objectives, multi-unit events, and integrated plant risks; and specific studies to inform NRC's EP program including: (1) NUREG/CR–7160, ''Emergency Preparedness Significance Quantification Process: Proof of Concept,'' dated June 2013; (2) Task 1.5–1.6 Report to User Need Request NSIR–2017–002, ''Analyses Informing Emergency Planning Zone Size Determinations: Identification of Parameter Sensitivities,'' dated December 2019; (3) SAND2022–3706, ''Scoping Analysis of MACCS Modeling Improvements for the Study of Protective Action Recommendations, dated March 2022; and (4) SAND2025–08913, ''Dose Exceedance Distance Sensitivity Based on Parametric Uncertainty,'' dated July 2025. Combined, these analyses support the use of an EPZ that is generally no less than 2 miles (3.2 km) and no more than 10 miles (16 km) for implementing predetermined, prompt protective measures. Certain analyses were also based, in part, on conservative source terms for designs with an authorized power level less than 300 MWt, which suggest that there is a very low risk of exceeding acute doses offsite requiring a predetermined, prompt response. Additionally, numerous research reports from national laboratories, peer-reviewed published articles, and studies on small modular reactors, microreactors, and advanced reactor designs consistently demonstrate these designs would not require extensive plume exposure pathway EPZs. Combined, these analyses support the proposed changes to 10 CFR 50.33(g), 50.47(c)(2), and 53.1109(g) to reduce the conservatism in the current 10-mile (16-km) EPZ size and provide certainty for a smaller EPZ or a site-boundary EPZ without requiring extensive analyses on the part of the applicant or licensee.

The proposed rule would also simplify the case-by-case EPZ determination under 10 CFR 50.33(g)(1) and (g)(2) and 53.1109(g)(1) and (g)(2). The EPZ determination should be a simple evaluation of the consequences of a spectrum of accidents to inform protective action strategies. Tools like PRA are useful to help inform EPZ determinations and the risk insights can be used to produce a robust and resilient emergency plan to deal with the residual risk of the facility and to account for uncertainty and unknowns in the design and operation of the facility. While a risk-informed design can provide valuable information to develop a risk-informed EP program, including sizing the EPZ, the EP program is not part of the design and the EPZ determination is not an analysis to reiterate the safety case of the design, demonstrate compliance with the Licensing Modernization Project (LMP) process, or enforce design changes on an applicant or licensee to ensure that no accident will ever exceed 1 rem (10 mSv) at the EPZ boundary. Accordingly, the EPZ criteria for the case-by-case analysis are not design criteria or dose limits. The 1 rem (10 mSv) TEDE value in 10 CFR 50.33(g)(2)(i)(A) is a threshold dose quantity below which it may be demonstrated that no EPZ is needed to manage the radiological risks and hazards of the facility. The EPZ criteria does not require an applicant to demonstrate that doses cannot exceed 1 rem (10 mSv) TEDE over 96 hours beyond the EPZ boundary for all accidents. When doses can exceed 1 rem (10 mSv) TEDE, it is generally necessary to risk-inform the EPZ size by considering additional factors as specified in 10 CFR 50.33(g)(2)(i)(A) and by considering the need for predetermined, prompt protective measures as specified in 10 CFR 50.33(g)(2)(i)(B). The EPZ criteria in 10 CFR 53.1109(g)(2) are applied in the same way. For analysis purposes, the dose criteria is applied to a reference individual, as is done with other dose criteria (*e.g.,* 10 CFR 50.34(a)(1)(ii)(D)(*1*) and (*2*)) and with the Environmental Protection Agency (EPA) protective action guides (PAGs) (see EPA, ''PAG Manual: Protective Action Guides and Planning Guidance for Radiological Incidents,'' issued in 2017). Therefore, the proposed rule would amend 10 CFR 50.33(g)(2)(i)(A) and 53.1109(g)(2)(i)(A) to remove the reference to public dose as defined in 10 CFR 20.1003 and to

apply the dose to a reference individual. The EPZ dose criteria is not a limit, so the term ''public dose'' would be removed to avoid confusion.

When the radiological consequences can exceed 1 rem (10 mSv), dose criteria should not be strictly imposed at an EPZ boundary. There is significant inherent variability in any consequence analysis. For dose quantities less than 25 rem (250 mSv), this inherent variability can be on the order of kilometers. This creates a significant challenge for defining an EPZ boundary based on low dose, especially for EPZs less than 2 miles (3.2 km) in radius as the inherent variability in the consequence analysis could be as large or larger than the defined EPZ. In developing the 2023 EP final rule, the NRC extensively reviewed available studies and performed additional sensitivity analyses to understand the inherent variability of consequence analyses that inform the EPZ determination. The NRC is issuing, for public comment along with this proposed rule, DG–1430, ''Performance-Based Emergency Preparedness,'' which would be Revision 1 to the existing RG 1.242, with an updated methodology for a case-by-case EPZ determination. The revised guidance would provide applicants with clarification on the spectrum of accidents, including the consideration of security-related events and severe seismic events; additional guidance on risk-informing dose-distance evaluations to account for uncertainty and inherent variability in the calculation; and additional guidance for assessing the need for predetermined, prompt protective measures. These guidance updates, based on NRC analyses of parameter uncertainty and NRC staff experience with the review of EPZ methodologies, would provide simple methods to make better risk-informed EPZ determinations.

The proposed rule would reinforce the purpose of the EPZ as a planning tool and encourage the use of risk-informed protection strategies for situations that do not rely on EPZs. The proposed rule would amend 10 CFR 50.47(b)(10) by removing the word ''EPZ'' wherever it appears to ensure protection strategies are developed for the potential pathways of exposure and are not limited to a predefined zone. The proposed rule would also amend 10 CFR 50.33(g)(1), 50.47(c)(2), and 53.1109(g)(1) to state that emergency plans would need to describe such actions as are appropriate to avoid or reduce dose within and beyond the EPZ or site boundary. The EPZ concept is not limited to protective actions for the public, but applies to anyone within the EPZ, including emergency workers and onsite personnel. The proposed rule would ensure that the planning necessary to implement predetermined, prompt protective measures would be focused within the area most at-risk surrounding a nuclear power reactor, including areas within the site boundary. Consistent with the historical planning basis for the EPZ, this is an area where there is potential for acute doses or early health effects from the accidental release of radioactive material in addition to the risk of stochastic effects from radiation exposure. An EPZ may also be defined for purposes of managing the risk of stochastic effects, but the proposed rule would encourage the use of risk-informed protection strategies to make informed protective action decisions for the management of such risks, rather than rely on a predetermined, prompt response that could do more harm than benefit. The NRC proposes to clarify the requirements for use of evacuation time estimates (ETE) to inform protective action recommendations and protective action strategies to distinguish between the level of planning required for predetermined, prompt protective actions, as opposed to taking action as conditions warrant. Specifically, the proposed rule would amend the requirements in paragraphs IV.3 and IV.4 in appendix E to 10 CFR part 50 by adding the phrase, ''predetermined, prompt'' to clarify which protective action recommendations and strategies within the EPZ are informed by the ETE.

Consistent with the rationale for revision of the EPZ criteria, the proposed rule would amend 10 CFR 50.33(g)(1) and 53.1109(g)(1) by eliminating the requirement to submit response plans of State, local, and participating Tribal governmental entities. The proposed change to 10 CFR 50.33(g)(1) and 53.1109(g)(1) would require applicants to coordinate with offsite organizations with responsibilities for coping with emergencies, including State, local, and Tribal governmental agencies, as applicable. This coordination would ensure that response organizations are aware of potential radiological consequences of the facility and have been consulted on appropriate protective measures, including the extent of any EPZ. The proposed rule would require applicants to include information that describes the extent of interaction with these agencies. The NRC would not require FEMA findings and determinations on the extent of interaction between the applicant and offsite response organizations because this proposed change is not part of the FEMA review of offsite plans under FEMA's regulations in 44 CFR part 350, ''Review and Approval of State and Local Radiological Emergency Plans and Preparedness.''

The proposed rule changes to the plume exposure pathway EPZ would be consistent with Federal guidance and international standards. Section 2.2.4 of the EPA PAG Manual discusses the relation between PAGs and EPZs and states, ''The pre-designated areas for immediate protective action may be reserved for use only in the most severe incidents and in cases when the facility operator cannot provide a quick estimate of projected dose based on actual releases. For lesser incidents, or if the facility operator is able to provide prompt off-site dose projections, the area for immediate protective action may be specified at the time of the incident instead of using a pre-designated area.'' Similarly, the International Atomic Energy Agency (IAEA) Safety Standards in General Safety Requirements (GSR) No. 7, ''Preparedness and Response for a Nuclear or Radiological Emergency,'' specify use of a precautionary action zone (PAZ) for taking urgent protective actions before any significant release occurs on the basis of conditions at the facility in order to avoid or to minimize severe deterministic effects. The recommended size for the PAZ within IAEA standards is 1.9 to 3.1 miles (3 to 5 km) for reactors greater than 1000 MWt and 0.3 to 1.9 miles (0.5 to 3 km) for reactors 100 to 1000 MWt. The proposed change to 10 CFR 50.33(g), 50.47(c)(2), and 53.1109(g) would establish EPZs that remain aligned with EPA guidelines and international standards to meet the purpose of the EPZ as a planning tool for implementation of predetermined, prompt protective actions. Consistent with the PAG Manual, the zones for response could also be specified at the time of the emergency, rather than predesignated.

The proposed rule would add new 10 CFR 50.47(g), 50.160(c)(3), and 53.855(c) to allow a licensee to submit a license amendment to change its plume exposure pathway EPZ. The proposed rule would require the change to be agreed on by the applicable State, local, and Tribal governmental authorities before submission to the NRC. The FEMA REP Program Manual provides a process for offsite response organizations to follow for changes to the EPZ boundary in accordance with FEMA regulations in 44 CFR 350.14.

Consistent with the 2023 EP final rule, the proposed rule would remove

the requirement to define an ingestion pathway EPZ. The proposed rule would remove reference to the ingestion pathway EPZ in 10 CFR 50.33(g)(1) and 53.1109(g)(1), 50.47(b)(10), 50.47(c)(2), and paragraph IV.F.2.a.(i) and footnote 1 of appendix E to 10 CFR part 50. In lieu of a defined zone, the proposed rule would amend 10 CFR 50.33(g)(1), 50.47(c)(2), and 53.1109(g)(1) to require emergency plans to describe such actions as are appropriate to protect the ingestion pathway. The capabilities described in the emergency plan would need to address major exposure pathways associated with the ingestion of contaminated food and water. The duration of any exposure to contaminated food or water could range from weeks to months and represents a long-term response need. The current 50-mile ingestion pathway EPZ is based on the planning assumptions in NUREG–0396 and does not reflect technology advancements and modern response capabilities for interdicting to prevent ingestion of contaminated food and water, such as the use of Geographic Information System (GIS) tools and unmanned aerial vehicles for monitoring.

Currently, paragraph IV.E.8.b of appendix E to 10 CFR part 50 requires the licensee's emergency operation facility (EOF) to be located between 10 miles and 25 miles of the nuclear power reactor site(s), or a primary facility located less than 10 miles from the nuclear power reactor site(s) and a backup facility located between 10 miles and 25 miles of the nuclear power reactor site. The 10 miles is based on the current 10-mile EPZ requirement and does not account for scalable EPZs under current and proposed 10 CFR 50.33(g) and 53.1109(g). The proposed rule would amend paragraph IV.E.8.b of appendix E to 10 CFR part 50 to specify the location of the emergency operations facility in relation to the EPZ boundary. The proposed rule would not change the requirement for a licensee to request Commission approval to locate an EOF more than 25 miles from a nuclear power reactor site.

C. Eliminating Redundant Requirements

(i) Preliminary Emergency Plans

The NRC proposes to eliminate the requirements for applicants to submit preliminary plans for coping with emergencies because these submittals do not significantly enhance licensing efficiency. Many details of the emergency plan depend on conditions of the as-built facility and site-specific parameters, including agreements with offsite emergency response organizations. These details are often not available early in the licensing process. The NRC reviewed the content of CPs and ESPs and found that the level of information contained in the associated preliminary emergency plans or major features of emergency plans was very limited, often nothing more than a general structure and placeholder for more detailed information. The proposed rule would eliminate 10 CFR 50.34(a)(10) and 53.1309(a)(4) that require applicants to submit the preliminary plans for coping with emergencies as part of the preliminary safety analysis report for a CP application. The proposed change would reduce the burden on applicants to provide preliminary plans of limited benefit in licensing. The proposed rule would not change 10 CFR 52.17(b)(2)(i) because applicants may choose not to submit major features of the emergency plan in the ESP site safety analysis report if such details are not available. Instead, the NRC encourages applicants to engage the NRC in pre-application activities in preparation for submission of emergency plans as part of the FSAR or in preparation for submission of major features of the emergency plan as part of the ESP site safety analysis report. As a conforming change, the proposed rule would amend paragraphs I.1 and I.2 of appendix E to 10 CFR part 50 to remove the requirements to submit emergency plan information in the preliminary safety analysis report and would eliminate section II, ''The Preliminary Safety Analysis Report,'' of appendix E to 10 CFR part 50. Many of the elements in section II of appendix E to 10 CFR part 50 are redundant to other criteria or would be considered as part of the development of emergency plans in coordination with offsite response organizations under proposed 10 CFR 50.33(g) and 53.1109(g).

(ii) Independent Program Element Reviews

The proposed rule would amend 10 CFR 50.54(t) and 53.1565(d)(3)(vii) to eliminate the requirement for licensees to ensure that all program elements are reviewed by people who have no direct responsibility for implementation of the EP program. Since the implementation of this regulation, the NRC's oversight program has evolved such that this regulation is redundant to the NRC Reactor Oversight Program and adds no additional oversight benefit to the EP program. However, the proposed rule would retain the requirement in 10 CFR 50.54(t)(2) and 53.1565(d)(3)(vii)(B) for an annual review of the interface between licensee and offsite response organizations to ensure the adequacy of the interface with State and local governments.

(iii) Evacuation Time Estimate Updates

The NRC is proposing to eliminate requirements related to updates of the ETE that have limited utility in ensuring effective implementation of protective action recommendations. The proposed rule would eliminate the requirement to estimate EPZ permanent resident population changes during the years between decennial censuses and to update the ETE based on the criteria of paragraphs IV.5 and IV.6 of appendix E to 10 CFR part 50. This proposed change is based, in part, on an analysis of the limited number of licensees over the past decennial periods that met the criteria to perform the ETE update and an analysis of the impact of updated ETEs on protective action strategies, following the guidance in Supplement 3, ''Guidance for Protective Action Strategies,'' to NUREG–0654/FEMA–REP–1. Decennial ETE updates include sensitivity analyses that provide the expected change to the ETE as the permanent resident population changes. In addition, section 5.4.1, ''Extreme Conditions,'' of NUREG/CR–7002, ''Criteria for Development of Evacuation Time Estimate Studies,'' Revision 1, contains guidance for updating the ETE if conditions within the EPZ change significantly. The NRC has determined that the sensitivity analyses and the ETE guidance would ensure that ETEs remain adequate for use in protective action recommendations and in developing offsite protective action strategies in the years between decennial censuses. For similar reasons, a review of changes in the EPZ population under paragraph IV.7 of appendix E to 10 CFR part 50 would not be required for parts 52 and 53 licensees. As such, the proposed rule would eliminate paragraphs IV.5, IV.6, and IV.7 of appendix E to 10 CFR part 50.

(iv) Periodic Communication Tests With NRC

The proposed rule would eliminate the requirement to test each NRC Regional Office Operations Center under paragraph IV.E.9.d of appendix E to 10 CFR part 50. A monthly test between each licensee and the appropriate Regional Office Operations Center would not be required because the regional Operations Centers are not typically staffed by the NRC unless it is warranted by the escalation of an emergency event. Monthly testing of communication between the licensee's primary response location and the NRC

Headquarters Operations Center would be sufficient.

D. Risk-Informing the Emergency Plan Change Process

The NRC proposes to revise and risk-inform the emergency plan change process in 10 CFR 50.54(q) and 53.1565(d)(3) regarding which proposed changes would need to receive prior approval from the NRC. Licensees would be required to evaluate a reduction in effectiveness for only changes to the emergency plan involving risk-significant planning standards. Under the proposed rule, the licensee would analyze changes related to the other planning standards and applicable requirements in appendix E to 10 CFR part 50, or 10 CFR 50.160 only to ensure they continue to meet the regulatory requirements.

The proposed rule would add new 10 CFR 50.54(q)(1)(v) and 53.1565(d)(3)(i)(E) to define risk-significant planning standards as those providing the most essential functions of EP to ensure adequate protective measures are taken to protect the public in the event of a radiological emergency, including classification, notification, assessment, and protective actions. The proposed definition would also include the standards for providing adequate staffing and facilities as risk-significant for the purposes of evaluating changes to the emergency plan as these standards have a direct impact on the ability to effectively implement the risk-significant planning standards. The proposed definition would apply to the standards of 10 CFR 50.160 or 50.47 and applicable requirements in appendix E to 10 CFR part 50.

Consistent with the proposed changes to allow licensees the option to comply with either the requirements in appendix E to 10 CFR part 50 and, for nuclear power reactor licensees, the planning standards of 10 CFR 50.47(b), or the requirements in 10 CFR 50.160, the proposed rule would combine 10 CFR 50.54(q)(2)(i) and (ii) into a single paragraph (q)(2) and would revise (q)(3)(i) and (ii) for the evaluation of changes to the emergency plan. The proposed rule would similarly combine 10 CFR 53.1595(d)(3)(ii)(A) and (B) and revise 10 CFR 53.1595(d)(3)(iii).

XXV. Background—Optional Submittal of Operational Programs

For several years, stakeholders have expressed growing interest in the rapid, widespread deployment of reactors of a standard design (*e.g.,* July 31, 2024, letter from NEI to the NRC, ''Regulation of Rapid High-Volume Deployable Reactors in Remote Applications (RHDRA) and Other Advanced Reactors,'' followed by a July 14, 2025, supplement to that letter). At the same time, the NRC staff developed strategies to provide for the predictable and efficient licensing and regulation of microreactors that would use standard designs. The staff sought Commission approval for some of these proposals in SECY–24–0008, ''Micro-Reactor Licensing and Deployment Considerations: Fuel Loading and Operational Testing at a Factory,'' dated January 24, 2024, and SECY–25–0052, ''Nth-of-a-Kind Microreactor Licensing and Deployment Consideration,'' dated June 18, 2025. The latter paper recommended a change in Commission policy to allow the NRC to review, approve, and afford finality to, as appropriate, standard operational programs submitted to the NRC in connection with a design certification or ML application. These agency actions would support the rapid licensing and high-volume deployment of new microreactors and other low consequence reactors and the direction in E.O. 14300 to adopt shorter timeframes tailored to particular licensing pathways.

The Commission approved the staff's recommendations in SRM–SECY–0008, ''Staff Requirements—SECY–24–0008—Micro-Reactor Licensing and Deployment Considerations: Fuel Loading and Operational Testing at a Factory,'' dated June 17, 2025, and SRM–SECY–25–0052, ''Staff Requirements—SECY–25–0052—Nth-of-a-Kind Microreactor Licensing and Deployment Consideration,'' dated November 13, 2025. The NRC included many of these proposals, including the proposal to allow an ML applicant to include standard operational program information in its application, in the ''Licensing Requirements for Microreactors and Other Reactors With Comparable Risk Profiles'' proposed rule (91 FR 23628; May 1, 2026). The NRC is proposing conforming changes to 10 CFR parts 52 and 53 in this rulemaking to allow microreactor and other developers the option to submit essentially complete programmatic controls, operational programs, or operational requirements with an ML application under 10 CFR part 52 or 53.

XXVI. Discussion—Optional Submittal of Operational Programs

The NRC proposes to modify 10 CFR 52.158, ''Contents of application; additional technical information,'' to allow ML applicants the option to submit essentially complete operational program information with their applications and 10 CFR 52.171, ''Finality of manufacturing license; information requests,'' to provide finality to such program information that is reviewed and approved by the NRC as part of the ML review. As stated in proposed 10 CFR 52.158(c), this optional program information would be submitted ''to satisfy requirements for license applications that may reference a manufacturing license,'' and this program information submitted with the ML application would be assessed against the pertinent requirements for these other license applications.

The appropriate change control mechanism for changes to this information by an ML holder would be established through the issuance of the ML. Under current regulations, the change control requirements in 10 CFR 52.171(b)(1) for changes sought by the holder of an ML apply to design information, not operational program information. Elsewhere in this proposed rule, the NRC proposes to modify 10 CFR 52.171(b)(1), but as modified, the change control provision would apply to information in the FSAR submitted under 10 CFR 52.157 and not to non-FSAR information submitted under 10 CFR 52.158. Moreover, the change control process in proposed 10 CFR 52.171(b)(1) relies on the change control criteria in 10 CFR 50.59, whereas some operational programs are subject to other change control provisions (*e.g.,* 10 CFR 50.54(a), (p), and (q)). Therefore, the NRC would establish the appropriate change control process for the optionally submitted operational program information as part of issuing the ML.

An applicant or licensee who references or uses a nuclear power reactor manufactured under an ML who wishes to depart from or omit (in whole or part) the optional operational program information approved in the ML would not be subject to the process in 10 CFR 52.171(b)(2) because this optional operational program information would not constitute design characteristics, site parameters, terms and conditions, or approved design information subject to 10 CFR 52.171(b)(2). Departures from, or omissions of, the optional operational program information approved in the ML would be reviewed in accordance with the applicable operational program requirements for the license being applied for (*e.g.,* OL or COL).

This proposed change would enhance regulatory certainty and expedite review timelines for CP/OL and COL applicants wishing to reference operational programs approved with an ML but would still allow flexibility for these applicants to submit their own

programs. There would be no additional obligations imposed on license applicants as this would be optional information for a developer to provide and optional for a CP/OL or COL applicant to reference. Additionally, the hearing opportunity provided as part of the ML review process would allow for public engagement on the program information included in the ML application. For licensing efficiency, agreement on operational programs being considered to be essentially complete could be achieved between the NRC and applicants through pre-application interactions.

The NRC is proposing a similar change to 10 CFR part 53 to allow for the optional submittal with the ML application of operational program information not material to the design. The NRC is proposing to modify 10 CFR 53.1282, ''Contents of applications for manufacturing licenses; other application content,'' to allow for the submittal of such program information and 10 CFR 53.1288, ''Finality of manufacturing licenses,'' to provide finality to the information that would be reviewed and approved by the NRC.

XXVII. Background—Early Site Permit for Nuclear Power Plants

Section 5(i) of E.O. 14300 directs the NRC to ''[r]econsider the regulations governing the time period for which a renewed license remains effective, and extend that period as appropriate based on available technological and safety data.'' In response, the NRC is proposing to amend its regulations to remove the ESP fixed term requirement.

The NRC issued 10 CFR part 52 on April 18, 1989 (54 FR 15372), to provide procedures for the early resolution of safety and environmental issues in commercial power reactor licensing proceedings and to provide for the standardization of the design of nuclear power plants. To further those ends, the Commission issued 10 CFR part 52 to add alternative licensing processes for early site permits (ESP), standard design certifications, and COLs. These alternatives in 10 CFR part 52 were in addition to the two-step licensing process that already existed in 10 CFR part 50. The processes in 10 CFR part 52 allow for resolving safety and environmental issues early in licensing proceedings, which would result in regulatory stability, and were intended to enhance the safety and reliability of nuclear power plants through standardization. Part 53 of 10 CFR also provides for ESPs.

In particular, ESPs provide a process for applicants to resolve the majority of site-specific safety and environmental issues prior to applying for a CP or COL. Subsequent to promulgating 10 CFR part 52, the NRC has issued six ESPs,—the Exelon Generation Company, LLC ESP Site, ESP–001, March 15, 2007; System Energy Resources, Inc., Grand Gulf ESP Site, ESP–002, April 5, 2007; Dominion Nuclear North Anna, LLC, North Anna ESP Site, ESP–003, November 27, 2007; Southern Nuclear Operating Company Vogtle Electric Generating Plant ESP Site, ESP–004, August 26, 2009; PSEG Power, LLC and PSEG Nuclear, LLC PSEG Site Early Site Permit, ESP–005, May 5, 2016; and Tennessee Valley Authority, Clinch River Nuclear Site Early Site Permit, ESP–006, December 19, 2019.

XXVIII. Discussion—Early Site Permit for Nuclear Power Plants

Under the current regulations in 10 CFR 52.26, ''Duration of permit,'' the NRC may issue an ESP with a term no longer than 20 years. Upon the elapse of 20 years, the ESP expires, but an ESP holder has the option to renew it for an additional term under current 10 CFR 52.29, ''Application for amendment to update an early site permit.'' The term for an ESP is similarly limited in 10 CFR 53.1164, ''Duration of permit.''

This proposed rule would remove the requirement in 10 CFR 52.26 and 53.1164 for an ESP to include a fixed term. Because each ESP would be issued without a fixed term, renewal would no longer be needed. Nonetheless, the revised regulations in 10 CFR 52.29 would provide an option by which an ESP holder may choose to update its ESP, which could maintain the preclusive effect of the ESP if the ESP is referenced in a COL or CP application. The proposed rule would similarly revise 10 CFR 53.1173, ''Application for renewal.'' The requirements specific to renewal at 10 CFR 52.33, ''Duration of renewal,'' and 10 CFR 53.1179, ''Duration of renewal,'' would be removed and reserved.

As noted in the 1989 10 CFR part 52 final rule, the ESP provides for early resolution of site-related issues, making possible the ''banking'' of the site, to enable more efficient licensing of a future nuclear power plant. The current rule mandates renewal of the ESP at a set point in time, not to exceed 20 years after issuance, and therefore requires the holder of the ESP to undertake updating the ESP to retain the benefits of issue finality. However, there are a number of factors that may influence the time that elapses between NRC's issuance of an ESP and a determination by the ESP holder to reference the ESP in a CP or COL application. Indeed, two of the issued ESPs are nearing 20 years since issuance without having been referenced in a CP or COL application. Therefore, this maximum 20-year duration of an ESP and the associated renewal requirement may artificially constrain the ESP holder's development planning because the renewal-requirement lacks a direct linkage to either a change in the ESP identified by the holder or the holder's plans to reference the ESP in a CP or COL application.

By removing the fixed term duration and providing a process for the permit holder to update the ESP through an amendment, the proposed rule would provide permit holders with flexibility to retain the site as ''banked,'' rather than referencing the ESP in a CP or COL application in a shorter time frame, and determine when or if the ESP will be updated. Removing the fixed term, however, would necessitate a change to the finality provisions in 10 CFR 52.39, ''Finality of early site permit determinations,'' to provide clarity regarding the limited duration of finality for site-specific characteristics of the initial ESP application and to account for stale environmental evaluations. Accordingly, the proposed rule would establish a 20-year timeframe for information in the ESP to retain finality, which would account for the limited time for which site data remains valid and the potential for environmental evaluations to become stale. The proposed rule would similarly revise 10 CFR 53.1188, ''Finality of early site permit determinations.''

The proposed 20-year timeframe would provide a boundary for both preparing a CP or COL application that references an ESP and NRC review, to avoid the level of uncertainty that would exist with providing analyses without a fixed term. However, ESP holders would have the option to update the information in the ESP to refresh the site data and environmental evaluations and thereby extend the 20-year timeframe at their discretion. Thus, when developing an ESP application, applicants for future ESPs should consider the 20-year expected duration for potentially time sensitive information, such as seismic, meteorological, hydrologic, and geologic characteristics; the presence of nearby facilities such as industrial, military, or transportation; the population profile; and environmental data and evaluations.

Under this proposed rule, the ESP holder may choose to update the ESP by submitting an amendment to update the potentially time sensitive information, which would provide an additional 20 years of finality for the updated safety

and environmental information if the NRC grants the amendment. Alternatively, an ESP holder could forgo finality and address those issues directly in a CP or COL application that references the ESP. The request for amendment of the ESP could be made by the ESP holder at any time. Unlike the current regulatory framework, where information must be updated prior to expiration of the ESP at year 20 through renewal to maintain issue resolution, the proposed changes would enable the ESP holder to retain the ESP for as long as desired and identify needed updates only when and if the holder determines the update would be advantageous to support a future CP or COL application. The proposed rule would allow the ESP holder to submit an amendment to update the time-sensitive information and request an extension for an already extended permit, providing flexibility for the ESP holder to update the ESP at such time and as many times as needed. To support the removal of a fixed term, a provision would be added to enable the ESP holder to request termination of an ESP at any time, with consideration for the status of any required redress for authorized activities. The changes would enhance flexibility for the ESP holder and reduce the effort associated with ESP renewal at year 20. NRC resources, likewise, would not be expended for review of ESP renewal applications. To be sure, some portions of an ESP, such as design parameters specified in the permit, are not time-sensitive and would continue in effect unless the ESP holder seeks to amend them or an applicant for a CP or COL referencing the ESP proposes to change them.

This proposed rule would remove and reserve paragraph (c) of 10 CFR 2.109, ''Effect of timely renewal application,'' which provides for timely renewal of the ESP.

This proposed rule would revise 10 CFR 52.15, ''Filing of applications,'' to remove the reference to ''renewal'' and replace it with ''amendment,'' reflecting that the permit would be issued with no fixed term and would not expire.

This proposed rule would revise 10 CFR 52.18, ''Standards for review of applications,'' to clarify its applicability to the initial issuance of the ESP. This proposed rule would revise 10 CFR 52.25, ''Extent of activities permitted,'' to remove the reference to the duration of the permit, reflecting that an ESP would no longer have a fixed term. The requirement for an ESP to remain in effect for site redress by the ESP holder if any activities authorized by 10 CFR 52.24(c) are performed would be unchanged. The proposed rule would similarly revise 10 CFR 53.1161, ''Extent of activities permitted.''

This proposed rule would revise 10 CFR 52.26(a) to remove the current duration, identifying that the permit would be issued with no fixed duration. The proposed rule would similarly revise 10 CFR 53.1164. Removal of the expiration date from the ESP would enable the permit holder to retain the site as banked until such time as either the permit is subsumed into another application or a decision is made to terminate the ESP. Because some site-specific characteristics are potentially time dependent, 10 CFR 52.39 and 53.1188 would limit finality for safety issues to 20 years from issuance of the ESP or an amendment to update the information for those items. Finality for environmental issues would also be limited to 20 years from issuance of the ESP or an amendment. Because the ESP would be issued with no fixed term, this proposed rule would revise 10 CFR 52.35, ''Use of site for other purposes,'' to provide a provision for the permit holder to request termination and to ensure the ESP holder identifies site redress activities to the Commission as part of the termination request. The ESP would not be terminated until site redress activities have been performed in accordance with 10 CFR 52.25. Termination of the ESP would not preclude the same or another applicant from submitting another application for an ESP or another license for the same site at a future time. The proposed rule would similarly revise 10 CFR 53.1182, ''Use of site for other purposes.''

This proposed rule would rename 10 CFR 52.29 and 53.1173 to, ''Application for amendment to update an early site permit,'' and revise these sections to provide the requirements for submitting an amendment. Following NRC review and completion of the hearing process, issuance of the amended ESP would extend finality for future use of the ESP for reference in a CP or COL application. The specific information limited to a 20-year duration for finality would be specified in 10 CFR 52.39 and 53.1188.

This proposed rule would rename 10 CFR 52.31, ''Criteria for renewal,'' as ''Issuance of amendment to update an early site permit,'' and revise it to include specific provisions for the Commission's issuance of an amended ESP. An application for amendment would be reviewed against similar criteria to that previously identified for renewal, which reflect the AEA, the Commission's regulations, and orders applicable and in effect at the time the ESP was originally issued. New requirements to be imposed during the amendment would be limited to those necessary for adequate protection to public health and safety or common defense and security. Additionally, for the purpose of site characteristic data and environmental data and evaluations which may be time dependent, the proposed rule would limit finality for those issues to 20 years while providing flexibility for the ESP holder to update that information through an amendment at any time. Therefore, the NRC's review of those potentially time-dependent characteristics would encompass the 20-year timeframe that aligns with the finality that would be afforded to that information. The proposed rule would similarly revise 10 CFR 53.1176, ''Criteria for renewal,'' and rename it as, ''Issuance of amendment to update an early site permit.''

This proposed rule would revise 10 CFR 52.39 to remove reference to a renewed ESP and replace it with an amended ESP. The site characteristic data on which an ESP is based, however, is valid for only a limited duration. Accordingly, the finality provisions in 10 CFR 52.39 would be revised to reflect that an ESP does not resolve siting issues in 10 CFR part 100, ''Reactor Site Criteria,'' specifically including site characteristics in the ESP, in a proceeding on a referencing application submitted more than 20 years after the date of issuance of the ESP or the date of an update to the ESP in which a matter has been resolved, whichever is later. This revised provision would not affect the finality of the source term included in the ESP. The duration limitation on finality of safety issues would be updated by revising 10 CFR 52.39(c)(1)(v) and finality of environmental issues would be updated by revising 10 CFR 52.39(c)(1)(vi). The proposed rule would similarly revise 10 CFR 53.1188.

The new provisions in 10 CFR 52.29 would provide for amendments to update ESPs in paragraph (e) of 10 CFR 52.39. The proposed rule would similarly revise 10 CFR 53.1188(e) to add 10 CFR 53.1173 as a requirement.

This proposed rule would amend 10 CFR 52.79 by redesignating paragraphs (b)(3) through (5) as paragraphs (b)(4) through (6) and revising paragraph (3) to add a requirement for a referencing COL application to confirm whether the potentially time-dependent site characteristics were updated in the ESP within the 20 years prior to filing the COL application and thus resolved under 10 CFR 52.39. If not, the COL applicant would need to evaluate and update that information in the FSAR. The information to be evaluated would be that information in the site safety analysis report required by paragraphs

10 CFR 52.17(a)(1)(vi) through (ix), which includes seismic, meteorological, hydrologic, and geologic characteristics; the presence of nearby facilities such as industrial, military, or transportation; and the population profile. The safety assessment based on these characteristics would also require evaluation and update, except that the referencing COL application would not need to update the postulated source term stated in the ESP if it fell within the source term derived from the design. If the postulated source term stated in the ESP did not fall within the source term derived from the design, then the referencing application would need to propose a variance from the ESP in accordance with 10 CFR 52.39 and 10 CFR 52.93. The proposed rule would similarly revise 10 CFR 53.1416.

This provision parallels the requirement in 10 CFR 52.39 and 53.1188 that specifies the 20-year limitation for finality on this type of potentially time-dependent information and recognizes that the holder of an ESP may choose not to update the ESP to retain finality once the ESP is 20 years past issuance. Together, the proposed revised provisions of 10 CFR 52.39 and 52.79, as well as 10 CFR 53.1188 and 53.1416, would provide flexibility for an ESP holder to determine when and what information to update while retaining the ESP for reference until such time as the holder chooses to terminate, and for a referencing COL applicant to have clarity regarding which aspects of the ESP would need to be evaluated and updated in the FSAR submitted as part of the application.

XXIX. Background—Manufacturing License Term Extension

Section 5(i) of E.O. 14300 directs the NRC to ''[r]econsider the regulations governing the time period for which a renewed license remains effective, and extend that period as appropriate based on available technological and safety data.'' In response, the NRC is proposing to amend its regulations to extend the term for initial issuance and the renewal of an ML to enhance the NRC's regulatory effectiveness and efficiency in implementing its licensing and approval processes. This change would align the term of MLs with the current term of design certifications.

On August 28, 2007, the NRC revised the provisions applicable to the licensing and approval processes for nuclear power plants with the final rule, ''Licenses, Certifications, and Approvals for Nuclear Power Plants'' (72 FR 49352). In that final rule, a new subpart F, ''Manufacturing Licenses,'' of 10 CFR part 52 replaced former appendix M of 10 CFR parts 50 and 52 that previously governed MLs. Under subpart F, an ML would be issued upon the submission of an acceptable final reactor design, equivalent to that required for a design certification under 10 CFR part 52, and certain information on the manufacturing process. The term for an ML was set to be for not less than 5, nor more than 15 years from the date of issuance, and was established to be consistent with the maximum term for a standard design certification in 2007. The Commission's stated intent was ''to encourage the use of a manufacturing license for the manufacture of more than one nuclear power reactor.'' However, no ML has been issued under subpart F of 10 CFR part 52.

In the July 2, 2025, direct final rule, ''Revising the Duration of Design Certifications'' (90 FR 28869), the NRC replaced the 15-year duration for design certifications with a 40-year duration period, both for certifications currently in effect and generically for future certifications, including renewals. As explained in that direct final rule, extending the term of design certifications reduces unnecessary regulatory burden on applicants and saves NRC resources without any reduction in safety or security.

XXX. Discussion—Manufacturing License Term Extension

The proposed amendments to the regulations in 10 CFR 52.173, ''Duration of manufacturing license,'' and 52.181, ''Duration of renewal,'' would change the duration of an ML to a maximum of 40 years and the duration of the renewed ML to a maximum of 40 years. The minimum terms of initial and renewed MLs would remain at 5 years. Amending the regulations to extend the term of an ML would make the duration of the ML consistent with the current durations of design certifications. The current landscape for nuclear power reactors designs, which encompasses potential microreactors and small modular reactors in addition to traditional large LWRs, may significantly benefit from the regulatory stability afforded by a longer ML term. This proposed change would allow ML holders to significantly decrease the burden associated with license renewal as the frequency of renewals would decrease. No other impact on licensees or other stakeholders is expected.

The NRC proposes to align the maximum term for an ML with the maximum term for a design certification because of the similarities between the scope of the two approvals. Most of the required information for an ML pertains to the same final design information required for a design certification. While part of an ML application pertains to organizational and QA information on manufacturing activities, this information is similar in kind to the organizational and QA information required for reactor COLs, which are also subject to a 40-year license term. Finally, consistent with the explanation provided by the NRC when it extended the term of a design certification to 40 years, the proposed extension to the term of MLs would not lead to any reduction in safety or security. If a safety or security issue is discovered during the term of an ML, the issue finality provisions in 10 CFR 52.171 allow the NRC to impose requirements to address the issue, as well as allow the holder of an ML or the applicant or licensee who references or uses a nuclear power reactor manufactured under an ML to seek a change to address the issue.

XXXI. Background—Nuclear Power Plant License Renewal

Section 5(i) of E.O. 14300 directs the NRC to ''[r]econsider the regulations governing the time period for which a renewed license remains effective, and extend that period as appropriate based on available technological and safety data.'' Also, as set forth in section 2 of the E.O., it is the policy of the United States to facilitate appropriate operational extensions of the current nuclear fleet. In response, the NRC is proposing to make several amendments to its nuclear power reactor license renewal regulations.

The NRC first issued the license renewal rule (10 CFR part 54) on December 13, 1991 (56 FR 64943) and later revised it on May 8, 1995 (60 FR 22461). The rule establishes the procedures, criteria, and standards governing the renewal of nuclear power plant OLs. It also references the environmental protection requirements in 10 CFR part 51 for the evaluation of the environmental effects of the extended plant operation.

Since publishing the 1995 rule, the NRC has issued renewed licenses for nearly all currently operating plants, extending their operation from 40 to 60 years. The NRC has also issued second, subsequent renewed licenses for several plants, allowing them to operate for up to 80 years. Based on the experience gained through these renewals, the NRC has identified several opportunities to revise the regulations to make the process more flexible, efficient, and better able to support operational extensions.

XXXII. Discussion—Nuclear Power Plant License Renewal

This rulemaking proposes revising requirements in the following areas:

A. Extension of the Renewal Time Period

When the NRC issued the 1991 license renewal rule, it noted that the 40-year limit on licenses in section 103 of the AEA was not based on safety or security reasons; rather, it ''was adopted for antitrust and financial reasons'' (56 FR 64960; December 13, 1991). Section 103 of the AEA also provides that OLs may be renewed. However, the NRC noted that, because existing plants were licensed for 40-year periods, some aging-related issues expected to arise beyond 40 years of operation may not have been fully considered. (Id. at 64946, 64954). Therefore, while the NRC determined that there was no reason to assess all aspects of a plant's licensing basis during license renewal, the NRC should ensure that aging will be effectively managed during the period of extended operation. Moreover, this aging management does not ensure that a plant will operate until the end of its period of extended operation; rather it ensures that aging-related degradation will be identified and addressed before it becomes a safety issue.

The current regulation in 10 CFR 54.31(b) limits a renewed license to no more than 20 years beyond the existing license expiration. The NRC explained that the intent of the 20-year limit was to provide ''a useful opportunity to validate and reassess, if necessary, the current understanding of age-related degradation effects.'' (Id. at 64964). At that time, the NRC also noted that it might revisit the limit once additional experience is acquired and the NRC gains confidence in licensee programs that manage age-related degradation.

The NRC has examined its experience with aging management and in light of that experience is proposing to revise 10 CFR 54.31(b) to extend the maximum renewal term to 40 years, consistent with the maximum license period in section 103 of the AEA. Most U.S. reactors are already operating beyond 40 years under renewed licenses and are following their approved aging management programs. The NRC's oversight has confirmed that licensees are effectively detecting and resolving aging issues in a timely manner. The NRC has not identified any fundamental gaps in the understanding of aging that licensees have not been able to adequately address through the current renewal process or other existing regulatory processes.

The NRC has long recognized that issuing a renewed license for a full 40-year term is legally consistent with the terms of the AEA. When the NRC issued the 1991 rule, it considered two approaches to renewing licenses: (1) a ''tack-on'' license, which would take effect at the end of the current OL term, and (2) a ''supersession'' license, which would be immediately effective upon renewal and would add a number of years, at the time up to 20, to the existing license. The NRC chose to use the supersession approach. At that time, the NRC also noted that future efforts to extend the 20-year limit closer to the 40-year maximum would require a reappraisal of the use of supersession licensing. The supersession license approach that the Commission currently uses never results in a license greater than 40 years because the renewal term is 20 years and licensees currently may not apply for renewal until there are 20 years or less remaining on the license. In contrast, a renewed license that includes any number of years remaining on the existing license plus a 40-year extension would necessarily extend the term of the renewed license past the limit in section 103 of the AEA. Therefore, the NRC concludes that granting a 40-year extension would require the use of a tack-on license. Moreover, as the NRC noted when it initially promulgated its license renewal rules, a tack-on license may be more compatible with the terms of the AEA that state that licenses ''may be renewed upon the expiration'' of the license term. (Id. at 64964).

Maintaining a tack-on license may require additional administrative steps, particularly if it is issued well before the beginning of the period of extended operation. Therefore, these amendments to 10 CFR part 54 would also include a requirement that the licensee take steps to ensure the renewed license remains up to date, consistent with the current licensing basis as defined in 10 CFR 54.3, prior to the period of extended operation. Also, currently, certain activities are implemented prior to the period of extended operation in accordance with the conditions of the renewed license that is immediately in effect upon issuance, such as implementing new aging management programs and enhancing existing programs. The NRC's oversight program verifies that these activities are completed, including taking advantage of the plant's refueling outage prior to the period of extended operation to observe licensee activities that take place at reduced power levels. The NRC is considering alternative means of conditioning these activities, given that a tack-on license would not be in effect until the start of the period of extended operation, and the NRC is seeking the public's input on this topic.

With the change to a longer renewal term, applicants may need to address potential gaps in the current safety and environmental review guidance until the guidance is updated. For example, the current revision of NUREG–2191, ''Generic Aging Lessons Learned for Subsequent License Renewal (GALL–SLR) Report,'' was based on evaluations of up to one term of subsequent license renewal under the current regulation, or 80 total years of plant operation. Likewise, NRC regulations at subpart A of appendix B to 10 CFR part 51 codify the conclusions of NUREG–1437, ''Generic Environmental Impact Statement for License Renewal of Nuclear Plants,'' (LR GEIS) for one initial term of renewal and one term of subsequent renewal. However, the NRC staff noted in SECY–22–0109, ''Proposed Rule: Renewing Nuclear Power Plant Operating Licenses—Environmental Review,'' dated December 6, 2022, that, when it provided the draft LR GEIS to the Commission, the underlying analysis of environmental issues in that document ''could apply to any license renewal term,'' even one beyond the first subsequent license renewal term.

However, with the proposed change to allow license extensions of 40 years, plants currently operating in their initial renewal period (40 to 60 years) could apply for a 40-year subsequent renewal that would bring the plant to a total of 100 years of operation. Similarly, licensees that will be operating in their approved subsequent renewal period (60 to 80 years under existing regulations) could apply for a third 40-year renewal that would bring the plant to a total of 120 years of operation. As a result, applicants seeking to operate beyond 80 years would need to consider whether to supplement the guidance to address any aging and environmental effects specific to the longer operating life. No such gap analysis would be needed for applicants for an initial renewal, extending operation from 40 to 80 years, as the current subsequent renewal guidance readily applies to 80 total years of plant operation. For environmental effects, because the analysis in the LR GEIS is term neutral, licensees could consider using the LR GEIS as a starting point for that environmental analysis (although for environmental impacts past year 80, that analysis is not codified in 10 CFR part 51). The NRC has prepared draft

interim staff guidance, LR–ISG–2026–01, ''Updated Review Criteria for License Renewal,'' on this topic as part of this rulemaking. The NRC is also seeking the public's input on this topic.

B. Alternative Risk-Informed and Performance-Based Criteria

The current license renewal rule is often described as a deterministic rule because it prescribes the specific structures and components whose function must be demonstrated to be maintained. Under 10 CFR 54.21(a)(1), in-scope structures and components are included in the aging management review if they perform their function without moving parts or without a change in configuration or properties (*i.e.,* they are ''passive'') and if they are long-lived. In addition, 10 CFR 54.21(a)(3) requires applicants to demonstrate that the effects of aging will be adequately managed so that intended function(s) will be maintained for ''each structure and component identified in'' 10 CFR 54.21(a)(1). These regulations do not explicitly allow applicants to use risk insights to weigh the importance of the need to evaluate aging for license renewal.

When the NRC issued the 1995 license renewal rule, it considered allowing risk-informed methods, specifically PRA. The NRC decided against it due to concerns about the quality of risk data and models at that time. However, in SRM–SECY–98–144, ''Staff Requirements—SECY–98–144—White Paper on Risk Informed and Performance-Based Regulation,'' dated March 1, 1999, the Commission defined its expectations for risk-informed and performance-based regulation. Since then, the agency has encouraged the use of such approaches to improve regulatory decision-making, enhance safety, and reduce unnecessary regulatory burden. There has since been widescale adoption of risk initiatives such as 10 CFR 50.69 and risk-informed technical specification completion times and surveillance frequencies that require PRAs to have a high level of acceptability. Since 1995, PRA standards have matured, data collection has improved, and NRC reviews of these activities have strengthened.

As a result, the NRC is proposing to add 10 CFR 54.21(a)(4) to allow applicants to voluntarily propose risk-informed and performance-based alternatives to the current prescriptive requirements of the aging management review. Applicants could use these alternative criteria to decide which structures and components need an aging management review and how to show that aging effects will be managed. Similarly, the NRC is also proposing to revise 10 CFR 54.29, ''Standards for issuance of a renewed license,'' to clarify that the NRC's safety finding could rely on risk insights in assessing the adequacy of an applicant's actions, or lack thereof, to maintain the functionality of structures and components.

The purpose of the license renewal rule is to ensure the preservation of intended functions during long-term operations for which the understanding of aging is more limited. The NRC focused the aging management requirements on passive structures and components because they generally lack performance and condition indicators that can be easily monitored. Although operating experience shows that passive components are typically more reliable than active ones, and PRA often assigns them a low contribution to plant risk, this does not guarantee their future performance over extended operating periods. New degradation mechanisms may emerge, existing mechanisms may progress faster than expected, or safety margins may be reduced. In addition, common cause aging issues that impact overall system function may emerge.

For these reasons, alternative risk-informed or performance-based criteria could not inappropriately weaken the capability of aging management programs to preserve intended functions over long-term operations. These criteria could not be used to eliminate aging management review requirements solely because past operating experience suggests passive structures and components are reliable. The criteria would need to be applied carefully to preserve the intent of 10 CFR part 54. The NRC has prepared draft interim staff guidance, LR–ISG–2026–01, ''Updated Review Criteria for License Renewal,'' on this topic as part of this rulemaking.

C. Eliminate the Limitation on Early Application Submittal

The current regulation in 10 CFR 54.17(c) states that a licensee cannot apply for renewal more than 20 years before its current license expires. When the NRC issued the 1995 license renewal rule, it stated that the purpose of this limitation was to ensure that plants had sufficient operating experience to reveal any aging concerns before applying for renewal. At the same time, this 20-year limit was also intended to give utilities enough time to plan for alternatives, like replacing a plant, if the license was not renewed.

The NRC is proposing to remove the 20-year limit. Instead, the proposed regulations in 10 CFR 54.17(c) would permit licensees to apply for a renewed license anytime within their current operating period. For example, licensees could apply for initial renewal anytime within their initial 40-year license, and they could apply for subsequent renewal anytime within the period of extended operation. Removing the 20-year limit would give licensees more flexibility, such as coordinating their renewal applications with other licensing actions at the same plant or across their fleet to make the process more efficient. This change would not change the timely renewal provisions in 10 CFR 2.109.

The NRC has already granted exemptions from this regulation to several plants, based on the availability of operating experience from similar facilities (*i.e.,* similar materials and service environments) to inform the renewal decision. At this time, most U.S. plants have been operating past 40 years, and many for more than 50 years. As a result, there is a large amount of industry-wide operating experience to inform the NRC's renewal reviews, even if a specific plant has been operating for a short time. Also, the regulatory process will continue to provide the NRC with the means to verify that plants are effectively addressing emergent aging issues after a license is renewed. As described in NUREG–2191, Appendix B, ''Operating Experience for Aging Management Programs,'' holders of renewed licenses should have processes to capture and review operating experience to assess the need to enhance their aging management programs, as appropriate.

The NRC understands that newer reactor designs might use unique materials in new service environments, so they may not immediately have a complete base of operating experience. If licensees with newer designs request a renewed license early in plant life, the NRC's review guidance (*e.g.,* GALL Report) might not fully apply in some areas. In those cases, applicants would be expected to explain how they will address any unique issues and uncertainties in their demonstration of adequate aging management.

D. Eliminate the Required Application Content on Exemptions

The current regulation in 10 CFR 54.21(c)(2) requires that the application for a renewed license include a list of plant-specific exemptions granted under 10 CFR 50.12 that are based on time-limited aging analyses (TLAAs), along with a justification for continuing those exemptions during the extended operating period. When the NRC issued the 1995 rule, it explained that this

requirement was important because it was necessary to make an independent assessment that all exemptions based on TLAAs had been evaluated as part of the license renewal process.

However, the NRC's experience in reviewing applications has found that this requirement leads to duplication of submitted information and adds unnecessary burden for applicants in their preparations to support the NRC's application review. The regulation in 10 CFR 54.21(c)(1) already requires applicants to identify and evaluate all TLAAs, whether or not they involve an exemption. Repeating the same information to meet the separate 10 CFR 54.21(c)(2) requirement does not aid the NRC's review. As a result, the NRC is proposing to remove 10 CFR 54.21(c)(2) to streamline the process and reduce the burden on applicants.

E. Eliminate the Required Application Content on Technical Specifications

The current regulation in 10 CFR 54.22, ''Contents of application—technical specifications,'' requires that applicants include and justify any technical specification changes needed to manage the effects of aging. However, based on its experience in reviewing renewal applications, the NRC has found that this requirement is not necessary. As the renewal process is meant to maintain a plant's current licensing basis (not change it), technical specification changes are very rarely needed. Also, even without this explicit application content requirement, the review process is capable of ensuring that any needed technical specification changes are identified. As a result, the NRC is proposing to remove 10 CFR 54.22. In addition, this regulation would no longer be cited in 10 CFR 54.9, ''Information collection requirements: OMB approval,'' and 10 CFR 54.43, ''Criminal penalties.''

F. Reduce Ongoing, Post-Renewal Updates to the Final Safety Analysis Report

The license renewal rule requires applicants to include a supplement to the plant's final safety analysis report (FSAR). This supplement must provide a summary description of the programs and activities credited for managing the effects of aging and the evaluation of TLAAs. In addition, after the NRC issues a renewed license, the regulation in 10 CFR 54.37(b) requires a licensee to keep the FSAR updated. These required updates are to ''include systems, structures, and components newly identified'' and ''describe how the effects of aging will be managed.'' The NRC Regulatory Issue Summary (RIS) 2007–16, Revision 1, ''Implementation of the Requirements of 10 CFR 54.37(b) for Holders of Renewed Licenses,'' dated April 28, 2010, explained the definition of ''newly identified'' systems, structures, and components (SSCs) as those that are either related to a change to the plant's licensing basis or were already installed during the original license renewal review but were not included in that review.

When the NRC issued the 1995 license renewal rule, some commenters pointed out that 10 CFR 54.37(b) requires more detail in the ongoing FSAR updates than the summary description provided in the original renewal application. At that time, the NRC justified the discrepancy on the grounds that, after a renewed license is issued, the ongoing FSAR updates serve dual purposes. They function as both the renewal application (in that they describe how the licensee evaluated the effects of aging for newly identified SSCs) and the FSAR supplement (establishing appropriate regulatory controls on aging management programs).

However, based on its oversight experience, the NRC believes the current level of detail in the required FSAR update is not necessary, provided that licensees keep details of their evaluation of newly identified SSCs available for NRC inspection. As a result, the NRC is proposing to revise 10 CFR 54.37(b) to only require a summary description of aging management activities, consistent with what is required in the renewal application. Under this change, a newly identified SSC would trigger an FSAR update only if it affects the summary description of aging management programs or TLAAs. However, regardless of whether an FSAR update is needed, the licensee would be required to keep the full evaluation of newly identified SSCs available in a form that could be audited and retrieved.

Finally, the other currently proposed revisions to 10 CFR part 54 (described in sections XXXII.A. and C. of this document) would change how licensees would need to address some physical plant additions or modifications made prior to the start of the period of extended operation. To date, newly installed SSCs have not been considered to be subject to 10 CFR 54.37(b), based on the idea that they would not be in service for more than 40 years during the extended license period. In its responses to comments on draft RIS–2007–16, Revision 1, ''Implementation of the Requirements of 10 CFR 54.37(b) for Holders of Renewed Licenses'' dated May 27, 2009, the NRC explained that plant operating programs and NRC regulatory activities are adequate to address aging during the first 40 years of service, and aging management is only necessary when that service life is exceeded. However, with the other proposed changes to 10 CFR part 54—extending the renewal term from 20 to 40 years with a tack-on license and removing the 20-year limit on early applications—SSCs newly installed after the NRC completes its license renewal review, but prior to start of the period of extended operation, could significantly exceed 40 years of service during the period of extended operation. Because of that, any of these SSCs that are installed before the start of the period of extended operation would be subject to the provisions of 10 CFR 54.37(b).

XXXIII. Background—Enhancing Flexibility of Reactor Site Criteria

The NRC acknowledges the importance of site characterization in the determination of site suitability to demonstrate reasonable assurance of adequate protection of public health and safety, particularly as it relates to external hazards with broad impacts and the potential to cause failure of all preventative and mitigative controls with one initiating event. Site investigations performed to determine the site-specific external hazards and to adequately characterize the geology, seismology, meteorology, and hydrology of a proposed power reactor site can be time consuming and expensive. The NRC further recognizes that the emergence of new reactor technologies, including non-stationary reactors, and alternate fuels may justify greater flexibility within the siting requirements, and site investigations performed to meet those requirements.

In the current regulatory framework, 10 CFR part 100, ''Reactor Site Criteria,'' consists of two subparts: subpart A, ''Evaluation Factors for Stationary Power Reactor Site Applications Before January 10, 1997 and for Testing Reactors,'' and subpart B, ''Evaluation Factors for Stationary Power Reactor Site Applications on or After January 10, 1997.'' The requirements in subpart B to 10 CFR part 100 are more prescriptive than the requirements of subpart A to 10 CFR part 100 and impose an increased burden to obtain the required information. For example, subpart A of 10 CFR part 100 requires an applicant to consider the seismology, meteorology, geology, and hydrology of a site, but the requirements in subpart B of 10 CFR part 100 demand greater specificity, such as maximum probability wind speed, data on site

foundation materials, earthquake recurrence rates, and groundwater velocity. Within the current framework, all power reactor applicants, even those for new reactor designs with smaller physical footprints, potentially lower radiological risk, and enhanced safety features, would perform the same site characterization and hazard analysis under the requirements in subpart B to 10 CFR part 100.

Subpart B to 10 CFR part 100 and the supporting guidance on acceptable site characterization methods impose a higher burden because they were developed primarily with large LWR sites in mind and were informed by the scale and potential radiological consequences of these facilities. Conversely, subpart A to 10 CFR part 100, including appendix A, contains less prescriptive requirements applicable to older LWR sites not reflective of updated method of external hazards analysis or testing reactors with a lower potential radiological consequence. Applying this regulatory framework and associated site characterization guidance as it currently exists to new reactor designs may not reflect a risk-informed, performance-based approach to site characterization that fully considers the site, design, and hazard-specific conditions at a prospective site.

Therefore, the NRC is proposing changes to these criteria to introduce a more risk-informed, performance-based approach to siting. The proposed changes to the regulations would clearly define a graded approach to site characterization for nuclear power reactor applicants, including non-stationary reactors, by introducing a tiered approach in the regulatory framework that would allow a lower consequence power reactor applicant to demonstrate site suitability through an appropriately scaled site investigation rather than the potentially more burdensome requirements in the current subpart B to 10 CFR part 100. Further, the draft guidance documents issued for public comment along with this proposed rule would provide a risk-informed approach that could be leveraged by reactor applicants under any licensing pathway to optimize their site characterization to achieve an acceptable level of risk for external hazards. This proposed approach is consistent with other recent rulemaking actions, such as the 10 CFR part 53 rulemaking, and would provide similar requirements for applicants across licensing frameworks.

The NRC has a long-standing preference to site reactors in areas of low population density but recognizes that safety, environmental, economic, or other factors may justify siting nuclear plants in areas with greater population densities. Therefore, the NRC proposes to revise its regulations in subparts A and B of 10 CFR part 100 to allow reactors to be sited in areas with greater population densities when justified by an assessment that compares the societal risks and societal benefits of siting reactors in those areas. This proposed change is consistent with the recent 10 CFR part 53 rulemaking and would provide similar requirements for applicants across licensing frameworks.

XXXIV. Discussion—Enhancing Flexibility of Reactor Site Criteria

The proposed changes to 10 CFR part 100 would allow power reactor applicants under 10 CFR part 50 or 52 to have greater flexibility to determine the appropriate level of site characterization. Specifically, these proposed changes would utilize existing flexibility in the regulatory framework for licensing testing and power reactors, including non-stationary reactors, by allowing certain lower consequence power reactor applicants to use the same siting criteria used for testing reactors under subpart A to 10 CFR part 100. Additionally, these proposed changes would remove outdated information on a deterministic approach to seismic hazards analysis in appendix A to 10 CFR part 100 that no longer applies to new reactor applications. The proposed changes to 10 CFR 100.10, ''Factors to be considered when evaluating sites,'' would streamline the regulation and be accompanied by guidance on how to meet the regulatory requirements for subpart A to 10 CFR part 100. The proposed title change to subpart B to 10 CFR part 100 would retain the more prescriptive regulatory requirements that would remain applicable to higher consequence power reactor applicants. These more prescriptive regulatory requirements would continue to ensure appropriate siting criteria for this class of applications. The existing titles of subparts A and B to 10 CFR part 100 are currently reflected in 10 CFR 50.34(a) and (b). Accordingly, conforming changes to those sections would be needed to align the proposed changes in 10 CFR part 100 with the requirements for content of applications described in 10 CFR 50.34(a) and (b). These conforming changes include updating 10 CFR 50.34(a) and (b) to remove references to applications on or after January 10, 1997, and stationary power reactors.

Specific proposed changes to 10 CFR part 100 implementing this approach are described below. The title of subpart A to 10 CFR part 100 would be changed to ''Subpart A—Evaluation Factors for Tier 1 Power and Testing Reactors.'' Appendix A to 10 CFR part 100 would be deleted in its entirety as it provides a description of an approach to determine the safe shutdown earthquake that is outdated and is not consistent with the current practice for performing a probabilistic seismic hazards analysis at nuclear power plant sites. The information necessary to perform an acceptable probabilistic seismic hazards analysis would be included in guidance. The proposed revisions to 10 CFR 100.3, ''Definitions,'' would be conforming changes to define the new terms introduced in proposed revisions to 10 CFR part 100: ''Tier 1 reactor'' and ''Tier 2 reactor.'' These terms would be defined based on an unmitigated consequence. The proposed revision to 10 CFR 100.8, ''Information collection requirements: OMB approval,'' would be a conforming change to remove the mention of appendix A, which would be deleted. The proposed revisions to 10 CFR 100.10 would remove the references to appendix A to 10 CFR part 100 and delete explanatory text. That explanatory text would instead be contained in the draft guidance documents issued for public comment along with this proposed rule. With the deletion of appendix A to 10 CFR part 100, a new reference to appendix S to 10 CFR part 50 would be added to 10 CFR 100.10(b) to provide earthquake engineering criteria for applicants pursuing siting under subpart A to 10 CFR part 100. Additional changes to 10 CFR 100.11, ''Determination of exclusion area, low population zone, and population center distance,'' related to the exclusion area, low population zone, and population center distance are being proposed to align with the dose reference values in subpart B to 10 CFR part 100, which references 10 CFR 50.34(a)(1). Other proposed changes to the text describing the consequence analysis in 10 CFR 100.11 would align with proposed revisions to the text in 10 CFR 50.34(a)(1)(ii)(D) to be more technology-inclusive and meaningful for designs with functional containments. The proposed rule would also revise footnote 1 to 10 CFR 100.11, which provides additional information on the fission product release, to be more technology inclusive and allow for the evaluation of designs with mechanistic source terms and functional containments. In addition, the proposed rule would remove outdated information from footnote 2 to 10 CFR

100.11, which discusses the use of 25 rem (0.25 Sv) TEDE as a reference value.

These proposed changes to subpart A to 10 CFR part 100 would enable power reactor applicants that meet the Tier 1 entry criterion for subpart A to 10 CFR part 100 to develop the appropriate level of site characterization information to support the permit or license application. The proposed entry criterion for a Tier 1 reactor would be to demonstrate an unmitigated consequence of less than 25 rem (0.25 Sv) TEDE at the site exclusion area boundary. The draft guidance documents issued for public comment along with these proposed rule changes would provide guidance on how to determine the unmitigated consequence, select the site parameters to include when defining a site parameter envelope and apply graded approaches for seismic and other external hazard characterization for any power reactor applicant. The draft guidance documents also would describe appropriate uses of existing site characterization information and alternative site investigation techniques, which would increase regulatory clarity and review efficiency.

Proposed entry criteria for subpart A to 10 CFR part 100 and guidance on graded approaches for external hazards with the potential to impact all safety controls with a single initiating event (*e.g.,* seismic) would be based on an unmitigated consequence analysis. The unmitigated consequence analysis would be necessary to account for the common-cause failure aspect of external hazards and to determine the appropriate target performance criteria for acceptable risk. Information on appropriate methods for performing unmitigated consequence analyses will be provided in the draft guidance documents being issued for public comment along with this proposed rule.

Additionally, an appendix within the draft guidance would provide considerations for optimizing seismic design bases using the unmitigated consequence analysis. The NRC recognizes that the seismic design basis for a nuclear facility often has a significant impact on cost and schedule. This appendix would enable applicants to optimize the seismic design basis, reducing the burden of seismic design while still ensuring safety.

With the proposed introduction of the concept of a Tier 1 reactor in subpart A to 10 CFR part 100, the title to subpart B to 10 CFR part 100 would be changed to ''Subpart B—Evaluation Factors for Tier 2 Power Reactor Site Applications.'' The NRC proposes to make additional changes to 10 CFR 100.20, ''Factors to be considered when evaluating sites,'' and 100.23, ''Geologic and seismic siting criteria,'' to reflect the new ''Tier 2'' terminology. Tier 2 reactors would be power reactors that have not been demonstrated to meet the Tier 1 entry criterion. This would include power reactors with an unmitigated consequence of greater than 25 rem (0.25 Sv) TEDE at the site exclusion area boundary or where the unmitigated consequence is undetermined. No other changes are proposed to subpart B as part of this rulemaking, and the framework would be maintained to accommodate higher consequence reactor applications.

The NRC proposes to maintain its long-standing preference for siting reactors in areas of low population density, while providing flexibility to allow siting reactors in areas of greater population density when warranted. The NRC recognizes that safety, environmental, economic, or other factors may justify siting nuclear plants in areas with higher population densities or within a densely populated center containing more than about 25,000 residents. Therefore, the NRC is proposing to revise 10 CFR 100.10, 100.11(a)(3), 100.21(b), and 100.21(h) to allow applicants to justify siting reactors at such sites by performing assessments of additional societal risks associated with siting a reactor in areas of higher population density (*e.g.,* potential increases in population dose or economic consequences from reactor accidents) and comparing those risks to the societal benefits of a specific proposed site (*e.g.,* ability to use existing infrastructure for a retired fossil fuel power plant). Implementing guidance for these assessments will be developed.

The proposed changes to 10 CFR part 100 and the explanations provided in the draft guidance documents issued for public comment along with this rulemaking could result in timelier and more efficient site investigations, more appropriate seismic design bases, and more streamlined reviews for new power reactor applications.

XXXV. Background—Increased Enrichment of Conventional and Accident Tolerant Fuel Designs for Light-Water Reactors

A. Accident Tolerant Fuels

Accident tolerant fuels (ATFs) are advanced nuclear fuel technologies that have the potential to enhance safety at U.S. nuclear power plants by offering better performance during normal operation, transient conditions, and accident scenarios. Section 107, ''Commission Report on Accident Tolerant Fuel,'' of the Nuclear Energy Innovation and Modernization Act defines ATF as a new technology that makes an existing commercial nuclear reactor more resistant to a nuclear incident (as defined in section 11 of the AEA (42 U.S.C. 2014)) and lowers the cost of electricity over the licensed lifetime of an existing commercial nuclear reactor.

While this proposed rule would not make any fuel-design-specific conclusions, it would facilitate the adoption of increased enrichment and higher burnup to enable entities, licensed to use conventional or ATF designs, to use LWR fuel containing uranium enriched to greater than 5.0 weight percent uranium-235 (U-235), in most cases, without the use of exemptions.

B. Rulemaking Development

(i) Early Considerations of Increased Enrichment

From interactions with stakeholders, the NRC is aware that licensees and applicants plan to request to deploy ATF concepts and operate fuel to extract more energy from each fuel rod (*i.e.,* operate fuel at higher burnups). Specifically, the NRC expects requests to raise fuel burnup limits to higher than the 62 gigawatt-days per metric ton of uranium (GWd/MTU) rod-average burnup limit set by the NRC in most safety analysis methodologies. To achieve higher burnup limits, licensees and applicants would need to request increases in fuel enrichment from the current standard of 5.0 weight percent U–235 up to approximately 10.0 weight percent U-235. Additionally, in February 2019, nuclear power industry representatives identified potential advantages of increased enrichment fuel for LWRs in the NEI white paper, ''The Economic Benefits and Challenges with Utilizing Increased Enrichment and Fuel Burnup for Light-Water Reactors.''

In September 2021, the NRC issued version 1.2 of the ''Project Plan to Prepare the U.S. Nuclear Regulatory Commission for Efficient and Effective Licensing of Accident Tolerant Fuels,'' which describes the pursuit of higher burnup and increased enrichment as key components of nuclear power industry ATF efforts. Currently, the industry plans to deploy batch loads of fuels enriched to levels greater than the current standard of 5.0 weight percent U-235 by the mid-to-late 2020s. Paragraph (b)(7) of 10 CFR 50.68, ''Criticality accident requirements,'' requires that U-235 enrichment levels in power reactor fuel be no more than 5.0

percent by weight, unless the NRC approves exemptions from this limit. The development of the current regulatory framework did not foresee use of enrichments greater than 5.0 weight percent U-235. The NRC established the current weight percent limits as reasonable bounding assumptions for its safety analysis methodologies. As part of this rulemaking, the NRC evaluated the framework and considered whether the current weight percent limits can be adjusted while maintaining reasonable assurance of adequate protection of public health and safety. In addition, the NRC considered whether rulemaking would support a more efficient review of licensing actions.

In response to industry interest in LWR fuels enriched to between 5.0 to 10.0 weight percent U-235, the NRC staff submitted to the Commission a rulemaking plan in SECY–21–0109, ''Rulemaking Plan on Use of Increased Enrichment of Conventional and Accident Tolerant Fuel Designs for Light-Water Reactors,'' dated December 20, 2021. The staff requested Commission approval to initiate rulemaking to amend NRC requirements to facilitate the use of LWR fuel containing uranium enriched to greater than 5.0 weight percent U-235. In SECY–21–0109, the staff recommended rulemaking to reduce the number of exemption requests and facilitate increased regulatory efficiency and consistency. The staff explained that rulemaking on this topic would allow the staff to thoroughly review the potential regulatory implications of fuels enriched to greater than 5.0 weight percent U-235 and identify and assess the potential costs and benefits of changing regulatory requirements that impact the use of these fuels. Rulemaking also would provide options for a generic resolution of these issues and invite stakeholder participation in decisions affecting this regulatory area, rather than deciding issues on a case-by-case basis as in the current regulatory framework.

In SRM–SECY–21–0109, ''Staff Requirements—SECY–21–0109—Rulemaking Plan on Use of Increased Enrichment of Conventional and Accident Tolerant Fuel Designs for Light-Water Reactors,'' dated March 16, 2022, the Commission approved the staff's plan to initiate rulemaking to amend requirements for the use of LWR fuel containing uranium enriched to greater than 5.0 weight percent U-235. The Commission stated that the provisions of the rule should apply only to high-assay, low-enriched uranium (HALEU) fuel, both for nonproliferation and safeguards reasons, and that the staff's analysis should focus on the range of enrichment most likely to be contemplated in future applications.

In addition, the Commission directed that (1) fuel fragmentation, relocation, and dispersal (FFRD) issues relevant to fuels of higher enrichment and burnup levels should be appropriately addressed and analyzed in the regulatory basis for this rulemaking; and (2) staff should take a risk-informed approach when developing this rule and the associated regulatory basis and guidance.

(ii) Other Considerations

On April 11, 2024, the Commission returned the 10 CFR 50.46c draft final rule to the staff in SRM–SECY–16–0033, ''Staff Requirements—SECY–16–0033—Draft Final Rule—Performance-Based Emergency Core Cooling System Requirements and Related Fuel Cladding Acceptance Criteria.'' As a result, this rulemaking proposes to leverage the previously proposed performance-based approach to emergency core cooling system (ECCS) requirements, including the expanded applicability to advanced fuels, and incorporate the embrittlement research findings from the 10 CFR 50.46c draft final rule into the new voluntary 10 CFR 50.46a proposed rule. This is discussed in sections XXXV.C.(v)(c), ''10 CFR 50.46c Rulemaking and Cladding Embrittlement Research Findings,'' and XXXVI.F.(v), ''Alternative ECCS Analysis Requirements and Acceptance Criteria,'' of this document.

C. Background and History of Affected Regulations

This section provides the regulatory history and the background of each of the affected regulatory areas and its relationship to fuel enrichment.

(i) 10 CFR 70.24 and 10 CFR 50.68 Criticality Accident Requirements

One regulation initially evaluated by the NRC for its relationship to fuel enrichment is 10 CFR 70.24, ''Criticality accident requirements.'' This regulation was established as part of the rulemaking for 10 CFR part 70, ''Domestic Licensing of Special Nuclear Material,'' in 1974 (39 FR 39020; November 5, 1974). Section 70.24 ensures that licensees handling special nuclear material (SNM) have the appropriate monitoring systems in place for detecting a criticality accident and establish an emergency plan.

During the 1980s and 1990s, nuclear power reactor licensees sought exemptions from several requirements in 10 CFR 70.24, including those related to active criticality monitoring alarm capabilities, criticality emergency drills, and plans for evacuations, decontamination, medical treatment for radiation exposure, and reentry protocols, which must also be demonstrated through the regular criticality safety drills. As discussed in SECY–97–155, ''Staff's Action Regarding Exemptions from 10 CFR 70.24 for Commercial Nuclear Power Plants,'' dated July 21, 1997, in response to these numerous exemption requests, the staff evaluated the likelihood of an inadvertent criticality accident during fuel handling operations at nuclear power plants and concluded that such events would be unlikely for power reactor facilities because existing administrative and design controls were based on no more than 5.0 weight percent U-235 fuel enrichment. As a result, in 1998 the NRC issued 10 CFR 50.68 to offer these licensees an alternative to 10 CFR 70.24, provided that they meet certain criteria (63 FR 63127; November 12, 1998).

Under 10 CFR 50.68, licensees may decide not to comply with the requirements of 10 CFR 70.24 and, instead, must comply with the requirements in 10 CFR 50.68(b), if they can demonstrate appropriate subcriticality margins that are expressed in terms of k-effective (keff), the estimated ratio of neutron production to neutron absorption and leakage, for new and fresh fuel storage facilities. Section 50.68(b) specifies the following keff limits:

- *10 CFR 50.68(b)(2):* keff ≤ 0.95 at 95 percent probability and 95 percent confidence level for fresh fuel wet storage racks in unborated water.
- *10 CFR 50.68(b)(3):* keff ≤ 0.98 at 95 percent probability and 95 percent confidence level for fresh fuel storage in low-density hydrogenous fluid (fog). This keff limit is only applicable to the current fleet of operating LWRs if they use a dry new fuel storage vault that is susceptible to moderation by natural weather or fire suppression fogging conditions. If new fuel is stored submerged in the fuel pool (*i.e.,* 10 CFR 50.68(b)(2) wet storage conditions), then 10 CFR 50.68(b)(3) does not apply.
- *10 CFR 50.68(b)(4):* keff ≤ 0.95 at 95 percent probability and 95 percent confidence level for spent fuel wet storage racks in unborated water.
- *10 CFR 50.68(b)(4):* keff ≤ 0.95 at 95 percent probability and 95 percent confidence level for spent fuel wet storage racks in borated water; furthermore, keff must remain < 1.0 at 95 percent probability and 95 percent confidence level without soluble boron credit taken.

In addition to the keff requirements, 10 CFR 50.68(b)(6) requires radiation monitoring only during fuel handling and movement. Finally, 10 CFR 50.68(b)(7) limits current applications to 5.0 weight percent U–235 for fresh fuels. The NRC added 10 CFR 50.68(c) in 2006 (71 FR 66648; November 16, 2006) to delineate independent spent fuel storage installation dry storage cask loading applicability.

Most operating reactors currently adhere to 10 CFR 50.68(b) requirements in lieu of the criticality monitoring requirements in 10 CFR 70.24. When fuel transition changes are made, if enrichments are being increased, the licensee must perform a safety analysis of spent fuel pool criticality as part of the fuel transition because increasing enrichments may cause a decrease in margin to the applicable keff safety limits of 10 CFR 50.68(b)(4). There is also a plant-specific criticality safety limit for the new and spent fuel storage areas listed in Standard Technical Specification Design Feature 4.3, ''Fuel Storage,'' in NUREG–1430, ''Standard Technical Specifications—Babcock and Wilcox Plants''; NUREG–1431, ''Standard Technical Specifications—Westinghouse Plants''; NUREG–1432, ''Standard Technical Specifications—Combustion Engineering Plants''; NUREG–1433, ''Standard Technical Specifications—General Electric Plants (BWR/4)''; NUREG–1434, ''Standard Technical Specifications—General Electric Plants BWR/6''; and NUREG–2194, ''Standard Technical Specifications—Westinghouse Advanced Passive 1000 (AP1000) Plants.'' The guidance in these NUREGs assists the NRC's review of any proposed fuel changes that could affect 10 CFR 50.68 compliance.

Nonetheless, given that 10 CFR 50.68(b)(7) limits current applications to 5.0 weight percent U-235, if reactor licensees transition to using fuel enriched above 5.0 weight percent U-235, then 10 CFR 50.68 would not be available as an alternative to 10 CFR 70.24. Absent rulemaking, the NRC expects that reactor licensees seeking to transition to fuel enriched above 5.0 weight percent U-235 would likely request exemptions from 10 CFR 50.68.

Unlike 10 CFR 50.68, 10 CFR 70.24 does not have an enrichment limit, so a licensee or applicant could comply with 10 CFR 70.24 and implement enrichments beyond 5.0 weight percent U-235. Licensees or applicants complying with 10 CFR 70.24 that seek exemption from that section's active criticality monitoring and emergency planning requirements could not justify the exemptions with the subcriticality margin approach methodology used in 10 CFR 50.68. Furthermore, under 10 CFR 70.24(d)(2), any exemption from 10 CFR 70.24 held by a licensee becomes ineffective once that licensee elects to comply with 10 CFR 50.68. Industry stakeholders have also acknowledged the greater regulatory flexibility of the 10 CFR 50.68 subcriticality margin approach, and licensees have expressed interest in applying the 10 CFR 50.68 methodology to higher enrichments in lieu of meeting the 10 CFR 70.24 criticality safety approach. Proposed amendments to address this issue are discussed in section XXXVI.A., ''Criticality Accident Requirements in 10 CFR 50.68,'' of this document.

(ii) Environmental Requirements in 10 CFR 51.51 and 51.52

In 10 CFR 51.51, table S–3, ''Table of Uranium Fuel Cycle Environmental Data,'' references the original environmental assessments in WASH–1248, ''Environmental Survey of the Uranium Fuel Cycle,'' issued April 1974, and NUREG–0116, ''Environmental Survey of the Reprocessing and Waste Management Portions of the LWR Fuel Cycle: A Task Force Report,'' Supplement 1 to WASH–1248, issued October 1976.

In 10 CFR 51.52, summary table S–4, ''Environmental Impact of Transportation of Fuel and Waste to and From One Light-Water-Cooled Nuclear Power Reactor,'' references the environmental assessments in WASH–1238, ''Environmental Survey of Transportation of Radioactive Materials to and from Nuclear Power Plants,'' issued December 1972, and Supplement 1 to NUREG–75/038, ''Environmental Survey of Transportation of Radioactive Materials to and from Nuclear Power Plants,'' issued April 1975.

The aforementioned environmental surveys were based on enrichments up to 4.0 weight percent U-235. Subsequent analysis by the NRC, incorporated into section 4.12.1.1 of NUREG–1437, ''Generic Environmental Impact Statement for License Renewal of Nuclear Plants: Final Report,'' Revision 1, issued June 2013, confirmed that table S–3 of 10 CFR 51.51 and table S–4 of 10 CFR 51.52 are also bounding for enrichments up to 5.0 weight percent U-235. The NRC does not have an approved assessment of environmental impacts related to the uranium fuel cycle in current 10 CFR 51.51, or to transportation of enriched fresh, nonirradiated fuel to a reactor in current 10 CFR 51.52, for enrichments greater than 5.0 weight percent U-235.

Under 10 CFR 51.51 and related to 10 CFR 51.50, ''Environmental report—construction permit, early site permit, or combined license stage,'' the environmental data of table S–3 apply for enrichments up to 5.0 weight percent U-235 and apply to the environmental report for the CP stage, ESP stage, or COL stage of an LWR. Also, as required in 10 CFR 51.50, an applicant for a CP, ESP, or COL must submit an environmental report that contains information specified in 10 CFR 51.45, ''Environmental report,'' 10 CFR 51.51, and 10 CFR 51.52.

Under 10 CFR 51.52, an environmental report prepared for the CP stage, ESP stage, or COL stage of an LWR must contain a statement concerning the environmental impacts of transportation of fuel and radioactive waste to and from the LWR. If the conditions in 10 CFR 51.52(a) as extended to 5.0 weight percent U-235 are met, then table S–4 gives these environmental impacts and can be so stated in the applicant's environmental report. If an LWR applicant for a CP, ESP, or COL cannot meet the conditions for using table S–4 (for example, the plant has enrichments greater than 5.0 weight percent U-235), then the environmental report must contain a full description and detailed analysis of the environmental effects of transportation of fuel and radioactive waste to and from the reactor, including values for the environmental impact under normal conditions of transport and for the environmental risk from accidents in transport.

For licensing actions other than CP, ESP, and COL applications, which may not require submission of an environmental report (*e.g.,* license amendment requests), the uranium fuel cycle and the transportation of the fuel and waste could be considered necessary to support the operation of the plant. In such situations, the NRC would assess the environmental effects of the licensing action with respect to the uranium fuel cycle or transportation of fuel and waste or both.

Sections XXXVI.B., ''Uranium Fuel Cycle Environmental Data—Table S–3 in 10 CFR 51.51,'' and XXXVI.C., ''Environmental Effects of Transportation of Fuel and Waste—Table S–4 in 10 CFR 51.52,'' of this document include discussions of proposed amendments to support the use of fuel with enrichments greater than 5.0 weight percent U-235 for the uranium fuel cycle in 10 CFR 51.51 and transportation and waste requirements in 10 CFR 51.52. In a separate rulemaking, the NRC is considering changing the types of environmental impacts considered in tables S–3 and S–4.

(iii) Fissile Packaging Requirements

In an effort to fully utilize ATF capabilities, licensees and applicants are expected to seek approval for the transport of fissile material with enrichments that range between 5.0 and 10.0 weight percent U-235. The fuel cycle for commercial LWR fuel includes enrichment of uranium hexafluoride (UF_6) and shipment of the enriched UF_6 to a fuel fabricator for deconversion to uranium dioxide (UO_2). The enriched UF_6 is transported in NRC-approved packages that incorporate 30-inch cylinders.

The regulation in paragraph (b) of 10 CFR 71.55, ''General requirements for fissile material packages,'' requires that a transportation package be designed and constructed, and its contents limited, so that it would be subcritical if water were to leak into the containment system. This criticality analysis with moderation ensures criticality safety in transport in the unanticipated event that water leaks into the containment vessel and provides moderating materials for the fissile contents.

In the 2004 amendments to 10 CFR part 71 (69 FR 3698; January 26, 2004), the NRC implemented an exception to 10 CFR 71.55(b) in 10 CFR 71.55(g), which codified a longstanding NRC and worldwide practice for evaluating the leakage of water into UF_6 packages. This exception for UF_6 transportation packages can be used if all of the following conditions are met:

- The UF_6 cylinder remains leak tight following the tests specified for hypothetical accident conditions.
- The valve body of the cylinder does not impact any other part of the package, other than where it is attached to the cylinder.
- There is adequate quality control in the manufacture, maintenance, and repair of packagings.
- Each package is tested to demonstrate closure before each shipment.
- The uranium is enriched to not more than 5.0 weight percent U-235.

This exception is a performance-based assessment of the structural and containment integrity of the UF_6 cylinder, which is independent of the enrichment level of the contents.

Similarly, 10 CFR 71.55(c) also provides for an exception to the requirements in 10 CFR 71.55(b) if the applicant specifies that the package incorporates special design features that ensure that no single packaging error would permit leakage and that appropriate measures are taken before each shipment to ensure that the containment system does not leak. This exception does not limit the enrichment of the package contents.

In the 2004 amendments to 10 CFR part 71, the NRC explained the basis for the specific exception in 10 CFR 71.55(g) and its enrichment limit of 5.0 weight percent U-235 as follows: (1) it would maintain consistency with worldwide practice, (2) operation experience and history demonstrate safe shipment of fuel enriched to less than or equal to 5.0 weight percent U-235, and (3) it is necessary to transport an essential commodity (UF_6 feed material).

Currently, the regulations in 10 CFR part 71 are sufficiently performance-based and, except for 10 CFR 71.55(g), do not directly reference or limit the enrichment level of the radioactive contents. The regulatory issue with 10 CFR 71.55(g) is that it specifies an enrichment limit (5.0 weight percent U-235) for UF_6 that does not bound the range of enrichment that applicants may choose to ship in their UF_6 transportation packages in the future.

Section XXXVI.D., ''Fissile Material Packaging Requirements in 10 CFR 71.55,'' of this document includes a discussion of proposed amendments to the fissile packaging requirements in 10 CFR 71.55 to support the use of fuel with enrichments greater than 5.0 weight percent U-235.

(iv) Appendix A to 10 CFR Part 50 (General Design Criterion 19) and 10 CFR 50.67(b)(2)(iii)

The general design criteria (GDC) in appendix A to 10 CFR part 50, ''General Design Criteria for Nuclear Power Plants,'' Criterion 19, ''Control room'' (GDC 19), provide minimum design, fabrication, construction, testing, and performance requirements for structures, systems, and components (SSCs) that provide reasonable assurance that the facility can be operated without undue risk to public health and safety. Additionally, 10 CFR 50.67, ''Accident source term,'' allows applicable licensees to voluntarily revise the accident source term used in design basis radiological consequences analyses if certain requirements in 10 CFR 50.67(b)(2) are met.

Both GDC 19 and 10 CFR 50.67(b)(2)(iii) provide a specific dose-based criterion of 5 rem (0.05 Sv) TEDE for demonstrating the acceptability of the control room design. They represent a distinct layer of defense-in-depth that assumes a major accident that results in substantial meltdown of the reactor core with subsequent release of appreciable quantities of fission products. In application, GDC 19 and 10 CFR 50.67(b)(2)(iii) are performance based and require that a licensee or applicant provide a control room habitability design using traditional deterministic radiological consequence analyses methods to judge the acceptability of the design.

An acceptable level of control room habitability for design basis events (DBEs) is necessary to provide reasonable assurance that the control room would continue to be staffed and operated effectively to mitigate the effects of the postulated accident and protect public health and safety. GDC 19 and 10 CFR 50.67(b)(2)(iii) are *design* criteria and should not be construed as operational *limits.* While the design criteria are computed in terms of dose, they are figures of merit used to characterize the minimum requirements for design, fabrication, construction, testing, and performance for SSCs. The design criteria do not represent actual occupational exposures received during normal and emergency conditions, which are primarily controlled by 10 CFR part 20, ''Standards for Protection Against Radiation.''

The preamble for the 1971 final rule (36 FR 3255; February 20, 1971) that first published the GDC addressed the criteria only in the aggregate; the individual criteria were not discussed. However, there is a record of a change made to the proposed GDC 11 (32 FR 10213; July 11, 1967), which became the final GDC 19. The proposed GDC 11 referred to the occupational exposure limits of 10 CFR part 20 rather than specifying a numeric dose criterion. Industry comments on that proposal generally recommended deletion of the reference to 10 CFR part 20 (see SECY–R–143, ''Amendment to 10 CFR 50—General Design Criteria for Nuclear Power Plants,'' dated January 28, 1971). The Commission resolved these comments by deleting the reference to 10 CFR part 20 occupational exposure limits and providing the current ''5 rem whole-body, or its equivalent to any part of the body, for the duration of the accident'' in its place.

Section 50.67 of 10 CFR was established shortly after a revision to 10 CFR part 20 was issued in 1991, providing the voluntary regulatory mechanism for licensees to replace the original design criteria of whole body and thyroid with the new TEDE criteria. The preamble for the 10 CFR 50.67 final rule included the Commission's rationale for establishing 5 rem (0.05 Sv) TEDE as the GDC 19 numeric design criterion for licensees using an alternative source term. That rationale was composed of the following:

- The criteria in GDC 19 were based on a primary occupational exposure limit.
- The use of 5 rem (0.05 Sv) TEDE as the control room criterion did not imply that this value would be an acceptable exposure during emergency conditions, or that other radiation protection standards of 10 CFR part 20, including individual organ dose limits, might not apply. This criterion was provided only to assess the acceptability of design provisions for protecting control room operators under postulated design-basis accident (DBA) conditions. The DBA conditions assumed in these analyses, although credible, generally did not represent actual accident sequences but were specified as conservative surrogates to create bounding conditions for assessing the acceptability of engineered safety features.
- The regulations at 10 CFR 20.1206, ''Planned special exposures,'' permitted a planned special dose of five times the annual dose limits. Also, the pertinent U.S. Environmental Protection Agency (EPA) guidance at that time, ''Manual of Protective Action Guides and Protective Actions for Nuclear Incidents,'' EPA–400/R–92–001, issued May 1992, set a limit of five times the annual dose limits for workers performing emergency services such as lifesaving or protection of large populations. The Commission did not suggest that control room dose during an accident can be treated as a planned special exposure or that the EPA emergency worker dose limits are an alternative to GDC 19. However, the Commission stated that these provisions offer a useful perspective that supports the conclusion that the organ doses implied by the 5 rem (0.05 Sv) criterion can be considered to be acceptable due to the relatively low probability of the events that could result in doses of this magnitude.

Development of the current control room design criterion did not foresee how licensees are currently operating their facilities and managing their fuel or considering fuel enrichments up to but less than 20.0 weight percent U-235. The history of fuel utilization for the current large LWR fleet has seen a gradual progression toward higher fuel burnups and increased enrichments. The original control room design criteria were developed during the late 1960s when burnup rates and enrichments were relatively low. During that time, there was enough margin in the facilities' design bases to accommodate the control room design criteria, even for power uprates of up to 120 percent of the originally licensed steady-state thermal power level. Today, vendors, licensees, and other members of the nuclear power industry have indicated to the NRC that they are looking for further power uprates using fuel enrichments up to 10.0 weight percent U-235 with fuel burnup limits higher than the 62 GWd/MTU rod-average burnup.

Depending on how the reactor core is designed with increased U-235 enrichment fuel elements and operation at higher burnup levels to reach longer cycle time, the results of a licensee's DBA radiological consequence analysis results would increase. The impact of this increase would decrease the retained margin maintained by the licensee to provide operational flexibility. An unjustifiably low design criteria can unnecessarily burden licensees for seeking increased enrichments with extensive analyses to preserve margin for operational flexibility purposes. These additional analyses may not result in safety benefits and can increase actual operational exposure to workers due to increased maintenance activities.

Under the current definition of ''safety-related structures, systems and components'' in 10 CFR 50.2, ''Definitions,'' any SSCs credited with providing mitigation functions during a DBE (or accident) must be designated as ''safety-related.'' The traditional radiological consequence analyses performed to demonstrate compliance with the control room design criterion assess the performance of safety-related SSCs because they are relied upon to remain functional during and following DBAs to ensure the capability to prevent or mitigate the consequences of accidents that could result in potential exposure. The analyses are not intended to be actual event sequences but, rather, are intended to be surrogates to enable deterministic evaluation of the response of the plant-engineered safety features. These accident analyses are intentionally conservative in order to address uncertainties in accident progression, fission product transport, and atmospheric dispersion. With few exceptions, these analyses do not credit non-safety-related SSCs or operator actions that would otherwise lower the radiological consequence results. This analysis approach can ensure conservative results, but the results can also have large uncertainties. Due to the modeling approach and inherent uncertainty, overly conservative results can lead licensees to perform extensive re-analyses to preserve margin for operational flexibility purposes that do not necessarily enhance safety.

The radiological consequence analyses also confirm several aspects of the facility's design- and licensing-basis when safety-related SSCs are credited as input parameters. These input parameters are often specific values and limits found in the facility's updated FSAR and technical specifications, pursuant to 10 CFR 50.36, ''Technical specifications.'' Deviations from the Technical Specification identified during maintenance or testing (*e.g.,* higher leakage rates or lower filter efficiencies) indicate a non-conformance issue with the facility's licensing basis. In such cases, additional maintenance must be performed to correct the discrepancy to bring the facility back into compliance with established licensing requirements. The degree of maintenance necessary to ensure the facility is in compliance can significantly influence the amount of radiation exposure incurred by workers. The numerical value of the control room design criteria, through the radiological consequence analyses that utilize specific values and limits found in the facility's technical specifications, factors into the licensee's decisions when performing maintenance activities and thus directly impacts the amount of workers' exposure to ionizing radiation. A very low design criteria value can result in an excessive amount of maintenance, leading to potentially avoidable occupational exposure and unnecessary operational disturbances. Conversely, a very high value may allow for unacceptable degradation, potentially compromising overall safety and performance over time. Adequate protection of public health and safety and occupational radiological safety can still be achieved at a higher and safe control room design criteria performance level while balancing both dose-savings to workers and providing some regulatory relief to maintain operational flexibilities. As discussed in section XXXVI.E., ''Control Room Requirements in 10 CFR 50.67 and GDC 19,'' of this document, the NRC proposes to address these issues so licensees would not need to perform potentially extensive re-analyses or excessive maintenance activities, or possibly request exemptions, to demonstrate compliance without a commensurate increase in safety.

The NRC's Radiation Protection and Emergency Response Framework

The NRC's comprehensive radiation protection and emergency response framework, which covers both normal operations and accident conditions, is another important aspect of the control room design criteria rulemaking efforts. This framework helps to protect occupational workers from ionizing radiation as well as prepare the licensee

to respond to abnormal and emergency conditions to protect the public health and safety.

At the time that GDC 19 was established in 1971, 10 CFR part 20 limited occupational radiation exposure to 3 rem (0.03 Sv) whole body dose per calendar quarter, provided the total lifetime dose was verified not to exceed 5 rem (0.05 Sv) times the individual's age in years minus 18. Thus, a worker could receive a radiation exposure of up to 12 rem (0.12 Sv) in a given year.

The current annual limit on occupational radiation dose exposure in 10 CFR 20.1201, ''Occupational dose limits for adults,'' is 5 rem (0.05 Sv) TEDE. Under 10 CFR 20.1201, an adult worker could receive occupational radiation exposure of up to 10 rem (0.10 Sv) TEDE over a 12-month period straddling two calendar years. The current 10 CFR 20.1206 also permits an adult worker to receive doses in addition to, and accounted for separately from, the doses received under the limits specified in 10 CFR 20.1201 of five times the annual dose limits during the individual's lifetime, not to accumulate faster than 5 rem (0.05 Sv) TEDE in any one year. As such, an adult worker could receive radiation exposure of up to 10 rem (0.10 Sv) TEDE within a single calendar year period. In setting these standards in the 1991 amendment of 10 CFR part 20 (56 FR 23360; May 21, 1991), the Commission concluded that an infrequent exposure of workers up to twice the occupational dose limit was adequately protective of radiation workers.

The NRC's emergency planning regulations in appendix E to 10 CFR part 50, ''Emergency Planning and Preparedness for Production and Utilization Facilities,'' and planning standards for nuclear power reactors in 10 CFR 50.47, ''Emergency plans,'' require each nuclear power reactor licensee to have an emergency plan that gives the NRC reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency. The regulation at 10 CFR 50.47(b)(11) requires licensees to establish the means for controlling radiological exposures in an emergency and states that the means for controlling radiological exposures must include exposure guidelines consistent with EPA Emergency Worker and Lifesaving Activity Protection Action Guides (PAG). The EPA exposure guidelines found in the current version of its ''PAG Manual: Protective Action Guides and Planning Guidance for Radiological Incidents,'' recommend that doses received under emergency conditions should be maintained as low as reasonably achievable and, to the extent practicable, limited to 5 rem (0.05 Sv). The guideline for actions to protect valuable property is 10 rem (0.10 Sv) where a lower dose is not practicable, the guideline for actions to save a life or to protect large populations is 25 rem (0.25 Sv) where a lower dose is not practicable, and exposures greater than 25 rem (0.25 Sv) may be appropriate for lifesaving or protecting large populations if the workers are volunteers who are fully aware of the risks involved.

The events that could result in control room radiation exposures comparable to the 10 CFR part 20 normal occupational exposure limit of 5 rem (0.05 Sv) TEDE would result in the activation of the facility's emergency response plan and the emergency response organization. These emergency actions include establishing higher exposure limits for control room operators if necessary to provide public health and safety, as permitted by paragraph (x) of 10 CFR 50.54, ''Conditions of licenses,'' and paragraph (b) of 10 CFR 20.1001. The emergency coordinator can also authorize issuing potassium-iodide tablets for thyroid protection or use of emergency respiratory protection equipment.

The Commission's framework for emergency planning and response encompasses a combination of regulatory requirements and industry commitments tailored to address a spectrum of potential events, from design-basis scenarios to extremely low-probability severe accident events. This comprehensive approach ensures preparedness to effectively protect public health and safety by enabling robust planning and response capabilities.

Scientific Recommendations for Radiation Protection for Worker and Regulations Under Accident and Emergency Conditions

The NRC reviewed several source materials to understand the current recommendations from national and international organizations responsible for making recommendations for radiation protection standards. The purpose of this review was to determine whether reexamining the scientific and technical basis for the numerical value of the control room design criteria would be warranted. Section XXXVI.E., ''Control Room Requirements in 10 CFR 50.67 and GDC 19,'' of this document describes how the NRC used this review to inform the development of this proposed rule.

ICRP Publication 109, ''Application of the Commission's Recommendations for the Protection of People in Emergency Exposure Situations,'' issued in 2009, specifies a reference range of 2 to 10 rem (0.02 to 0.10 Sv) acute, or per year, for emergency exposure situations. The reference level represents the level of residual dose or risk above which it is generally judged to be inappropriate to plan to allow exposures to occur. The ICRP considers that a dose rising towards 10 rem (0.10 Sv) will almost always justify protective measures and that protection against all exposures, above or below the reference level, should be optimized.

The IAEA 2024 guidance, ''Portable Digital Assistant for First Responders to a Radiological Emergency: Emergency worker turn-back dose guidance,'' specifies a range of 5 to 100 rem (0.05 to 1 Sv), depending on the severity of the actions needed.

The 2018 NCRP Report No. 180, ''Management of Exposure to Ionizing Radiation: Radiation Protection Guidance for the United States,'' specifies the following: (1) during lifesaving activities or actions to prevent a catastrophic situation, which includes other urgent rescue activities, 50 radiation-absorbed dose (rad) (0.5 gray (Gy)) cumulative whole-body absorbed dose (50 rad) should be implemented at the command level, and (2) for other emergency activities, including extended activities following initial lifesaving, rescue, and damage control response, an effective dose to emergency workers should not exceed 10 rem (0.10 Sv).

Modern Health Physics and Radiation Epidemiology Knowledge

The NRC's comprehensive radiation protection and emergency response framework for protecting individuals during normal and emergency conditions is informed by scientific recommendations by national and international organizations. These recommendations are based on fundamental modern health physics and radiation epidemiology knowledge. The NRC's consideration of these organizations' recommendations has contributed to developing this proposal to amend the control room design criteria value from 5 rem (0.05 Sv) TEDE to 10 rem (0.10 Sv) TEDE with the additional provisions to justify a higher numerical value up to 25 rem (0.25 Sv) TEDE.

The range of proposed control room design criteria values is significantly below the threshold for observable deterministic health effects such as acute radiation syndrome and

hematopoietic syndrome, which occurs at a dose around 70 to 100 rad (0.7 to 1 Gy). This range is also far below the mean lethal dose of ionizing radiation without medical treatment, which is estimated to be approximately 300 to 500 rad. This demonstrates that the proposed design criteria range is well within safe limits relative to acute radiation effects that could impair workers from performing their safety function in response to an event. Additionally, the criteria range results in a small radiation risk for cancer mortality, which would be further mitigated by radiation protection and emergency planning actions during an actual event. This ensures a high level of protection is still provided, thereby minimizing long-term health impacts.

In RG 8.29, Revision 1, ''Instruction Concerning Risks from Occupational Radiation Exposure,'' the NRC adopted a risk value, for an occupational dose of 1 rem (0.01 Sv) TEDE, of 4 in 10,000 of developing a fatal cancer, or approximately 1 chance in 2,500 of fatal cancer per rem of TEDE received. The uncertainty associated with this risk estimate does not rule out the possibility of higher risk, or the possibility that the risk may even be zero at low occupational doses and dose rates. The radiation risk incurred by a worker depends on the amount of dose received. Under current health physics models, a worker who receives 5 rem (0.05 Sv) in a year incurs 10 times as much risk as another worker who receives only 0.5 rem (0.005 Sv).

Thus, in a group of 10,000 people, each exposed to 1 rem (0.01 Sv) of ionizing radiation, and using the risk factor of 4 effects per 10,000 rem (100 Sv) of dose, 4 of the 10,000 people might die from delayed cancer because of that 1 rem (0.01 Sv) dose in addition to the 2,000 normal cancer fatalities expected to occur in that group from all other causes. From an individual perspective, a 1 rem (0.01 Sv) dose may increase an individual worker's chances of dying from cancer from 20 percent to 20.04 percent. If one's lifetime occupational dose is 10 rem (0.1 Sv), the estimate would increase to 20.4 percent. A lifetime dose of 100 rem (1.0 Sv) may increase chances of dying from cancer from 20 to 24 percent. This small increase in cancer risk could be inferred over the lifetime, however it is unlikely that an increased incidence of cancer due to irradiation would be discernible. This is because the normal variability in baseline rates of cancer incidence is much larger than the inferred radiation-associated cancer rates. As a point of reference, according to NUREG–0713, Volume 43, ''Occupational Radiation Exposure at Commercial Nuclear Power Reactors and other Facilities,'' published in 2021, the average measurable dose for radiation workers reported to the NRC was 0.16 rem (0.0016 Sv) for 2021.

(v) Fuel Dispersal

(a) 10 CFR 50.46 and Fuel Dispersal

In 1974, the Atomic Energy Commission (AEC) established ECCS acceptance criteria during postulated loss-of-coolant accidents (LOCAs) in 10 CFR 50.46, ''Acceptance criteria for emergency core cooling systems for light-water nuclear power reactors'' (39 FR 1001; January 4, 1974). The core cooling acceptance criteria in 10 CFR 50.46 were based on the available research, operating experience, and fuel operating conditions applicable to that era. Potential impacts of FFRD phenomena were not understood at that time and were not referenced in 10 CFR 50.46 or the accompanying analysis methods described in appendix K to 10 CFR part 50, ''ECCS Evaluation Models.'' The lack of reference to such phenomena in these regulations may be attributed to the fact that, in the early 1970s, fuel discharge burnups were well below the threshold local burnup (*i.e.,* 55 GWd/MTU) at which FFRD phenomena are now recognized to be a risk. Now that increased enrichment and higher fuel discharge burnups are being contemplated, the NRC is examining the original intent of the rulemaking as well as the current state of knowledge and operational experience to date to develop a performance-based regulatory framework that addresses fuel dispersal in a manner that maintains reasonable assurance of adequate protection of public health and safety.

The acceptance criteria in the original 10 CFR 50.46(b) included limits on peak cladding temperature (PCT) and maximum local oxidation (MLO) in 10 CFR 50.46(b)(1) and (b)(2), respectively, as well as the requirement in 10 CFR 50.46(b)(4) that the core should remain amenable to cooling. As stated in the AEC's 1973 opinion announcing its decision on the 10 CFR 50.46 final rule, the limits on PCT and MLO were intended ''to ensure the zircaloy cladding would remain sufficiently intact to retain the UO_2 fuel pellets in their separate fuel rods and therefore remain in an easily coolable array.'' In other words, these criteria were intended to prevent the fuel from leaving the confines of the cladding.

Regarding the coolability criterion, the AEC envisioned two scenarios that were deemed unacceptable: (1) the ballooning of the cladding to the extent that the coolant passages are blocked and (2) allowing the fuel pellets to fall together into a heap that would be difficult to cool. The 1973 AEC opinion stated that the coolability criterion should be superfluous because of the PCT and MLO criteria, but that the AEC maintained it as a basic objective in view of its fundamental and historical importance. In other words, the objective of the core coolability criterion should not be viewed as different from that of the PCT and MLO criteria. While brittle failure is precluded under the PCT and MLO criteria of 10 CFR 50.46, the AEC understood and accepted that ductile failure (*i.e.,* ballooning and burst) would occur, but it would be limited such that it would not block the coolant flow, as stated in the first unacceptable scenario considered in the formulation of the coolability criterion. Fuel dispersal is typically associated with the ductile failure of cladding encapsulating finely fragmented fuel at local burnups in excess of 55 GWd/MTU. Based on the historical record, the AEC expected the fuel would remain confined by the cladding following ductile failure, as fine fuel fragmentation and dispersal was not a known phenomenon at the time and further would not have been operative at the fuel discharge burnups attained in the early 1970s.

After the AEC's approval of 10 CFR 50.46 in 1973, fuel discharge burnups at operating reactors continued to increase. Fuel fragmentation and relocation were first discovered in the early 1980s, when experiments conducted at several test facilities showed that irradiated fuel could fragment into small pieces during a LOCA and may relocate axially, settling into the ballooned regions. In 1984, the NRC decided to consider the implications of the phenomena in the generic issue (GI) program, specifically as GI–92, ''Fuel Crumbling During LOCA,'' as described in NUREG–0933, ''Resolution of Generic Safety Issues,'' issued September 2021. The NRC found that the known conservatisms in appendix K to 10 CFR part 50 would more than offset the heat generation in the balloon region because of the fragmentation and relocation of fuel in calculations performed under appendix K to 10 CFR part 50.

In the early 1990s, the conclusion of GI–92 was that fuel fragmentation and relocation should be placed no higher than the low priority category of the GI program. This meant that there was insufficient justification for starting a major re-review of existing ECCS performance analyses conducted in adherence to appendix K to 10 CFR part

50. However, there were ongoing efforts to develop and license more realistic (and thus less conservative) ECCS performance models. Therefore, the NRC expected that the ECCS evaluation methodologies would appropriately address fuel fragmentation and relocation in their calculations. As a result, the NRC decided that a separate GI was not necessary, and the issue was later dropped from the GI program in 1995.

Until 2006, there was no expectation from any prior research that fragmentation and relocation into the balloon region could result in the loss of fuel particles through the rupture opening. In 2006, several research tests challenged this assumption. Integral LOCA tests conducted at the U.S. Department of Energy's (DOE's) Argonne National Laboratory on rods up to local burnups of 64 GWd/MTU observed a small amount of fuel loss (about the quantity of one fuel pellet). Since the amount of material was small, this discovery was not thought to be of safety significance. In April 2006, a LOCA test was run in the Halden Reactor Project in Norway on a fuel rod segment with a very high local burnup of 91.5 GWd/MTU. Results from this test showed gross loss of fuel material from above the rupture opening. In this very-high-burnup fuel specimen, more than 40 percent of the fuel material was in a nearly powdered form, as described in NUREG–2121, ''Fuel Fragmentation, Relocation, and Dispersal During the Loss-of-Coolant Accident,'' issued March 2012.

In 2008, the NRC's Office of Nuclear Regulatory Research (RES) issued Research Information Letter (RIL)–0801, ''Technical Basis for Revision of Embrittlement Criteria in 10 CFR 50.46,'' dated May 30, 2008, which discussed research findings in the area of high-burnup fuel performance during postulated LOCAs. The RIL–0801 noted that additional research on fuel dispersal was being conducted but concluded that ''the current NRC burnup limit of 62 GWd/MTU (average for the peak rod) is probably low enough to prevent significant fuel loss during a LOCA.'' The RIL–0801 recommended rulemaking be pursued to revise the criteria in 10 CFR 50.46(b) to account for high burnup phenomena that may cause the current criteria to be non-conservative.

In 2012, the NRC published NUREG–2121 to capture the state of knowledge and history of FFRD as of that time. NUREG–2121 concluded that additional experimental research was needed to quantify the extent and downstream effects of fuel dispersal. Additionally in SECY–15–0148, ''Evaluation of Fuel Fragmentation, Relocation and Dispersal Under Loss-of-Coolant Accident (LOCA) Conditions Relative to the Draft Final Rule on Emergency Core Cooling System Performance During a LOCA (50.46c),'' dated November 30, 2015, the staff concluded that there was ''no imminent safety concern'' for operating reactors with respect to FFRD and that the 10 CFR 50.46c rulemaking should not be delayed to address FFRD. The SECY paper also stated that additional research was ongoing, and that future regulatory action could be initiated, if needed, to address FFRD after more research was conducted.

In December 2021, RES published RIL 2021–13, ''Interpretation of Research on Fuel Fragmentation, Relocation, and Dispersal at High Burnup,'' to inform the NRC's Office of Nuclear Reactor Regulation about RES's interpretation of the FFRD research to date. In RIL 2021–13, the staff defines conservative empirical boundaries for FFRD-related phenomena, such as the amount of fuel that is expected to be dispersed during a LOCA. Additionally, RIL 2021–13 identifies data gaps associated with FFRD-related phenomena. While the models in RIL 2021–13 can be used to estimate the potential mass of fuel that could be dispersed to the coolant, that RIL does not attempt to address the consequences of fuel dispersal into the coolant. To fully characterize such consequences, the NRC needs to better understand the behavior of dispersed fuel particles in the coolant and their impact on core coolability and safety under LOCA conditions that may involve significant core geometry changes due to rod ballooning, significant and varying single- and two-phase core flows, and dynamic LOCA loads. The NRC is involved in several collaborative domestic and international research programs, such as the Studsvik Cladding Integrity Project, which are, in part, addressing some of the data gaps presented in RIL 2021–13. Additionally, the NRC sponsored a phenomena identification and ranking table (PIRT) exercise concerning the consequences of fuel dispersal. The findings of the expert PIRT panel are documented in NUREG/CR–7307, ''Phenomena Identification and Ranking Tables on High Burnup Fuel Fragmentation, Relocation, Dispersal, and Its Consequences for Design-Basis Accidents in Pressurized- and Boiling-Water Reactors,'' and have informed DG–1434, ''Addressing the Consequences of Fuel Dispersal in Light-Water Reactor Loss-of-Coolant Accidents,'' which is being issued for comment with this proposed rule. The PIRT will also help inform future research efforts and NRC review of applications that may evaluate FFRD.

In 2022, in SRM–SECY–21–0109, as part of its approval of the staff's plan to begin this increased enrichment rulemaking, the Commission directed that FFRD should be appropriately addressed and analyzed in the rulemaking's regulatory basis. The NRC considered several alternatives in the regulatory basis, along with other options received in the public comments on the regulatory basis, in developing the following path forward to addressing FFRD.

(b) 10 CFR 50.46a Rulemaking

In 2010, the staff sent to the Commission for approval via SECY–10–0161, ''Final Rule: Risk-Informed Changes to Loss-of-Coolant Accident Technical Requirements (10 CFR 50.46a) (RIN 3150–AH29),'' a draft final rule that would have created alternative ECCS requirements in 10 CFR 50.46a. The rule would have divided the current spectrum of LOCA break sizes into two regions. The division between the two regions would have been delineated by the transition break size (TBS). The first region included small breaks, up to and including the TBS. The second region included breaks larger than the TBS, up to and including the double-ended guillotine break (DEGB) of the largest reactor coolant system (RCS) pipe. The likelihood of these larger breaks is much lower than the smaller breaks in the first region, which was used to support a different regulatory treatment for the larger breaks.

In this rulemaking, the NRC proposes to build on the 10 CFR 50.46a rulemaking as a means of analytically resolving FFRD issues. The analytical margins gained from the treatment of large-break LOCAs as beyond-design-basis are expected to eliminate or greatly reduce the calculated quantity of fuel dispersal, as described in section XXXVI.F.(ii), ''Original Determination of the Transition Break Size,'' of this document. While the NRC has attempted to update this proposed rule with information available since SECY–10–0161 was issued, the NRC expects stakeholders will provide significant additional information in their comments on this proposed rule that could support the NRC further risk-informing these aspects of the rule.

(c) 10 CFR 50.46c Rulemaking and Cladding Embrittlement Research Findings

In 2016, the staff sent to the Commission for approval via SECY–16–

0033 a draft final rule to create 10 CFR 50.46c. The draft final rule would have established performance-based regulatory requirements for determining the acceptability of an ECCS for a nuclear power reactor. Similar to existing regulations in 10 CFR 50.46, the draft ECCS performance requirements in 10 CFR 50.46c were largely based upon acceptance criteria for fuel rod cladding performance. The final rule would have expanded the applicability of the 10 CFR 50.46 acceptance criteria from only uranium oxide pellets within cylindrical zircaloy or ZIRLO™ [1] cladding to any LWR fuel, regardless of fuel design or cladding material. The draft final rule also incorporated improved performance-based requirements to address research findings on fuel cladding integrity and degradation mechanisms that were described in RIL–0801.

The Commission returned the 10 CFR 50.46c draft final rule to the staff in SRM–SECY–16–0033, ''Staff Requirements—SECY–16–0033—Draft Final Rule—Performance-Based Emergency Core Cooling System Requirements and Related Fuel Cladding Acceptance Criteria,'' on April 11, 2024. In this SRM, the Commission stated that the staff should reconsider the topics presented in the 10 CFR 50.46c draft final rule and provided the following directions:

1. The staff should apply an appropriate risk-informed regulatory approach to address the research findings on cladding embrittlement effects under LOCA conditions described in SECY–16–0033.

2. The staff should evaluate Item 1 with other associated technical issues being addressed, such as FFRD and risk-informed treatment of LOCAs, including the 10 CFR 50.46a draft final rule.

3. The staff should evaluate whether specific ECCS criteria such as cladding temperature should be codified or instead addressed in regulatory guidance.

This rulemaking proposes to leverage the previously proposed performance-based approach to ECCS requirements, including the expanded applicability to advanced fuels, and incorporate the embrittlement research findings from the 10 CFR 50.46c draft final rule into the new voluntary 10 CFR 50.46a proposed rule and associated guidance. The following discussion describes the embrittlement research findings that the 10 CFR 50.46c draft final rule planned to address and that this rulemaking proposes to address.

[1] ZIRLO is a registered trademark of Westinghouse Electric Company LLC.

All licensees who adopt the new voluntary 10 CFR 50.46a proposed rule would address the embrittlement research findings through their updated analyses and associated acceptance criteria. The NRC would continue to conduct annual safety assessments for licensees that do not choose to adopt the new requirements to confirm reasonable assurance of adequate protection. After the completion of this rulemaking, the NRC would continue to consider whether any new regulatory requirements are needed for these licensees that do not adopt proposed 10 CFR 50.46a because the research findings show that the current criteria may not always ensure that the fuel cladding remains ductile after the reactor is reflooded, referred to as post-quench ductility (PQD). The NRC expects that its assessment of further actions would consider (1) the resource needs for and results of the ECCS annual safety assessments, (2) the industry's plans for adoption of 10 CFR 50.46a, and (3) whether there is a safety basis for additional requirements beyond the promulgation of this voluntary alternative proposed rule. If the majority of the industry adopts 10 CFR 50.46a, then little to no future regulatory action may be needed to resolve these matters.

1. Overview of Cladding Embrittlement Research Findings

Since 1997, the NRC has undertaken a fuel cladding research program to investigate the behavior of high-exposure fuel cladding under accident conditions. This research program included an extensive LOCA research and testing program at Argonne National Laboratory, as well as jointly funded programs at the Kurchatov Institute (supported by the French Institute for Radiological Protection and Nuclear Safety and the NRC) and the Halden Reactor Project (a jointly funded program under the auspices of the Organization for Economic Cooperative Development—Nuclear Energy Agency, sponsored by national organizations in 18 countries). The effects of both alloy composition and fuel burnup on cladding embrittlement (*e.g.,* loss of ductility) under accident conditions were studied in these research programs. The research programs identified new cladding embrittlement mechanisms that were not previously known and expanded the NRC's knowledge of previously identified mechanisms.

2. Major Research Findings Cladding Embrittlement

These research findings have been summarized in RIL–0801, and the detailed experimental results from the program at Argonne National Laboratory are contained in NUREG/CR–6967, ''Cladding Embrittlement during Postulated Loss-of-Coolant Accidents,'' dated July 31, 2008. Since the publication of NUREG/CR–6967 and RIL–0801, additional testing was conducted related to the embrittlement phenomenon, which has been documented in supplemental reports. Where the additional testing relates to conclusions and recommendations in RIL–0801, RIL–0801 has been supplemented to reference the additional reports and incorporate findings (''Update to Research Information on Cladding Embrittlement Criteria in 10 CFR 50.46,'' dated December 29, 2011).

i. Hydrogen-Enhanced Beta-Layer Embrittlement

In current 10 CFR 50.46, the preservation of cladding ductility, via compliance with regulatory criteria on PCT (10 CFR 50.46(b)(1)) and local cladding oxidation (10 CFR 50.46(b)(2)), provides a level of assurance that fuel cladding will not experience gross failure and that the fuel rods will remain within their coolable lattice arrays. The 1997–2016 LOCA research program, as summarized in NUREG/CR–7219, ''Cladding Behavior During Postulated Loss-of-Coolant Accidents,'' identified new cladding embrittlement mechanisms that demonstrated that the current combination of PCT (2200 degrees Fahrenheit (°F) (1204 degrees Celsius (°C)) and local cladding oxidation (17 percent equivalent cladding reacted (ECR)) criteria may not always ensure PQD. As explained in section 1.5 of NUREG/CR–7219, oxygen diffusion into the base metal under LOCA conditions promotes a reduction in the thickness (referred to as beta-layer thinning) and ductility (referred to as beta-layer embrittlement) of the metallurgical structure within the cladding that provides its macroscopic mechanical behavior. The presence of hydrogen within the cladding accelerates this embrittlement process. Hydrogen is produced from the corrosion of zirconium in water, some of which is absorbed by the cladding, which is frequently referred to as ''hydrogen pickup.''

The NRC's cladding embrittlement program did not investigate cladding degradation mechanisms or develop the technical basis for performance-based

requirements beyond the existing 2200 °F (1204 °C) PCT criterion. Examples of degradation mechanisms beyond cladding embrittlement (via oxygen diffusion) include excessive exothermic metal-water reaction, alloy-specific eutectics, and loss of fuel rod geometry due to plastic deformation. As a result, the existing 2200 °F (1204 °C) limit remains an upper limit on PCT for zirconium-based alloys. However, as reflected in this embrittlement criterion in DG–1263, ''Establishing Analytical Limits for Zirconium-Based Alloy Cladding,'' and based on the results of the fuel cladding research program, a lower PCT may be required to preserve ductility. Although the 2200 °F (1204 °C) limit in 10 CFR 50.46 remains unchanged in this rulemaking, the acceptance criteria in proposed 10 CFR 50.46a would establish a requirement to address cladding degradation phenomena, which would include cladding embrittlement. The 2200 °F (1204 °C) temperature is proposed as an acceptable limit in DG–1263 rather than codified in 10 CFR 50.46a.

ii. Oxygen Ingress From Cladding Inside Diameter

As explained in section 1.5.6 of NUREG/CR–7219, oxygen sources may be present on the inner surface of irradiated cladding due to gas-phase uranium trioxide transport prior to gap closure, fuel-cladding-bond formation (uranium dioxide in solid solution with zirconium dioxide), and the fuel bonded to this layer. Under LOCA conditions, this available oxygen may diffuse into the base metal of the cladding, which could cause the cladding to become more brittle.

iii. Breakaway Oxidation

As explained in section 1.5.5 of NUREG/CR–7219, zirconium dioxide can exist in several crystallographic forms, or allotropes. During normal operation, the zirconium dioxide layer that develops has a monoclinic crystallographic structure, which is neither fully dense nor fully protective. During LOCA conditions, the monoclinic oxide will transform to a tetragonal structure, and the oxide that newly forms under LOCA conditions is also tetragonal. The tetragonal oxide is dense, adherent, and protective against hydrogen pickup. However, there are conditions, both mechanical (*e.g.,* local regions of tensile stress) and chemical (*e.g.,* impurities at the metal surface), that promote a transformation of the zirconium dioxide from the tetragonal back to the monoclinic phase. The tetragonal-to-monoclinic transformation is an instability that initiates at local regions of the metal-oxide interface and grows rapidly throughout the oxide layer. Because this transformation results in an increase in oxidation rate, it is referred to as breakaway oxidation. Along with this increase in oxidation rate resulting from cracks in the monoclinic oxide, significant hydrogen pickup also occurs. Hydrogen that enters in this manner during a LOCA transient promotes rapid embrittlement of the cladding.

While all zirconium alloys will eventually experience breakaway oxidation when exposed to long enough durations of high-temperature steam oxidation, the fuel cladding research program demonstrated that alloying composition and manufacturing process (*e.g.,* surface roughness) influence the timing of this phenomenon.

iv. Applicability of Ductility-Based Analytical Limits to Burst Region

During a postulated LOCA, a portion of the fuel rod population may be predicted to experience fuel rod ballooning and cladding rupture as a result of rapid depressurization of the RCS in combination with elevated cladding temperature. The number of burst rods depends on several variables including initial conditions (*e.g.,* fuel rod design, rod internal pressure, rod power) and accident conditions (*e.g.,* LOCA break size, cladding temperature). A burst section of the fuel rod may experience degradation mechanisms beyond oxygen diffusion embrittlement encountered in the remaining portions of the fuel rod, including significant amounts of hydrogen uptake from steam entering the fuel rod through the rupture.

To investigate the mechanical behavior of ruptured fuel rods, the NRC conducted testing, designed to result in the ballooning and burst of as-fabricated and hydrogen-charged cladding specimens and high-burnup fuel rod segments exposed to high-temperature steam oxidation followed by rapid cooling by liquid water, or quench. The research results and conclusions are documented in the NUREG–2119, ''Mechanical Behavior of Ballooned and Ruptured Cladding.'' This testing confirms that continued exposure to a high-temperature steam environment weakens the already flawed region of the fuel rod surrounding the cladding rupture. Hence, limitations on PCT and integral time-at-temperature are necessary to preserve an acceptable amount of mechanical strength and fracture toughness to maintain a coolable fuel geometry. Integral time-at-temperature is related to the time spent at the elevated temperatures seen during the LOCA and typically expressed in terms of the ECR. In addition, the research demonstrated that the degradation in strength and fracture toughness with prolonged exposure to steam oxidation was increased with pre-existing cladding hydrogen content.

These research findings have been summarized in RIL–0801, and the detailed experimental results from the program at Argonne National Laboratory are contained in NUREG/CR–6967, ''Cladding Embrittlement during Postulated Loss-of-Coolant Accidents,'' dated July 31, 2008. Since the publication of NUREG/CR–6967 and RIL–0801, additional testing was conducted related to the embrittlement phenomenon, which has been documented in supplemental reports. Where the additional testing relates to conclusions and recommendations in RIL–0801, RIL–0801 has been supplemented to reference the additional reports and incorporate findings (''Update to Research Information on Cladding Embrittlement Criteria in 10 CFR 50.46,'' dated December 29, 2011).

These research findings presented the NRC with two options for revising the fuel performance requirements: (1) establish a separate performance requirement within the burst region (*i.e.,* analytical limits that preserve sufficient fracture toughness to ensure burst region survival), or (2) apply the hydrogen-based embrittlement analytical limits to the entire fuel rod.

In the absence of a credible analysis of loads, cladding stresses, and cladding strains for a core degraded by LOCA conditions, there are no absolute metrics to determine how much ductility or strength would be needed to provide assurance that fuel rod cladding would maintain its geometry during and following post-LOCA quench. It is also not clear what impact breakage of some fuel rods into two pieces, owing to potential loads following a hypothetical LOCA, would have on core coolability. Fragmentation of fuel rod cladding would be more detrimental to core coolability than severance of rods into two pieces. Even minimal ductility ensures that cladding will have high strength and toughness and, therefore, high resistance to fracturing. Brittle cladding, on the other hand, might fail at low strength and shatter. Therefore, the intent to maintain ductility is beneficial even with limited knowledge of LOCA loads. The research documented in NUREG–2119 showed that if wall thinning and double-sided oxidation are accounted for, then hydrogen-based embrittlement limits, such as the limit provided in Figure 2

of DG–1263, are sufficient to ensure reasonable behavior of the ballooned and ruptured region.

Therefore, the NRC elected to propose a revision to the fuel performance requirements by applying a single performance-based criterion to the entire fuel rod. This decision recognizes that portions of the cladding within the burst region may not maintain ductility. This position is reflected in DG–1263 and supported by the technical basis documented in NUREG–2119.

D. Regulatory Basis

The NRC published the regulatory basis to support a rulemaking for the ''Increased Enrichment of Conventional and Accident Tolerant Fuel Designs for Light-Water Reactors'' in the **Federal Register** on September 8, 2023 (88 FR 61986). In the regulatory basis, the NRC presented draft recommendations that focused on those requirements needed for LWR high-assay, low-enriched uranium fuel, specifically with approved conventional or ATF designs. The NRC requested public comment on these recommendations and asked specific questions associated with the identified regulatory topics. The NRC concluded that there was sufficient regulatory basis to proceed with rulemaking to address the regulatory issues associated with the use of fuel enriched to greater than 5.0 weight percent U–235. The NRC held a public meeting on October 25, 2023, to discuss the regulatory basis and issued a summary of the meeting on November 21, 2023.

The public comment period for the regulatory basis closed on January 22, 2024. The NRC received 15 public comment submissions on the regulatory basis, which are available for review at *www.regulations.gov* under Docket ID NRC–2020–0034. Table 1 of this document provides ADAMS references for these public comment submissions. Section XXXVI.F.(xiv), ''Discussion of Public Comments on the Fuel Dispersal Aspects of the Regulatory Basis,'' of this document includes the NRC's summaries of, and responses to, the comments that the NRC used to inform the development of this proposed rule and the draft regulatory analysis.

BILLING CODE 7590–01–C

XXXVI. Discussion—Increased Enrichment of Conventional and Accident Tolerant Fuel Designs for Light-Water Reactors

This proposed rule would amend the current regulations related to the use of conventional and accident tolerant LWR fuel designs. From interactions with stakeholders, the NRC is aware that licensees and applicants plan to request higher fuel burnup limits (*i.e.,* above 62 GWd/MTU rod average) along with the deployment of ATF concepts. To achieve higher burnup limits, licensees and applicants would need to request increases in fuel enrichment above the current standard of 5.0 weight percent U–235.

One of the NRC's goals in this rulemaking is to establish effective and efficient licensing of applications using fuels enriched to greater than 5.0 weight percent U–235, including reducing the need for requests for exemptions from existing regulations, while continuing to provide reasonable assurance of adequate protection of public health and safety.

The NRC proposes revising requirements in six technical areas.

A. Criticality Accident Requirements in 10 CFR 50.68

The NRC proposes to amend 10 CFR 50.68(b)(7) to allow licensees or applicants that comply or propose to comply with that section's criticality safety requirements to enrich their fuel beyond the current limit of 5.0 weight percent U–235. Each licensee or applicant would have the option between the existing 5.0 weight percent U–235 enrichment limit or the value specified in their OL. The enrichment limit is most often specified as a technical specification design feature as defined in 10 CFR 50.36(c)(4) and is currently part of generic standard technical specifications for various reactor technologies, as described in section XXXV.C.(i), ''10 CFR 70.24 and 10 CFR 50.68 Criticality Accident Requirements,'' of this document.

The proposed change would not affect safety. Licensees and applicants electing higher enrichments would be required to ensure the same minimum margin to subcriticality that is required for licensees implementing 10 CFR 50.68 with fuel enriched up to 5.0 weight percent U–235. Maintaining these margins of safety would be accomplished by applying the same keff safety limits for higher enriched fuels as for fuel enriched up to 5.0 weight percent U–235. Licensees or applicants that would seek to implement the requirements of 10 CFR 50.68 while using fuel enriched above 5.0 weight percent U–235 would need to submit for NRC review and approval a fuel transition license amendment request. These requests would need to include calculations that show that the new and spent fuel storage applications demonstrate compliance with the keff safety limits specified in 10 CFR 50.68.

The proposed revision also would meet one of the purposes of this rulemaking: allow a licensee the option to implement fuel enriched to greater than 5.0 weight percent U–235 without requiring the licensee to seek specific exemptions from 10 CFR 50.68 requirements.

This change would not result in any significant radiological consequences that could impact plant workers or members of the public. While increased enrichment would add more radioactive material to the spent fuel pool, this increase would not change the anticipated dose rates for occupational dose to workers in and around the fuel storage areas or for members of the public beyond the site boundary because the material in the pool is completely shielded by water.

The keff safety limits specified in 10 CFR 50.68(b)(2), (3), and (4) would be maintained at their current levels with the same required probability and confidence levels. The feasibility study contracted by the NRC, ORNL/TM–2024/3350, ''Scoping Studies on the Impacts of Increased Enrichment on Nuclear Criticality Safety,'' May 2024, indicates that existing fuel technologies, like integral fuel burnable adsorber coatings and gadolinium burnable poisons, should be able to maintain compliance with 10 CFR 50.68 requirements for the entire range of low enriched uranium (*i.e.,* up to 19.75 weight percent U–235). However, if the increased enrichment were to adversely impact the subcriticality requirements, then additional modifications to the fuel storage facilities would be required to restore compliance.

The NRC received several comments on the regulatory basis that suggested that the NRC revise RG 1.240, ''Fresh and Spent Fuel Pool Criticality Analyses,'' in coordination with any changes to 10 CFR 50.68. In March 2021, the NRC issued RG 1.240, which endorses NEI 12–16, Revision 4, ''Guidance for Performing Criticality Analyses of Fuel Storage at Light-Water Reactor Power Plants,'' dated September 2019. The NRC reviewed this guidance during the development of the regulatory basis and determined that neither RG 1.240 nor NEI 12–16, Revision 4 is specifically dependent on enrichment levels, whether at the current levels or those considered in this proposed rule. During this review, the NRC also noted that RG 1.240, section C.1.o specifies that the document's recommendations are based on existing fuel applications currently in widespread industry use, and that new and novel configurations and concepts implemented in the future may require additional justification for continued use of the assumptions and recommendations. However, the NRC did not identify any cases where the regulatory guidance would not be applicable to the enrichment levels being considered in this proposed rule. Further, licensees may provide any necessary justification as part of license amendment requests. Therefore, the NRC concluded that the guidance does not need to be immediately updated as a part of this rulemaking effort. The NRC observes that future revisions of RG 1.240 desired by industry stakeholders should be pursued separately under the standard regulatory guide maintenance and revision process.

B. Uranium Fuel Cycle Environmental Data—Table S–3 in 10 CFR 51.51

The NRC proposes to provide a regulatory justification in 10 CFR 51.51(b) for the use of table S–3 for fuel enrichment up to 20.0 weight percent U–235. This rulemaking action is predicated on the information provided by current LWR licensees to use enriched nuclear fuel of up to 10.0 weight percent U–235 and by new reactor developers to use high-assay low enriched uranium with enrichment levels greater than 10.0 weight percent U–235 and less than 20.0 weight percent U–235. The regulatory justification would be included in a proposed amendment of 10 CFR 51.51(b), table S–3, note 1. Specifically, note 1 would be amended to add a discussion of NUREG–2249, ''Generic Environmental Impact Statement for Licensing of New Nuclear Reactors—Final Report,'' for the environmental effects of up to 20.0 weight percent U–235 on the uranium fuel cycle as still bounded by table S–3, and text explaining the rationale for the addition of this document. NUREG–2249 discusses the High-Assay Low-Enriched Uranium (HALEU) Availability Program under the DOE with the direction to secure a domestic supply of HALEU fuel following the Energy Act of 2020. As outlined in NUREG–2249 section 3.14.1.3, DOE has identified and contracted with partners for enrichment services for the production of HALEU as UF_6. Additionally, DOE has identified and contracted with partners for deconversion of HALEU stored as UF_6 to other chemical forms (*i.e.,* metal or oxide) for fuel fabrication purposes. The DOE HALEU Availability program is ongoing and has produced the first quantities of HALEU with further expansion of production capacities expected over the next several years. NUREG–2249 concludes that for the enrichment of uranium, table S–3 would bound the environmental impacts from a centrifuge enrichment facility to produce HALEU and the impact would be SMALL.

Note 1 would also be amended to add a reference to NUREG–2266, ''Environmental Evaluation of Accident Tolerant Fuels with Increased Enrichment and Higher Burnup Levels,'' for the environmental effects of up to 80,000 MWd/MTU maximum assembly averaged burnup as still bounded by table S–3, and text explaining the rationale for the addition of this document. This is because the analysis in WASH–1248 was based on 12-month refueling cycles and lower enrichment and burnup levels than are used for the

current fleet of LWRs. The higher burnup levels achieved since issuance of WASH–1248 result in greater utilization of the uranium fuel (*i.e.,* greater efficiency in extracting energy from the fuel). This also has resulted in extended time between refueling operations and the removal of fewer fuel assemblies on a per reactor-year basis for many of the operating nuclear power plants. Deployment and use of nuclear fuels with increased enrichment and higher burnup levels would result in further increases in fuel efficiency in extracting energy, resulting in further reductions in the number of spent nuclear fuel assemblies removed during refueling operations and further extending the time between refueling operations. Thus, the use of nuclear fuels with increased enrichment and higher burnup levels would reduce the annual nuclear fuel needs to support refueling to below the figures that were used in the analysis supporting Table S–3.

C. Environmental Effects of Transportation of Fuel and Waste—Table S–4 in 10 CFR 51.52

The NRC proposes to permit the use of table S–4 of 10 CFR 51.52 for fresh nuclear fuel shipments with increased enrichment up to 8.0 weight percent U–235 by applying the supporting transportation analysis from NUREG–2266. The maximum enrichment level in the supporting core analysis relied upon in NUREG–2266 went as high as 8.0 weight percent U–235. This proposed amendment would include a change to the enrichment and burnup conditions under 10 CFR 51.52(a), adding a new note 2 to table S–4 along with moving the current note 2 to note 3, and adding a new note 4 to table S–4 to replace the current note 3. The transportation analyses in NUREG–2266 would be referenced in table S–4, note 2, with text explaining the rationale for the addition of this document for addressing this enrichment level as well as a level of burnup of up to 80,000 MWd/MTU for UO_2 fuel. Any licensing action with enrichments above 8.0 weight percent U–235 would have to be addressed on a case-by-case basis, in accordance with 10 CFR 51.52(b), by providing a full description and detailed analysis of the environmental effects of the transportation of fuel and waste. The methodology in NUREG–2266, section 3, ''Transportation,'' could be applied for such a detailed analysis. Note 2 would also include the environmental effects of burnup levels of up to 133,000 MWd/MTU for TRISO fuel as still bounded by table S–4.

This rulemaking also proposes revisions and updates to 10 CFR 51.52(a), (b), and (c), which provide for the evaluation of the environmental impacts of transportation of fuel and waste to and from the reactor for LWRs. Reactors other than light-water-cooled nuclear power reactors (*i.e.,* non-LWRs) will utilize the same uranium fuel cycle as LWRs with the transportation of material between uranium fuel cycle stages plus transportation to and from the nuclear power plant. The transportation of fuel to and waste from non-LWRs, like transportation of fuel and waste for LWRs, is necessary to support the operation of the plant. Therefore, the environmental impacts of transportation, regardless of whether for an LWR or non-LWR, must be assessed by the NRC. Similarly, the NRC's regulations in 10 CFR 51.50(b)(3) and (c) already provide for the evaluation of the environmental impacts of the uranium fuel cycle for non-LWRs. To ensure there is regulatory clarity for the transportation of non-LWR fuel and waste in a similar manner as there is for the uranium fuel cycle for non-LWRs, and for the transportation of fuel and waste for LWRs and non-LWRs, the words ''other than light-water-cooled nuclear power reactors'' from 10 CFR 51.50(b)(3) and (c), would be added to the introductory paragraph of 10 CFR 51.52 and 10 CFR 51.52(b).

The NRC also proposes to update the information in paragraph (c), table S–4, to the current conditions for the transportation of radioactive material and the impacts important to such transportation. The transportation weight values would be adjusted for trucks to the current U.S. Department of Transportation regulations of 80,000 lb per truck (23 CFR part 658, ''Truck Size and Weight, Route Designations—Length, Width and Weight Limitations'') and for rail cars to 240 tons per cask per rail car based on DOE information on the developed Atlas spent fuel rail car (DOE Article, ''New Railcar Designed to Transport Spent Nuclear Fuel Cleared for Operation,'' June 4, 2024). The NRC also would remove the cumulative dose values from table S–4 because this information is redundant to the exposed individual doses also being provided in table S–4 and is a very small fraction of the average natural background annual radiation exposure of 310 millirem (0.0031 Sv) per person. For example, the 1,469,000 persons along the route for the updated table S–4 would receive on an annual basis approximately 1469 person-rem from natural radiation sources. Thus, the 3 or 4 person-rem in the current table S–4 would only add the insignificant amount of approximately 0.3 percent of additional cumulative radiation exposure from the transportation of fuel and waste for the 1,469,000 persons along the route for all annual shipments.

The $475 property damage per reactor year would be removed from table S–4 because this value dates back to 1972 in appendix C of WASH–1238, the risk of a transportation accident is very small as shown in NUREG–2266, and there has not been a radiological transportation accident in the United States that would have resulted in property damage greater than the amount of damages from a commercial hazardous material transportation accident. If necessary, to determine the property damage risk from transportation accidents, the same methodology in appendix C of WASH–1238 can be applied on a case-by-case basis by assessing the annual shipment miles multiplied by the probability of an accident per mile and multiplied by the average worth of property damage per accident with property damage in that year.

D. Fissile Material Packaging Requirements in 10 CFR 71.55

The NRC proposes to increase the allowable enrichment range in its fissile packaging requirements through a graded approach and include an additional design requirement for enrichment levels from 5.0 to 10.0 weight percent U–235 to enable the use of the exception in 10 CFR 71.55(g) and remove the requirement to consider water in-leakage. The existing 5.0 weight percent U–235 enrichment limitation is based on standard industry and worldwide practice rather than a calculated effect on criticality of moderator in-leakage for UF_6 enriched to this level. Because the basis for approval of the exception relies on the performance requirement for the cylinder during the specified tests in 10 CFR 71.73, ''Hypothetical accident conditions,'' the NRC has concluded that the addition of a design feature (*e.g.,* valve protection device) of the individual cylinders containing UF_6 with enrichments greater than 5.0 weight percent U–235 would be consistent with the current performance-based requirements contained in 10 CFR 71.55(g) as well as risk insights gained from operational experience. This design enhancement requirement would provide additional defense-in-depth against water in-leakage that considers the relative consequences of an inadvertent criticality as a function of increasing enrichment level.

The NRC considered including in the proposed rule enrichments between 10.0 weight percent U–235 up to but less than 20.0 weight percent U–235. Although the NRC could consider additional prescriptive and non-technology inclusive defense-in-depth design requirements to mitigate the increasing risk of a criticality event as a function of this range of enrichment levels, the NRC could not formulate a technical or regulatory justification for providing a redundant, prescriptive, and non-technology inclusive exception from 10 CFR 71.55(b), which was already functionally present in 10 CFR 71.55(c) for all fissile material transportation packages. The provisions in 10 CFR 71.55(c) could be used to achieve the same desired regulatory outcome, including enrichments for UF_6 packages up to but less than 20.0 weight percent U–235, while maintaining the principles of good regulation of efficiency, clarity, and reliability.

This proposed amendment to 10 CFR 71.55(g) differs from the regulatory basis recommendation to not pursue a change in the regulations. Part of the rationale for that recommendation was based on the staff's assumption that the rule change would be cost-neutral based on only rulemaking and licensing costs. However, that analysis did not consider indirect shipping costs to the industry, an exclusion that the nuclear industry, in comments on the regulatory basis, described as a departure from the principles of good regulation. The NRC received public comments on the regulatory basis that demonstrated that there was sufficient net positive effect for fuel enrichment facilities and fuel fabricators to consider a rulemaking approach that would be cost-beneficial and maintain adequate protection of the public health and safety.

During the development of the regulatory basis for this proposed rule, the nuclear industry and the NRC identified that a change to 10 CFR 71.55(g) could create a misalignment with U.S. Department of Transportation and IAEA standards. The American National Standards Institute (ANSI) was in the process of revising its N14.1 standard, ''Nuclear Materials–Uranium Hexafluoride–Packagings for Transport'' (ANSI N14.1), when the regulatory basis was developed. The standard ANSI N14.1 was subsequently finalized, and its incorporation into U.S. Department of Transportation regulations will likely remove any potential misalignment that was identified in the regulatory basis. Specifically, ANSI N14.1 maintains a reference to a 5.0 weight percent U–235 limit but now allows for additional flexibility to the regulatory authority to make the final safety determination independent of an enrichment limit. In addition, future routine harmonization activities for transportation regulations with the IAEA will also likely remove any misalignment.

E. Control Room Requirements in 10 CFR 50.67 and GDC 19

This proposed rule would increase the numerical value of the control room design criteria from 5 rem to 10 rem (0.05 to 0.10 Sv); the value may range up to 25 rem (0.25 Sv) TEDE with consideration of the plant-specific risk profile or risk information. Increasing this value would support increased fuel enrichments and the expected associated increases in power levels and fuel burnup by preserving operational flexibility by providing additional safety margin and avoiding occupational exposures. In addition, the NRC would make minor editorial changes to 10 CFR 50.67 to remove the term ''total effective dose equivalent'' after the abbreviation ''TEDE'' is provided for that term.

Comments on the regulatory basis document indicated potential misunderstanding and concern about potential outcomes resulting from the proposal to amend the control room design criteria. Although the control room design criteria are distinct from operational dose limits, the NRC recognizes the two concepts share some similarities. Specifically, both the operational occupational exposure limit in 10 CFR part 20 and the control room design criteria are numerically equivalent and use the same unit of ''rem TEDE.'' As part of this rulemaking effort, the NRC attempts to clearly explain that the proposed changes would only be to the control room design criterion and would not change normal operational and emergency exposure limits of 10 CFR part 20.

The NRC recognizes the challenges that licensees face to retain margin within their licensing bases for the purposes of operational flexibility and the small amount of margin to the control room design criteria itself. The key driver behind the proposal to amend the control room design criteria is to facilitate increased regulatory efficiency and consistency while continuing to provide adequate protection of public health and safety. An unjustifiably low design criteria could unnecessarily burden licensees for seeking increased enrichments by requiring extensive analyses to preserve margin for operational flexibility purposes. As discussed in section XXXV.C.(iv), ''Appendix A to 10 CFR part 50 (General Design Criterion 19) and 10 CFR 50.67(b)(2)(iii),'' of this document, these analyses do not necessarily result in safety benefits and can increase actual operational exposure to workers due to increased maintenance activities.

The proposed numerical value of the control room design criteria in 10 CFR 50.67 and GDC 19 would increase from 5 to 10 rem (0.05 to 0.10 Sv) with a consideration of the plant-specific risk profile or risk information. Nuclear power reactor licensees would benefit from a higher, and safe, performance level between 5 and 10 rem (0.05 and 0.10 Sv) TEDE when implementing advanced nuclear fuel technologies and operational flexibility. If additional operational flexibilities are needed beyond 10 rem (0.10 Sv) TEDE, facility-specific risk profile or risk information can be leveraged to justify a higher numerical value up to 25 rem (0.25 Sv) TEDE.

Under the current regulations in 10 CFR 20.1201 and 20.1206, an adult worker can receive radiation exposure of up to 10 rem (0.10 Sv) TEDE within a single calendar year or over a 12-month period straddling two calendar years under normal operations. The control room design criterion of 5 rem (0.05 Sv) TEDE, which is intended to assess the acceptability of a given control room design for a potential reactor accident of exceedingly low probability, is at least a factor of two lower than what is found to be acceptable under normal operations. Thus, the proposed rule increase in the control room design criterion to 10 rem (0.10 Sv) TEDE would be consistent with the Commission's current regulations for normal operations.

The proposed rule would enable a higher control room design criteria, ranging from 10 to 25 rem (0.10 to 0.25 Sv) TEDE, for licensees whose facility-specific risk profiles warrant them. This range is consistent with recommendations from national and international organizations responsible for radiation protection standards. These recommendations are based on fundamental modern health physics and radiation epidemiology knowledge. These organizations generally recommend emergency exposure doses up to 25 rem (0.25 Sv) TEDE or 50 rad (0.5 gray) whole body. Thus, the proposed control room design criterion of 10 rem (0.10 Sv) TEDE intended to assess the acceptability of a given control room design for a potential reactor accident of exceedingly low probability is generally bounded by recommended values to protect against radiation exposure during an accident. As described in section XXXV.C., ''Background and History of Affected

Regulations,'' of this document, updated scientific recommendations for radiation protection for workers under accident and emergency conditions help form the technical basis for the proposal to increase the control room design value from 5 rem (0.05 Sv) TEDE originally based on the occupational exposure limit in 10 CFR part 20.

The upper range of the proposed numerical values would be consistent with the Commission's use of the 25 rem (0.25 Sv) TEDE limit primarily in regulations for power reactor siting to protect the public during emergencies, as specified in 10 CFR 100.11, ''Determination of exclusion area, low population zone, and population center distance''; 10 CFR 50.34, ''Contents of applications; technical information''; 10 CFR 50.67; and 10 CFR part 52 for the exclusion area boundary and low population zone. As discussed in the preamble for the final rule updating the NRC's siting criteria (61 FR 65157; December 11, 1996), the Commission's use of 25 rem (0.25 Sv) TEDE does not imply that the Commission considers it to be an acceptable limit for an emergency dose to the public under accident conditions, but only that it represents a reference value to be used for evaluating plant features and site characteristics intended to mitigate the radiological consequences of accidents in order to provide assurance of low risk to the public under postulated accidents. The Commission, based upon extensive experience in applying this criterion and in recognition of the conservatism of the assumptions in its application (*i.e.,* a large fission product release within containment associated with major core damage; maximum allowable containment leak rate; a postulated single failure of any of the fission product cleanup systems, such as the containment sprays; adverse site meteorological dispersion characteristics; an individual presumed to be located at the boundary of the exclusion area at the centerline of the plume for two hours without protective actions), determined that the 25 rem (0.25 Sv) TEDE criterion clearly resulted in an adequate level of protection. As an illustration of the conservatism of this assessment, the Commission noted that the maximum whole-body dose received by an actual individual during the accident at Three Mile Island Nuclear Station in March 1979, which involved major core damage, was estimated to be about 0.1 rem (0.001 Sv).

A review of modern health physics and radiation epidemiology knowledge provides further technical background for proposing to amend the control room design criteria to a higher, and safe, performance level. An important distinction from this review (see section XXXV.C., ''Background and History of Affected Regulations,'' of this document) highlights that the control room design criterion radiation unit of ''rem TEDE'' does not technically correspond with the expected measured deterministic health effects from a reactor accident that would prevent operators from performing their safety function of protecting the public health and safety. These deterministic health effects are best expressed in the radiation unit of ''rad.'' The 10 CFR part 20 annual occupational exposure limit of 5 rem (0.05 Sv) TEDE, which is applicable under accident and emergency conditions, is set sufficiently low that no deterministic threshold dose would be reached.

To clarify the purpose of the control room design criteria contained in GDC 19 and repeated in 10 CFR 50.67, and to distinguish the control room design criteria from the radiation protection and EP frameworks, the NRC is proposing several editorial changes to both provisions. The phrase ''Adequate radiation protection'' in 10 CFR 50.67(b)(2)(iii) and GDC 19 would be replaced with ''The necessary design, fabrication, construction, testing, and performance criteria for structures, systems, and components important to safety.'' As explained in the introduction to appendix A to 10 CFR part 50, ''General Design Criteria for Nuclear Power Plants,'' SSCs important to safety are those SSCs that provide reasonable assurance that the facility can be operated without undue risk to the health and safety of the public. In the case of control room design, the original role of GDC 19 was to ensure that adequate SSCs were provided to permit occupancy of the control room during an accident. The adequacy of the control room SSCs was to be determined by the ability of workers to occupy the control room for the duration of an accident without exceeding the radiological design criteria specified in GDC 19. However, over time the phrase ''adequate radiation protection'' in GDC 19 has been conflated with the NRC's statutory standard of adequate protection. Adequate protection is achieved through a licensee's compliance with the NRC's comprehensive regulatory framework, of which the GDC is one part, and not just a particular design criterion. To increase consistency between these rules, the phrase ''Adequate radiation protection'' in 10 CFR 50.67(b)(2)(iii) and GDC 19 would be replaced with ''The necessary design, fabrication, construction, testing, and performance'' to be consistent with appendix A to 10 CFR part 50. Appendix A to 10 CFR part 50 requires that the principal design criteria establish the necessary design, fabrication, construction, testing, and performance requirements for SSCs important to safety.

To further clarify the purpose of 10 CFR 50.67 and GDC 19 as they relate to the radiation protection and emergency response frameworks, the phrase ''personnel receiving'' in 10 CFR 50.67 and GDC 19 would be replaced with ''calculated'' and the phrase ''access to and'' would be deleted because the traditional DBA radiological consequence analyses performed to demonstrate compliance with the criteria do not assess actual ''personnel receiving'' radiation exposures or plant personal traveling from the site boundary to the control room. The use of a dose-based control room design criterion does not imply that it would be an acceptable exposure during emergency conditions, or that the radiation protection standards and emergency response standards of 10 CFR part 20 and part 50 might not apply. Rather, these analyses assess the acceptability of design provisions for protecting control room operators under postulated DBA conditions. The DBA conditions assumed in these analyses, although credible, generally do not represent actual accident sequences. These DBA conditions are specified as conservative surrogates to create bounding conditions for assessing the acceptability of engineered safety features.

However, rare events (*e.g.,* events involving multiple failures) can exceed the design basis of the facility originally envisioned by the designers. During such events, the Commission's regulations for radiation protection and emergency response programs require licensees to take measures to minimize actual radiation exposures. The on-shift emergency coordinator has the authority and responsibility to immediately and unilaterally initiate any emergency actions. These emergency actions include establishing higher exposure limits if necessary to provide public health and safety. Furthermore, arrangements are made not only with respect to the detection and assessment of dose or intake of ionizing radiation, but also with respect to the mitigating interventions that may have to be applied to further protect workers. The traditional DBA radiological consequence analyses do not necessarily credit these mitigative interventions as they do not directly assess the performance of the control room

habitability envelop design itself. As a result, actual doses received during an event are expected to be significantly lower than the computed results in realistic accident scenarios.

The graded, risk-informed, and performance-based framework developed for DG–1425 (proposed revision 2 of RG 1.183), ''Alternative Radiological Source Terms for Evaluating Design-Basis Accidents at Nuclear Power Reactors,'' would enable a performance-based evaluation using traditional deterministic radiological consequence analysis methods within defined risk-informed boundaries as described in ''Method for Graded Risk-Informed Performance-Based Control Room Design Criteria Framework,'' dated September 2024. These boundaries would be defined by acceptable radiation exposure guidelines for radiation workers during accident and emergency conditions and acceptable contemporary nuclear facility risk profiles using modern PRA methods. Such a framework would provide flexibility when determining how to meet an established acceptance criterion in a way that encourages and rewards safety of the facility consistent with the Commission's policy in SRM–SECY–98–144, ''Staff Requirements—SECY–98–144—White Paper on Risk-Informed and Performance-Based Regulation,'' dated March 1, 1999. In practice, the method would produce a framework that uses, in part, the facility's safe design and operations to justify a higher control room design criterion with a lower plant-specific risk metric.

The DG–1425 framework leverages a licensee's existing PRA model. Acceptability of the PRA model used to demonstrate that the specified criterion is commensurate with the risk of the plant is determined for the following aspects: scope, level of detail, conformance with PRA technical elements (*i.e.,* technical robustness), and plant representation and PRA configuration control. The PRA model would be consistent with the philosophy in RG1.174 and the technical adequacy expectations for the model in RG 1.200. For instance, the use of overall core damage frequency (CDF) results from an NRC-approved license amendment request that incorporates the risk-informed completion time program into the facility's technical specifications (*i.e.,* Technical Specifications Task Force Traveler 505, ''Provide Risk-Informed Extended Completion Times—RITSTF Initiative 4b'') would be acceptable. The baseline PRA model would estimate the overall CDF for all significant sources of risk both internal and external to the plant (*e.g.,* internal, flood, fires, seismic, high winds, and others).

The CDF risk metric would be the most appropriate for the purposes of a graded, risk-informed, and performance-based control room design criteria framework. This is because CDF accounts for a broad range of accident scenarios and can generally encompass the risk relevant to the sequences considered for control room habitability when deriving the maximum hypothetical accident source term. There is also consistency between the CDF risk metric, which does not consider radiation protection protective actions, and the traditional DBA radiological consequence analysis performed to demonstrate compliance. Additionally, control room habitability design primarily concerns the ability of personnel to maintain reactor safety during and after accidents, which aligns closely with the overarching goals of preventing core damage and mitigating radiological releases, which are captured by the CDF risk metric.

In the regulatory basis for this proposed rule, the NRC sought comments on the alternatives proposed in that document's appendix A, ''Control Room Requirements.'' Additionally, the NRC asked two questions. The first question sought input as to whether the numerical selection of the control room design criteria would be better aligned with regulations designed to limit occupational exposures during emergency conditions or regulations designed to limit annual occupational radiation exposures during normal operations. The second question sought input as to whether a graded, risk-informed method to demonstrate compliance with a range of acceptable control room design criterion values instead of a single selected value, such as the current 5 rem (0.05 Sv) TEDE, provides the necessary flexibilities for current and future nuclear technologies.

Overall, public comments were supportive of the staff's recommendation to amend the control room design criteria. The comments in support of alternative 2 generally suggested a value of 25 rem (0.25 Sv) TEDE be applied in amended regulations. Commenters stated that using a value of 25 rem (0.25 Sv) TEDE would be more consistent with the various U.S. and international organizations' recommendations for emergency dose limitations up to 25 rem (0.25 Sv) TEDE. Nearly all comments included suggestions to develop a graded, risk-informed approach to the control room design criteria. Several comments relied on PRA technology and methods and contemporary understandings of facility risk to justify a higher numerical value for low-probability, high-consequence events.

Based, in part, on the comments received, the NRC is proposing to increase the numerical value of the control room design criteria from 5 to 10 rem (0.05 to 0.10 Sv) TEDE but range up to 25 rem (0.25 Sv) TEDE with a consideration of the plant-specific risk profile or risk information. In response to stakeholder interest, the NRC developed a graded, risk-informed, and performance-based control room design criteria framework for the supporting regulatory guidance.

F. Fuel Dispersal

(i) Overview

Based on the Commission's direction in SRM–SECY–21–0109, the public comments on the regulatory basis (see section XXXVI.F.(xiv), ''Discussion of Public Comments on the Fuel Dispersal Aspects of the Regulatory Basis,'' of this document) for details on the public comments received on the fuel dispersal portions of the regulatory basis), the anticipated impacts on this rulemaking's schedule from each of the alternatives described in the regulatory basis, the technical maturity of those alternatives, and the anticipated impact on safety of each of the alternatives, the NRC proposes to address fuel dispersal in this rulemaking. Specifically, the proposed rule would designate LOCAs above the TBS as beyond-design-basis, allowing for best-estimate analysis for such LOCAs, while instituting performance-based cladding embrittlement criteria, and clarifying and updating the NRC's definition of coolability for the LOCA event to encompass both fuel in the reactor core and any fuel dispersed into the RCS or containment.

The proposed flexibility in ECCS analyses for LOCAs above the TBS might enable entities using the proposed rule to demonstrate that no fuel dispersal occurs for LOCAs above the proposed TBS. These entities would be able to use the best-estimate (*i.e.,* based on conditions consistent with expected, nominal operating conditions without biases or uncertainties) modeling under proposed 10 CFR 50.46a(e)(3) for this category of LOCAs until more data or analyses are developed to address fuel dispersal in another way, such as a demonstration that the fuel remains coolable if there is fuel dispersal and the other downstream consequences of dispersal do not have any significant

deleterious impacts. The proposed rule would redesignate existing 10 CFR 50.46a (which contains acceptance criteria for RCS venting systems) as 10 CFR 50.46b and establish an alternative set of risk-informed requirements in a new proposed 10 CFR 50.46a with which entities could choose to comply in lieu of meeting the current emergency core cooling system requirements in 10 CFR 50.46. Using these alternative ECCS requirements would provide some entities with opportunities to change various aspects of their facility design and operation, although potential impacts of the changes pertaining to plant physical security or cybersecurity would be evaluated during license amendment reviews.

As used in proposed 10 CFR 50.46a and this discussion of proposed 10 CFR 50.46a, ''entities'' would include applicants for and holders of CPs, OLs, COLs, standard design approvals, and MLs, and applicants for standard design certification rules (including such applicants after NRC issuance of a final standard design certification rule).

The proposed rule would divide the current spectrum of LOCA break sizes into two regions. The division between the two regions would be delineated by the TBS. The first region would include small size breaks, up to and including the TBS. The second region would include breaks larger than the TBS, up to and including the DEGB of the largest RCS pipe. While both sets of breaks are unlikely to occur, the larger breaks are considered to have a much lower likelihood of occurring than the smaller breaks in the first region. Under the proposed rule, the ECCS design requirements for breaks smaller than the TBS would remain the same as the requirements for all breaks under the current 10 CFR 50.46 ECCS rule. By contrast, under the proposed rule, the ECCS design requirements for the pipe breaks larger than the TBS could be analyzed using less conservative assumptions based on their lower likelihood of occurrence. Although LOCAs for break sizes larger than the TBS would be classified as ''beyond-design-basis accidents'' for entities that implement the proposed 10 CFR 50.46a, these break sizes in license applications would still be subject to regulatory evaluation. The proposed rule would require that entities maintain the ability to mitigate all LOCAs, up to and including the DEGB of the largest RCS pipe. Mitigation analyses for LOCAs larger than the TBS would not need to assume the loss of offsite power or the occurrence of a coincident single failure event. Entities also would be allowed to credit the use of non-safety-grade systems.

Entities who perform LOCA analyses using the proposed risk-informed alternative requirements could find that their plant design or operation is no longer limited by certain parameters associated with previous DEGB analyses. Reducing the DEGB limitations would allow some entities to propose a wide scope of design or operational changes until another parameter in required accident analyses becomes limiting. Potential design changes could include fuel burnup increases and other management improvements; power uprates; and changes to the required number of accumulators, diesel start times, sequencing of equipment, valve stroke times, and containment spray system setpoints. Some of these design and operational changes could increase plant safety because an entity could modify its systems to better mitigate the more likely, but still very rare, smaller LOCAs. Other changes, such as increasing power, could increase the overall risk of inadvertent release of radioactive material, which may be acceptable if the overall plant risk increase is demonstrated to be acceptably small.

The risk-informed proposed 10 CFR 50.46a would include risk acceptance criteria for evaluating future design changes to ensure that any risk increases would be acceptably small. These acceptance criteria would be consistent with the guidelines for risk-informed license amendments in RG 1.174, ''An Approach for Using Probabilistic Risk Assessment in Risk-Informed Decisions on Plant-Specific Changes to the Licensing Basis,'' and ensure both the acceptability of the changes from a risk perspective and the retention of sufficient defense-in-depth, safety margins, and performance monitoring. The requirements for the risk-informed evaluation process are discussed in detail in section XXXVI.F.(vi), ''Risk-Informed Changes to the Facility, Technical Specifications, or Procedures,'' of this document.

In addition to changes to current 10 CFR 50.46a, which would be redesignated as 10 CFR 50.46b, and establishing a new proposed 10 CFR 50.46a, the NRC would make conforming changes to existing 10 CFR 50.46, and 50.69; GDC 17, 35, 38, 41, 44, and 50 in appendix A to 10 CFR part 50; appendix K to 10 CFR part 50; 10 CFR 52.54; and appendix G to 10 CFR part 52.

(ii) Original Determination of the Transition Break Size

To help determine the TBS in support of the prior 10 CFR 50.46a rulemaking (see section XXXV.C.(v)(b), ''10 CFR 50.46a Rulemaking,'' of this document), the NRC developed pipe break frequencies as a function of break size using an expert elicitation process for degradation-related pipe breaks in typical BWR and PWR RCSs (NUREG–1829, ''Estimating Loss-of-Coolant Accident (LOCA) Frequencies through the Elicitation Process,'' March 2008). The elicitation process is used for quantifying phenomenological knowledge when data or modeling approaches are insufficient. The NUREG–1829 elicitation focused solely on determining event frequencies that initiate from failures of the unisolable reactor coolant pressure boundary (RCPB), or primary system side, related to material degradation. This effort did not consider the AP1000 and other similar passive-safety reactor designs.

A baseline TBS was established from the expert elicitation results for each reactor type (*i.e.,* PWR and BWR) that corresponded to a break frequency of once per 100,000 reactor years (1×10^{-5}, or 10^{-5} per reactor year). The NRC then considered uncertainty in the elicitation process, other potential mechanisms that could cause passive component failure that were not explicitly considered in the expert elicitation process, and the higher susceptibility to rupture/failure of specific locations in the RCS by adjusting the TBS upward to account for these factors. Other mechanisms that contribute to the overall LOCA frequency include LOCAs resulting from failures of non-passive components and LOCAs resulting from low probability direct and indirect events (*e.g.,* earthquakes of magnitude larger than the safe shutdown earthquake and dropped heavy loads). These LOCAs have a strong dependency on plant-specific factors.

LOCAs caused by failure of non-passive components, such as stuck-open valves and blown out seals or gaskets, have a greater frequency of occurrence than LOCAs resulting from the failure of passive components. LOCAs resulting from the failure of non-passive components would be small-break LOCAs, when considering the size of the opening that could result should components fail open or blow out (*e.g.,* safety valves, pump seals). LOCAs resulting from stuck-open valves are limited by the size of the auxiliary pipe. In some PWRs, there are large loop isolation valves in the reactor pressure vessel outlet and inlet piping. However,

a complete failure of the valve stem packing is not expected to result in a high rate of coolant loss due to the size of the resulting penetration in the system, because the valves are sealed in such a way that limits leaks when they are open (*i.e.,* they are back-seated in the open configuration). Based on these considerations, non-passive LOCAs are relatively small in size and are bounded by the selected TBS.

LOCAs could also be caused by dropping heavy loads that could cause a breach of the RCS piping or damage safety-related equipment. The majority of heavy loads are lifted during refueling when the reactor is shut down and the primary system is depressurized, further reducing the risk of a LOCA and a loss of core cooling. During power operation, personnel entry into the containment is typically infrequent and of short duration and the largest cranes are generally not accessible. There are also operational limitations designed to limit risk due to heavy load drops. Consequently, loads moved at power are substantially fewer than during refueling. In addition, the RCS is inherently protected by surrounding concrete walls, floors, missile shields, and biological shielding. For these reasons, the NRC did not consider the contribution of heavy load drops to overall LOCA frequency to be significant or affect the TBS.

Seismically induced LOCA break frequencies can vary greatly from plant to plant because of factors such as site seismicity, seismic design considerations, and plant-specific layout and spatial configurations. Seismic break frequencies are also affected by the amount of pipe degradation occurring prior to postulated seismic events. Seismic PRA insights were accumulated from the NRC Seismic Safety Margins Research Program and the Individual Plant Examination of External Events submittals available in the late 1990s. Based on these studies, piping and other passive RCPB components generally exhibit high seismic capacities and, therefore, are not significant risk contributors. However, these studies did not explicitly consider the effect of degraded component performance on the risk contributions. Therefore, the NRC conducted a study in the early 2000s to evaluate the seismic performance of undegraded and degraded passive system components (NUREG–1903, ''Seismic Considerations for the Transition Break Size,'' February 2008). This effort examined operating experience, seismic PRA insights, and models to evaluate the failure likelihood of undegraded and degraded piping. The operating experience review considered passive component failures that have occurred as a result of strong motion earthquakes in nuclear and fossil power plants as well as other industrial facilities. No catastrophic failures of large pipes resulting from earthquakes between 0.2g and 0.5g (where g is the gravitational acceleration or approximately 9.81 meters/second^2) peak ground acceleration have occurred in power plants. However, piping degradation could increase the LOCA frequency associated with seismically induced piping failures. The NUREG–1903 report evaluated seismic loadings on degraded piping and concluded that a large, pre-existing crack on the order of 30 percent through-wall and 145 degrees around the piping circumference would have to be present during a large, rare earthquake (*i.e.,* corresponding to the mean annual frequency of exceedance equivalent to 10^{-5} or 10^{-6} per year) in order for pipe failure to occur. The NRC concluded that the likelihood of flaws large enough to fail during such a seismic event was sufficiently low that the TBS need not be modified to address seismically induced direct piping failures.

Indirect RCPB failures are primary system ruptures that are a consequence of failures in primary and non-primary system components or structural support failures (such as reactor coolant pump supports and steam generator supports). Structural support failures could then cause displacements in components, causing stress on the piping and potential failure. The NRC performed studies on two plants to estimate the conditional pipe failure probability due to structural support failure given a large, rare earthquake (*i.e.,* 10^{-5} to 10^{-6} per year). These studies used seismic hazard curves from NUREG–1488, ''Revised Livermore Seismic Hazard Estimates for Sixty-Nine Nuclear Power Plant Sites East of the Rocky Mountains,'' April 1994. The results of these studies, as described in NUREG–1903, showed that indirectly induced piping failure attributable to major component support failure has a mean failure probability on the order of 10^{-6} per year, which was less than the TBS criterion. However, the NRC noted in NUREG–1903 that indirect failure analyses are highly plant-specific. Therefore, it is possible that example plants assessed in the NRC analyses were not necessarily limiting for all plants.

The NRC considered the importance of indirect failures on the selection of the TBS. For the cases considered in NUREG–1903, the likelihood of indirectly induced piping failures resulting from major component support failures was less than 10^{-5} per reactor year, the frequency criterion used to select the TBS. Also, the median seismic capacities for both the primary piping system and primary system components are typically higher than other safety-related components within the nuclear power plant. Because of these relative capacities, the NRC expected that a seismic event of sufficient magnitude to cause consequential failure within the primary system would also induce failure of components in multiple trains of mitigation systems, or even induce multiple RCS pipe breaks. Consequently, the risk contribution from seismically induced indirect failures was expected to depend more heavily on the relative fragilities of plant components and systems than the size of the TBS. Therefore, the NRC determined that adjustment to the TBS for seismically induced indirect LOCAs was not warranted.

The final consideration in selecting the TBS was actual piping system design (*e.g.,* piping sizes) and operating experience. For example, due to system configuration and operating environment, certain piping was considered to be more susceptible to degradation and failure than other piping in the same size range.

For PWRs, the NRC determined that 6- to 10-inch inside diameter (*i.e.,* inside dimension) was an appropriate range of pipe break sizes associated with the 95th percentile LOCA frequency estimates of 1×10^{-5}/yr from NUREG–1829. This range is only slightly smaller than the PWR surge lines, which are attached to the RCS main loop piping (*i.e.,* hot leg, cold leg, and crossover leg) and are typically 12- to 14-inch diameter Schedule 160 piping with inside diameters of 10.1 to 11.2 inches. The RCS main loop piping is in the range of 30 inches in diameter and has substantially thicker walls than the surge lines. The expert elicitation panel concluded that this main loop piping is much less likely to break than other RCS piping. The shutdown cooling lines and safety injection lines may also be 12- to 14-inch diameter Schedule 160 piping and are likewise connected to the RCS. In some cases (*e.g.,* Babcock and Wilcox plants), the core flood lines may be bigger than the surge and residual heat removal lines that are attached to the main loop piping. The difference in diameter and thickness of the reactor coolant piping and the piping connected to it forms a reasonable line of demarcation to define the TBS. Therefore, in SECY–10–0161, to capture the surge, shutdown cooling, core flood,

and safety injection lines in the range of piping considered to be equal to or less than the TBS, for PWRs, the NRC staff specified the TBS as the largest cross-sectional flow area of the RCPB piping excluding the main loop piping.

For BWRs, the NRC determined that 13- to 20-inch inside diameter was an appropriate range of pipe break sizes associated with the 95th percentile LOCA frequency estimates of 1×10^{-5}/yr from NUREG–1829. The information gathered from the elicitation for BWRs also showed that the estimated frequency of pipe breaks dropped markedly for break sizes beyond the range of approximately 18 to 20 inches. After evaluating BWR designs, the NRC determined that typical residual heat removal piping connected to the recirculation loop piping and feedwater piping is about 18 to 24 inches in diameter. These pipe sizes are consistent with break sizes beyond which the pipe break frequency was expected to decrease markedly below 10^{-5} per year. The NRC staff recognized that the sizes of attached pipes vary somewhat among plants. Thus, for BWRs, in SECY–10–0161, the staff specified the TBS as the larger cross-sectional flow area of either the feedwater or the residual heat removal piping inside primary containment.

Because the effects of TBS breaks on core cooling vary with the break location, the NRC evaluated whether the frequency of TBS breaks varies with location and whether TBS breaks could, therefore, vary in size with location. In PWRs, the pressurizer surge line is only connected to one hot leg and the pipes attached to the cold legs are generally smaller than the surge line. The cold legs (including the intermediate legs) also operate at slightly cooler temperatures such that thermally activated degradation mechanisms would be expected to progress more slowly in the cold leg than in the hot leg. The frequency of occurrence of a break of a given size is composed of both the frequency of a completely severed pipe of that size (*i.e.,* a complete circumferential break) plus the frequency of a partial break of that size in an equal or larger size pipe (*i.e.,* a partial circumferential or longitudinal break). Therefore, the NRC considered an option where the TBS for the hot and cold legs would be distinctly different by considering the frequency contributions of these two break components: (1) complete breaks of the pipes attached to the hot or cold legs at the limiting locations within each attached pipe, and (2) partial breaks of a constant size, as appropriate for either the hot or cold leg, at the limiting locations within the hot or cold legs. However, the elicitation was not envisioned to develop LOCA frequencies specific to piping systems. As a result, there was insufficient detail from the elicitation to draw conclusions about either the difference between hot and cold leg failure frequencies or the frequency of occurrence of smaller LOCAs within a large diameter pipe. Therefore, the NRC concluded that the TBS associated with partial breaks in the hot and cold legs should remain equivalent in size to the internal cross-sectional area of the largest piping system other than the main loop. Similarly, the elicitation results do not contain sufficient detail to quantify break frequency differences among the BWR recirculation, residual heat removal, and feedwater system piping. Thus, a smaller partial break TBS criterion also could not be established for BWR recirculation piping. Notably, mitigating the effects of such partial breaks up to and including a TBS break remains within the design basis for all RCPB piping with an inner diameter equivalent to or larger than the TBS.

During this time, the NRC also evaluated whether TBS breaks should be analyzed as single-ended or double-ended breaks. A postulated double-ended break assumes that the pipe rupture causes a complete separation and displacement of both ends of the pipe at the break such that coolant loss occurs from both sides of the displaced piping. A single-ended break results in an orifice through which the coolant would flow. To address this issue, the NRC reviewed the expert elicitation process and the guidance given to the experts in developing their frequency estimates. The NRC concluded that the expert elicitation LOCA frequency estimates correspond to a break area having an equivalent circular diameter at each break size. This correspondence is representative of a single-ended break. Additionally, the experts based their estimates on knowledge of postulated failure mechanisms in pressure boundary components and not on the flow rates emanating from the breaks. The flow rates are governed by the break location and system configuration, which determines whether reactor coolant will be discharged from both ends of the break.

The current design-basis analysis for LWRs requires analysis of a DEGB of the largest pipe in the RCS. Under the proposed rule, all breaks up to and including the TBS would be analyzed under existing requirements. A possible reason for specifying the TBS for PWRs as double-ended could be that a complete break of the pressurizer surge line would result in reactor coolant exiting both ends of the break. Although this occurs initially during a LOCA, core cooling requirements are dominated by the flow rate of coolant exiting from the hot leg side of the break, with much less contribution from the flow rate of coolant exiting from the pressurizer side. Therefore, specifying the TBS break as an area equivalent to a double-ended break of the surge line would be overly conservative. For BWRs, the effect of a double-ended break area is also considered to be overly conservative. The selected TBS for BWRs would be based on the larger of the residual heat removal or main feedwater lines. A single-ended break in these lines would bound double-ended breaks of the smaller lines in the reactor recirculation and feedwater system. Therefore, the NRC is proposing that the TBS be based on a single-ended break, which reasonably characterizes the expert elicitation results and represents the flow rates associated with postulated pipe breaks within the RCS. The NRC's proposed TBS definition is in proposed 10 CFR 50.46a(a)(9). As an option and to allow maximum flexibility, the proposed 10 CFR 50.46a(a)(9) definition would allow an entity to develop and justify an alternate TBS.

(iii) Determining the Ongoing Validity of the Transition Break Size

Because the work in the development of the TBS was conducted almost 20 years ago as part of the development of the earlier rulemaking to create alternative ECCS requirements in 10 CFR 50.46a, the NRC assessed if the TBS developed in the early 2000s is still valid today. This research identified possible scenarios not considered, or underestimated, in NUREG–1829 or NUREG–1903 that could result in primary pressure boundary breaches that are larger than the TBS in either PWR or BWR plants. These breaches could be directly due to operational transients (*e.g.,* anticipated transient without scram, water hammer, pressurized thermal shock) or indirectly due to other failures within the plant (*e.g.,* crane drop, secondary side failures). Age-related degradation of the RCPB components may be a contributing, or required, causal factor. Additionally, the breach could stem from failure of a single RCPB component or multiple common-cause RCPB component failures (*e.g.,* anticipated transient without scram event leading to the rupture of multiple degraded safety injection system lines on separate PWR loops). Improper maintenance and human factors may

also be a causal factor (*e.g.,* not properly torquing pressurizer manway bolts following inspection). The likelihood of such breaches was also considered up to the end of the subsequent license renewal period (*i.e.,* 80 years) or the maximum extent of the licensing period for plants that could adopt this proposed rule.

In its effort to determine the ongoing validity of the TBS, the NRC only considered reactors authorized to operate under 10 CFR part 50 on December 31, 2015 (*i.e.,* the NRC did not consider the AP1000 design or any other new LWR reactor design) because the NUREG–1829 study did not consider plant designs that were authorized to operate after December 31, 2015 or authorized to operate under 10 CFR part 52. LWRs licensed after that date may have different piping materials, configurations, and operational and service conditions, among other factors, that may impact the piping break frequencies and thus the TBS. A detailed description of the technical justification for the continued applicability of the NUREG–1829 results is found in the ''White Paper on Continued Applicability of NUREG–1829,'' dated November 13, 2024, while the technical justification for the continued applicability of NUREG–1903 is found in the ''White Paper on Continued Applicability of NUREG–1903,'' dated November 18, 2024.

To confirm the TBS's current validity, the NRC conducted a series of probabilistic fracture mechanics analyses using the xLPR code Version 2.3 to confirm the base cases analyzed in NUREG–1829. For these analyses, four of the original base case pipe systems were chosen for this validation: 12-inch recirculation line, 28-inch recirculation line, 30-inch hot leg, and a 10-inch surge line. The base case conditions, assumptions, and inputs from NUREG–1829 were generally adopted in these analyses. However, inputs were supplemented from Technical Letter Report TLR–RES/DE/REB–2021–09, ''Probabilistic Leak-Before-Break Evaluation of Westinghouse Four-Loop Pressurized-Water Reactor Primary Coolant Loop Piping using the Extremely Low Probability of Rupture Code,'' dated August 13, 2021, and Technical Letter Report TLR–RES/DE/REB–2021–14, ''Probabilistic Leak-Before-Break Evaluations of Pressurized-Water Reactor Piping Systems using the Extremely Low Probability of Rupture Code,'' dated September 28, 2021, for the PWR cases; and from NUREG–0313, ''Technical Report on Material Selection and Processing Guidelines for BWR Coolant Pressure Boundary Piping,'' dated January 1988, NUREG/CR–6674, ''Fatigue Analysis of Components for 60-Year Plant Life,'' dated June 2000, and NUREG/CR–4792, ''Probability of Failure in BWR Reactor Coolant Piping, Volume 1: Summary Report,'' dated December 1988, for the BWR cases as needed. Analyses were run to 80 years, and several sensitivity cases were conducted to investigate the impacts of mitigation and inspection on the probability of failure. The annual frequency of small-break, medium-break, and large-break LOCAs were calculated at 25, 40, 60, and 80 calendar years as well as the cumulative probability of a crack, leakage, and rupture at 80 years. A summary of the analyses and results can be found in section 5.3 of the ''White Paper on Continued Applicability of NUREG–1829.'' The analyses conducted show that annual frequencies calculated for the base case problems in the current effort were either bounded by, or representative of, those determined in NUREG–1829.

In addition to the probabilistic fracture mechanics analyses, the NRC conducted both an internal and external elicitation similar to the full elicitation conducted in the original development of NUREG–1829. The purpose of this elicitation was two-fold. The first objective was to determine scenarios that could result in primary pressure boundary breaches that are larger than the TBS in either PWR or BWR plants. The second objective was to determine the representativeness of NUREG–1829 to the current day. The internal elicitation included subject matter experts within the NRC with expertise in structural integrity analysis, materials performance, aged-related degradation, risk assessment, and thermal-hydraulic analysis. The external elicitation queried two of the original NUREG–1829 elicitation effort participants. The external elicitation confirmed that the current-day frequency of LOCAs, and specifically the frequency of LOCAs having a break size greater than the TBS, is conservatively represented by the NUREG–1829 estimates. Neither the internal nor external elicitations identified any generic issues or scenarios that either were not considered in the TBS development or have significantly changed since the TBS development that could undermine its technical basis.

However, both the internal and external elicitations did identify topics that should be addressed within the proposed rulemaking and associated guidance. Some of these topics included PRA requirements; impacts of plant changes; stress corrosion cracking in main loop and recirculation piping; indirect piping failures; direct and indirect seismic failure evaluations; maintaining mitigative capabilities; NUREG–1829 uncertainties; and attributes that could increase plant-specific LOCA frequencies. Many of these topics were already being addressed within this rulemaking effort, and the elicitations served to refine the proposed treatment of these topics, as well as identify some novel issues that were not initially considered. A more detailed summary of these elicitations is in the ''White Paper on Continued Applicability of NUREG–1829.''

The NRC reviewed operational experience since the original NUREG–1829 effort to use as a basis for determining both piping and non-piping failure frequencies. There have been only a few small (*i.e.,* smaller than 2-inch diameter piping) passive-system primary pressure boundary ruptures, and the operational experience indicates that degradation mechanisms such as cracking, wall thinning, or through-wall leakage are a precursor to a rupture. The precursor event frequency can be directly calculated from operational experience, while modeling is required to estimate the likelihood that these precursor events could lead to LOCAs of various sizes and, hence, estimate LOCA frequencies. The NUREG–1829 LOCA frequency estimates were based, in part, on operating experience accumulated up to approximately 2004. The NRC's more recent effort considered operating experience trends from 1970 to 2004, and then 2005 to the present day. This binning was used to compare precursor event frequencies and ultimately LOCA frequencies within the two time periods to assess trending since the completion of NUREG–1829.

Quantitative LOCA frequency estimates were calculated for each time period for PWR and BWR systems and for break sizes greater than and less than the TBS in this proposed rule. Initially, estimates were developed for each degradation mechanism that is applicable for a particular piping or non-piping primary pressure boundary system or component. The attribute-specific frequencies were then multiplied by the number of attributes (*e.g.,* number of welds) for each component and then the contributions from each applicable degradation mechanism were combined to develop component-specific piping and non-piping frequencies. The component-specific frequencies were then further combined to determine global piping and non-piping LOCA frequency estimates. Finally, the piping and non-

piping contributions are summed so that, ultimately, LOCA frequency estimates are determined as a function of rupture size. Uncertainties were initially addressed when determining degradation mechanism-specific estimates and appropriately combined so that the final estimates are expressed as distributions with associated mean values and 5th and 95th percentile LOCA frequency estimates. The findings predict that both the BWR and PWR large LOCA frequency estimates (*i.e.,* the largest NUREG–1829 LOCA size categories starting just below the TBS up to the highest category, which includes a DEGB of the largest pipe in the plant), based on operating experience from 2005 to the present day, are less than estimates based on operating experience from 1970–2004. Therefore, this work supports the expectation that the NUREG–1829 LOCA frequency estimates used to establish the TBS conservatively represent the current-day estimates, and that the TBS established for proposed 10 CFR 50.46a is appropriate. Additional details of this activity can be found in section 5.2 of the ''White Paper on Continued Applicability of NUREG–1829.''

In the ''White Paper on Continued Applicability of NUREG–1829,'' the NRC performed a qualitative analysis of the elicitation results, the operational experience, ongoing American Society of Mechanical Engineers (ASME) code activities, and recent research findings to determine if any of these findings impact the proposed TBS or may cause a break larger than the TBS. The NRC analyzed topics such as thermal embrittlement of cast austenitic stainless steel and stainless-steel welds; stress corrosion cracking in secondary PWR stainless lines; the effects of carbon macrosegregation, small surface breaking flaws, and quasi-laminar defects on reactor pressure vessel integrity; radiation embrittlement; and changes to passive-system inspection frequencies. The NRC evaluated each item's impact on both the direct and indirect failures and determined that these mechanisms would not impact the proposed TBS.

The NUREG–1903 report and the original analyses by the NRC considered the effects of direct (flawed and unflawed) and indirect piping failures on the selection of the TBS. For the direct unflawed piping failure, the NRC originally used the screening approach where the probability of exceedance of stresses corresponding to a 1 percent probability of failure was obtained for the 26 PWRs for the most highly stressed hot leg, cold leg, or crossover (suction) legs. The NRC concluded that failure probabilities of unflawed piping are significantly low compared to the frequency of 10^{-5} per year used as a basis to establish the TBS. For this original assessment, the NRC used the mean Lawrence Livermore National Laboratory seismic hazard curves corresponding to each selected site. Since then, all currently operating U.S. nuclear power reactor licensees have re-evaluated and submitted their Seismic Hazard and Screening Reports (SHSRs) in response to the March 12, 2012, letter issued by the NRC under 10 CFR 50.54(f), ''Request for Information Pursuant to Title 10 of the *Code of Federal Regulations* 50.54(f) Regarding Recommendations 2.1, 2.3, and 9.3, of the Near-Term Task Force Review of Insights from the Fukushima Dai-Ichi Accident,'' following the 2011 accident at the Fukushima Dai-Ichi nuclear power plant. As such, the original assessment results have been updated by using the more up-to-date site hazard information.

In addition, to better determine whether seismic loading conditions significantly increases the probability of a break above the TBS in the current NRC assessment, an unconditional mean piping failure probability value has been obtained by convolving a site-specific mean hazard curve with a representative mean large LOCA piping fragility function obtained from the Electric Power Research Institute (EPRI) Report (3002000709), ''Seismic Probabilistic Risk Assessment Implementation Guide.'' The results of this analysis show that failure probabilities of unflawed piping for a limited number of plants considered are well below the TBS frequency criterion. In addition, the study results show that the probabilities of exceedance corresponding to 1 percent probability of failure are all below the TBS threshold, even using the most conservative design stress intensity value and the most conservative failure criterion. Therefore, there is a clear indication that unflawed piping generally has a very low probability of failure attributable to seismic loads, which is consistent with the original NRC assessment conclusion in NUREG–1903 and the excellent performance experience of piping systems observed during past strong damaging earthquakes (''Summary and Evaluation of Historical Strong-Motion Earthquake Seismic Response and Damage to Above-Ground Industrial Piping,'' April 1985).

The NUREG–1903 report also showed that, for the direct flawed piping failure, the probabilities of pipe breaks larger than the TBS are likely to be less than 10^{-5} per year as the critical flaws associated with the stresses corresponding to the 10^{-5} and 10^{-6} probability of exceedance seismic events are generally large. However, considering the limited applicability of the results and the effects of the recent seismic hazard updates on the TBS, this conclusion needs to be verified by an entity on a case-by-case basis under proposed 10 CFR 50.46a(c)(1)(i).

For the two indirect piping failure cases considered in the original NUREG–1903 analysis, the likelihood of indirectly induced piping failures resulting from major component support failures is less than 10^{-5} per year, which was the frequency criterion used to select the TBS. Based on this frequency criterion, the NUREG–1903 report concluded that indirectly induced piping failure is unlikely to govern the combined failure of piping. However, the NRC noted that this conclusion is not necessarily bounding and may not be applicable to all sites because the assessment used generic seismic hazard curves and representative major support fragilities in lieu of plant-specific hazard curves and fragilities. This is further complicated by the recent seismic hazard updates documented in the aforementioned SHSRs. The assessment results documented in NUREG/KM–0017, ''Seismic Hazard Evaluations for U.S. Nuclear Power Plants: Near-Term Task Force Recommendation 2.1 Results,'' dated December 16, 2021, show that some sites have experienced noticeable changes in both seismic exceedance frequencies and Ground Motion Response Spectrum shapes relative to those of the prior assessments. Taken together, these changes affect seismic demand estimates used as an input to fragility analysis of key component supports as well as the resulting unconditional failure probability of indirectly induced piping failure. More details on this effort can be found in the ''White Paper on Continued Applicability of NUREG–1903.'' Because the risk associated with indirect piping failures is plant-specific, the NRC would require in proposed 10 CFR 50.46a(c)(1)(i) that each entity perform an assessment of indirect piping failures using the most up-to-date seismic hazard information. This assessment would be part of the comprehensive risk assessment required to implement 10 CFR 50.46a and graded approaches would be possible depending on the significance of the associated risk. More detailed guidance on this topic would be provided in DG–

1426, ''An Approach for a Risk-Informed Evaluation Process Supporting Alternative Acceptance Criteria for Emergency Core Cooling Systems for Light-Water Reactors,'' and DG–1428, ''Plant-Specific Applicability of the Transition Break Size.''

Periodic inservice inspections are a key performance monitoring strategy for verifying that analyses that predict component failure remain accurate through the time the component is analyzed, and they provide a method to identify novel degradation that may impact the analysis and the structural integrity of the component. Reactor coolant boundary piping in PWRs and BWRs is both ASME Class 1 piping and risk significant and is typically inspected by a prescribed inservice inspection program, a risk-informed inspection program, or an augmented inspection program under 10 CFR 50.55a, ''Codes and standards.'' For instance, in PWRs, the dissimilar metal welds that join the hot leg to the reactor pressure vessel nozzle are inspected through ASME Code Case N–770, ''Alternative Examination Requirements and Acceptance Standards for Class 1 PWR Piping and Vessel Nozzle Butt Welds Fabricated With UNS N06082 or UNS W86182 Weld Filler Material With or Without Application of Listed Mitigation Activities,'' as incorporated by reference in 10 CFR 50.55a, which requires different inspection frequencies depending on the type of mitigation employed. Also, the stainless-steel welds in the same piping system are typically covered under Category R.1.20 in ASME Code Case N–716–2, ''Alternative Classification and Examination Requirements,'' as incorporated by reference in 10 CFR 50.55a through RG 1.147, Revision 20, ''Inservice Inspection Code Case Acceptability, ASME section XI, Division 1.'' However, the wording of the code case does not require a minimum number of these welds to be inspected in the overall program (see section 4(b)(2) of Code Case N–716–2). In addition, there is a concerted effort within the ASME code community to use risk arguments to reduce inspections in piping (thereby increasing time between inspections) and other components, such as steam generator shell welds, which may extend to Class 1 piping for cases with no active degradation. This industry, EPRI, and ASME effort is addressed in the 2023 white paper entitled, ''Draft White Paper: Statistical Approach to Optimizing a Performance Monitoring Program.''

The analyses conducted within NUREG–1829 rely on the continuing inservice inspection of the piping considered in predicting LOCA frequencies. The inspections assumed were historical prescribed ASME inspection procedures and frequencies (*e.g.,* once in a 10-year interval). The impact of increasing the time between inspections on the predicted LOCA frequencies estimated in the elicitation is unknown, therefore performance monitoring is needed to confirm the continued adequacy of the analyses used to calculate the LOCA frequencies and identify novel degradation that may challenge the component integrity. To provide appropriate performance monitoring, proposed 10 CFR 50.46a(b)(3) would require that a sampling inspection program be conducted on the welds in piping systems whose diameter is greater than the TBS. Under the proposed rule, credit may be given for those welds inspected as part of an established inspection program (*e.g.,* these welds could be included in the sample inspected in the risk-informed piping inspection programs in lieu of other welds in the same risk-informed category). The dissimilar metal welds in PWRs, which are susceptible to primary water stress corrosion cracking, are inspected periodically per Code Case N–770, while the similar circumferential welds are part of a risk-informed program. Due to the number of similar metal, circumferential, Class 1 welds in a PWR reactor coolant loop, or those circumferential welds in a BWR that are classified as Category A welds (*i.e.,* welds of resistant material as defined in Generic Letter 88–01), it is possible that welds from the systems whose diameter is greater than the TBS might not be included in the sample inspected as part of the risk-informed inspection program. In addition, future ASME code changes might decrease the number of these circumferential welds inspected. Therefore, the proposed rule would require licensees to inspect an NRC-approved risk-informed sample of these similar metal circumferential welds in a PWR or the Category A circumferential welds in a BWR in accordance with 10 CFR 50.55a with the highest failure potential before implementation of proposed 10 CFR 50.46a and every subsequent in-service inspection interval. This proposed requirement, coupled with the ongoing inspection programs, would provide for the appropriate amount of performance monitoring data over the course of the plant's licensed life. Additional technical background supporting this proposed requirement can be found in the ''White Paper on Continued Applicability of NUREG–1829.''

The NRC also considered the possibility that currently licensed AP1000 facilities; other currently certified designs listed in appendices A through G of 10 CFR part 52 (*i.e.,* the AP600, ESBWR, APR1400, System 80+, U.S. Advanced Boiling Water Reactor, and NuScale designs); and other future LWR plants could apply the proposed TBS. The original elicitation effort did not consider these newer reactor designs when developing the LOCA frequencies. The current validation effort also did not consider the effects of design differences between these newer plants and other currently operating PWRs on the TBS. These newer plants may have different piping materials, configurations, and operational and service conditions, among other factors, that may impact the piping break frequencies and, thus, the TBS. Therefore, the NRC decided that the proposed TBS would not be applicable to newer plant designs, and these reactors should collectively be treated as ''new reactors'' as described in section XXXVI.F.(xii), ''Applicability to New Reactor Designs,'' of this document.

(iv) Evaluation of the Plant-Specific Applicability of the Transition Break Size

Because both the NUREG–1829 and NUREG–1903 studies developed representative and not bounding estimates, and the recent validation efforts in the ''White Paper on Continued Applicability of NUREG–1829'' and ''White Paper on Continued Applicability of NUREG–1903'' only confirmed the continued applicability of these representative estimates, unique plant attributes may result in plant-specific LOCA frequencies that are greater than reported in either NUREG–1829 or NUREG–1903. Consequently, proposed 10 CFR 50.46a(c)(1)(i) would require entities applying to implement proposed 10 CFR 50.46a for plants authorized to operate under 10 CFR part 50 on December 31, 2015, to conduct an evaluation to demonstrate the applicability of the TBS as defined in 10 CFR 50.46a(a)(9) to their individual plants. In addition, proposed 10 CFR 50.46a(a)(9) and 10 CFR 50.46a(c)(1)(i) also would allow for an alternate TBS to be proposed and justified. Similarly, proposed 10 CFR 50.46a(c)(2) would require that entities applying to implement proposed 10 CFR 50.46a for all other LWRs submit an analysis demonstrating that the proposed reactor design is similar to the designs of reactors authorized to operate under 10 CFR part 50 on December 31, 2015. This

analysis should demonstrate that the NUREG–1829 and NUREG–1903 results, which supported the development of the proposed TBS definition as described in section XXXVI.F.(iii), ''Determining the Ongoing Validity of the Transition Break Size,'' of this document, are generally applicable to these plant designs. Applicants for all other plants would also need to propose and justify an appropriate TBS.

Additionally, proposed 10 CFR 50.46a(c)(1)(i) for reactors authorized to operate under 10 CFR part 50 on December 31, 2015, and proposed 10 CFR 50.46a(c)(2) for all other LWRs would require demonstration that the TBS as defined in proposed 10 CFR 50.46a(a)(9) remain applicable after initial plant changes such that the TBS remains valid. Proposed 10 CFR 50.46a(d)(4) would require demonstration that subsequent plant changes enacted under this proposed rule also do not invalidate the TBS. Most anticipated plant changes should not impact the TBS, so little, if any, evaluation would be necessary to demonstrate the acceptability of such changes. However, some changes, such as power uprates, have the potential to affect the TBS by increasing operating temperatures, coolant flow rate, and neutronic flux.

Guidance for conducting the plant-specific evaluations to demonstrate the initial applicability of the TBS and the subsequent applicability after implementing changes under this proposed rule is provided in DG–1428.

(v) Alternative ECCS Analysis Requirements and Acceptance Criteria

For breaks at or below the TBS, proposed 10 CFR 50.46a(e)(2)(ii) would specify that acceptance criteria be satisfied to a high level of probability (*i.e.,* 95 percent probability level, as explained in RG 1.157, ''Best-Estimate Calculations of Emergency Core Cooling System Performance''), which is currently required for all breaks under 10 CFR 50.46. Commensurate with the lower probability of breaks larger than the proposed TBS, 10 CFR 50.46a(e)(3) of the proposed rule would specify alternative ECCS analysis requirements in addition to the current 10 CFR 50.46 for breaks larger than the proposed TBS. Therefore, proposed 10 CFR 50.46a(e)(3)(ii) would require entities to analyze ECCS cooling performance for breaks up to and including a double-ended rupture of the largest pipe in the RCS using a relaxed set of criteria compared to current LOCA requirements. These analyses would need to be performed by methods acceptable to the NRC and would need to demonstrate that ECCS cooling performance conforms to the acceptance criteria set forth in the proposed rule.

Additionally, the proposed rule would modify the ECCS acceptance criteria from the current 10 CFR 50.46 to be more performance-based and would address the research findings in RIL–0801 for all breaks. The proposed rule would establish two ECCS performance criteria in proposed 10 CFR 50.46a(e)(1) and fuel system requirements in proposed 10 CFR 50.46a(f).

(a) ECCS Performance Criteria

The SSCs of the ECCS are designed to provide residual heat removal during and following a postulated LOCA. Failure of the ECCS to perform its intended function would result in a loss of coolable geometry followed by core reconfiguration. While the principal ECCS performance requirements are simple in nature (*i.e.,* remove residual heat and maintain a coolable geometry), the system must be designed to achieve specified performance objectives, taking into consideration all degradation mechanisms and any unique performance features of the particular fuel system that the ECCS is intended to cool. Sufficient empirical data must be available for the particular fuel system to enable the entity to identify all degradation mechanisms (*e.g.,* embrittlement, loss of structural integrity) and any unique performance features (*e.g.,* eutectic or exothermic reactions, combustible gas generation). Consideration of applicable degradation mechanisms would in turn allow specification of limits for key parameters (*e.g.,* cladding or fuel temperatures) that would establish the duration for which the ECCS must remove residual heat and ensure that a coolable geometry is maintained. In addition, fuel-specific analytical requirements may be necessary to accurately or conservatively model unique phenomena that impact the ECCS performance demonstration (*e.g.,* fuel rod balloon and burst, cladding inside-diameter oxygen ingress).

Section 50.46a(e)(1) of the proposed rule would establish the following principal ECCS performance requirements:

- Sufficient coolant so that the fuel remains in a coolable geometry during and following the LOCA heatup and quench.
- Sufficient long-term cooling so that decay heat will be removed for the extended period of time required by the long-lived radioactivity remaining in the fuel.

Compliance with these performance requirements would provide reasonable assurance that the overall objective of maintaining a coolable fuel geometry during and after a LOCA. In addition, the proposed rule would dictate specific analytical requirements for demonstrating compliance with the ECCS performance requirements. For instance, to demonstrate compliance with these system performance requirements, ECCS performance would be evaluated using fuel-specific performance objectives and associated analytical limits that take into consideration all known degradation mechanisms and unique performance features of the particular fuel system, along with an acceptable evaluation model.

In previous comments, Framatome suggested changes to the draft final 10 CFR 50.46c rule to make it more performance based. Those changes included two ECCS performance criteria that, according to Framatome, would support new fuel types. The NRC agreed that the performance criteria suggested by Framatome would have benefits such as making those performance requirements more performance based. The two performance criteria in proposed 10 CFR 50.46a(e)(1) align closely with Framatome's recommended performance criteria. The difference between the proposed rule and Framatome's suggestion is also a change from the draft final 10 CFR 50.46c rule (see section XXXV.C.(v)(c), ''10 CFR 50.46c Rulemaking and Cladding Embrittlement Research Findings,'' of this document). In that draft rule, core temperature was the first ECCS performance requirement. In this proposed rule, the NRC replaced core temperature with fuel coolability to potentially allow for a demonstration of coolability and safety of fuel outside of a fuel rod, such as dispersed fine fuel fragments resulting from FFRD.

(b) Fuel Coolability

As explained in section XXXV.C.(v)(a), ''10 CFR 50.46 and Fuel Dispersal,'' of this document, since 1973, the AEC and NRC position has been that the objective of the coolable geometry criterion in 10 CFR 50.46(b)(4) is to maintain fuel pellets within the cladding and fuel rods within the fuel bundle lattice. While fuel dispersal is not explicitly addressed in the NRC's current regulations, the objective of the coolability criterion indicates that significant fuel dispersal during a LOCA is not permitted, as fuel leaving the fuel rod leads to loss of the fuel rod structure and loss of fuel bundle configuration. However, the state-of-knowledge

surrounding LOCAs and the ability to simulate complex phenomena during a LOCA have drastically improved since 1973 and is expected to continue to do so. Therefore, it is appropriate to update the understanding of coolability. Based on the conclusions in NUREG/CR–7307, which describes the NRC-sponsored fuel dispersal consequences PIRT exercise, it is reasonable to conclude that some amount of fuel dispersal could be coolable, and it is expected that this can be demonstrated with the tools and experimental capabilities available today. The PIRT expert panel believed that relatively simple bounding calculations can be performed to address the primary downstream consequences of dispersal.

While core configuration, fuel bundle array geometry, and fuel rod structure have traditionally been considered to be challenged by any significant amount of fuel dispersal, the NRC is open to the possibility that core configuration, fuel bundle array geometry, and fuel rod structure could be shown to remain generally intact even if some amount of fuel is dispersed. While simple bounding calculations may be possible at the present time, the models and testing necessary to perform a more detailed analysis and a more detailed demonstration in support of reactor safety analyses have not been developed and specific limits concerning how much dispersed fuel would be acceptable have not been defined. Therefore, similar to any other LOCA phenomena, prior to approving LOCA analysis methods involving fuel dispersal under both the existing regulations and the proposed rule, the NRC would review the relevant modeling approaches, including their underlying validation and experimental basis, to ensure their credibility. Should fuel dispersal be calculated to occur, an entity would need to provide a technical basis addressing the coolability of both fuel retained in the core and fuel dispersed into the reactor vessel or containment.

The proposed 10 CFR 50.46a provides an explicit risk-informed framework for treatment of breaks above the TBS that could relax required analytic assumptions. The proposed risk-informed framework is not the only permissible way to use risk insights in addressing the ECCS requirements. The NRC will continue to assess regulatory compliance consistent with the existing regulatory framework on risk-informed regulation, including regulatory guidance such as RG 1.174. An acceptable level of defense-in-depth and safety margins should continue to be maintained when applying risk insights. As a result of addressing coolability in a more performance-based way and treating dispersal as not being incompatible with coolability, other licensing pathways may be made possible to address coolability, such as other alternatives postulated in the regulatory basis for this rulemaking or proposed by industry in topical reports.

This proposed rule would represent a change in the Commission's position on coolability to allow for demonstrations of fuel dispersal. This proposed change could result in questions on when the core geometry would no longer be considered coolable. The proposed requirements to demonstrate fuel coolability (in proposed 10 CFR 50.46a(e)(1)(i) and (f)(3)) and address cladding degradation phenomena (in proposed 10 CFR 50.46a(f)(1)) in the ECCS performance analyses would provide reasonable assurance that unacceptable scenarios would not occur. Unacceptable scenarios would include, but would not be limited to the following:

- Widespread brittle cladding failure. Brittle failure of the cladding during a LOCA could lead to the shattering of the cladding and the release of much of the fuel in the rod. While fuel may be dispersed out of a rupture opening of a fuel rod when considering FFRD, less fuel is expected to be dispersed than if PQD is not preserved. Additionally, the general fuel bundle configuration of the core would be lost in the case of widespread brittle cladding failure, which would have major deleterious effects on core coolability. For these reasons, the NRC would maintain PCT and PQD criteria for zirconium-alloy and UO_2 fuel systems in 10 CFR 50.46 but include them in guidance (*i.e.,* DG–1263) to support proposed 10 CFR 50.46a. The PCT and PQD criteria in DG–1263 would address proposed 10 CFR 50.46a(f)(1), which states that cladding degradation phenomena must be addressed.
- Fuel/cladding melt. In addition to ensuring PQD, emergency coolant provided by the ECCS is intended to prevent the fuel from melting during a LOCA. If the ECCS is unable to provide sufficient cooling to prevent the fuel from melting, then this situation could lead to an outcome where the fuel becomes uncoolable. While this rulemaking proposes to recategorize LOCAs above the TBS as beyond-design-basis, the NRC continues to find that avoidance of fuel melting during a LOCA is appropriate to ensure a coolable geometry. Similarly, the fuel dispersal PIRT identified fuel accumulation on the spacer grids as a concern. If fuel particles settle on spacer grids and there is two-sided heating of the cladding, then it could potentially cause the cladding to melt and therefore damage the configuration of the core. This postulated scenario must be avoided. For zirconium-alloy and UO_2 fuel systems that retain their fuel, the PCT criteria in DG–1263, which would address the proposed 10 CFR 50.46a(f)(1) requirement to have NRC-approved limits that address cladding degradation phenomena, would prevent fuel melt during a LOCA.

(c) Acceptable Methodologies and Analysis Assumptions

Proposed 10 CFR 50.46a(e) would retain the requirement in existing 10 CFR 50.46 that ECCS cooling performance must be calculated in accordance with an acceptable evaluation model. Acceptable evaluation models are currently of two types: those that realistically describe the behavior of the RCS during a LOCA, and those that conform with the required and acceptable features specified in appendix K to 10 CFR part 50. Appendix K to 10 CFR part 50 evaluation models incorporate conservatism as a means to justify that the acceptance criteria are satisfied by an ECCS design. In contrast, the realistic or best-estimate models attempt to accurately simulate the expected phenomena while accounting for uncertainty such that there is a high level of probability that the ECCS acceptance criteria will not be exceeded. As a result, comparisons to applicable experimental data must be made and uncertainty in the evaluation model and inputs must be identified and assessed. All these existing requirements are included in proposed 10 CFR 50.46a(e)(2) for breaks at or below the TBS.

As currently required under 10 CFR 50.46, the ECCS analysis performed with realistic modeling must demonstrate with a high level of probability that the acceptance criteria will not be exceeded. The NRC position in RG 1.157 is that 95 percent probability constitutes an acceptably high probability. Section 50.46a(e)(2) of the proposed rule retains this high level of probability as the statistical acceptance criterion for breaks below the TBS. For breaks at or above the TBS, proposed 10 CFR 50.46a(e)(3) would depart from the requirement of high probability to state that assurance to at least a best-estimate level is acceptable. For these breaks, best-estimate would refer to nominal and unbiased analyses. Thus, for realistic evaluation models for breaks above the TBS, entities would not be required to account for the

uncertainty. The best-estimate analyses could also take credit for offsite power, as stated in proposed 10 CFR 50.46a(e)(3).

Proposed 10 CFR 50.46a(e)(2) and (e)(3) would each require a separate determination of the most limiting break scenarios within each of the two break-size regions: (1) breaks at or below the TBS and (2) breaks larger than the TBS up to and including a double-ended rupture of the largest pipe in the RCS. Different methodologies, analytical assumptions, and acceptance criteria could be used for each break size region. Consistent with current 10 CFR 50.46 requirements, entities would be required to analyze breaks at or below the TBS by assuming the worst single failure concurrent with a loss-of-offsite power and only crediting the mitigative capability of safety-related SSCs. For breaks larger than the TBS, entities could credit operation of both safety and non-safety-related SSCs (subject to system availability as supported by plant-specific data or analysis) provided that onsite power could be readily provided to that equipment through manual actions after a loss-of-offsite power (*e.g.,* within approximately 30 minutes). This requirement for non-safety-related equipment would be a defense-in-depth consideration for severe accident management. The SSCs that are credited for such accidents should have at least a pedigree similar to that of the equipment credited in other beyond-design-basis accidents. All non-safety equipment that is credited for analyses of breaks larger than the TBS would need to be identified as such and evaluated whether they should be listed in the plant technical specifications in order to satisfy criterion 4 of 10 CFR 50.36(c)(2)(ii). Criterion 4 of 10 CFR 50.36(c)(2)(ii) states that a technical specification limiting condition for operation must be established for a ''structure, system, or component which operating experience or probabilistic risk assessment has shown to be significant to public health and safety.'' Despite the recategorization of LOCAs greater than the TBS as beyond-design-basis, the NRC still believes that it is significant to public health and safety that such events are able to be mitigated. Criterion 4 of 10 CFR 50.36(c)(2)(ii) is the basis for the establishment of technical specifications for equipment that are used in the mitigation of another beyond-design-basis accident, anticipated transient without scram. For example, in the BWR/6 standard technical specifications in Volume 2 of Revision 5.0 of NUREG–1434, ''Standard Technical Specifications—General Electric BWR/6 Plants,'' the typically non-safety-related anticipated transient without scram recirculation pump trip system is stated as satisfying criterion 4 of 10 CFR 50.36(c)(2)(ii).

(d) Fuel-Specific Performance and Analytical Requirements

Section 50.46a(f) of the proposed rule would include performance requirements for fuel designs. The fuel designs would be required to have NRC-approved limits that do the following:

- Address cladding degradation phenomena.
- Maintain fuel coolability.
- Avoid explosive concentration of combustible gas.
- Demonstrate that, after any calculated successful initial operation of the ECCS, the ECCS must provide sufficient coolant to remove decay heat and prevent further cladding failure for the extended period of time required by the long-lived radioactivity remaining in the fuel.

Means of meeting the requirement to address cladding degradation criteria are provided in DG–1263 for fuel designs consisting of uranium oxide or mixed uranium-plutonium oxide fuel pellets within cylindrical zirconium-alloy cladding. Under this requirement, entities should address the research findings discussed in section XXXV.C.(v)(c), ''10 CFR 50.46c Rulemaking and Cladding Embrittlement Research Findings,'' of this document when establishing criteria on PCT, PQD, and breakaway oxidation, as detailed in DG–1263. The NRC is proposing to not include PCT and PDQ requirements in the proposed 10 CFR 50.46a, unlike the current 10 CFR 50.46(b)(1) and (b)(2). Instead, the NRC proposes to include PCT and PQD criteria in guidance to enable regulatory flexibility. For example, additional criteria for fuel performance above 2200 °F (1204 °C) may be needed to address other high-temperature failure mechanisms that may not occur below 2200 °F (1204 °C). Including the PCT, the maximum local oxidation, and maximum hydrogen generation criteria in DG–1263 rather than codified in proposed 10 CFR 50.46a would provide this flexibility.

Exemptions from proposed 10 CFR 50.46a would not be needed for new fuels to which the current criteria may not be applicable, such as non-zirconium-alloy cladded fuel, since the criteria would be located in guidance. The NRC did not include guidance for fuel designs that do not consist of uranium oxide or mixed uranium-plutonium oxide fuel pellets within cylindrical zirconium-alloy cladding as a part of this rulemaking due to a lack of operational experience on which to base specific criteria and to accelerate the rulemaking schedule. The NRC has determined that these new fuels should be able to be licensed based on technical justifications without the need for exemptions from regulation. For example, since the detailed criteria would be in guidance, justification could be provided for alternative criteria for PCT that exceed the 2200 °F (1204 °C) limit in 10 CFR 50.46(b)(1) and has historically been used for fuel designs consisting of uranium oxide or mixed uranium-plutonium oxide fuel pellets within cylindrical zirconium alloy cladding.

As discussed in section XXXVI.F.(ii), ''Original Determination of the Transition Break Size,'' of this document, some amount of fuel dispersal could be shown to be coolable and therefore acceptable under proposed 10 CFR 50.46a. During FFRD, fuel is dispersed following ductile failure of the cladding (*i.e.,* ballooning and burst) and also can be dispersed from brittle failure of the cladding. Historically, brittle failure of even a single rod has been prevented by ensuring compliance with 10 CFR 50.46(b), as described in section XXXV.C.(v)(a), ''10 CFR 50.46 and Fuel Dispersal,'' of this document. Under this proposed rule, the NRC may review applications for safety demonstrations of FFRD during breaks above the TBS, so it is logical to consider safety demonstrations of fuel dispersed from brittle failure for LOCAs above the TBS. Such brittle failures should be limited so that there is not a widespread loss of the general fuel rod bundle configuration in the core, as widespread destruction of the fuel rod bundle configuration would have significant deleterious effects on core coolability.

There has been little research on the amount of fuel dispersal expected to occur due to brittle failure, but if coolability and safety can be ensured following brittle failure of the cladding, then the NRC may find it to be acceptable for breaks above the TBS. Entities would need to justify the safety case for permitting brittle failure of fuel rods and the resulting fuel dispersal.

Additionally, the criteria in proposed 10 CFR 50.46a(f) may be used as an alternative to the criteria in proposed 10 CFR 50.46(b), as applicable, without having to adopt the rest of proposed 10 CFR 50.46a, as stated in proposed 10 CFR 50.46(a)(3)(i).

The existing regulation in 10 CFR 50.46(b)(5) requires that, for long-term cooling, the calculated core temperature

be maintained at an acceptably low value following any calculated successful initial operation of the ECCS. It also requires that decay heat be removed for the extended period of time required by the long-lived radioactivity remaining in the fuel. Section 50.46a(f)(4) of the proposed rule would retain these requirements from 10 CFR 50.46(b)(4) and specify that cladding failure should be prevented in the extended period of time required by the long-lived radioactivity remaining in the fuel.

(e) Restriction of Reactor Operation

Proposed 10 CFR 50.46a(i) would allow the Director of the NRC's Office of Nuclear Reactor Regulation to impose restrictions on reactor operation if the NRC determines that the evaluations of ECCS cooling performance are not consistent with the requirements for evaluation models and analysis methods specified in proposed 10 CFR 50.46a(e)(1) through (e)(3) and 10 CFR 50.46a(f). Non-compliance could be due to factors such as lack of a sufficient database upon which to assess model uncertainty, use of a model outside the range of an appropriate data base, use of models inconsistent with the requirements of appendix K to 10 CFR part 50, or discovery of phenomena unknown at the time of approval of the methodology. Lack of compliance with methodological requirements would not necessarily mean that the ECCS capability is unacceptable, but only that the analysis results using the methodology in question cannot be relied upon to demonstrate compliance with the appropriate acceptance criteria. Thus, depending upon the specific circumstances, it might be necessary for the NRC to impose restrictions on operation until these issues are resolved. This requirement would be consistent with the current ECCS regulations in existing 10 CFR 50.46(a)(2).

(vi) Risk-Informed Changes to the Facility, Technical Specifications, or Procedures

The proposed 10 CFR 50.46a would designate LOCAs above the TBS as beyond-design-basis, allowing for best-estimate analysis for such LOCAs. The proposed flexibility in ECCS analyses for LOCAs above the TBS would enable a wide range of changes that could be implemented at facilities seeking to apply the proposed 10 CFR 50.46a.

Entities that would request approval to use 10 CFR 50.46a would use a risk-informed evaluation to demonstrate that facility changes would satisfy the risk-informed acceptance criteria in proposed 10 CFR 50.46a(h). Changes that would need to be evaluated would be specified in proposed 10 CFR 50.46a(d)(3) and would include all ''enabled'' changes (*i.e.,* changes that would be permissible if the NRC were to approve the entity's request to use proposed 10 CFR 50.46a) that satisfy the alternative ECCS analysis requirements in proposed 10 CFR 50.46a but do not satisfy the ECCS analysis requirements in current 10 CFR 50.46.

Proposed 10 CFR 50.46a(h)(1), (2) and (3) would require entities to demonstrate in their risk-informed evaluations that increases in plant risk (if any) would meet appropriate risk acceptance criteria, defense-in-depth would be maintained, adequate safety margins would be maintained, and adequate performance-measurement programs would be implemented. All changes to a plant, its technical specifications, or its procedures that would be based upon the analyses of ECCS performance permitted under proposed 10 CFR 50.46a(e)(3)–except for those changes made under proposed 10 CFR 50.46a(h)(1)–would need to be reviewed and approved by the NRC. A wide range of changes could be implemented under proposed 10 CFR 50.46a that, if improperly implemented by entities, could result in significant adverse impacts on public health and safety or common defense and security. NRC review and approval would provide verification that an entity has properly evaluated each proposed change against the acceptance criteria in proposed 10 CFR 50.46a. Existing 10 CFR 50.36(b) requires each license authorizing operation of a production or utilization facility of a type described in 10 CFR 50.21, ''Class 104 licenses; for medical therapy and research and development facilities,'' or 50.22, ''Class 103 licenses; for commercial and industrial facilities,'' to include technical specifications, so changes to the technical specifications require the license to be amended. However, 10 CFR 50.36 does not provide risk thresholds, nor does it require a risk-informed evaluation to demonstrate that the proposed change does not result in significant adverse impacts on public health and safety or common defense and security. Therefore, for technical specifications changes proposed under 10 CFR 50.46a, 10 CFR 50.46a(h)(2) would provide the risk acceptance criteria necessary for entities to evaluate each proposed change, beyond that required in 10 CFR 50.36. Accordingly, the NRC's proposed rule would require NRC review and approval of all changes initiated under proposed 10 CFR 50.46a(h)(2).

An entity other than a design certification applicant or holder of an ML who sought to make certain changes that would be enabled by the proposed rule without prior NRC review and approval would need to submit for NRC review its risk-informed process that would be used in evaluating the acceptability of these changes as described in proposed 10 CFR 50.46a(c)(1)(v). The entity's process would also need to include a means to evaluate the continued applicability of the TBS with the acceptance criteria used in the evaluation described in proposed 10 CFR 50.46a(c)(1)(i) for plants authorized to operate under 10 CFR part 50 on December 31, 2015 or as described in proposed 10 CFR 50.46a(c)(2) for entities other than those authorized to operate under 10 CFR part 50 on December 31, 2015. An entity who would make only a single or a few changes enabled by the rule would not need to submit a risk-informed evaluation process. Instead, that entity would submit only its risk-informed evaluation of each change it has requested. Proposed 10 CFR 50.46a(h)(1) would contain acceptance criteria for self-made changes enabled by the rule. Under the proposed framework, if an entity's initial application to implement proposed 10 CFR 50.46a does not include a risk-informed evaluation process, then that entity could, at any later time, submit another license amendment requesting approval of a risk-informed evaluation process. The DG–1426 would provide guidance for the risk-informed evaluation specified in proposed 10 CFR 50.46a(c)(1)(iv) and the risk-informed evaluation process specified in proposed 10 CFR 50.46a(c)(1)(v).

(a) Requirements for the Risk-Informed Evaluation

The acceptability of all entity-initiated changes made under the rule would be judged in a risk-informed manner. The risk-informed assessment process would include methods for evaluating compliance with the risk criteria, defense-in-depth criteria, safety margin criteria, and performance measurement criteria in proposed 10 CFR 50.46a(h). These attributes have been identified by the NRC in RG 1.174 as a set of risk evaluation tools to ensure that changes to the facility do not endanger public health and safety.

Compliance with the risk criteria would play a key role in the regulatory structure of the proposed rule. Entities would be required to use a risk assessment to determine the change in

risk associated with facility changes. Inasmuch as the Commission's final policy statement on the ''Use of Probabilistic Risk Assessment Methods in Nuclear Regulatory Activities'' (60 FR 42622; August 16, 1995) sets forth the Commission's intention to encourage the use of PRA and to expand the scope of PRA applications in all nuclear regulatory matters to the extent supported by the state-of-the-art in PRA methods and data, 10 CFR 50.46a(h)(4) of the proposed rule would require that a technically acceptable PRA be used to demonstrate compliance with the requirements of proposed 10 CFR 50.46a if the change being assessed could substantively increase risk. Proposed 10 CFR 50.46a(h)(4)(i) through (iv) set forth the four general attributes of an acceptable PRA for the purposes of this proposed -rule. However, the NRC recognizes that nonquantitative PRA assessment methodologies and approaches could also be used to complement or supplement the quantitative aspects of a PRA, especially when performance of a quantitative PRA methodology of the level needed to support a particular plant modification decision would not be justifiable because the safety significance of the decision would not warrant the level of technical sophistication inherent in a PRA. Accordingly, proposed 10 CFR 50.46a(h)(5) would establish the minimum requirements for risk assessment methodologies other than PRA. This proposed requirement would provide flexibility for entities to use the nonPRA risk methodology (or combination of different methodologies) when these methodologies produce results that are sufficient to -determine that the risk acceptance criteria in the proposed rule have been met.

(b) Aggregation of Plant Changes When Evaluating Changes in Risk

Entities often make changes to their facilities, technical specifications, and procedures. Some changes that entities would be able to make after being approved to use this proposed rule would not have been permitted without the proposed 10 CFR 50.46a ECCS requirements (*i.e.,* enabled changes). Other changes would be unrelated insofar as the basis of the changes and NRC approval, when necessary, would rely on regulations, guidelines, or facility priorities that would not depend on the proposed 10 CFR 50.46a ECCS requirements. Unrelated changes would indirectly influence the change in risk of the proposed 10 CFR 50.46a related changes because they would change the risk profile of the facility. If unrelated changes were combined (bundled) with enabled changes in evaluating the proposed 10 CFR 50.46a change in risk estimates, the result would typically be different than if the unrelated changes were considered as part of the baseline risk associated with the current design and operation of the facility. Regulatory guide 1.174 permits bundling changes (referred to as combined changes in RG 1.174) and provides additional acceptance guidelines when combining unrelated plant changes that might decrease risk together with a group of enabled changes to evaluate the total change in risk for comparison to the acceptance guidelines.

Allowing the bundling of unrelated changes into the proposed 10 CFR 50.46a change in risk estimates would encourage entities to use risk-informed methods to take advantage of opportunities to reduce risk. However, in some situations, bundling could mask the creation of significant risk outliers. To ensure that outliers would not be created, the proposed rule would not permit bundling of unrelated changes with enabled changes without NRC review and approval. Specifically, proposed 10 CFR 50.46a(h)(2)(i) and (iii) would allow changes not enabled by proposed 10 CFR 50.46a to be bundled with changes enabled by proposed 10 CFR 50.46a in the calculation of the change in risk when an entity would submit an application for a change under 10 CFR 50.90, ''Application for amendment of license, construction permit, or early site permit.''

(c) NRC approval of an Entity Process for Making Changes to an Entity's Facility or Procedures Without NRC Review and Approval

As a general matter, the proposed rule would require an entity to obtain NRC review and approval through an application for any changes to its facility, technical specifications, or procedures that may be implemented under proposed 10 CFR 50.46a. However, the proposed rule would allow an entity, other than a design certification applicant or holder of an ML, to make a subset of plant and procedure changes without NRC approval if the changes would involve minimal changes in risk and no significant impact upon defense-in-depth capabilities, safety margins, or performance monitoring. Prior NRC review and approval of these changes on an individual basis would be unnecessary if the NRC had previously concluded that the entity other than a design certification applicant or holder of an ML had an adequate technical process for appropriately identifying this subset of changes. Plant changes that would involve minimal changes in risk and have no significant impact upon defense-in-depth, safety margins, and performance monitoring (and do not involve a change to the technical specifications), would not result in significant issues involving public health and safety or common defense and security.

Expending entity resources to prepare, and NRC resources to review and approve, an application for approval of plant changes involving minimal changes in risk would not be efficient uses of resources. Rather, if the NRC would review and approve in advance the entity's processes (including the acceptability of the entity's PRA and other risk assessment methods) and criteria for identifying changes that would have minimal impact on risk and would not significantly affect defense-in-depth, safety margin, performance monitoring, or plant physical security, then there would be no need for the NRC to review and approve each of the individual changes. Accordingly, the NRC is proposing an approach in 10 CFR 50.46a(h)(1) that would allow an entity other than a design certification applicant or holder of an ML to obtain ''pre-approval'' of a process for identifying minimal plant and procedure changes made possible under proposed 10 CFR 50.46a.

Proposed 10 CFR 50.46a(h) would enable an entity other than a design certification applicant or holder of an ML to make changes based upon the provisions of proposed 10 CFR 50.46a, without prior NRC approval, if the requirements in proposed 10 CFR 50.46a(h)(1) and (h)(3) were met. The proposed rule also would require that the change be permitted under the 10 CFR 50.59, ''Changes, tests and experiments.'' Compliance with the 10 CFR 50.59 requirements would be necessary to ensure that facility changes made without NRC approval would not result in plant conditions that could impact public health and safety. Compliance with the proposed 10 CFR 50.46a(h) requirements for risk assessments would be required to ensure that facility changes would result in acceptable changes in risk, that adequate defense-in-depth would be maintained, that safety margins would be maintained, and that adequate performance-measurement programs would be implemented.

Design certification applicants would not be subject to the change process in proposed 10 CFR 50.46a(h)(1), either before or after NRC certification of the design. An applicant for a design certification that has not been approved

by the NRC would not need this provision because it could change the design specified in its application before NRC issuance of a final standard design certification rule for its design. The NRC also has determined that design certification applicants whose designs have been certified should not be allowed to change the certified designs without NRC review and approval via rulemaking. Allowing the design certification applicant to make changes to the certified design without NRC approval through proposed 10 CFR 50.46a(h)(1) would be inconsistent with the purpose of certifying the design in a rulemaking and would effectively reduce the NRC's regulatory control over the design certification. The NRC would review any deviations from the certified design when reviewing the COL application. The NRC also would exclude ML holders from this option to avoid a reduction of NRC regulatory control over the approved manufacturing design, consistent with the requirement in existing 10 CFR 52.171(b)(1) that holder of an ML may not make changes to the design of the nuclear power reactor authorized to be manufactured without NRC approval.

(d) Risk Acceptance Criteria for Plant Changes

To make changes to the facility, technical specifications, or procedures not permitted by proposed 10 CFR 50.46a(h)(1), proposed 10 CFR 50.46a(h)(2) would require the submission of information from the risk-informed evaluation demonstrating, among other things, that the total increases in risk from the proposed change would be very small and that the overall plant risk would remain small. These characterizations of ''very small'' and ''small'' are intended to be consistent with their use in RG 1.174, which introduces surrogate guidelines that provide assurance that overall plant risks remain bounded by the Commission's Policy Statement on ''Safety Goals for the Operations of Nuclear Power Plants'' (51 FR 28044; August 4, 1986).

1. Risk Estimate

To satisfy the Commission's requirement in proposed 10 CFR 50.46a(h)(2)(ii) that the total increases in risk are very small, an entity would need to evaluate the change in risk for each facility change and show that the change meets the acceptance guidelines. If a series of changes were made over time, proposed 10 CFR 50.46a(h)(2)(iii) would require that the cumulative effect of these changes be evaluated and shown to meet the acceptance criteria. Proposed 10 CFR 50.46a(h)(2)(iii) also would permit an entity to combine changes in risk from facility changes not enabled by proposed 10 CFR 50.46a with changes in risk from facility changes that would be enabled by proposed 10 CFR 50.46a for the purposes of meeting the acceptance guidelines. Taken together, this bundled group of enabled changes and unrelated changes would be referred to as the ''changes made under'' proposed 10 CFR 50.46a.

For each change requiring a risk-informed evaluation, the total change in risk from all facility changes made under the proposed 10 CFR 50.46a would need to be evaluated and compared to the ''very small'' acceptance criterion when the change is first made and then with each subsequent enabled change that would result in a greater than minimal increase in risk. Requiring that the total change in risk from all facility changes made under the proposed 10 CFR 50.46a be compared to the proposed 10 CFR 50.46a acceptance criteria instead of allowing the changes in risk to be partitioned and individually compared to the acceptance criteria would ensure that the total risk increase for all changes, as they are implemented over time, would not constitute more than a very small increase in risk. If the total increase in the applicable risk metrics were not compared to the acceptance criteria, then several changes in which each individual change's risk increase was kept below the proposed rule's risk acceptance criteria could, considered cumulatively, result in a significant increase in risk. A significant increase may not satisfy the Commission's proposed criterion that the overall plant risk remains small. Also, comparing the risk increase from each change to the acceptance criteria independently of all previous changes would render the use of the ''very small'' criterion inadequate to monitor and control increases in risk from a series of plant changes implemented over time.

Comparing the total risk increase to the risk increase criterion, and allowing bundling of unrelated changes in the change in risk estimate, would support the NRC's position as stated in RG 1.174 that, consistent with the key principles of risk-informed integrated decision-making, entities should have a risk management approach in which risk insights are not just used to systematically increase risk, but also to help reduce risk where appropriate and where it is shown to be cost effective.

2. Acceptance Criteria

The risk acceptance guidelines proposed in 10 CFR 50.46a(h)(2)(ii) use CDF and large early release frequency (LERF) risk metrics. As discussed in SRM–SECY–98–015, ''Staff Requirements—SECY–98–015—Final General Regulatory Guide and Standard Review Plan for Risk-Informed Regulation of Power Reactors,'' dated May 20, 1998, the Commission approved the use of RG 1.174, which incorporated Commission direction in the March 19, 1998, SRM issued for SECY–97–287, ''Final Regulatory Guidance on Risk-Informed Regulation: Policy Issues,'' dated December 12, 1997. Based on proposals made by the staff, the Commission approved the use of very small increases in CDF and LERF independent of the baseline calculated CDF/LERF, provided that licensees track and NRC staff monitor the cumulative effect of changes. These risk metrics are based on subsidiary objectives derived from the NRC's safety goals and their quantitative health objectives. In particular, the CDF risk metric is used as a surrogate for the individual latent cancer fatality risk, and the LERF risk metric is used as a surrogate for the individual early fatality risk. The NRC has used CDF and LERF in making regulatory decisions for more than 30 years. The NRC endorsed the use of CDF and LERF as appropriate measures for evaluating risk and ensuring safety in nuclear power plants when it adopted RG 1.174 in 1998. Since the adoption of RG 1.174, the NRC has had 27 years of experience in applying risk-informed regulation to support a variety of applications, including amending facility procedures and programs (*e.g.,* inservice testing and inservice inspection programs), amending facility OLs, making changes to the FSAR, and implementing risk-informed technical specifications. Based on this experience, the NRC has determined that CDF and LERF are acceptable measures for evaluating changes in risk as the result of changes to a facility, technical specifications, and procedures, except for certain changes that affect containment performance but do not affect CDF or LERF. Changes that affect containment performance are considered as part of the defense-in-depth evaluation.

In SRM–SECY–07–0082, ''Staff Requirements—SECY–07–0082—Rulemaking to Make Risk-Informed Changes to Loss-of-Coolant Accident Technical Requirements; 10 CFR 50.46a, 'Alternative Acceptance Criteria for Emergency Core Cooling Systems for Light-Water Nuclear Power Reactors,' ''

dated August 10, 2007, the Commission concluded that, to more closely follow the approach presented in RG 1.174, the staff, in the 10 CFR 50.46a draft final rule, should restrict changes to a plant to very small risk increases. As discussed in RG 1.174, a very small risk increase is independent of a plant's overall risk as measured by the current CDF and LERF. Increases in CDF of 10^{-6} per reactor year or less and increases in LERF of 10^{-7} per reactor year or less are very small risk increases for existing reactor facilities. Limiting the acceptance criteria for plant changes enabled under proposed 10 CFR 50.46a to very small risk increases ensures that significant plant changes will not be enabled strictly due to the initiating event frequency for a LOCA greater than the TBS, which is on the order of 10^{-5} and the same as the criteria for small risk increases. In SRM–SECY–12–0081, ''Staff Requirements—SECY–12–0081—Risk-Informed Regulatory Framework for New Reactors'' dated October 22, 2012, the Commission approved the staff's recommendation to transition new reactors from large release frequency to LERF at or before initial fuel load and discontinue regulatory use of large release frequency. Applicants for new reactor OLs under 10 CFR part 50 or COLs under 10 CFR part 52 may need to transition to LERF to demonstrate in the risk-informed evaluation that the proposed changes meet the requirements in proposed 10 CFR 50.46a(h).

Since adopting RG 1.174 in 1998, the NRC has applied the quantitative change in risk guidelines to individual plant changes and to sequences of plant changes implemented over time. The NRC has found these guidelines and the CDF and LERF values (when used together with the defense-in-depth, safety monitoring, and performance measurement criteria) to be capable of differentiating between changes, and sequences of changes, that are not expected to endanger public health and safety and those that might.

When the change does not significantly increase LOCA frequencies or invalidate the evaluation demonstrating the applicability of the TBS to the applicant's facility and the change is permitted under 10 CFR 50.59, 10 CFR 52.98(b), 10 CFR 52.98(c), and 10 CFR 52.98(d), as applicable, proposed 10 CFR 50.46a(h)(1) would permit entities other than a design certification applicant or holder of an ML to make changes without prior NRC approval if the changes involve minimal increases in risk that also have no significant impact upon defense-in-depth capabilities, safety margins, and performance monitoring. A minimal risk increase is one that, when considered qualitatively by itself or in combination with all other minimal increases, would never become significant. A minimal increase in risk is an increase less than 10 percent of the risk increases that would be very small for any licensee. Therefore, a minimal increase is an increase of less than 10^{-7} per reactor year for CDF and an increase in LERF of less than 10^{-8} per reactor year. These values are two orders of magnitude below the maximum allowed risk increase guidelines in RG 1.174 and one order of magnitude less than the very small criterion. Although multiple changes, when evaluated separately, could each be a minimal increase in risk, when combined and evaluated together, they could exceed the very small criterion. Most of these changes would have a much smaller (and, in some cases, an unmeasurable) increase in risk. If an entity other than a design certification applicant or holder of an ML were to implement an unexpectedly large number of minimal risk changes, then the periodic reporting requirements in proposed 10 CFR 50.46a(j)(3) would provide adequate notice to ensure that the NRC is aware of potentially significant changes (or any collective impact), so that the NRC could undertake additional oversight actions as deemed necessary and appropriate.

(e) Defense-in-Depth

Section 50.46a(h)(3)(i) of the proposed rule would require that the risk-informed evaluation demonstrate that defense-in-depth is maintained. Defense-in-depth is an element of the NRC's safety philosophy that employs successive measures to prevent accidents or mitigate damage if a malfunction, accident, or naturally caused event occurs at a nuclear facility. As conceived and implemented by the NRC, defense-in-depth provides, among other things, redundancy in addition to a multiple barrier approach against fission product releases. Defense-in-depth continues to be an effective way to account for uncertainties in equipment and human performance. The NRC has determined that retention of adequate defense-in-depth must be ensured in all risk-informed regulatory activities.

(f) Safety Margins

Proposed 10 CFR 50.46a(h)(3)(ii) would require that adequate safety margins be retained to account for uncertainties. These uncertainties include phenomenology, modeling, plant construction, and plant operation. Without this proposed provision, entities could make plant changes that would inappropriately reduce safety margins, resulting in an unacceptable increase in risk or challenge to plant SSCs. This proposed requirement would ensure that an adequate safety margin exists to account for these uncertainties, such that there would be no unacceptable results or consequences (*e.g.,* structural failure) if an acceptance criterion or limit is exceeded.

(g) Performance Measuring Programs

Section 50.46a(h)(3)(iii) of the proposed rule would require entities to implement adequate performance-measurement programs and feedback strategies to ensure that the risk-informed evaluation continues to reflect actual plant design and operation. The risk-informed evaluation would include the risk assessment, maintenance of adequate defense-in-depth, and maintenance of adequate safety margins. This proposed requirement would require that the monitoring programs be designed to detect degradation of SSCs before plant safety is compromised.

(vii) Leak Detection Requirements

In its SRM on SECY–07–0082, the Commission directed the NRC staff to increase the defense-in-depth against large pipe breaks provided by the 10 CFR 50.46a draft final rule. The SRM also directed the NRC staff to evaluate various approaches for enhancing that draft final rule with requirements for improved leak detection methods. The NRC determined that adequate leak detection capability meeting this direction could enhance defense-in-depth for LOCAs larger than the TBS by reducing the likelihood of pipe breaks in the large break region. Thus, proposed 10 CFR 50.46a(d)(2) would require that licensees have leak detection systems available at the facility and implement actions as necessary to identify, monitor, and quantify leakage to ensure that adverse safety consequences do not result from leaking primary pressure boundary components that are larger than the TBS.

Because proposed 10 CFR 50.46a would not change the design basis of piping and components that are smaller than the TBS, the requirements of proposed 10 CFR 50.46a(d)(2) would apply only to piping and components that are larger than TBS. The NRC recognizes that leakage detection methods that satisfy these proposed requirements may not be capable of determining whether the source of leakage is from piping or a component that is larger or smaller than the TBS.

Discrimination between leaks in pipes larger or smaller than the TBS would be unnecessary as long as adequate leak detection would be provided for all beyond-TBS piping.

(viii) Programmatic Requirements

The proposed rule would include several specific programmatic requirements in proposed 10 CFR 50.46a(d) that would apply to entities who are approved to implement proposed 10 CFR 50.46a. These requirements would remain applicable to such an entity as long as the entity is subject to the proposed 10 CFR 50.46a alternative ECCS requirements until such time as the licensee permanently ceases operations by submitting the certifications required under 10 CFR 50.82(a). The proposed programmatic requirements would require entities implementing proposed 10 CFR 50.46a to do the following:

(a) Maintain ECCS models and/or analysis methods that demonstrate compliance with the ECCS acceptance criteria.

(b) Maintain adequate reactor coolant leak detection equipment available at the facility and identify, monitor, and quantify leakage to ensure that adverse safety consequences do not result from leaking primary pressure boundary components that are larger than the TBS.

(c) Perform a risk-informed evaluation for each potentially risk-significant change (or group of changes) to the facility enabled by proposed 10 CFR 50.46a.

(d) Perform an evaluation to determine the effect of all planned nuclear power plant changes and do not implement any facility change that would invalidate the applicability of the TBS to the facility.

(e) Within 120 days after the outage in which the inspection required in proposed 10 CFR 50.46a(b)(3) has been performed, submit to the NRC a report that details the results of the inspection and any impact these results have on the TBS in accordance with proposed 10 CFR 50.46a(b)(3).

The following discussion describes each of the programmatic requirements.

(a) Maintain ECCS Models and/or Analysis Methods That Demonstrate Compliance With the ECCS Acceptance Criteria

Section 50.46a(d)(1) of the proposed rule would require that calculated results of entity ECCS models and/or analysis methods must demonstrate compliance with the ECCS acceptance criteria as long as the entity is subject to the requirements in proposed 10 CFR 50.46a. Entities also would be required to update ECCS models and/or analysis methods by modifying them as needed to address any error corrections and plant design changes affecting ECCS performance during this time period.

(b) Maintain Adequate Reactor Coolant Leak Detection Equipment Available at the Facility and Identify, Monitor, and Quantify Leakage To Ensure That Adverse Safety Consequences Do Not Result From Leaking Primary Pressure Boundary Components That Are Larger Than the Transition Break Size

The requirement for adequate leak detection capability would be in proposed 10 CFR 50.46a(d)(2) and was discussed in section XXXVI.F.(vii), ''Leak Detection Requirements,'' of this document. Adequate leak detection would be required for all primary coolant pressure boundary piping and other components whose rupture could result in a break larger than the TBS.

(c) Perform a Risk-Informed Evaluation for Each Change (or Group of Changes) to the Facility Enabled by Proposed 10 CFR 50.46a

In addition to meeting all other applicable requirements, entities would be required by proposed 10 CFR 50.46a(d)(3) to perform a risk-informed evaluation for changes enabled by proposed 10 CFR 50.46a. If an entity had a change methodology that was submitted under proposed 10 CFR 50.46a(c)(1)(iv) and approved by the NRC, that licensee would be able to make some changes without NRC approval as long as the acceptance criteria in proposed 10 CFR 50.46a(h)(1) were met. Otherwise, the entity would be required to submit the results of its risk-informed evaluation for NRC review and approval. The entity would need to retain the results of all risk-informed evaluations made under proposed 10 CFR 50.46a(h)(1) and periodically submit a summary of the results to the NRC as required under proposed 10 CFR 50.46a(j)(3).

(d) Perform an Evaluation To Determine the Effect of All Planned Facility Changes and Do Not Implement Any Facility Change That Would Invalidate the Applicability of the TBS to the Facility

For the TBS as defined in 10 CFR 50.46a(a)(9) to properly apply to an entity's facility, that entity would be required to perform an evaluation to demonstrate that the TBS is applicable to that particular facility. For those entities that decide to propose an alternate TBS, a similar evaluation would be needed as part of the basis for the proposed TBS. But after the initial evaluation has demonstrated the applicability of the TBS, an entity could make significant facility changes that would invalidate the initial evaluation. Therefore, after a facility has been approved to use proposed 10 CFR 50.46a, the proposed rule would require the entity to ensure that the TBS remains applicable to the facility by reviewing all subsequent plant changes to ensure that the facility is not modified to the extent that the results impact the applicability of the TBS. Licensees' existing configuration management programs, which contain a process to control plant changes made under 10 CFR 50.59, could be modified, through screening or evaluation, to identify future plant changes that may invalidate the applicability of the NRC's generic studies. Most anticipated plant changes should not impact the TBS, so little, if any, evaluation would be necessary to demonstrate the acceptability of such changes. However, some changes, such as power uprates, would have the potential to affect the TBS by increasing operating temperatures, coolant flow rate, and neutronic flux.

(e) Submit to the NRC a Report Within 120 Days After the Outage When the Inspection Occurred Detailing the Results of the Inspections and Any Impact These Results Have on the TBS in Accordance With Proposed 10 CFR 50.46a(b)(3)

Under proposed 10 CFR 50.46a(b)(3), for RCPB piping whose inner diameter is greater than the TBS, licensees would be required to inspect an NRC-approved risk-informed sample of the similar metal piping circumferential welds in a PWR and the Category A welds (as defined in Generic Letter 88–01) in a BWR in accordance with 10 CFR 50.55a(g) before implementing proposed 10 CFR 50.46a and in every subsequent inservice inspection interval (as defined in 10 CFR 50.55a(y)). Any indications found during this inspection should be dispositioned according to ASME section XI requirements and the effects of any indications on the continued applicability of the TBS should be evaluated.

(ix) Reporting Requirements

(a) ECCS Reporting Requirements

The ECCS reporting requirements currently provided in 10 CFR 50.46(a)(3) were added during the 1988 revision to 10 CFR 50.46 (53 FR 35996; September 16, 1988). The proposed rule (52 FR 6334; March 3, 1987) preceding that final rule prompted several public

comments on the reporting requirements, some of which suggested that the reporting requirements be relaxed or even eliminated (see NRC Summary of Public Comments, ''PR–050—52FR06334—Emergency Core Cooling Systems: Revisions to Acceptance Criteria,'' March 3, 1987).

In response to these comments, the NRC identified several reasons for requiring reporting of changes to, or errors in, ECCS evaluation models or in the applications thereof. First, the Commission believed that significant changes or errors raise potential questions about the adequacy of an evaluation model as a whole. Second, the Commission noted that even minor or inconsequential errors and changes constituted a deviation from what previously had been reviewed and accepted. Finally, the Commission also noted that applications of models to areas not contemplated during initial review of the model could result in errors by extending a model beyond its intended range. The Commission stated that, overall, the reporting requirements were a clarification and relaxation of the then-existing requirements.

More than 20 years later, in its rulemaking efforts for 10 CFR 50.46c, the NRC again received numerous public comments about reporting requirements, some of which suggested that the reporting requirements should be relaxed or eliminated. In response to those public comments, the NRC is proposing in the new 10 CFR 50.46a several relaxations to, and clarifications of, the reporting requirements compared to what currently appears in 10 CFR 50.46(a)(3). However, the NRC proposes to leave the deterministic reporting requirements under the 1988 revision to the ECCS regulations largely intact, with the addition of reporting requirements for changes and error corrections affecting the integral time-at-temperature (*i.e.,* ECR) calculation.

Reporting remains necessary for changes to, or errors in, ECCS evaluation models, and applications thereof, for several reasons. First, considering all safety analyses for DBEs, LOCA analysis requires substantially more complex thermal-hydraulic calculations. The reporting requirements allow minor changes to, and error corrections for, these calculations. Second, the reporting requirements provide a regulatory framework for communicating, and addressing the effects of, these changes and errors. And finally, reporting requirements are less burdensome than an alternative that would include topical report revisions and license amendments to address changes and errors. The NRC considered these benefits, in addition to the original, safety-related justification for the reporting requirements set forth in the 1988 rulemaking, when deciding to retain reporting requirements in proposed 10 CFR 50.46a.

The ECCS reporting criteria in proposed 10 CFR 50.46a(j) generally match the criteria in the 10 CFR 50.46c draft final rule in SECY–16–0033. One of the primary differences would be that an entity could propose an alternative definition for a ''significant change'' for breaks above the TBS. Furthermore, proposed 10 CFR 50.46a(j)(1)(iii) would relax the reporting requirements for applicants for a standard design certification (including applicants after the Commission has adopted a final design certification regulation) or applicants for or holders of a standard design approval under 10 CFR part 52 that are approved to use proposed 10 CFR 50.46a. Under proposed 10 CFR 50.46a(j)(1)(iii), standard design approval holders and applicants and standard design certification applicants that are approved to use the alternative ECCS criteria in proposed 10 CFR 50.46a would be required to internally document the nature and estimated effect of all changes and errors affecting ECCS evaluation models. This documentation would be subject to NRC inspection. Also, if the cumulative effect of changes or errors would result in an inability to ensure compliance with the alternative ECCS criteria in proposed 10 CFR 50.46a(f), then proposed 10 CFR 50.46a(j)(1)(iv) would continue to require NRC notification of the underlying changes or errors and associated corrective actions so that the NRC may evaluate the potential for impacts to the affected standard design approval or standard design certification.

Instead of the existing requirement for the applicant for or holder of a standard design approval or applicant for a standard design certification to report this information to the NRC, the CP, OL, or COL applicant would be responsible for providing an acceptable analysis of the ECCS in its application submitted to the NRC under proposed 10 CFR 50.46a(j)(1)(i)–(iii). The proposed relaxation for applicants for or holders of standard design approvals and applicants for standard design certifications is justified because reporting changes and errors to the NRC before the design is referenced in an application for a CP, OL, or COL would not produce a tangible public health and safety benefit, provided that the changes or errors would not create the potential for the standard design approval or standard design certification to become noncompliant with NRC requirements. There would be no public health and safety benefit because the change or error would not impact the operation of an operating reactor or even the NRC's safety review of an application.

Moreover, instead of the existing 30-day reporting requirements that are in 10 CFR 50.46(a)(3)(ii), the reporting requirements proposed in 10 CFR 50.46a(j)(1)(ii), (j)(1)(iv), (j)(2)(ii), and (j)(2)(iii) would require reports to be submitted to the NRC within 60 days of discovery to better align with the 10 CFR 50.73, ''Licensee event report system,'' report timeframe. As stated in 10 CFR 50.46(a)(3)(ii), discovery of a change or error that exceeds the 10 CFR 50.46 acceptance criteria would be a reportable event as described in paragraph (e) of 10 CFR 50.55, ''Conditions of construction permits, early site permits, combined licenses, and manufacturing licenses''; 10 CFR 50.72, ''Immediate notification requirements for operating nuclear power reactors''; and 10 CFR 50.73. Likewise, discovery of a change or error that exceeds the criteria in proposed 10 CFR 50.46a would also be a reportable event under 10 CFR 50.55(e), 10 CFR 50.72, and 10 CFR 50.73. Since exceeding the proposed 10 CFR 50.46a criteria would be reportable under those regulations, the NRC proposes to align the report required under proposed 10 CFR 50.46a(j)(1) and (2) with the 60-day timeframe in 10 CFR 50.73. The additional time permitted relative to 10 CFR 50.46 would be based on the low initiating event frequency for many of the limiting LOCAs, which would be confirmed on a plant-specific basis in order to employ the proposed 10 CFR 50.46a. The additional time may also result in increased accuracy in the information provided to the NRC in the report required under proposed 10 CFR 50.46a.

The 10 CFR 50.46a proposed rule would clarify existing reporting and corrective action requirements. Proposed 10 CFR 50.46a(j)(1) would distinguish four possible combinations of reporting criteria based upon predicted response, level of significance (*i.e.,* significant or not significant, as defined by the proposed rule), and whether the error, change, or operation would result in any exceedance of acceptance criteria. For each scenario, the proposed rule would provide the required actions, reports, and a time frame for providing the necessary reports.

Presently, the reporting requirements in 10 CFR 50.46(a)(3) require that entities report changes to, or errors in,

an ECCS evaluation model, or in the application of the evaluation model, and the estimated effect of the changes or errors on predicted PCT. Proposed 10 CFR 50.46a would expand the definition of a significant change or error to include integral time-at-temperature (*i.e.,* ECR). Any changes or errors that prolong the temperature transient may further challenge the PQD analytical limits; however, they may not significantly change the predicted PCT. As such, this change or error would not be captured in the existing reporting requirements. The NRC would include the reporting requirements for changes and errors in integral time-at-temperature in proposed 10 CFR 50.46a to improve the content and communications of reports submitted to the NRC. The NRC also proposes this requirement to inform the agency's response to future changes to, or errors discovered in, ECCS evaluation models or in the applications thereof.

A significant change or error would occur when the sum of the absolute magnitudes of the respective changes is greater than 50 °F (10 °C) PCT or 1.0 percent ECR for breaks at or below the TBS, as defined in proposed 10 CFR 50.46a(k)(1). A change of 1.0 percent ECR is correlated to a change in calculated ECR for a 50 °F (10 °C) change in cladding temperature for a typical analysis of record PCT. The definition of significant change in proposed 10 CFR 50.46a(k)(1) would be specific to zirconium-alloy cladding. A new definition of significant change or error may be necessary for other cladding materials. In addition, proposed 10 CFR 50.46a(k)(1)(ii) would require the use of maximum local oxidation (*i.e.,* percent ECR) to evaluate the impact of a change or error on the predicted integral time-at-temperature. In proposed 10 CFR 50.46a(k)(2), for breaks above the TBS, the significant change or error is one that results in a significant reduction in the capability to meet the requirements of proposed 10 CFR 50.46a(e)(1) and (f). For LOCAs above the TBS, this significant change or error is higher level than the criteria for LOCAs at or below the TBS to allow for an entity to define alternative criteria for a significant change. If alternative criteria are not defined, then the same reporting criteria in proposed 10 CFR 50.46(k)(1) would be applied.

Existing reporting requirements in 10 CFR 50.46(a)(3) with respect to any ''change to or error discovered in an acceptable evaluation model or in the application of such a model'' have been a source of confusion. Two areas of common misconceptions are related to (1) the baseline PCT and integral time-at-temperature values when estimating a significant change or error (*i.e.,* greater than 50 °F (10 °C)), and (2) the 30-day reporting requirement including ''a proposed schedule for providing a reanalysis or taking other action as may be needed to show compliance with § 50.46 requirements.'' Similar to the 10 CFR 50.46c draft final rule, the NRC is proposing in this rulemaking to revise the existing reporting requirements to (1) identify more clearly the baseline values to be used in reporting pursuant to the requirements of proposed 10 CFR 50.46a(j), (2) require under proposed 10 CFR 50.46a(j)(1)(ii) and (iv) that entities include, in a report describing a significant change, a proposed scope and schedule for providing a reanalysis, and (3) distinguish between the requirements for proposing a reanalysis scope and schedule, and for proposing to implement corrective action as may be needed to show compliance with proposed 10 CFR 50.46a(e) requirements.

As is the case with 10 CFR 50.46(a)(3), flexibility would exist in terms of the scope of reanalysis that would be required to comply with proposed 10 CFR 50.46a(j)(1)(ii) and (iv), and with the schedule that the reporting entity may propose. Since the promulgation of the 1988 revision to 10 CFR 50.46, the NRC has accepted multiple evaluations, which have been performed within a scope that has been significantly limited when compared to full-scale implementation of an ECCS evaluation model. In these cases, the NRC has concluded that such evaluations satisfied the requirements of 10 CFR 50.46(a)(3)(ii). The Commission does not propose to change its approach in this regard. In addition, a proposed schedule for reanalysis may also incorporate appropriate flexibility. The NRC has accepted proposed schedules that extend as far as four years into the future and that are managed using regulatory commitments that can be changed or updated as operating conditions require and nuclear safety considerations permit. Proposed 10 CFR 50.46a(j)(1)(ii) and (iv) would retain this flexibility.

Proposed 10 CFR 50.46a(k)(1) would provide threshold values for PCT and integral time-at-temperature for entities to use when estimating the effect of a significant change or error. The baseline predictions used to assess a significant change or error should be the PCT and integral time-at-temperature values documented in a plant's updated final safety analysis report (UFSAR). These values should represent the latest LOCA analyses that were submitted and reviewed by the NRC as part of a license amendment request (*e.g.,* power uprate, fuel transition) or as incorporated into the facility licensing basis in accordance with NRC-approved methods, as amended by subsequent annual reports.

Existing 10 CFR 50.46(a)(3) requires entities to include, in a report describing the nature of a significant error or change and its estimated effect on the predicted PCT, a proposed schedule for providing a reanalysis or taking other action as may be needed to show compliance with 10 CFR 50.46. This requirement has led to a misconception that, when a significant error is reported that does not cause the predicted PCT to exceed its 2200 °F (1204 °C) acceptance criterion, a proposed schedule for providing a reanalysis is not required and taking other action is not needed to show compliance with the requirements. As explained in the preamble to the 1988 revision of 10 CFR 50.46, it has long been the NRC's position that facility operation in excess of the 10 CFR 50.46 acceptance criteria is an immediate safety concern that requires prompt corrective action and the ''taking other action'' language in the rule was intended to address that concern. This position is underscored by the final sentence of the existing 10 CFR 50.46(a)(3)(iii): ''The affected applicant or holder shall propose immediate steps to demonstrate compliance or bring plant design into compliance with § 50.46 requirements.'' Therefore, the reporting and reanalysis requirements would be further separated into proposed 10 CFR 50.46a(j)(1) and 10 CFR 50.46a(j)(2) to distinguish the requirements that apply when a significant change or error is identified that results in facility operation in excess of the proposed 10 CFR 50.46a acceptance criteria, from the requirements that apply when a significant change or error is identified that does not result in facility operation in excess of the proposed 10 CFR 50.46a acceptance criteria.

When a change to, or error in, an ECCS evaluation model, or in the application of such a model, is discovered, the entity would be responsible for estimating the magnitude of changes in predicted results to (1) determine if immediate steps are necessary to demonstrate compliance or bring plant design or operation into compliance with proposed 10 CFR 50.46a(e) requirements, and (2) identify reporting requirements. Under proposed 10 CFR 50.46a(j), an entity's obligation to report and take corrective action would vary depending upon whether the licensee's

situation falls into one of the following three possible scenarios:

1. *Change or error that does not result in any predicted response that exceeds any acceptance criteria and is itself not significant.*

In this scenario, proposed 10 CFR 50.46a(j)(1)(i) would require the entity to do the following:

a. Submit an annual report documenting the change(s) and/or error(s), along with the estimated magnitudes of changes in predicted results, and the basis for the entity's determination that the change or error is not significant.

b. Revise the UFSAR in accordance with paragraph (e) of 10 CFR 50.71, ''Maintenance of records, making of reports.''

c. Use the revised UFSAR PCT/ECR predictions as a baseline for future evaluations.

2. *Change or error that does not result in any predicted response that exceeds any acceptance criteria but is significant.*

In this scenario, proposed 10 CFR 50.46a(j)(1)(ii) would require the entity to do the following:

a. Within 60 days of making a change, discovering an error, or both, submit a report documenting the change, error, or both, estimated magnitudes of changes in predicted results, the proposed scope and schedule for providing a reanalysis, and a description of and schedule for implementing corrective actions. The reanalysis must be performed within a scope of detail appropriate to address the reported, significant change to, or error in, the ECCS evaluation model, or in its application. The proposed reanalysis schedule should reflect consideration for both the magnitude of the change or error and the available margin to NRC acceptance criteria, once the estimated effect of the change or error is applied to the existing results.

b. In accordance with the schedule proposed in paragraph a., provide the reanalysis to the NRC. This may be accomplished by submitting a subsequent report, pursuant to proposed 10 CFR 50.46a(j)(1), describing the reanalysis and providing the updated results. The reanalysis may be limited in scope but must otherwise be performed using an acceptable evaluation model.

c. Revise the UFSAR to include new evaluation model results in accordance with 10 CFR 50.71(e).

d. Use the revised UFSAR evaluation model results as a baseline for the future evaluations.

3. *Change or error that results in any predicted response that exceeds any of the four acceptance criteria in proposed 10 CFR 50.46a(f).*

In this scenario, proposed 10 CFR 50.46a(j)(1)(iv) and 10 CFR 50.46a(j)(2)(i) would require the entity to do the following:

a. Take immediate actions to bring the plant into compliance with the acceptance criteria.

b. Within 60 days of making a change, discovering an error, or both, submit a report documenting the change, error, or both, estimated magnitudes of changes in predicted results, description of corrective actions and/or compensatory measures, and the proposed scope and schedule for providing a reanalysis, and a description of and schedule for implementing corrective actions. The reanalysis must be performed within a scope of detail appropriate to address the reported change to, or error in, the ECCS evaluation model, or in its application. The proposed reanalysis schedule should reflect consideration for both the magnitude of the change or error and the fact that the change or error has caused the NRC's acceptance criteria to be exceeded. The entity may also need to submit this information in the reports required under 10 CFR 50.55(e), 10 CFR 50.72, and 10 CFR 50.73, as applicable.

c. Provide the reanalysis to the NRC in accordance with the schedule submitted to the NRC. This may be accomplished by submitting a subsequent report, pursuant to proposed 10 CFR 50.46a(j)(1), describing the reanalysis and providing the updated results. The reanalysis must be performed using an acceptable evaluation model. Revise the UFSAR to include new evaluation model results in accordance with 10 CFR 50.71(e).

d. Use the revised UFSAR evaluation model results as the baseline for future evaluations.

As described in scenario 3, proposed 10 CFR 50.46a(j)(1)(iv) and (j)(2)(i) would apply to changes to, or errors in, ECCS evaluation models, or the applications thereof, that affect the predicted performance relative to all of the acceptance criteria contained in proposed 10 CFR 50.46a(f). For example, an error or change in a PWR boron precipitation calculation that invalidates the timing for emergency operating procedures is considered a condition in which a plant's conformance to proposed 10 CFR 50.46a(f)(4) would be uncertain. In this circumstance, the NRC would consider this a potentially serious safety issue in need of immediate attention and potential correction. In proposed 10 CFR 50.46a(j)(2)(i), if a licensee with a COL identifies a change or error that results in the acceptance criteria in proposed 10 CFR 50.46a(f) being exceeded before the Commission has made a finding under paragraph (g) of 10 CFR 52.103, ''Operation under a combined license,'' immediate action to bring a facility into compliance would not be required due to the low safety significance of exceeding the acceptance criteria before the initial startup of the plant. Similarly, in proposed 10 CFR 50.46a(j)(2)(ii) and (iii), for design certification applicants (including an applicant after the Commission has adopted a final design certification regulation) and applicants and holders for standard design approvals, if a change or error correction results in calculated ECCS performance that does not conform to the criteria in proposed 10 CFR 50.46a(e), immediate action would not be required. In this situation, the affected applicant or holder would need to propose appropriate steps to the Commission within 60 days to demonstrate compliance with proposed 10 CFR 50.46a requirements, along with a report of the nature of the changes or errors that resulted in an inability to assure compliance and an estimate of their effect on the limiting transient.

Based upon the complexity of the ECCS performance demonstration, entities may need to report multiple estimated effects on PCT and integral time-at-temperature to assess available margin to analytical limits under the proposed rule. For example, if the fuel rod population in a reactor core is subdivided, analyzed, and judged against different analytical limits (*e.g.,* burnup-dependent fuel rod populations), the entity may need to report multiple estimated effects and estimated available margin to PCT and integral time-at-temperature analytical limits. This would enhance communication with the NRC, especially for understanding the proposed scope and schedule for reanalysis, if required.

(b) Risk-Informed Evaluation Process Reporting

Section 50.46a(j)(3) of the proposed rule would require periodic reports of changes that required a risk-informed evaluation under proposed 10 CFR 50.46a(d)(3) and were implemented without prior NRC approval under proposed 10 CFR 50.46a(h)(1). Proposed 10 CFR 50.46a(j)(3) would not require the submission of a report if no changes involving minimal changes in risk were made under proposed 10 CFR 50.46a(h)(1) during the reporting period.

(c) TBS Applicability Requirements

Section 50.46a(j)(3) of the proposed rule would require an entity to provide a brief summary of the basis for the

entity determination under proposed 10 CFR 50.46a(h)(1)(iii) that each change made under proposed 10 CFR 50.46a(h)(1) would not invalidate the TBS applicability evaluations made under proposed 10 CFR 50.46a(c)(1)(i) for an operating reactor authorized to operate under 10 CFR part 50 on December 31, 2015, or under proposed 10 CFR 50.46a(c)(2) for entities other than those authorized to operate under 10 CFR part 50 on December 31, 2015.

Proposed 10 CFR 50.46a(j)(4) would include reporting requirements for the periodic inspections used to provide assurance that no significant degradation would be occurring in piping systems with an inner diameter greater than the TBS that could undermine the technical basis of the TBS. During each inservice inspection interval, the licensee would be required to submit a summary report within 120 days after completing the outage when the inspections specified in proposed 10 CFR 50.46a(b)(3) are completed. If any reportable indications were found during these inspections, then the licensee's summary report would need to include an evaluation of the impact of these indications on the TBS as well as any other ASME section XI requirement. This report could be combined with the summary report required by 10 CFR 50.55a(b)(2)(xxxii), which has an identical reporting time requirement. The level of detail in the report specified in proposed 10 CFR 50.46a(j)(4) would be consistent with the report specified in 10 CFR 50.55a(b)(2)(xxxii).

(x) Documentation Requirements

Section 50.46a(l) of the proposed rule would require that entities maintain records sufficient to demonstrate compliance with proposed 10 CFR 50.46a requirements. When making changes under proposed 10 CFR 50.46a(h), entities would be required to document the bases for concluding that the acceptance criteria in proposed 10 CFR 50.46a(h)(1) and (h)(2) would be satisfied and would continue to be satisfied as long as the entity is subject to the proposed 10 CFR 50.46a. Entities would be required under proposed part II of appendix K to 10 CFR part 50 to document the bases of evaluation models used to perform ECCS calculations. Entities also would be required to document plant design changes made under proposed 10 CFR 50.46a by updating the FSAR in accordance with the requirements in 10 CFR 50.71(e). All documentation could be reviewed during NRC inspections and/or audits.

(xi) Submittal and Review of Applications

(a) Initial Application for Implementing Proposed 10 CFR 50.46a Requirements

When an entity would first apply to use the proposed 10 CFR 50.46a requirements, that entity would need to submit an application under 10 CFR 50.34, 10 CFR 50.90, or 10 CFR part 52 for NRC review and approval. The initial application would need to contain the information specified in proposed 10 CFR 50.46a(c)(1)(i) through (vii), as applicable. This would include information related to the applicability of the TBS to the facility (if the entity desires to develop an alternate TBS, the information needed in the application would include those items discussed in section XXXVI.F.(xii), Applicability to New Reactor Designs,'' of this document); information identifying the ECCS analysis methods to be used; information describing the risk-informed evaluation for all changes enabled by the proposed rule and proposed in the application; information describing the proposed process for making risk-informed changes without prior NRC approval (if the applicant would seek approval of such a process); information describing non-safety equipment to be credited for compliance with the ECCS acceptance criteria in proposed 10 CFR 50.46a(e); and information describing how the leak detection program would satisfy the criteria in proposed 10 CFR 50.46a(d)(2).

An entity's initial change from its existing ECCS analysis would not need to be reviewed by the entity under the provisions of 10 CFR 50.59 because the proposed rule would require NRC review and approval of the initial application to implement the proposed 10 CFR 50.46a requirements. After the proposed 10 CFR 50.46a evaluation models and initial ECCS LOCA analyses were established by approval of the proposed 10 CFR 50.46a application, subsequent changes to ECCS analyses would be controlled by the process in 10 CFR 50.59 (which provides criteria for determining which changes are within the licensee's authority to make) and the requirements in proposed 10 CFR 50.46a(j) for reporting changes to evaluation models and analysis methods (whether from correction of errors or changes). The initial application could request one or more facility changes.

The initial application also would include a request for NRC approval of a process for evaluating the acceptability of future facility changes enabled by proposed 10 CFR 50.46a using the provisions in proposed 10 CFR 50.46a(h)(1). If approval of a process for evaluating future changes were requested, the application would need to include the information described in proposed 10 CFR 50.46a(c)(1)(iv).

(b) Subsequent Applications for Changes Under Proposed 10 CFR 50.46a

After NRC approval of an entity's initial application addressing ECCS analyses and the risk-informed evaluation processes under the proposed rule, the entity could submit applications for proposed changes under 10 CFR 50.90. These license amendment applications would need to contain the following:

- For licensees, the information required by 10 CFR 50.90;
- Information from the risk-informed evaluation demonstrating that the risk criteria, defense-in-depth criteria, safety margins, and performance monitoring criteria in proposed 10 CFR 50.46a(h)(2) and (h)(3) would be met;
- Information demonstrating that the ECCS acceptance criteria in proposed 10 CFR 50.46a(e)(1) would be met; and
- Information demonstrating that the proposed change would not increase the LOCA frequency of the facility by an amount that would invalidate the applicability of the TBS to the facility.

After reviewing the application with the proposed change, the NRC could approve the change if it complies with the criteria in proposed 10 CFR 50.46a(h)(2) and (h)(3) and all other applicable NRC regulations, including the current requirements for plant physical security. In addition, the NRC would evaluate potential impacts of the proposed change on facility security to ensure that the change would not significantly reduce the ''built-in capability'' of the plant to resist security threats, thus ensuring that the change would not be inimical to the common defense and security and would provide adequate protection to public health and safety.

Entities who would not submit a request for NRC approval of a process for evaluating the acceptability of future changes enabled by proposed 10 CFR 50.46a using the provisions in proposed 10 CFR 50.46a(h)(1) could make such a request at any time by submitting the application containing the information described in proposed 10 CFR 50.46a(c)(1)(iv).

(xii) Applicability to New Reactor Designs

As discussed in sections XXXVI.F.(ii), ''Original Determination of the Transition Break Size,'' and (iii), ''Determining the Ongoing Validity of the Transition Break Size,'' of this

document, the TBS was established in NUREG–1829, which was based on the commercial LWR designs authorized to operate under 10 CFR part 50 on December 31, 2015. LWRs authorized to operate under 10 CFR part 52 or after that date may have different piping materials, configurations, and operational and service conditions, among other factors, that may impact the piping break frequencies and thus the TBS. New LWR reactor designs (*i.e.,* the class of commercial LWR reactors authorized to operate under 10 CFR part 50 after December 31, 2015, or under 10 CFR part 52) may have similar piping materials, service conditions and operational programs, piping designs, and mitigation and control of age-related degradation programs as those found in currently operating plants. There are several new LWR designs for which the NRC expects that the frequency of LOCAs above the TBS could be as low as it is at current LWRs. Thus, applicants can apply the proposed 10 CFR 50.46a requirements to these new reactor designs with adequate justification. New large LWR or small modular reactor entities under 10 CFR part 50 or part 52 who wish to apply proposed 10 CFR 50.46a would have to submit an analysis for NRC approval, as specified in proposed 10 CFR 50.46a(c)(2), demonstrating why it would be appropriate to apply the alternative ECCS requirements and what the appropriate TBS would be in order for the new design to meet the proposed 10 CFR 50.46a rule.

In its analysis, the entity would be required to demonstrate that the proposed reactor facility is similar to reactors authorized to operate under 10 CFR part 50 on December 31, 2015. In addressing similarity of the proposed design to reactors authorized to operate under 10 CFR part 50 on December 31, 2015, the entity should address design, construction and fabrication, and operational factors that include, but are not limited to:

- The similarity of the piping materials of construction and construction techniques for new reactors to those in the operating fleet authorized to operate under 10 CFR part 50 on December 31, 2015;
- The similarity of service conditions and operational programs (*e.g.,* in-service inspection and testing, leak detection, QA, etc.) for new reactors to those for the operating fleet authorized to operate under 10 CFR part 50 on December 31, 2015;
- The similarity of piping design (*e.g.,* pipe sizes and pipe configuration) for new reactors to those found in the operating fleet authorized to operate under 10 CFR part 50 on December 31, 2015;
- Adherence to existing regulatory requirements, regulatory guidance, and industry programs related to mitigation and control of age-related degradation (*e.g.,* aging management, fatigue monitoring, water chemistry, stress corrosion cracking mitigation, etc.); and
- Any plant-specific attributes that may increase LOCA frequencies compared to those used to support the development of the proposed TBS.

Proposed 10 CFR 50.46a(c)(2) would also require that the analysis include a recommendation for an appropriate TBS and a justification that the proposed TBS is consistent with the technical basis for the proposed 10 CFR 50.46a (*i.e.,* the TBS would include sufficient margin to provide assurance that, when considering the limited availability of operating experience data and the uncertainty in the estimation of LOCA frequency, the estimated frequency of breaks larger than the TBS for all initiators would not exceed 10^{-5} per year). For those new reactor (large LWR and small modular reactor) designs that employ design features that effectively increase the break size via opening of specially designed valves to rapidly depressurize the RCS during any size LOCA, justification of the acceptability of a TBS would also be necessary. The justification should consider the integral impacts of fluid conditions such as flow quality at the discharge node(s), which can substantially affect the temperature transient experienced by the fuel. The methodology used to determine the proposed TBS should be described in the justification.

(xiii) Changes to 10 CFR 50.46

The NRC is proposing several changes to 10 CFR 50.46. Proposed 10 CFR 50.46(a) would include a pointer to proposed 10 CFR 50.46a as a voluntary alternative. Proposed 10 CFR 50.46(a)(3)(i) would be revised to permit use of the ECCS criteria in proposed 10 CFR 50.46a(f) instead of 10 CFR 50.46(b). To align with these changes, the applicable ECCS reporting requirements from proposed 10 CFR 50.46a would be added as proposed 10 CFR 50.46(a)(iv) and 50.46(a)(v) for entities that are approved to use proposed 10 CFR 50.46a(f). These changes would not invalidate current exemptions from 10 CFR 50.46 and could reduce the number of exemptions for non-zircaloy and non-ZIRLO claddings due to the allowance to use the fuel technology-neutral proposed 10 CFR 50.46a(f) criteria in place of the prescriptive 10 CFR 50.46(b) criteria.

(xiv) Discussion of Public Comments on the Fuel Dispersal Aspects of the Regulatory Basis

In the public comments on the regulatory basis, representatives of the nuclear power industry did not present a unanimous recommendation among the alternatives provided by the NRC. Alternative 5 would have had the NRC pursue rulemaking to modify 10 CFR 50.46 to allow for insights from piping fracture mechanics to be used to disposition large-break LOCAs and, thus, fuel dispersal during large-break LOCAs. NEI and Westinghouse supported a modified version of alternative 5 that would have aligned with EPRI's ''Alternate Licensing Strategy.'' The EPRI Alternate Licensing Strategy proposed to utilize piping fracture mechanics to show that leaks in large pipes can be detected and operator action taken with sufficient probability before the pipe breaks, such that the larger LOCAs that could challenge fuel integrity would not occur. EPRI submitted its Alternate Licensing Strategy to the NRC via topical reports in April 2024.

NEI also supported, along with the BWR Owners' Group, alternative 4, a rulemaking that would provide a generic bounding assessment of dose and use risk insights for post-FFRD consequences. The former alternative was not viewed by NEI and the BWR Owners' Group as a solution for BWRs since it would utilize the leak-before-break (LBB) concept and LBB has only ever been approved for use in PWRs. Historically, the NRC has not allowed LBB to be applied to ECCS design, containment design, or equipment qualification, as described in the preamble to a 1987 final rule amending GDC 4, ''Environmental and dynamic effects design bases'' (52 FR 41288; October 27, 1987). The PWR Owners' Group and Framatome expressed support for an approach that would employ integrated decision-making as done in the disposition of in-vessel downstream effects associated with generic safety issue (GSI)–191.

Additionally, there was support from NEI, the BWR Owners' Group, and Westinghouse for alternative 2, a rulemaking to recategorize large-break LOCAs as beyond-design-basis accidents, though they recommended that a rulemaking with an updated 10 CFR 50.46c be pursued separately from this increased enrichment rulemaking due to the perceived schedule impact. Aspects of Framatome's response also aligned with this alternative, such as their statement in their proposed path forward that ''the amount of dispersal

and coolability evaluation in a [large-break LOCA] would be based on fully best-estimate models (*i.e.,* conditions consistent with expected, nominal operating conditions without biases or uncertainties).'' Moreover, in response to question 2 posed to the public on fuel dispersal in the regulatory basis **Federal Register** notice, NEI, Westinghouse, and Framatome stated that they believed that with a true best-estimate analysis for large-break LOCAs, it would be reasonable to demonstrate that no high burnup rods rupture and, therefore, disperse fuel, especially when combined with the anticipated benefits from ATF.

Industry recommendations stated schedule as a large reason for their support of particular alternatives. The regulatory basis attempted to qualitatively compare the rulemaking schedule impacts of each alternative. After further consideration of these alternatives, the NRC's accuracy of the estimated impacts has improved and the qualitative schedule estimates presented in the regulatory basis have been updated significantly. The NRC now considers that alternative 2 would take less time than alternatives 4 and 5 because the previous work on the draft 10 CFR 50.46a rulemaking could be leveraged. For example, the technical basis and rule language were already developed by the NRC, so most of the work would be in confirming that the technical basis is still applicable, modernizing the rule, and developing guidance. In addition, the previous work performed on the previous 10 CFR 50.46c rulemaking could be leveraged to develop a performance-based rule with guidance that would facilitate future efforts to pursue other licensing pathways. As such, the risk-informed approach in alternative 2 and the performance-based approach in the previous 10 CFR 50.46c rule have been adapted into this proposed rule.

The Union of Concerned Scientists and two members of the public stated that they did not support any approach that allows for fuel dispersal. Another member of the public recommended that the NRC wait until more research and analysis is performed for fuel dispersal. The NRC considered all these comments, among other factors, as discussed in section XXXVI.F.(i), ''Overview,'' of this document, when deciding to pursue a performance-based alternative 2.

XXXVII. Specific Questions

The NRC is seeking advice and recommendations from the public on the proposed rule, draft guidance documents, and a draft regulatory analysis. The NRC is particularly interested in comments and supporting rationale from the public on the following:

Expedited Construction of Certain Structures, Systems, and Components

Question 1: Should the NRC consider granting one or more general licenses to begin construction activities as part of an existing or future standard design certification rule? If the NRC were to issue such a general license, should the NRC require that the general license holder reference another plant that has completed construction (resulting in the general license excluding first of a kind applicants)? If not, what conditions should the NRC include in the general license to ensure that the construction activities authorized by the general license can be completed safely? Please provide a basis for your response.

Question 2: Would it be useful for the NRC to issue regulations to provide for general licenses related to production and utilization facilities for other activities described under section 109 of the AEA, with the exception of import, export, construction, or operation? Please provide a basis for your response.

Question 3: Does the proposed regulatory change achieve its intended objective of allowing applicants to make business decisions on the appropriate balance between expedited construction and the regulatory risk that changes will be necessary to address safety issues? Are there other approaches that can both provide the needed flexibility while better allowing applicants to structure the degree of regulatory risk they take on through interactions with the NRC staff (*e.g.,* hold-points during construction for NRC inspection)?

Risk-Informing 10 CFR 50.59 and Allowing Flexibility for Changes to Methods

In accordance with Commission direction in the staff requirements memorandum (SRM), dated July 21, 1993, on SECY–93–087, ''Policy, Technical, and Licensing Issues Pertaining to Evolutionary and Advanced Light-Water Reactor (ALWR) Designs,'' dated April 2, 1993, the NRC staff considers common cause failures (CCFs) in digital instrumentation and controls (DI&C) systems to be beyond design-basis events (BDBEs). In addition, SECY–93–087 states that common mode failures could defeat the redundancy achieved by the hardware architectural structure, and could result in the loss of more than one echelon of defense-in-depth provided by the monitoring, control, reactor protection, and engineered safety functions performed by the DI&C systems. Therefore, a CCF could result in ''a malfunction of an SSC important to safety with a different result than any previously evaluated in the final safety analysis report'' (see 10 CFR 50.59 (c)(2)(vi)), and a licensee would have to obtain a license amendment pursuant to 10 CFR 50.90 prior to implementing the proposed DI&C modification.

Question 4: In light of these considerations, do the proposed revisions to 10 CFR 50.59 adequately address issues that may arise from facilities that have transitioned to DI&C? If not, please provide specific comments on changes that would be necessary to address these issues.

Updates to Construction Permit Requirements and Related Licenses

Question 5: Are there any additional requirements in 10 CFR 50.34 that the NRC should consider changing to be more technology-inclusive or provide additional clarity? Should conforming changes to 10 CFR 50.67 be made to be consistent with 10 CFR 50.34 wording updates? Please provide a basis for your response.

Question 6: Are there any requirements in 10 CFR 50.34 that the NRC should consider changing that are posing undue barriers to timely and efficient submittal of CP applications, or which are unnecessary at the CP stage? Please provide a basis for your response.

Establishing Thresholds for Changes to Reactor Designs During Construction and Operation Under 10 CFR Part 52

Question 7: The proposed revisions to the definitions in each of the appendices in 10 CFR part 52 identify the specific sections in the generic DCD that contain the various categories of Tier 1 information (*i.e.,* definitions and general provisions, design descriptions, ITAAC, significant site parameters, and significant interface requirements). The proposed revisions to section VIII in each of the appendices in 10 CFR part 52 describe the change control process associated with each category of Tier 1 information. Will there be adequate regulatory clarity regarding the category of Tier 1 information in the generic DCD such that the change control process can be readily identified? Please provide a basis for your response.

Question 8: The proposed revisions to section VIII.B of appendix D to 10 CFR part 52 would effectively treat Tier 2* information for the AP1000 design as Tier 2 information during construction as well as operation. However, for appendices A (ABWR) and E (ESBWR) Tier 2* information would not be treated as Tier 2 information until after

the plant has achieved full power. The basis for this difference is the construction and licensing experience gained from the COLs referencing the AP1000 design which is lacking for the ABWR and ESBWR designs. Should the flexibility provided to the AP1000 design in appendix D during construction also be extended to the ABWR and ESBWR designs in appendices A and E? Please provide a basis for your response.

Question 9: Paragraph (b) of 10 CFR 53.1535 states ''The holder of a COL under this part for which the NRC has not yet made a finding in accordance with 10 CFR 53.1452(g) must request amendments required by 10 CFR 53.1525 or 53.1550 no later than 45 days from the date the licensee begins the construction of the SSCs to implement the change or departure requiring NRC approval. The licensee proceeds with such changes at its own risk recognizing that there is a possibility that the amendment will not be granted.'' This differs from provisions in 10 CFR part 52 by adopting requirements that explicitly support a change process described in RG 1.237, ''Guidance for Changes During Construction for New Nuclear Plants Being Constructed Under a Combined License Referencing a Certified Design Under 10 CFR part 52.'' Should the provisions in 10 CFR part 52 be revised to also explicitly support this change process? Please provide a basis for your response. Question 10: The proposed revisions to 10 CFR 52.98 and 53.1550 allow holders of an OL or COL that reference a manufacturing license (ML) to make changes to the FSAR without obtaining a license amendment if the changes are identical to changes approved by the Commission by amendment to the ML for the manufactured reactor and upon determining that implementation of the changes will be consistent with the basis for the Commission's approval of the amendment to the ML and not involve any additional changes that would require an amendment to its OL or COL. Should this flexibility be provided to COLs that reference a design certification? Please provide a basis for your response.

Question 11: Should the proposed rule changes to 10 CFR 50.59 described in section XII of this document also be applied to the 10 CFR 50.59-like process in the appendices of 10 CFR part 52? Please provide a basis for your response.

Revision of the Emergency Preparedness Regulations for Nuclear Power Reactors

Conduct of Exercises

The NRC is considering risk-informed revisions to the conduct of exercises in section F, ''Training,'' of appendix E to 10 CFR part 50. Paragraph IV.F.2.b of appendix E to 10 CFR part 50 requires a biennial exercise of the onsite plan to ensure that emergency response organization (ERO) proficiency in key skills is maintained. The NRC is assessing risk-informed revisions to the conduct of exercises to ensure ERO proficiency is maintained through the appropriate frequency of exercises and performance of the exercise cycle as required by paragraph IV.F.2.j of appendix E to 10 CFR part 50. Licensees conduct drills and exercises to develop and maintain key skills such as timely and accurate classification and notification of events; assessment of radiological releases and development of protective actions; planning, analysis, and implementation of mitigative actions; worker protection during emergency conditions; and coordination with offsite response organizations to include dissemination of information to the public through media channels. Following each exercise, licensees perform a critique of their actions to comply with 10 CFR 50.47(b)(14) which states, in part, ''deficiencies identified as a result of exercises or drills are (will be) corrected.'' In 1996, the NRC revised the emergency plan regulations for exercises from annual to biennial (61 FR 30129; June 14, 1996) to allow greater flexibility in licensee emergency planning training activities while maintaining readiness. The NRC is considering another revision to the frequency to either a triennial, or quadrennial basis. For example, a quadrennial exercise cycle could be supplemented with additional drills to ensure that proficiency is maintained between exercise years. Additionally, the NRC is considering additional language in paragraph IV.F.2.c of appendix E to 10 CFR part 50 to allow for the use of tabletop exercises or other performance enhancing methods when offsite authorities are not participating in the exercise of the onsite emergency plan required by paragraph IV.F.2.b. These potential changes could increase scheduling flexibility and reduce the resource burden while maintaining reasonable assurance that ERO proficiency will be maintained. If the exercise frequency is changed to quadrennial for some sites, the NRC is considering a corresponding change to the exercise cycle from 8 to 16 calendar years in paragraph IV.F.2.j.(iii) of appendix E to 10 CFR part 50 to reflect the proposed change to quadrennial exercises. However, a change to the exercise cycle may impact the ability of the ERO to demonstrate proficiency in the key skills necessary to respond to various emergency events, particularly in sites with increased turnover in ERO members. During the 1996 change from annual to biennial, the NRC received several comments about the ability of licensees to maintain proficiency with a longer gap between exercises and how this increased gap could also affect the performance of State and local responders. These comments were ultimately resolved and the NRC determined that reasonable assurance remained with the change in exercise frequency. With an additional three decades of experience, advances in all-hazards emergency preparedness, and a range of potential new advanced reactor designs in the future, the NRC is again interested in comments on the conduct of exercises. The NRC urges stakeholders to provide comments on the following questions:

Question 12: What are the potential benefits and challenges of a change to the conduct of exercises to applicants and licensees and offsite response organizations? Please provide a basis for your response.

Question 13: What specific criteria related to maintaining onsite ERO proficiency should be considered in evaluating whether a biennial, triennial, or quadrennial exercise is appropriate? Please provide a basis for your response.

Question 14: How would a potential change impact the conduct of exercises of the offsite plans required under paragraph IV.F.2.c of appendix E to 10 CFR part 50? Please provide a basis for your response.

Question 15: If there was a change to the exercise frequency, should the exercise cycle be changed or otherwise be revised to ensure there is adequate opportunity for the ERO to demonstrate adequate performance under paragraph IV.F.2.j of appendix E to 10 CFR part 50? Please provide a basis for your response.

Considerations for Emergency Planning Zones

The proposed change to 10 CFR 50.33(g)(1) would provide certainty for a site-boundary EPZ for facilities less than 300 MWt. This proposed change is based on NRC staff review of available technical analyses that estimate radiological consequences for a variety of reactor designs and design power levels. The NRC is considering factors that may obviate the need for applicants of certain reactor designs to perform

detailed analyses to support a site-boundary EPZ determination or reach a determination that no EPZ is needed. Such factors may include use of novel fuel forms or the performance of functional containment that may generically demonstrate that predetermined, prompt protective measures are unwarranted. The NRC is also considering factors that may necessitate additional analysis by the applicant for facilities less than 300 MWt.

Question 16: Are there additional design factors or analyses that should be considered to provide certainty on EPZ determinations? Please address within the comment the technical basis for consideration and how they relate to EPZ determinations and, specifically, the criteria of 10 CFR 50.33(g)(2).

Question 17: Should design features, other than power level, or site attributes be considered for determining when additional analysis by the applicant is necessary to justify site-boundary EPZ for facilities less than 300 MWt? Please provide the basis for your response.

Optional Submittal of Operational Programs

The NRC is proposing to add a new provision in 10 CFR 52.158(c) that will allow an applicant for an ML to voluntarily submit standardized operational program information for approval and to revise 10 CFR 52.171 to provide finality for such information that is approved by the NRC in the ML review. The NRC is proposing these changes in response to stakeholder interest in the context of deployment of factory-fabricated reactors.

Question 18: Should the NRC consider making similar changes to the requirements in 10 CFR 52.47, 52.63, 53.1239, and 53.1263 for design certifications? Please provide a basis for your response.

Question 19: If the NRC were to add a provision for the optional submittal of standardized operational program information in a design certification application, please describe how change control should be accounted for as a part of certifying the design.

Early Site Permit for Nuclear Power Plants

Question 20: With the proposed change to remove the requirement for renewal, all changes to update the early site permit (ESP) must be made by amendment. What other options could the staff consider to increase the useability of an ESP? Could the provisions in the, ''Commission Policy Statement on Deferred Plants,'' (52 FR 38077; October 14, 1987) be applied to ESPs? Please provide a basis for your response.

Question 21: For a COL application that references an ESP, the changes proposed in 10 CFR 52.39 and 53.1188 would limit finality on safety and environmental issues to 20 years following ESP issuance or approval of an update amendment. Because the proposed rule would also retain the requirement for applicants to review for new and significant information when referencing an ESP, the NRC requests input on whether limiting finality to 20 years is necessary to ensure that all relevant environmental information is considered in licensing decisions.

Manufacturing License Term Extension

Question 22: The manufacturing license term extension aligns with the recently promulgated July 2, 2025, direct final rule, ''Revising the Duration of Design Certifications,'' where the NRC replaced the 15-year duration for design certifications with a 40-year duration period. The Commission is interested in determining if a manufacturing license or design certification term limit is necessary. Should the NRC eliminate time limits for manufacturing licenses, design certifications, or both? Please provide a basis for your response.

Nuclear Power Plant License Renewal

Safety Guidance

The NRC currently has separate safety guidance for initial and subsequent renewal to address 40 to 60 years and 60 to 80 years of operation, respectively. In addition, some licensees may soon apply for a third renewal, for which no guidance has yet been developed. One option would be to maintain a single set of safety guidance that represents the state-of-the-art for aging management, covering initial renewal, subsequent renewal, and periods beyond. This guidance would identify an acceptable approach for managing aging and evaluating time-limited aging analyses, regardless of the renewal period. The question below applies to the Generic Aging Lessons Learned Report for initial (NUREG–1801) and subsequent (NUREG–2191) license renewal and the Standard Review Plan for initial (NUREG–1800) and subsequent (NUREG–2192) license renewal.

Question 23: Should the NRC consolidate its safety guidance into one collection that is time-independent (*i.e.,* the same guidance applying to all periods of extended operation), instead of having separate guidance for initial renewal, subsequent renewal, and the upcoming third renewal term? Is there a different approach that should be considered? Please provide a basis for your response.

Implementation of Aging Management

Question 24: With the proposed change to use a 40-year ''tack-on'' license, what regulatory approach should the NRC take with respect to aging management activities that are currently required to be implemented prior to the period of extended operation? Should conditions that are currently included in the renewed license be revised or instead imposed by different means? Please provide a basis for your response.

Considerations for Shorter License Renewal Term

Question 25: Should the NRC retain an option for licensees seeking shorter renewals (those that would not exceed 40 years when combined with the number of years remaining on an existing license) to apply for a ''supersession'' license?

Increased Enrichment of Conventional and Accident Tolerant Fuel Designs for Light-Water Reactors

Expansion of 10 CFR 71.55(g) Enrichment Levels

The NRC is proposing to change 10 CFR 71.55(g) to expand the exception from 10 CFR 71.55(b) for enrichment levels between 5.0 and 10.0 weight percent U–235. The NRC is not considering expanding the exception for enrichments from 10.0 weight percent U–235 up to but less than 20.0 weight precent U–235 for two reasons: (1) limited technical data with respect to overall mechanisms and consequences of a canister breach allowing water in-leakage that would provide additional risk insights; and (2) the current transportation package certification path using 10 CFR 71.55(c) adequately addresses the potential need to ship UF_6 enriched above 10.0 weight percent U–235, has no enrichment limitation, and is technology neutral.

Question 26: 10 CFR 71.55(c) provides a certification pathway that has limited prescriptive requirements and no enrichment limitations. Should the NRC add another option to the exception in 10 CFR 71.55(g) to account for enrichment levels from 10.0 weight percent U–235 up to but less than 20.0 weight percent U–235? Please provide a basis for your response.

Regulatory Certainty of Performance-Based ECCS Rod Embrittlement Criteria

Question 27: Will there be adequate regulatory certainty if the fuel system criteria for uranium oxide or uranium-

plutonium oxide pellets within cylindrical zirconium-based cladding are located in guidance and 10 CFR 50.46a(f) of the proposed rule is performance-based? Please provide a basis for your response.

Inspection Requirements

The NRC is proposing to add non-destructive evaluation inspection requirements for circumferential welds in piping systems with inner diameters that are larger than the TBS to provide assurance that an acceptable level of performance monitoring is maintained in these systems such that breaks larger than the TBS remain highly unlikely.

The NRC has evaluated several sampling schemes to determine the most effective approach for providing assurance against breaks larger than the TBS in these systems. These inspections may support plant-specific applicability of the TBS. The option in this proposed rule is:

- Inspecting a smart sample of those welds with attributes (*e.g.,* operating temperature, type of welding, fabrication history) most conducive to degradation and having the highest failure potential before implementation of the proposed rule and in every subsequent inservice inspection interval thereafter.

Other schemes include:

- Inspecting all welds at least one-time over the plant's remaining licensing period.
- Inspecting a random sample of the weld population before implementation of the proposed rule and in every subsequent inservice inspection interval thereafter.

Question 28: Please provide feedback on the effectiveness of the proposed sampling scheme in providing assurance against breaks larger than the TBS in these systems. Are there pros and cons to the other sampling schemes, an alternative sampling scheme, or a holistic approach relying on existing performance monitoring strategies that the NRC should consider, and why? Should the sampling scheme be required before or as plants enter into extended operation beyond what is currently authorized in the operating fleet (*e.g.,* if authorized beyond 80 years)?

The NRC is also proposing a requirement to evaluate the effect of any identified indications found during inspections required by this proposed rule on the TBS. The NRC recognizes that any such findings must be dispositioned under ASME section XI, which would require a demonstration that the indications remain acceptable for continued service or are repaired before placing the component back into service. However, the NRC has not included criteria in this proposed rule regarding what constitutes an acceptable additional evaluation of any inspection findings. The NRC is considering that an acceptable additional evaluation would consist of two parts. The first part would be a deterministic or probabilistic fracture mechanics analysis to demonstrate that the failure likelihood of any indications identified during the inspection resulting in a likelihood of ruptures greater than the TBS is less than 10^{6} per year. The second part would, if the indications are evidence that active degradation is occurring, recharacterize the risk-informed inspection examination category for the population of all similar welds to be commensurate with the expected degradation mechanism. All future inspections of this weld population would then be performed according to the ASME section XI requirements associated with that inspection category.

Question 29: The NRC is interested in obtaining feedback on the efficacy of this proposed evaluation method and more broadly on what an acceptable additional evaluation of any indications found during the inspection should entail.

DG–1261—Breakaway Oxidation

Question 30: The DG–1261, Revision 1, ''Measuring Breakaway Oxidation Behavior,'' contains breakaway oxidation testing criteria. The NRC is interested in obtaining feedback on this regulatory position. Please provide a basis for your response. The NRC is interested in specific information on how quality assurance practices and industry operating experience have evolved since the underlying research was published, and whether these developments should inform potential adjustments to this provision.

Regulatory Analysis

Question 31: The NRC is interested in feedback on the draft regulatory analysis, in particular, the benefits associated with power uprates under the proposed 10 CFR 50.46a. Please provide a basis for your response.

DG–1426—Risk-Informed Evaluation and Risk-Informed Evaluation Process

An entity that wishes to make changes under the proposed rule would have to perform a risk-informed evaluation and demonstrate that the proposed change meets the acceptance criteria in proposed 10 CFR 50.46a(h). The acceptance criteria in the proposed rule would include that the total increases in core damage frequency (CDF) and large early release frequency (LERF) due to the proposed change are very small and that the overall plant baseline risk remains small. ''Small'' and ''very small'' are defined in RG 1.174 and DG–1426. The acceptance criteria are limited to very small changes instead of small changes, in part, because the TBS initiating event frequency is the same as the limit for small changes (*i.e.,* change in CDF of approximately 1×10^{-5}). If the acceptance criteria were limited to small changes, a PRA would show that not mitigating a TBS or DEGB LOCA is always less than the small threshold, making the risk assessment unnecessary and overly burdensome.

An entity seeking to make changes under the proposed rule without prior NRC approval would have to have an NRC-approved risk-informed evaluation process and demonstrate that any increases in the estimated risk are minimal. The proposed acceptance criteria for proposed changes that may be made without prior NRC approval were chosen to be an order of magnitude lower than the acceptance criteria for changes that require prior NRC approval for consistency with other established risk-informed programs.

The DG–1426 contains draft guidance that would be acceptable to the NRC for performing a risk-informed evaluation and establishing a risk-informed evaluation process that satisfies the requirements of the proposed rule. This DG follows the structure for risk-informed changes in RG 1.174. Entities would be able to leverage changes made for previous risk-informed amendments, such as 10 CFR 50.69, ''Risk-informed categorization and treatment of structures, systems and components for nuclear power reactors,'' or Technical Specification Task Force Traveler 505, ''Provide Risk-Informed Extended Completion Times—RITSTF Initiative 4B,'' when performing the risk-informed evaluation. Therefore, the NRC does not expect that the risk-informed evaluation would be burdensome.

Under current 10 CFR 50.59, ''Changes, tests and experiments,'' a licensee would need to obtain a license amendment if there would be more than a minimal increase in frequency or consequences of accidents or malfunctions. As described in the preamble for the 10 CFR 50.59 final rule (64 FR 53582; October 4, 1999), PRAs (*i.e.,* total increases in CDF and LERF) may not be used to determine if the minimal increase standard is met because 10 CFR 50.59 concerns DBEs, while RG 1.174 includes risk from severe accidents beyond the design basis. Similar to the change in proposed

10 CFR 50.59 as described in section XII, ''Discussion—Risk-Informing 10 CFR 50.59 and Allowing Flexibility for Changes to Methods,'' of this document, the risk-informed evaluation process in proposed 10 CFR 50.46a would provide additional flexibility by allowing a licensee to use the total increases in CDF and LERF to determine if the increase in risk associated with a change enabled by this proposed rule would be minimal.

In this proposed rule, the NRC is including the risk-informed evaluation and risk-informed evaluation process that were included in the previously proposed but discontinued 10 CFR 50.46a rulemaking in SECY–10–0161. As part of the development of that previous rule, the NRC received comments from the public and the Advisory Committee on Reactor Safeguards on the risk-informed evaluation and risk-informed evaluation process related to, among other things, the use of the ''very small'' threshold for changes, the definition of ''minimal increase in risk,'' PRA maintenance and upgrade, the evaluation of cumulative risk, and the relationship of the risk-informed evaluation process to 10 CFR 50.59. In addition, the NRC staff received direction from the Commission in SRM–SECY–07–0082 to use the ''very small'' threshold for changes. While some of these issues are addressed in this proposed rule, the NRC is seeking additional information to identify if further changes are needed.

Question 32: The NRC is interested in any additional considerations or feedback on the risk-informed evaluation and risk-informed evaluation process proposed in 10 CFR 50.46a and the implementing guidance in DG–1426, including whether they should be modified or removed from the proposed rule in their entirety. Specifically, what are the advantages and disadvantages of including a risk-informed evaluation as a necessary part of implementing the rule? In addition, what are the advantages and disadvantages of restricting all changes to very small risk increases? Would the risk-informed evaluation, restricting changes to very small risk increases, or both, make it burdensome to implement changes under the proposed rule? What are the advantages and disadvantages of removing the risk-informed evaluation and risk-informed evaluation process from the proposed rule? If the NRC removed the risk-informed evaluation and risk-informed evaluation process from the proposed rule, how should changes that could impact the risk calculation be evaluated? Please provide any supporting basis or justification for your response.

New Reactor Applicability

Question 33: The proposed rule would establish a TBS based on nuclear power reactor licensees' operating experience with piping materials, piping designs, service conditions, operational programs, and mitigation and control of age-related degradation programs. The proposed rule would allow new reactors to submit for NRC approval an alternate TBS that includes a demonstration that the proposed reactor design is similar to the designs of reactors authorized to operate under 10 CFR part 50 on December 31, 2015. This provision might not be applicable to some new reactor designs, including small modular reactors, due to fundamental design differences. For example, some of the new reactor designs may have novel LOCA mitigation strategies, such as passive features or use of valves and associated flanges in the piping system to ensure coolant inventory retention. Some applicants may be able to demonstrate that the failure frequencies at particular locations in the piping system are extremely low and can be maintained extremely low during plant operation. In lieu of the TBS, the failure frequencies of the piping system may be established and maintained extremely low during the plant operation to justify relaxation of the required assumptions for the analyses similar to the proposed rule (*e.g.,* a realistic treatment of defense-in-depth features and best-estimate analyses). The NRC is interested in receiving feedback on the applicability of the proposed rule to such new reactor designs. Please include in your feedback whether it is appropriate to risk-inform the LOCA requirements in light of novel design features, and language that would appropriately allow entities to treat breaks at particular locations in the piping systems for new reactor designs similarly to break sizes larger than the TBS in the proposed rule. Please also include in your feedback whether the option for a non-size-based TBS would improve the applicability of the proposed rule to these designs along with any supporting basis or justification for your response.

Alternate Transition Break Size

Question 34: The NRC incorporated in the proposed rule enabling language to allow currently operating power reactor licensees to recommend and justify an alternative TBS. The NRC is interested in feedback on this option. Please include in your feedback the potential advantages that could be realized by this alternative and if potential benefits are more likely to be realized generically or for individual plants. Please also provide any disadvantages that may result from a loss of regulatory consistency if similar plants have different TBS values and any potential impacts on fulfilling the inspection requirements in proposed 10 CFR 50.46a(b)(3). Please also describe the impact of any associated costs necessary to develop a risk-informed technical basis for an alternative TBS and the associated uncertainties due to the lack of current guidance for developing this basis.

Alternative 10 CFR 50.46a Licensing Pathways

Question 35: This proposed rule would add a voluntary alternative to 10 CFR 50.46 designed to provide flexibility by allowing licensees to adopt tailored approaches for ECCS performance evaluations. This flexibility is proposed in 10 CFR 50.46(a)(1), which would provide applicants and licensees the ability to select between two acceptance criteria pathways. The first is presented in proposed 10 CFR 50.46(b), which is the current 10 CFR 50.46 acceptance criteria. The second is presented in proposed 10 CFR 50.46a(f), which contains the new performance-based acceptance criteria. The NRC expects that the performance-based requirements in proposed 10 CFR 50.46a(f) would facilitate implementation of potential alternative approaches to FFRD such as those described in the regulatory basis for this rulemaking, some of which are already being considered by the NRC. These alternatives could be beneficial for licensees that elect not to pursue the remainder of proposed 10 CFR 50.46a. Please comment on any elements of the proposed rule that could have unintended consequences for implementation of these alternatives.

ECCS Reporting Requirements

Question 36: The industry has proposed that a graded approach could be used to relax the ECCS reporting requirements based on context beyond the current 10 CFR 50.46 criteria. Please provide thoughts on how a graded approach could be applied to relax the ECCS reporting requirements in 10 CFR 50.46 and proposed 10 CFR 50.46a. Please provide a basis for your response.

Threshold for Significance Determination

Question 37: The proposed fixed 50-degree peak clad temperature (PCT)

threshold for significant errors can either overstate or understate the safety significance of a change depending on available margin to the acceptance criterion. Further, it does not consider designs where a parameter other than PCT is proposed as the acceptance criterion. Alternative approaches, such as a margin-based threshold can more accurately reflect actual risk significance. Please provide your thoughts, with justification and any supporting information, on alternative approaches for determining the significance of errors in the LOCA evaluation model (*e.g.,* percent reduction in the margin between the acceptance criteria and the approved maximum value of the acceptance parameter).

ECCS Performance

Question 38: The proposed rule explicitly only provides the TBS-based approach to address FFRD. The TBS-based approach may not provide enough margin to demonstrate coolability at the upper end of the burnup range allowed by the proposed rule and therefore, could result in implementation and licensing challenges. The NRC previously included a dose consequence-based approach to addressing FFRD in the regulatory analysis for the Increased Enrichment Rule (Docket ID: NRC–2020–0034). What are the advantages and disadvantages of including an explicit option in the performance-based ECCS acceptance criteria in proposed 10 CFR 50.46a(f) that is based on dose-consequence? What implementation challenges (*e.g.,* acceptance threshold) would need to be addressed for such an option? Please provide the rationale and any supporting information for your response.

Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants

Question 39: Appendix T of 10 CFR is intended to address nuclear supply chain constraints by providing a graded approach for additional QA flexibilities and aligning with international standards. The proposed rule limits the applicability of appendix T to nth-of-a-kind (NOAK) plants referencing a first-of-a-kind (FOAK) plant constructed and operated under appendix B. How can the NRC expand the applicability of appendix T to FOAK plants and existing licensees, including any guardrails or restrictions that may be desirable (*e.g.,* vendor inspections for FOAK and new suppliers for NOAK)? Should the NRC consider alternative approaches to appendix T such as endorsement of ISO 19443 or changes to appendix B? Please provide the basis for your recommendations, including any unintended consequences.

Question 40: The change process for the Quality Management System (QMS) in proposed 10 CFR 50.54(a)(5) requires changes to the QMS be submitted to the NRC for NRC approval prior to implementation. Should the change process have a graded approach or mirror 10 CFR 50.54(a)(4) in which only changes that reduce the commitments be submitted to the NRC for prior approval? Please explain if there is a preferred method.

Alternative Risk-Informed and Performance-Based Acceptance Criteria for 10 CFR Parts 50 and 52

Question 41: The NRC is seeking views on increasing the flexibility provided by the proposed rule. The rule currently does not include the allowance for a licensee or applicant to adopt a previously approved alternative without submitting an application to the NRC, provided that the basis for the staff's approval is demonstrated and documented to be applicable to the adoptee's plant or facility. Would adding such flexibility increase or accelerate the use of the proposed rule? What are some viable approaches to resolve any conflicts of such flexibility with the requirements in 10 CFR 50.59?

Siting

Question 42: The proposed rule introduces a new graded approach to siting that provides entry criteria for the less restrictive requirements in subpart A to 10 CFR part 100 (*i.e.,* demonstrating an unmitigated consequence of less than 25 rem (0.25 Sv) TEDE at the site exclusion area boundary) as an alternative to the prescriptive siting requirements in subpart B. The associated draft guidance provides detailed information on how to evaluate this entry criteria. Given the significance of this new graded approach to siting, are there implications in terms of implementation of this new approach that should be further explored in guidance or addressed at the final rule stage?

XXXVIII. Regulatory Flexibility Certification

As required by the Regulatory Flexibility Act of 1980, 5 U.S.C. 605(b), the Commission certifies that this rule, if adopted, will not have a significant economic impact on a substantial number of small entities. This proposed rule affects only the licensing and operation of nuclear power plants. The companies that own these plants do not fall within the scope of the definition of ''small entities'' set forth in the Regulatory Flexibility Act or the size standards established by the NRC (10 CFR 2.810).

XXXIX. Regulatory Analysis

The NRC has prepared a draft regulatory analysis on this proposed regulation. The analysis examines the costs and benefits of the alternatives considered by the NRC. The NRC requests public comment on the draft regulatory analysis. The draft regulatory analysis is available as indicated in the ''Availability of Documents'' section of this document. Comments on the draft analysis may be submitted to the NRC as indicated under the **ADDRESSES** caption of this document.

XL. Backfitting and Issue Finality

This section describes the backfitting and issue finality implications of this proposed rule and the draft guidance documents described in section XLVII, ''Availability of Guidance,'' of this document, as applied to pertinent NRC approvals and certain applicants that reference NRC approvals in their applications. The NRC's backfitting provisions associated with nuclear power plants licensed under 10 CFR part 50 appear in 10 CFR 50.109, ''Backfitting.'' Issue finality provisions (analogous to the backfitting provisions in 10 CFR 50.109) for approvals under 10 CFR part 52 are located in various provisions of 10 CFR part 52. The NRC Management Directive (MD) 8.4, ''Management of Backfitting, Forward Fitting, Issue Finality, and Information Requests,'' describes the Commission's policies on backfitting and issue finality.

Part 53 of 10 CFR contains backfitting and issue finality provisions. Those provisions apply to NRC actions that would affect 10 CFR part 53 licensees and certain applicants that reference NRC approvals under 10 CFR part 53. The NRC has not issued any licenses or other approvals under 10 CFR part 53, so no licensees or applicants under 10 CFR part 53 could be affected by this proposed rule. Therefore, this proposed rule's changes to 10 CFR part 53 would not constitute backfitting under 10 CFR part 53 or affect the issue finality of an approval issued under 10 CFR part 53.

''Backfitting'' is defined in 10 CFR 50.109(a)(1) as, in relevant part, a modification of or addition to the systems, structures, and components or design of a facility; or the design approval or manufacturing license (ML) of a facility; or the procedures or organization required to design, construct, or operate a facility, which

results from a new or amended provision in the Commission's regulations. The issue finality provision for combined licenses (COLs) located in 10 CFR 52.98 provides, in relevant part, that the Commission may not modify, add, or delete any term or condition of a COL except in accordance with the provisions of 10 CFR 50.109. Essentially, if a change does not constitute backfitting, then the change does not affect the issue finality of a COL.

Part 52 of 10 CFR contains an issue finality provision for MLs. No entity holds an ML under 10 CFR part 52. Therefore, the proposed changes to 1) amend 10 CFR 52.173 to change the duration of an ML to a maximum of 40 years, 2) amend 10 CFR 52.181 to change the duration of a renewed ML to a maximum of 40 years, 3) amend 10 CFR 50.71(f) regarding final safety analysis report (FSAR) updates by ML holders, and 4) amend 10 CFR 52.171(b)(1) to allow the holder of an ML to use the regulations in 10 CFR 50.59 to determine whether changes to the facility or procedures as described in the FSAR would require prior Commission approval of an amendment to the ML, would not affect the issue finality of an ML.

Similarly, the proposed change to amend 10 CFR 52.98, which would allow COL holders who reference an ML to use the applicable change processes in 10 CFR part 50 to determine whether changes to the facility or procedures as described in the FSAR would require prior Commission approval, would not affect the issue finality of a COL referencing an ML because there are no MLs for a COL to reference. Also, the proposed change to amend 10 CFR 50.59 to allow the holder of an operating license (OL) under 10 CFR part 50 or a COL under 10 CFR part 52 that references a reactor manufactured under an ML to make changes in the facility or procedures as described in the FSAR without requesting a license amendment if the changes would be the same as changes approved by amendment to the ML and upon a determination that implementing the changes would be consistent with the basis for the Commission's approval of the amendment to the ML and would not involve any additional changes that would require an amendment to the OL or COL, would not constitute backfitting of a 10 CFR part 50 operating license or affect the issue finality of a 10 CFR part 52 COL referencing an ML because there are no MLs for an OL or a COL to reference.

Two sets of proposed changes would affect the issue finality of standard design certifications under 10 CFR part 52. First, the NRC proposes to clarify the definitions of Tier 1 information in section II.D of appendices A, D, E, F, and G to 10 CFR part 52 by identifying specific sections and tables within the generic design certification documents that correspond to each of these categories of Tier 1 information. Second, the NRC proposes to amend sections II.F and VIII.B of appendices A and E to 10 CFR part 52 to revert all Tier 2* information to Tier 2 status after the plant first achieves full power. These proposed changes would modify the certification information of the certified standard designs in those appendices. The issue finality provision for design certifications is in 10 CFR 52.63(a)(1) and prohibits the modification of certification information unless the Commission determines in a rulemaking that certain criteria are met. In this case, the Commission determines that these proposed changes would reduce unnecessary regulatory burden and maintain protection to public health and safety and the common defense and security in accordance with 10 CFR 52.63(a)(1)(iii). Therefore, the NRC may propose to make these changes.

Under 10 CFR 52.63(a)(2), in a rulemaking performed under 10 CFR 52.63(a)(1)(iii), the Commission will give consideration to whether the benefits justify the costs for plants that are already licensed or for which an application for a permit or license is under consideration. The NRC prepared an analysis addressing whether the benefits of the proposed changes would justify the costs for plants that are already licensed or for which an application for a permit or license is under consideration (see section XXXIX, ''Regulatory Analysis,'' of this document).

Other proposed changes to the standard design certifications under 10 CFR part 52 would not affect the issue finality of those certified designs or COL holders referencing the certified designs because the proposed changes would not amend certification information of the designs. The Commission explained in the 2007 10 CFR part 52 final rule that 10 CFR 52.63(a) applies to changes to the certification information (*i.e.,* the information in the generic design control document incorporated by reference in a design certification appendix in 10 CFR part 52) but does not apply to changes to the certified design rule language (72 FR 49381; August 28, 2007). Therefore, deleting section IX of appendix D to 10 CFR part 52 because it is redundant with 10 CFR 52.99 and 52.103 would not affect the issue finality of the existing design certification or COLs referencing the existing certified design because the proposed change would not amend certification information of the design.

Of the other proposed changes, many would not constitute backfitting under 10 CFR part 50 or affect the issue finality of a COL under 10 CFR part 52 because they would be non-mandatory relaxations of existing requirements. As explained in MD 8.4, non-mandatory relaxations of regulations generally do not meet the definition of ''backfitting'' in 10 CFR 50.109(a)(1). Thus, these proposed changes would not constitute backfitting under 10 CFR part 50 or affect the issue finality of a COL under 10 CFR part 52. The following proposed changes would be non-mandatory relaxations of existing requirements:

- Amending paragraphs IV.F.2.a.(i) through (iii) of appendix E to 10 CFR part 50 and paragraphs 10 CFR 50.160(c)(1) and (c)(2) to remove the requirement to demonstrate compliance within 2 years before issuance of an OL under 10 CFR part 50 or the scheduled date of initial loading of fuel for a 10 CFR part 52 COL. A 10 CFR part 50 OL applicant or 10 CFR part 52 COL holder could conduct the initial exercise within 2 years of the respective milestones and would comply with the proposed rule.
- Amending paragraph IV.D.3 of appendix E to 10 CFR part 50 to revise requirements for when backup alert and notification system methods are required. Licensees could continue to have a single primary method and a single backup method and would comply with the proposed rule.
- Amending 10 CFR 50.33(g), 50.47(c)(2), and 50.160(b)(3) to ensure the plume exposure pathway emergency planning zone (EPZ) is no larger than needed to implement predetermined, prompt protective measures. Licensees could continue to have a plume exposure pathway EPZ of an area about 10 miles (16 km) in radius and would comply with the proposed rule.
- Eliminating the requirement to define an ingestion pathway EPZ by removing references to the ingestion pathway EPZ in 10 CFR 50.33(g)(1), 50.47(b)(10), 50.47(c)(2), and paragraph IV.F.2.a.(i) and footnote 1 of appendix E to 10 CFR part 50. Licensees could continue to have an ingestion pathway EPZ of an area about 50 miles (80 km) in radius and would comply with the proposed rule.
- Amending paragraph IV.E.8.b of appendix E to 10 CFR part 50 to require the emergency plan to specify the location of the emergency operations facility in relation to the EPZ boundary. A licensee could continue to locate its

emergency operation facility between 10 and 25 miles (16 and 40 km) of the nuclear power reactor site, or a primary facility less than 10 miles (16 km) from the nuclear power reactor site and a backup facility between 10 and 25 miles (16 and 40 km) of the nuclear power reactor site, based on the current 10-mile (16-km) EPZ requirement, and would comply with the proposed rule.

- Amending 10 CFR 50.54(t) to eliminate the requirement for licensees to ensure that all program elements are reviewed by people who have no direct responsibility for implementation of the emergency preparedness (EP) program. Licensees could continue to have their EP program elements reviewed by people who have no direct responsibility for implementation of the EP program and would comply with the proposed rule.
- Amending paragraphs IV.5, IV.6, and IV.7 of appendix E to 10 CFR part 50 to eliminate certain requirements related to updates of evacuation time estimates. Licensees could continue to update their EPZ permanent resident population estimates and evacuation time estimate analysis, and would comply with the proposed rule.
- Amending paragraph IV.E.9.d of appendix E to 10 CFR part 50 to eliminate the requirement for monthly tests of communications between the licensee and the appropriate NRC Regional Office Operations Center. Licensees could try to communicate monthly with their NRC Regional Office Operations Center and would comply with the proposed rule.
- Amending 10 CFR 71.55 to expand the exception from 10 CFR 71.55(b) for packages containing enrichment levels between 5.0 and 10.0 weight percent U–235. Packages could contain enrichment levels below 5.0 weight percent U–235 and would comply with the proposed rule.
- Amending 10 CFR 50.67 and General Design Criterion (GDC) 19 of appendix A to 10 CFR part 50 to increase the numerical value of the control room design criteria from 5 to 10 rem (0.05 to 0.10 Sv) and enable a higher control room design criteria, ranging from 10 to 25 rem (0.10 to 0.25 Sv) TEDE, for licensees whose facility-specific risk profiles warrant them. Licensees could meet the current control room habitability design requirements and would comply with the proposed rule.
- Removing the restriction limiting proposed alternatives to paragraphs (b) through (h) of 10 CFR 50.55a so that proposed alternatives would now be permitted for all regulatory requirements in 10 CFR 50.55a using the existing criteria in paragraphs (z)(1) and (2) of 10 CFR 50.55a. Licensees could continue to propose alternatives to only paragraphs (b) through (h) of 10 CFR 50.55a and would comply with the proposed rule.
- Amending appendix A to 10 CFR part 50 to clarify that (1) deviations from GDC could be identified and justified within licensing submittals, with no need for a separate exemption request; and (2) demonstrating compliance with GDC 28 of appendix A to 10 CFR part 50 could be based on a different design basis accident than the control rod ejection or control rod drop accident. Licensees could continue to submit an exemption request or demonstrate compliance with GDC 28 using an evaluation of control rod ejection or control rod drop accidents and would comply with the proposed rule.
- Amending 10 CFR 54.37(b) to only require that the final safety evaluation report include a summary description of aging management activities that addresses newly identified SSCs, as appropriate, consistent with what is required in the renewal application.

Some of the changes in this proposed rule would not constitute backfitting under 10 CFR part 50 or affect the issue finality of an approval under 10 CFR part 52 because the proposed changes would provide a voluntary alternative set of requirements. Licensees could continue to comply with the current applicable requirement and would not be required to comply with the proposed rule. The following proposed changes would not require holders of 10 CFR part 50 or 52 approvals to comply with the proposed rule changes:

- Amending various regulations to allow applicants and licensees under 10 CFR parts 50 and 52 the option to use 10 CFR 50.160.
- Amending 10 CFR 52.26 to remove the requirement for an ESP to include a fixed term and making related conforming changes to subpart A of 10 CFR part 52.
- Amending 10 CFR 50.68(b)(7) to allow enrichment above 5.0 weight percent U–235.
- Amending 10 CFR 50.46a and making conforming changes to provide alternative acceptance criteria for emergency core cooling systems for light-water reactors.
- Adding 10 CFR 50.221 to establish an optional verification, validation, and uncertainty quantification (VVUQ) program.
- Adding appendix T to 10 CFR part 50 to establish an alternative to the current quality assurance requirements in appendix B to 10 CFR part 50.
- Amending various paragraphs in 10 CFR 50.4, 50.34, 50.54, 50.55, and 52.79 to make conforming changes to reflect the addition of appendix T to 10 CFR part 50.
- Adding 10 CFR 50.220 and 52.220 to allow licensees and applicants to voluntarily submit and use technology-inclusive, risk-informed, or performance-based acceptance criteria as alternatives to existing prescriptive requirements.

Several of the proposed changes would apply to only future applicants and to current licensees at their discretion, and therefore would not constitute backfitting under 10 CFR part 50 or affect the issue finality of a 10 CFR part 52 approval. Applicants and potential applicants (for licenses, permits, and other regulatory approvals) generally are not within the scope of the backfitting or issue finality regulations. Those regulations include language delineating when those provisions begin; in general, the backfitting and issue finality regulations begin upon the issuance of the license, permit, or other approval. The following proposed changes would apply to only future applicants and to current licensees at their discretion:

- Amending paragraph I.5 of appendix E to 10 CFR part 50 to determine the degree to which compliance with the requirements in certain sections of appendix E is necessary on a case-by-case basis for power reactors with a site-boundary EPZ or no EPZ.
- Amending 10 CFR 50.33(g), 50.47(c)(2), and 50.160(b)(3) to simplify EPZ determinations.
- Amending 10 CFR 50.33(g) to eliminate the requirement to submit response plans of State, local, and participating Tribal governmental entities.
- Amending 10 CFR 50.34(a)(10) and sections I.1, I.2, and II of appendix E to 10 CFR part 50 to remove the requirements for applicants to submit preliminary plans for coping with emergencies in the preliminary safety analysis report.
- Amending 10 CFR 52.158 and 52.171 to allow ML applicants the option to submit essentially complete operational program information with their applications and to provide finality to such program information that is reviewed and approved by the NRC as part of the ML review.
- Amending 10 CFR 54.31 to extend the maximum renewal period for a license to 40 years.
- Adding 10 CFR 54.21(a)(4) to allow applicants to voluntarily propose risk-informed and performance-based

alternatives to the current prescriptive requirements of the aging management review.

- Amending 10 CFR 54.17(c) to remove the 20-year limit on applying for license renewal.
- Amending 10 CFR 54.21(c)(2) to remove the requirement to submit a list of plant-specific exemptions granted under 10 CFR 50.12 that are based on time-limited aging analyses and a justification for continuing those exemptions during the extended operating period.
- Amending 10 CFR 54.22 to remove the requirement that applicants include and justify any technical specification changes needed to manage the effects of aging.
- Amending 10 CFR part 100 to allow power reactor applicants under 10 CFR part 50 or 52 to have greater flexibility to determine the appropriate level of site characterization.
- Amending or adding 10 CFR 50.10, 50.34(b), 50.57, 50.58, 51.4, 52.79(a), 52.85, 52.97(d), and 52.98 to revise the definition of construction to better focus the definition on safety-significant matters and reduce the cost impact of the current definition, to allow certain applicants to request generic finality, and to allow certain construction activities under a general license.
- Amending 10 CFR 50.2 to add definitions for the terms ''design basis events'' and ''beyond design basis events'' and making a conforming change to 10 CFR 50.49(b)(1)(ii).
- Adding a new paragraph (b)(2) to 10 CFR 50.75 to allow new reactor applicants and licensees to use an alternative decommissioning funding assurance pathway.
- Amending 10 CFR 50.75(c)(1) to delete language in the table of minimum amounts that requires reactors of less than 1200 MWt to use the certification amount for a 1200 MWt reactor.
- Amending 10 CFR 50.75(e) to include ''applicant or'' in all appropriate places where currently only ''licensee'' is referenced.
- Amending 10 CFR 50.34(a)(4) and (b)(4) and footnote 1 of 10 CFR 50.34(a) regarding construction permit and OL application requirements and making conforming changes to 10 CFR 52.47, 52.79, 52.137, and 52.157.
- Amending paragraph (a)(1)(ii)(D) and footnotes 3 and 6 of 10 CFR 50.34 to use technology-inclusive language and making conforming changes to 10 CFR 52.17, 52.47, 52.79, 52.137, and 52.157.
- Amending footnote 4 of 10 CFR 50.34(a)(1)(ii)(D)(*1*) to remove outdated information regarding recommendations included in a 1959 National Bureau of Standards handbook.
- Amending 10 CFR 52.1 to add the definitions of Tier 1, Tier 2, and Tier 2*, which would apply to design certifications issued after the effective date of the proposed rule (if finalized).

The remaining proposed changes in this proposed rule would not constitute backfitting under 10 CFR part 50 or affect the issue finality of a 10 CFR part 52 COL, and they would not be non-mandatory relaxations of existing requirements, voluntary alternative requirements, or applicable to only future applicants. These proposed changes would not require a licensee to modify or add to systems, structures, components, or the design of a facility; or the design approval or ML of a facility; or the procedures or organization required to design, construct, or operate a facility. Therefore, the proposed changes would not meet the 10 CFR 50.109 definition of ''backfitting'' and, thus, would not constitute backfitting and would not affect the issue finality of a 10 CFR part 52 COL. The following proposed rule changes would fall into this category:

- Amending 10 CFR 50.160(b)(1)(iv)(A)(*2*) and paragraph IV.D.2 of appendix E to 10 CFR part 50 to use modern terminology.
- Amending 10 CFR 50.54(q) to revise and risk-inform the emergency plan change process. The criteria to determine whether the licensee's emergency plan change would require prior NRC approval and the process to obtain that approval in 10 CFR 50.54(q) are not within the scope of ''backfitting'' as defined in 10 CFR 50.109(a)(1) because they are part of an NRC-designed administrative change process that is not required to design, construct, or operate a facility. In addition, the procedures a licensee might use to decide whether to change its emergency plan are not required to design, construct, or operate a facility. Other proposed changes that would amend a change process are the following:
  - Adding 10 CFR 50.59(e) to establish a risk-informed alternative to the existing 10 CFR 50.59 change process.
  - Amending 10 CFR 50.59(c)(2)(viii) to allow licensees to implement certain changes to analytical methods described in the FSAR (as updated) without prior NRC approval, provided those changes are undertaken pursuant to an NRC-approved VVUQ program under 10 CFR 50.221.
  - Amending section VIII.A of appendices A, D, E, F, and G to 10 CFR part 52 to revise the change process for licensee-requested changes to Tier 1 design description information and Tier 1 ITACC information, and to revise the change process for changes and departures during commercial operation.
  - Amending section VIII.B.5.c of appendices A, D, E, F, and G to 10 CFR part 52 to amend the change process criteria used to determine if a proposed departure from Tier 2 information affecting the resolution of an ex-vessel severe accident design feature identified in the plant-specific DCD requires a license amendment.
  - Amending section VIII.B of appendix D to 10 CFR part 52 to allow the use of the 10 CFR 50.59-like criteria in sections VIII.B.5.b and B.5.c to determine if licensees who reference appendix D to 10 CFR part 52 may depart from Tier 2* information without prior NRC approval.
- Amending table S–3 in 10 CFR 51.51(b). The information in table S–3 provides the basis for evaluating the contribution of the environmental effects of the uranium fuel cycle to support the NRC's NEPA obligations at the time of a nuclear reactor licensing action. Because table S–3 only provides information about the environmental effects away from a nuclear reactor, the NRC's proposed revision to table S–3 would not result in a modification or addition that meets the definition of ''backfitting'' in 10 CFR 50.109(a)(1).
- Amending table S–4 in 10 CFR 51.52. The information in table S–4 provides the basis for evaluating the contribution of the environmental impacts of the transportation of fuel and waste to and from a nuclear reactor to support the NRC's NEPA obligations at the time of a nuclear reactor licensing action. Because table S–4 only provides information about the environmental impacts away from a nuclear reactor, the NRC's proposed revisions to table S–4 would not result in a modification or addition that meets the definition of ''backfitting'' in 10 CFR 50.109(a)(1).
- Amending the terminology in 10 CFR 50.67 and GDC 19 of appendix A to 10 CFR part 50 to clarify the regulations.
- Amending current 10 CFR 50.34, 50.46, 50.46a, and 50.69; GDC 17, 35, 38, 41, 44 and 50 of appendix A to 10 CFR part 50; appendix K to 10 CFR part 50; 10 CFR 52.47, 52.54, 52.79, 52.137, and 52.157; and appendix G to 10 CFR part 52 to reflect the proposed 10 CFR 50.46a. Many of these proposed changes would support implementation of the proposed 10 CFR 50.46a, which would offer voluntary alternative criteria for emergency core cooling systems for light-water reactors. These proposed conforming changes would not meet the definition of backfitting for the same

reasons why the proposed 10 CFR 50.46a—voluntary alternative requirements—would not meet the definition of backfitting. The other proposed conforming changes would affect regulations for applicants and, therefore, would not constitute backfitting under 10 CFR part 50 or affect the issue finality of a 10 CFR part 52 approval.

- Removing footnote 3 from 10 CFR 50.49(b)(1) and redesignating footnote 4 as footnote 1.
- Amending 10 CFR 50.75(e), (g), and (h) to make editorial corrections.
- Amending 10 CFR 52.63(a)(1)(vii) to eliminate ''increased standardization'' as a criterion that the Commission must meet before modifying, rescinding, or imposing new requirements on certification information by rulemaking.
- Amending 10 CFR 52.63(a)(4)(ii) to eliminate whether special circumstances outweigh any decrease in safety that may result from a reduction in standardization as a criterion that the Commission must meet before imposing new requirements on a design by plant-specific order.
- Amending 10 CFR 52.63(b)(1) to eliminate the requirement for the Commission to review the impact of a requested exemption on standardization.
- Amending 10 CFR 52.93 and 52.171 to eliminate the requirement for the Commission to discuss the impact of a change on standardization as a criterion for the justification for departures from ML information.

As described in the ''Availability of Guidance'' section of this document, the NRC is issuing 24 draft guidance documents that, if finalized, would provide guidance on the methods acceptable to the NRC for complying with aspects of this proposed rule. Further, as discussed in the guidance documents, applicants and licensees would not be required to comply with the positions set forth in the guidance. Therefore, issuance of the guidance documents as final guidance would not constitute backfitting under 10 CFR parts 50 and 53 or affect the issue finality of any approval issued under 10 CFR parts 52 and 53.

XLI. Cumulative Effects of Regulation

The NRC seeks to minimize potential negative consequences resulting from the cumulative effects of regulation (CER). The NRC believes that the deregulatory impacts of this rulemaking activity are unlikely to cause implementation challenges for stakeholders. In addition, during the pendency of this rulemaking, the NRC is deprioritizing issuance of regulatory actions that might influence the implementation date for the new rule requirements (*e.g.,* orders, generic communications, license amendment requests, and inspection findings of a generic nature).

To fully understand any potential CER implications that could result from this rulemaking, the NRC is asking the following questions. Response to these questions is voluntary and any input will be considered during development of the final rule.

1. The NRC is proposing an effective date that will be 30 days after the date of publication of a final rule. Does this provide sufficient time to implement the proposed requirements? Please provide a rationale for your response.

2. Are there unintended consequences related to this rulemaking and how should they be addressed? Please provide a rationale for your response.

3. Please comment on the NRC's cost and benefit estimates in the regulatory analysis that supports this proposed rule.

XLII. Plain Writing

The Plain Writing Act of 2010 (Pub. L. 111–274) requires Federal agencies to write documents in a clear, concise, and well-organized manner. The NRC has written this document to be consistent with the Plain Writing Act as well as the Presidential Memorandum, ''Plain Language in Government Writing,'' published June 10, 1998 (63 FR 31885). The NRC requests comment on this document with respect to the clarity and effectiveness of the language used.

XLIII. National Environmental Policy Act

The Commission proposes to determine under the National Environmental Policy Act of 1969, as amended, and the Commission's regulations in subpart A of 10 CFR part 51, that this rule, if adopted, would not be a major Federal action significantly affecting the quality of the human environment, and an environmental impact statement is not required. The basis of this proposed determination regarding potential environmental impacts is the implementation of the proposed rule for the regulations described in this **Federal Register** notice would not have a significant impact on the environment. The proposed requirements would be administrative in application or matters of procedure or provide an equivalent level of safety as existing requirements; therefore, there would be similar environmental impacts from the implementation of the regulations in this proposed rule as there are for existing requirements.

The proposed determination of this draft environmental assessment is that there will be no significant effect on the quality of the human environment from this action. Public stakeholders should note, however, that comments on any aspect of this environmental assessment may be submitted to the NRC as indicated under the **ADDRESSES** caption. The draft environmental assessment is available as indicated under the ''Availability of Documents'' section of this document. This environmental assessment and proposed finding of no significant impact can be tracked with identification number NEPA ID EAXX–429–00–000–1770782365.

XLIV. Paperwork Reduction Act

This proposed rule contains new or amended collections of information subject to the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et *seq.*). This proposed rule has been submitted to the Office of Management and Budget for review and approval of the information collections.

Type of submission: New.

The title of the information collection: Modernizing Reactor Licensing, Safety Oversight, and Siting Practices.

OMB approval numbers: 3150–0008, 3150–0011, 3150–0093, 3150–0151, 3150–0155, 3150–0264, and 3150–0274.

The form number if applicable: Not applicable.

How often the collection is required or requested: Collections are submitted one-time, on-occasion, and periodically. The frequency of collections changes by adding new periodic reporting under 10 CFR50.46a, introducing event-driven submissions for quality management system (QMS) changes and EP framework transitions, while reducing EP program reviews from annual to biennial under 10 CFR50.54(t). Changes to the QMS must be maintained for three years, while other records are generally required to be maintained for the length of license.

Who will be required or asked to respond: The proposed rule would affect a range of entities that apply for or hold licenses from the NRC. The affected entities encompass both new applicants and current licensees operating under 10 CFR parts 50, 52, 53, 54, 71, and 100 and 10 CFR 50.55a.

An estimate of the number of annual responses: 2,075.1 (2,063.1 reporting responses, 10.3 recordkeeping responses for 10 CFR part 50; 1.7 reporting responses for 10 CFR part 53).

The estimated number of annual respondents: 130 (120 for 10 CFR part 50, 5 for 10 CFR part 53, 5 for 10 CFR part 100).

An estimate of the total number of hours needed annually to comply with the information collection requirement or request: 33,321.6 (83,116.6 reporting + 6,150 recordkeeping for 10 CFR part 50; −835 reporting for 10 CFR part 53; −55,110 reporting for 10 CFR part 100).

Abstract: The NRC is proposing to amend its regulations to modernize reactor licensing, safety oversight, and siting practices. The proposed rule introduces voluntary risk-informed and performance-based alternatives, updates EP requirements, streamlines quality assurance criteria through a new appendix T to 10 CFR part 50, and revises siting criteria to incorporate risk insights. These changes affect information collections associated with license applications, license amendment requests, periodic reporting, and recordkeeping. New collections include ECCS evaluation model reporting and monitoring under 10 CFR50.46a, QMS change approvals under 10 CFR50.54(a)(5), 50.55(f)(5), and 53.1565, and EP framework transition requests under 10 CFR50.160. The proposed rule also reduces burden by eliminating duplicative requirements, such as prescriptive EP content in CP applications and ESP renewal provisions, and by simplifying seismic/geologic siting criteria under 10 CFR part 100. Overall, the proposed rule results in a net increase in burden due to additional technical analyses and documentation required for voluntary alternatives, balanced by targeted reductions from modernization and streamlining initiatives.

This proposed action includes amendments to several requirements in 10 CFR 50.55a and parts 50, 52, 53, 54, 71, and 100. The proposed changes to 10 CFR parts 2 and 51 do not contain any new or amended collections of information subject to the Paperwork Reduction Act of 1995.

The NRC is seeking public comment on the potential impact of the information collections contained in this proposed rule and on the following issues:

1. Is the proposed information collection necessary for the proper performance of the functions of the NRC, including whether the information will have practical utility? Please explain your response.

2. Is the estimate of the burden of the proposed information collection accurate? Please explain your response.

3. Is there a way to enhance the quality, utility, and clarity of the information to be collected? Please explain your response.

4. How can the burden of the proposed information collection on respondents be minimized, including the use of automated collection techniques or other forms of information technology?

A copy of the Office of Management and Budget (OMB) clearance package and proposed rule are available in the ''Availability of Documents'' section of this document or may be viewed free of charge by contacting the NRC's Public Document Room reference staff at 1–800–397–4209, at 301–415–4737, or by email to *PDR.Resource@nrc.gov.*

You may obtain information and comment on submissions related to the OMB clearance package by searching on *https://www.regulations.gov* under Docket ID NRC–2025–0975.

You may submit comments on any aspect of these proposed information collections, including suggestions for reducing the burden and on the above issues, by the following method:

- *Federal rulemaking website:* Go to *https://www.regulations.gov* and search for Docket ID NRC–2025–0975.

Submit comments by August 17, 2026.

Public Protection Notification

The NRC may not conduct or sponsor, and a person is not required to respond to, a collection of information unless the document requesting or requiring the collection displays a currently valid OMB control number.

XLV. Executive Orders

The following are Executive orders that are related to this proposed rule:

A. Executive Order 12866: Regulatory Planning and Review (as Amended by Executive Order 14215, Ensuring Accountability for All Agencies)

The Office of Information and Regulatory Affairs (OIRA) has determined that this proposed rule is an economically significant regulatory action under section 3(f) of E.O. 12866. Accordingly, NRC submitted this proposed rule to OIRA for review. NRC is required to conduct an economic analysis in accordance with section 6(a)(3)(B) of E.O. 12866. More can be found in section XXXIX, ''Regulatory Analysis,'' of this document.

B. Executive Order 14154: Unleashing American Energy

NRC has examined this proposed rule document and has determined that it is consistent with the policies and directives outlined in E.O. 14154.

C. Executive Order 14192: Unleashing Prosperity Through Deregulation

This action is tentatively determined to be a deregulatory action as defined by E.O. 14192. Details on the estimated costs of this proposed rule document can be found in section XXXIX, ''Regulatory Analysis,'' of this document.

D. Executive Order 14267: Reducing Anti-Competitive Regulatory Barriers

Executive Order 14267 requires the NRC to identify anti-competitive regulations for recission or modification.

The NRC identified 10 CFR 50.34, and related portions of 10 CFR part 52, because these regulations could create a barrier to market participation by using language that may not be clear on the minimum level of information needed to be submitted for a construction permit and uses overly prescriptive language that is not technology inclusive. The proposed recission/modification of the regulations would support the objectives of E.O. 14267 by removing regulatory requirements that could create unnecessary barriers to entry for new market entrants. See section XVIII, ''Discussion—Updates to Construction Permit Requirements and Related Licenses,'' of this document for more information.

The NRC identified 10 CFR 50.54 because this regulation has an anticompetitive effect by raising barriers to entry. It also serves an important regulatory goal as many portions of this regulation are necessary for reasonable assurance of adequate protection. The proposed modifications of the regulation would support the objectives of E.O. 14267 by adding alternatives to enhance entry for new market entrants. The proposed amendments to 10 CFR 50.54 would be conforming changes to reflect the addition of performance-based QA criteria in the proposed appendix T to 10 CFR part 50 as an alternative to appendix B to 10 CFR part 50 for eligible applicants. See section XVI, Discussion—Incorporation of Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' of this document for more information.

The NRC identified 10 CFR 50.160 because this regulation creates a barrier to market participation by limiting use of performance-based emergency preparedness standards to small modular reactors less than 1000 MWt, non-light water reactors, and other new technologies. The proposed modification of the regulation would support the objectives of E.O. 14267 by making performance-based regulations available to all new market entrants. See section XXIV, ''Discussion—Revision of the Emergency Preparedness Regulations for Nuclear Power

Reactors,'' of this document for more information.

The NRC identified 10 CFR 100.3 because this regulation creates a barrier to market participation by limiting available potential facility sites, especially for designs that do not require low population zones beyond site boundaries. The proposed recission/modification of the regulation would support the objectives of E.O. 14267 by removing regulatory requirements that could create unnecessary barriers to entry for new market entrants. See section XXXIV, ''Discussion—Enhancing Flexibility of Reactor Site Criteria,'' of this document for more information.

XLVI. Voluntary Consensus Standards

The National Technology Transfer and Advancement Act of 1995, Public Law 104–113, requires that Federal agencies use technical standards that are developed or adopted by voluntary consensus standards bodies unless the use of such a standard is inconsistent with applicable law or otherwise impractical. In this proposed rule, the NRC would revise the regulations associated with the usage of increased enrichment of conventional and ATF designs for LWRs in 10 CFR parts 50, 51, 52, and 71. This action would not constitute the establishment of a standard that contains generally applicable requirements.

XLVII. Availability of Guidance

The NRC is issuing for comment 24 draft guidance documents to support the implementation of the proposed requirements in this rulemaking. You may obtain information and comment submissions related to the draft guidance by searching on *http://www.regulations.gov* under Docket ID NRC–2025–0975. You may submit comments on these draft guidance documents by the methods outlined in the **ADDRESSES** section of this document.

1. The DG–1261, Revision 1, ''Measuring Breakaway Oxidation Behavior,'' would be a new regulatory guide.

2. The DG–1262, Revision 1, ''Determining Post-Quench Ductility,'' would be a new regulatory guide.

3. The DG–1263, Revision 1, ''Establishing Analytical Limits for Zirconium-Based Alloy Cladding,'' would be a new regulatory guide.

4. The DG–1425, ''Alternative Radiological Source Terms for Evaluating Design-Basis Accidents at Nuclear Power Reactors,'' would be Revision 2 to the existing RG 1.183.

5. The DG–1426, ''An Approach for a Risk-Informed Evaluation Process Supporting Alternative Acceptance Criteria for Emergency Core Cooling Systems for Light-Water Reactors,'' would be a new regulatory guide.

6. The DG–1428, ''Plant-Specific Applicability of the Transition Break Size,'' would be a new regulatory guide.

7. The DG–1430, ''Performance-Based Emergency Preparedness,'' would be Revision 1 to the existing RG 1.242.

8. The DG–1434, ''Addressing the Consequences of Fuel Dispersal in Light-Water Reactor Loss-of-Coolant Accidents,'' would be a new regulatory guide.

9. The DG–1454, ''Implementation of Determinate and Data-Backed Thresholds for Reactor Safety Assessments,'' would be a new regulatory guide.

10. The DG–1456, ''Emergency Response Planning and Preparedness for Nuclear Power Reactors,'' would be Revision 8 to the existing RG 1.101.

11. The DG–1457, ''Guidance on Making Changes to Emergency Plans for Nuclear Power Reactors,'' would be Revision 2 to the existing RG 1.219.

12. The DG–1460, ''Applications for Nuclear Power Plants,'' would be Revision 2 to the existing RG 1.206.

13. The DG–1461, ''Guidance for Changes During Construction for New Nuclear Power Plants Being Constructed Under a Combined License Referencing a Certified Design Under 10 CFR part 52,'' would be Revision 1 to the existing RG 1.237.

14. The DG–1462, ''A Performance-Based Approach to Define the Site-Specific Earthquake Ground Motion,'' would be Revision 1 to the existing RG 1.208.

15. The DG–1463, ''Meteorological Monitoring Programs for Nuclear Power Plants,'' would be Revision 2 to the existing RG 1.23.

16. The DG–1464, ''Guidance for Content of Applications Under 10 CFR 50.220 and 52.220 Proposing Risk-Informed and Performance-Based Alternative Acceptance Criteria,'' would be a new regulatory guide.

17. The DG–1465, ''Guidance for a Technology Inclusive Content of Application Methodology to Inform the Licensing Basis and Content of Applications for Licenses, Certifications, and Approvals for Non-Light-Water Reactors,'' would be Revision 1 to the existing RG 1.253.

18. The DG–1466, ''Guidance for Implementation of 10 CFR 50.59, 'Changes, Tests, and Experiments,' '' would be Revision 4 to the existing RG 1.187.

19. The DG–1467, ''Assuring the Availability of Funds for Decommissioning Nuclear Reactors,'' would be Revision 3 to the existing RG 1.159.

20. The DG–1468, ''Guidance for Implementation of 10 CFR 50.221, 'Credibility Requirements for Modeling and Simulation,' '' would be a new regulatory guide.

21. The DG–4036, ''Graded Approach to Site Characterization for New Reactor Applications,'' would be a new regulatory guide.

22. The DG–4037, ''Preparation of Environmental Reports for Nuclear Power Stations,'' would be Revision 5 to the existing RG 4.2.

23. LR–ISG–2026–01, ''Updated Review Criteria for License Renewal,'' would be new interim staff guidance.

24. NUREG–0800, Chapter 14, Section 14.3, ''Inspections, Tests, Analyses, and Acceptance Criteria,'' would be a revision to the existing standard review plan (issued March 2007).

Draft regulatory guide updates beyond this rulemaking are included in DG–1425. These additional updates to DG–1425 include the following:

- Updated steady-state release fractions for accidents other than the maximum hypothetical accident (loss-of-coolant accident), based on American National Standards Institute/American Nuclear Society 5.4, ''Method for Calculating the Fractional Release of Volatile Fission Products from Oxide Fuel,'' May 2011, extending the applicability to higher burnups and increased enrichments;

- Additional guidance for modeling BWR main steam isolation valve (MSIV) leakage and fission product removal by suppression pool scrubbing;

- Guidance for crediting holdup and retention of MSIV leakage within the main steamlines and condenser for BWRs; and

- Guidance for use of best estimate plus uncertainty approaches to determining inputs to radiological models.

XLVIII. Availability of Documents

The documents identified in the following table are available to interested persons through one or more of the following methods, as indicated.

The NRC prepared an unofficial redline strikeout version of the proposed changes to regulatory text that is intended to help the readeridentifythe changes. The NRC is providing the unofficial redline as a reader tool only, and this document is listed in the ''Availability of Documents'' section of this document. Comments on the rule text should be made in this proposed rule.

The NRC may post materials related to this document, including public comments, on the Federal rulemaking website at *https://www.regulations.gov* under Docket ID NRC–2025–0975. In addition, the Federal rulemaking website allows members of the public to receive alerts when changes or additions occur in a docket folder. To subscribe: (1) navigate to the docket folder (NRC–2025–0975); (2) click the ''Subscribe'' link; and (3) enter an email address and click on the ''Subscribe'' link.

List of Subjects

10 CFR Part 2

Administrative practice and procedure, Antitrust, Byproduct material, Classified information, Confidential business information, Freedom of information, Environmental protection, Hazardous waste, Nuclear energy, Nuclear materials, Nuclear power plants and reactors, Penalties, Reporting and recordkeeping requirements, Sex discrimination, Source material, Special nuclear material, Waste treatment and disposal.

10 CFR Part 50

Administrative practice and procedure, Antitrust, Backfitting, Classified information, Criminal penalties, Education, Emergency planning, Fire prevention, Fire protection, Intergovernmental relations, Nuclear power plants and reactors, Penalties, Radiation protection, Reactor siting criteria, Reporting and recordkeeping requirements, Whistleblowing.

10 CFR Part 51

Administrative practice and procedure, Environmental impact statements, Hazardous waste, Nuclear energy, Nuclear materials, Nuclear power plants and reactors, Reporting and recordkeeping requirements.

10 CFR Part 52

Administrative practice and procedure, Antitrust, Combined license, Early site permit, Emergency planning, Fees, Inspection, Issue finality, Limited work authorization, Manufacturing license, Nuclear power plants and reactors, Probabilistic risk assessment, Prototype, Reactor siting criteria, Redress of site, Penalties, Reporting and recordkeeping requirements, Standard design, Standard design certification.

10 CFR Part 53

Administrative practice and procedure, Antitrust, Backfitting, Construction permit, Combined license, Classified information, Criminal penalties, Early site permit, Emergency planning, Fees, Fire prevention, Fire protection, Inspection, Intergovernmental relations, Limited work authorization, Manufacturing license, Nuclear power plants and reactors, Operating license, Penalties, Prototype, Radiation protection, Reactor siting criteria, Reporting and recordkeeping requirements, Standard design, Standard design certification, Training programs.

10 CFR Part 54

Administrative practice and procedure, Age-related degradation, Backfitting, Classified information,

Criminal penalties, Environmental protection, Nuclear power plants and reactors, Penalties, Radiation protection, Reporting and recordkeeping requirements.

10 CFR Part 71

Criminal penalties, Hazardous materials transportation, Intergovernmental relations, Nuclear materials, Packaging and containers, Penalties, Radioactive materials, Reporting and recordkeeping requirements.

10 CFR Part 100

Nuclear power plants and reactors, Radiation protection, Reactor siting criteria, Reporting and recordkeeping requirements.

For the reasons set out in the preamble and under the authority of the Atomic Energy Act of 1954, as amended; the Energy Reorganization Act of 1974, as amended; and 5 U.S.C. 552 and 553, the NRC is proposing to amend 10 CFR parts 2, 50, 51, 52, 53, 54, 71, and 100:

PART 2—AGENCY RULES OF PRACTICE AND PROCEDURE

■ 1. The authority citation for part 2 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 29, 53, 62, 63, 81, 102, 103, 104, 105, 161, 181, 182, 183, 184, 186, 189, 191, 234 (42 U.S.C. 2039, 2073, 2092, 2093, 2111, 2132, 2133, 2134, 2135, 2201, 2231, 2232, 2233, 2234, 2236, 2239, 2241, 2282); Energy Reorganization Act of 1974, secs. 201, 206 (42 U.S.C. 5841, 5846); Nuclear Waste Policy Act of 1982, secs. 114(f), 134, 135, 141 (42 U.S.C. 10134(f), 10154, 10155, 10161); Administrative Procedure Act (5 U.S.C. 552, 553, 554, 557, 558); National Environmental Policy Act of 1969 (42 U.S.C. 4332); 44 U.S.C. 3504 note. Section 2.205(j) also issued under Sec. 31001(s), Pub. L. 104–134, 110 Stat. 1321–373 (28 U.S.C. 2461 note).

§ 2.109 [Amended]

■ 2. In § 2.109, remove and reserve paragraph (c).

PART 50—DOMESTIC LICENSING OF PRODUCTION AND UTILIZATION FACILITIES

■ 3. The authority citation for part 50 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 11, 101, 102, 103, 104, 105, 108, 122, 147, 149, 161, 181, 182, 183, 184, 185, 186, 187, 189, 223, 234 (42 U.S.C. 2014, 2131, 2132, 2133, 2134, 2135, 2138, 2152, 2167, 2169, 2201, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2239, 2273, 2282); Energy Reorganization Act of 1974, secs. 201, 202, 206, 211 (42 U.S.C. 5841, 5842, 5846, 5851); Nuclear Waste Policy Act of 1982, sec. 306 (42 U.S.C. 10226); National Environmental Policy Act of 1969 (42 U.S.C. 4332); 44 U.S.C. 3504 note; ADVANCE Act of 2024, sec. 301 (42 U.S.C. 2133 note).

■ 4. In § 50.2, add in alphabetical order the definitions ''*Beyond design basis event*'' and ''*Design basis event*'' to read as follows:

§ 50.2 Definitions.

* * * * *

Beyond design basis event means an initiating event with a frequency below the threshold for a design basis event, but greater than or equal to a threshold for credibility that provides an appropriate level of safety and is deemed acceptable by the NRC, or an event (other than a design basis event) that is specifically required by regulation to be considered in the licensing basis. This definition, along with the corresponding definition of ''design basis event,'' applies to applications submitted on or after [DATE 180 DAYS AFTER THE EFFECTIVE DATE OF FINAL RULE] for construction permits and operating licenses under this part, as well as for early site permits, standard design certifications, combined licenses, standard design approvals, and manufacturing licenses under part 52 of this chapter. Applicants for or holders of licenses, permits, standard design certifications, or standard design approvals under this part or part 52 of this chapter who are not subject to this requirement may propose to adopt this definition and the corresponding definition of ''design basis event'' by submitting a request for NRC approval in an application, through a license amendment request under § 50.90, or through the applicable change process under part 52 of this chapter.

* * * * *

Design basis event means an initiating event with a frequency greater than or equal to a determinate, data-backed threshold that provides an appropriate level of safety and is deemed acceptable by the NRC. This definition, along with the corresponding definition for ''beyond design basis event,'' applies to applications submitted on or after [DATE 180 DAYS AFTER THE EFFECTIVE DATE OF FINAL RULE] for construction permits and operating licenses under this part, as well as for early site permits, standard design certifications, combined licenses, standard design approvals, and manufacturing licenses under part 52 of this chapter. Applicants for or holders of licenses, permits, standard design certifications, or standard design approvals under this part or part 52 of this chapter who are not subject to this requirement may propose to adopt this definition and the corresponding definition of ''beyond design basis event'' by submitting a request for NRC approval in an application, through a license amendment request under § 50.90, or through the applicable change process under part 52 of this chapter.

* * * * *

■ 5. In § 50.4, add paragraph (b)(7)(iii) to read as follows:

§ 50.4 Written Communications.

* * * * *

(b) * * *

(7) * * *

(iii) A change to the Safety Analysis Report quality management system under § 50.54(a)(5) or § 50.55(f)(5), or a change to a licensee's NRC-accepted quality management system topical report under § 50.54(a)(5) or § 50.55(f)(5), must be submitted to the NRC's Document Control Desk, with a copy to the appropriate Regional Office, and a copy to the appropriate NRC Resident Inspector if one has been assigned to the site of the facility. If the communication is on paper, the signed original must be sent.

* * * * *

■ 6. In § 50.10, revise paragraphs (a) and (c), and add paragraph (h) to read as follows:

§ 50.10 License required; limited work authorization.

(a) *Definitions.* As used in this section, *construction* means the activities in paragraph (a)(1) of this section.

(1) Activities constituting construction are the driving of piles, subsurface preparation, placement of backfill, concrete, or permanent retaining walls within an excavation, installation of foundations, or in-place assembly, erection, fabrication, or testing, which may impact the required functions of:

(i) Safety-related structures, systems, or components (SSCs) of a facility, as defined in § 50.2;

(ii) SSCs that perform safety-significant functions; and

(iii) SSCs necessary to comply with part 73 of this chapter.

(2) With respect to production or utilization facilities, other than testing facilities and nuclear power plants, required to be licensed under section 104a. or section 104c. of the Act, construction does not include the erection of buildings which will be used for activities other than operation of a facility and which may also be used to house a facility (*e.g.,* the construction of a college laboratory building with space for installation of a training reactor).

(3) Any activities that are determined to be outside the scope of those defined in § 50.10(a)(1) and that are undertaken by an applicant or on its behalf are entirely at the risk of the applicant and has no bearing on the issuance of a license with respect to the requirements of the Act, and rules, regulations, or orders issued under the Act.

* * * * *

(c) *Requirement for construction permit, early site permit authorizing limited work authorization activities, combined license, or limited work authorization.* Except as provided in paragraph (h) of this section, no person may begin the construction of a production or utilization facility on a site on which the facility is to be operated until that person has been issued either a construction permit under this part, a combined license under part 52 of this chapter, an early site permit authorizing the activities under paragraph (d) of this section, or a limited work authorization under paragraph (d) of this section.

* * * * *

(h) *Issuance of general license.* A general license is hereby issued to an applicant for a construction permit or combined license for a utilization facility under 10 CFR part 50 or 52 for construction activities on a site that is specified in the application, subject to the following conditions:

(1) The applicant has submitted and the Commission has docketed a construction permit or combined license application for a utilization facility under 10 CFR part 50 or 52 that meets the following criteria:

(i) The application references a reactor design for which the Commission issued an operating license or issued a combined license and made the finding under § 52.103(g) of this chapter and for which the Commission afforded generic finality under § 50.57(d) or § 52.97(d);

(ii) The operating license or combined license described in paragraph (h)(1)(i) of this section met the criteria for a categorical exclusion or resulted in a finding of no significant impact from an environmental assessment in accordance with part 51 of this chapter;

(iii) The application utilizing the general license includes a plan for redress of any adverse environmental impact from conduct of activities under the general license should such redress be necessary; and

(iv) The application must contain information demonstrating that the site characteristics are bounded by the site parameters postulated for the approval of generic finality.

(2) The applicant may perform construction only upon notification to the NRC Director of NRR using instructions in § 50.4 before the start of construction. The notice must state that all applicable permits, licenses, approvals, and other entitlements in connection with the proposed action have been obtained. The notice may be in the form of a letter, but must contain the applicant's name, address, and the name and means of contacting a person responsible for providing additional information concerning construction under this general license.

(3) All applicable Federal environmental consultations have been completed.

(4) The general license authorizes construction of those generic aspects of the design of the commercial nuclear plant for which the Commission afforded generic finality and does not authorize installation of the reactor vessel, the reactor coolant system, or associated reactivity control and heat removal systems;

(5) The applicant must allow for NRC inspections that the Commission deems necessary related to activities performed under the general license.

(6) Any activities undertaken by the applicant or on its behalf under the general license are entirely at the risk of the applicant and have no bearing on the issuance of a license with respect to the requirements of the Act, and rules, regulations, or orders issued under the Act.

■ 7. In § 50.33, remove footnotes 1 and 2 and revise paragraph (g) to read as follows:

§ 50.33 Contents of applications; general information.

* * * * *

(g)(1) If the application is for an operating license or combined license for a nuclear power reactor, or if the application is for an early site permit and contains plans for coping with emergencies under § 52.17(b)(2)(ii) of this chapter, the applicant must coordinate radiological emergency preparedness activities with offsite organizations with responsibilities for coping with emergencies including State, local, and Tribal governmental agencies, as applicable. Specifically, the applicant must ensure that these response organizations are aware of the potential radiological consequences of the facility and have been consulted on appropriate protective measures including the extent of any emergency planning zone (EPZ) for implementing predetermined, prompt protective measures. The application must include information that describes the extent of the applicant's interaction with these response organizations. If the application is for an early site permit that, under § 52.17(b)(2)(i) of this chapter, proposes major features of the emergency plans describing the EPZ, then the description of the EPZ must meet the requirements of this paragraph (g)(1). Generally, the plume exposure pathway EPZ for nuclear power reactors shall consist of an area about 2 to 10 miles (3.2 to 16 km) in radius. For reactors with an authorized power level less than 300 MW thermal, the plume exposure pathway EPZ may be established at the site boundary. The need for and size of the EPZ may also be determined on a case-by-case basis as described in § 50.33(g)(2). The exact size and configuration of the EPZ surrounding a particular nuclear power reactor shall be determined in relation to the local emergency response needs and capabilities as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. Emergency plans must describe such actions as are appropriate to avoid or reduce dose within and beyond the EPZ or site boundary and to protect the ingestion pathway.

(2) For a case-by-case EPZ determination, the applicant or licensee must submit an analysis used to determine whether the criteria in § 50.33(g)(2)(i)(A) and (B) are met and, if they are met, the size of the plume exposure pathway EPZ.

(i) The plume exposure pathway EPZ is the area within which:

(A) Dose to an individual is projected to exceed 1 rem (10 mSv) total effective dose equivalent over 96 hours from the release of radioactive materials from the facility considering accident likelihood and source term, timing of the accident sequence, and meteorology; and

(B) Pre-determined, prompt protective measures are necessary.

(ii) [Reserved]

* * * * *

■ 8. In § 50.34,

■ a. Remove the text ''LOCA's'' wherever it appears, and add, in its place, the text ''LOCAs'';

■ b. Remove the text ''PWR's'' wherever it appears, and add, in its place, the text ''PWRs'';

■ c. Remove the text ''BWR's'' wherever it appears, and add, in its place, the text ''BWRs'';

■ d. Revise paragraphs (a)(1) introductory text, (a)(1)(ii)(D), (a)(7), (b)(6)(ii), (b)(6)(v), (b)(10), (b)(11), and footnotes 1, 3, 4, and 6;

■ e. Remove the last sentence of paragraphs (a)(4) and (b)(4);

■ f. Remove and reserve paragraph (a)(10);

■ g. In paragraph (a)(12), remove the phrase ''On or after January 10, 1997, stationary power'' and add in its place ''Power''.

■ h. Add paragraph (b)(14); and

■ i. Revise paragraph (f)(3)(ii).

The revisions and additions are to read as follows:

§ 50.34 Contents of applications; technical information.

(a) *Preliminary safety analysis report.* Each application for a construction permit shall include a preliminary safety analysis report. The minimum information [1] to be included shall consist of the following:

(1) Power reactor applicants for a construction permit shall comply with paragraph (a)(1)(ii) of this section. All other applicants for a construction permit shall comply with paragraph (a)(1)(i) of this section.

* * * * *

(ii) * * *

(D) The safety features that are to be engineered into the facility and those barriers that must be breached as a result of an accident before a release of radioactive material to the environment can occur. Special attention must be directed to plant design features intended to mitigate the radiological consequences of accidents. In performing this assessment, an applicant shall assume a fission product release [3] assuming that the facility is operated at the ultimate power level contemplated. The applicant shall perform an evaluation and analysis of the postulated fission product release, using the expected demonstrable leakage rates from potential flow paths and any fission product cleanup systems intended to mitigate the consequences of the accidents, together with applicable site characteristics, including site meteorology, to evaluate the offsite radiological consequences. Site characteristics must comply with part 100 of this chapter. The evaluation must determine that:

(1) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 25 rem [4] (0.25 Sv) total effective dose equivalent (TEDE).

(2) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of 25 rem (0.25 Sv) TEDE;

* * * * *

(7) A description of the quality assurance program or a quality management system to be applied to the design, fabrication, construction, and testing of the structures, systems, and components of the facility. Appendix B to this part, ''Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' sets forth the requirements for quality assurance programs for nuclear power plants and fuel reprocessing plants. Appendix T to this part, ''Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' sets forth streamlined requirements for quality assurance programs for nuclear power plants and fuel reprocessing plants that an eligible construction permit applicant may voluntarily use as an alternative to appendix B to this part. The description of the quality assurance program for a nuclear power plant or a fuel reprocessing plant shall include a discussion of how the applicable requirements of appendix B will be satisfied or for eligible construction permit applications, the quality management system for a nuclear power plant or fuel reprocessing plant shall include discussions of how the applicable requirements of appendix T will be satisfied.

* * * * *

(10) [Reserved]

* * * * *

(b) * * *

(6) * * *

(ii) Managerial and administrative controls to be used to assure safe operation. Appendix B to this part, ''Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' sets forth the requirements for such controls for nuclear power plants and fuel reprocessing plants. Appendix T to this part, ''Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' sets forth streamlined requirements for such controls for nuclear power plants and fuel reprocessing plants that an eligible operating license applicant may voluntarily use as an alternative to appendix B to this part. The information on the controls to be used for a nuclear power plant or a fuel reprocessing plant shall include a discussion of how the applicable requirements of appendix B to this part will be satisfied or, for eligible operating license applications, the quality management system for a nuclear power plant or fuel reprocessing plant shall include discussions of how the applicable requirements of appendix T to this part will be satisfied.

* * * * *

(v) Plans for coping with emergencies. The applicant must provide the offsite response organizations that are expected to respond in an emergency with the opportunity to provide input on the emergency plan before submitting it to the NRC. The application must contain any input on the emergency plan received from offsite response organizations.

* * * * *

(10) Power reactor applicants who apply for an operating license, as partial conformance to General Design Criterion 2 of appendix A to this part, shall comply with the earthquake engineering criteria of appendix S to this part.

(11) Power reactor applicants who apply for an operating license shall provide a description and safety assessment of the site and of the facility as in § 50.34(a)(1)(ii).

* * * * *

(14) An applicant may include in its application a request for generic finality, to generic aspects of the design under this part, such that information in the application, if approved by the NRC, is considered resolved in other proceedings where information approved for generic finality is referenced. An application for an operating license that requests generic finality must include applicable site parameters postulated for the design, including the design-basis external hazard levels for the relevant external hazards, and an analysis and evaluation of the design in terms of those site parameters.

* * * * *

(f) * * *

(3) * * *

(ii) Ensure that the quality assurance (QA) list required by Criterion II of appendix B and appendix T of 10 CFR part 50 includes all structures, systems, and components important to safety. (I.F.1)

* * * * *

[1] This paragraph specifies the minimum required technical information to be included in a preliminary safety analysis report, while §§ 50.35(a)(1) through (4), 50.40, and 50.50 specify required findings for issuance of a construction permit. The level of detail provided in a preliminary safety analysis report to satisfy the minimum technical information requirements in paragraph (a) of this section will be deemed sufficient if the provided information enables the Commission to make the findings for issuance of a construction permit in §§ 50.35(a)(1) through (4), 50.40, and 50.50. The applicant may provide information

required by this paragraph in the form of a discussion, with specific references, of similarities to and differences from, facilities of similar design for which applications have previously been filed with the Commission.

* * * * *

[3] The fission product release assumed for this evaluation should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents. Such accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[4] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this number constitutes an acceptable limit for an emergency dose to the public under accident conditions. Rather, this dose value has been set forth in this section as a reference value, which can be used in the evaluation of plant design features with respect to postulated reactor accidents, to assure that such designs provide assurance of low risk of public exposure to radiation, in the event of an accident.

* * * * *

[6] The fission product release assumed for these calculations should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents. Such accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

■ 9. Revise and republish § 50.46 to read as follows:

§ 50.46 Acceptance criteria for emergency core cooling systems for light-water nuclear power reactors.

(a) Each boiling or pressurized light-water nuclear power reactor must be provided with an emergency core cooling system (ECCS) that is designed under requirements described in this paragraph.

(1) The requirements of this section or § 50.46a must be satisfied for:

(i) Holders of an operating license under this part authorized to operate on December 31, 2015;

(ii) Holders of an operating license under this part authorized to operate after December 31, 2015, and whose reactor design is demonstrated under § 50.46a(c)(2) to be similar to the designs of reactors authorized to operate under this part on December 31, 2015;

(iii) Holders of a construction permit issued under this part whose reactor design is demonstrated under § 50.46a(c)(2) to be similar to the design of reactors authorized to operate under this part on December 31, 2015;

(iv) Holders of a combined license, standard design approval, or manufacturing license under part 52 of this chapter whose reactor design is demonstrated under § 50.46a(c)(2) to be similar to the designs of reactors authorized to operate under this part on December 31, 2015;

(v) Applicants for a construction permit or operating license under this part whose reactor design is demonstrated under § 50.46a(c)(2) to be similar to the designs of reactors authorized to operate under this part on December 31, 2015; and

(vi) Applicants for a combined license, standard design approval, manufacturing license, or standard design certification (including such applicants after NRC issuance of a final standard design certification rule) under part 52 of this chapter whose reactor design is demonstrated under § 50.46a(c)(2) of this section to be similar to the designs of reactors authorized to operate under this part on December 31, 2015.

(2) The requirements of this section must be satisfied for:

(i) Holders of an operating license under this part that were authorized to operate after December 31, 2015, and whose reactor design is not demonstrated under § 50.46a(c)(2) to be similar to the designs of reactors authorized to operate under this part on December 31, 2015;

(ii) Holders of a construction permit issued under this part whose reactor design is not demonstrated under § 50.46a(c)(2) to be similar to the design of reactors authorized to operate under this part on December 31, 2015;

(iii) Holders of a combined license, standard design approval, or manufacturing license under part 52 of this chapter whose reactor design is not demonstrated under § 50.46a(c)(2) to be similar to the designs of reactors authorized to operate under this part on December 31, 2015;

(iv) Applicants for a construction permit or operating license under this part whose reactor design is not demonstrated under § 50.46a(c)(2) to be similar to the designs of reactors authorized to operate under this part on December 31, 2015; and

(v) Applicants for a combined license, standard design approval, manufacturing license, or standard design certification (including such applicants after NRC issuance of a final standard design certification rule) under part 52 of this chapter whose reactor design is not demonstrated under § 50.46a(c)(2) to be similar to the designs of reactors authorized to operate under this part on December 31, 2015.

(3) (i) The ECCS system must be designed so that its calculated cooling performance following postulated loss-of-coolant accidents (LOCAs) conforms to the criteria set forth in paragraph (b) of this section or § 50.46a(f). ECCS cooling performance must be calculated in accordance with an acceptable evaluation model and must be calculated for a number of postulated LOCAs of different sizes, locations, and other properties sufficient to provide assurance that the most severe postulated LOCAs are calculated. Except as provided in paragraph (a)(3)(ii) of this section, the evaluation model must include sufficient supporting justification to show that the analytical technique realistically describes the behavior of the reactor system during a LOCA. Comparisons to applicable experimental data must be made and uncertainties in the analysis method and inputs must be identified and assessed so that the uncertainty in the calculated results can be estimated. This uncertainty must be accounted for, so that, when the calculated ECCS cooling performance is compared to the criteria set forth in paragraph (b) of this section or § 50.46a(f), as applicable, there is a high level of probability that the criteria would not be exceeded. Section II, ''Required Documentation,'' of appendix K to this part, sets forth the documentation requirements for each evaluation model. This section does not apply to a nuclear power reactor facility for which the certifications required under § 50.82(a)(1) or § 52.110(a) of this chapter have been submitted.

(ii) Alternatively, an ECCS evaluation model may be developed in conformance with the required and acceptable features of appendix K to this part, ''ECCS Evaluation Models.''

(4) The Director of Nuclear Reactor Regulation may impose restrictions on reactor operation if it is found that the submitted evaluations of ECCS cooling performance are not consistent with paragraphs (a)(3)(i) and (ii) of this section.

(5) (i) Each applicant for or holder of an operating license or construction permit issued under this part, applicant for a standard design certification under part 52 of this chapter (including an applicant after the Commission has adopted a final design certification regulation), or an applicant for or holder of a standard design approval, a combined license, or a manufacturing license issued under part 52 of this chapter, must estimate the effect of any change to or error in an acceptable evaluation model or in the application of such a model to determine if the change or error is significant. For this purpose, a significant change or error is one which results in a calculated peak

fuel cladding temperature different by more than 50 °F from the temperature calculated for the limiting transient using the last acceptable model, or is a cumulation of changes and errors such that the sum of the absolute magnitudes of the respective temperature changes is greater than 50 °F.

(ii) For each change to or error discovered in an acceptable evaluation model or in the application of such a model that affects the temperature calculation, the applicant or holder of a construction permit, operating license, combined license, or manufacturing license must report the nature of the change or error and its estimated effect on the limiting ECCS analysis to the Commission at least annually as specified in § 50.4 or § 52.3 of this chapter, as applicable. If the change or error is significant, the applicant or licensee must provide this report within 30 days and include with the report a proposed schedule for providing a reanalysis or taking other action as may be needed to show compliance with § 50.46 requirements. This schedule may be developed using an integrated scheduling system previously approved for the facility by the NRC. For those facilities not using an NRC-approved integrated scheduling system, a schedule will be established by the NRC within 60 days of receipt of the proposed schedule. Any change or error correction that results in a calculated ECCS performance that does not conform to the criteria set forth in paragraph (b) of this section is a reportable event as described in §§ 50.55(e), 50.72, and 50.73. The affected applicant or licensee must propose immediate steps to demonstrate compliance or bring plant design or operation into compliance with § 50.46 requirements.

(iii) For each change to or error discovered in an acceptable evaluation model or in the application of such a model that affects the temperature calculation, the applicant or holder of a standard design approval or the applicant for a standard design certification (including an applicant after the Commission has adopted a final design certification rule) must report the nature of the change or error and its estimated effect on the limiting ECCS analysis to the Commission and to any applicant or licensee referencing the standard design approval or standard design certification at least annually as specified in § 52.3 of this chapter. If the change or error is significant, the applicant or holder of the standard design approval or the applicant for the standard design certification must provide this report within 30 days and include with the report a proposed schedule for providing a reanalysis or taking other action as may be needed to show compliance with § 50.46 requirements. The affected applicant or holder must propose immediate steps to demonstrate compliance or bring plant design into compliance with § 50.46 requirements.

(iv) For entities that are approved to use § 50.46a(f) instead of paragraph (b) of this section, changes or errors discovered in an acceptable evaluation model should be reported in accordance with § 50.46a(j)(1) and (2).

(b) The ECCS system of each boiling or pressurized light-water nuclear power reactor fueled with uranium oxide pellets within cylindrical zircaloy or ZIRLO cladding must be designed so that its calculated cooling performance following postulated LOCAs conforms to the following criteria:

(1) *Peak cladding temperature.* The calculated maximum fuel element cladding temperature must not exceed 2200 °F.

(2) *Maximum cladding oxidation.* The calculated total oxidation of the cladding may nowhere exceed 0.17 times the total cladding thickness before oxidation. As used in this subparagraph total oxidation means the total thickness of cladding metal that would be locally converted to oxide if all the oxygen absorbed by and reacted with the cladding locally were converted to stoichiometric zirconium dioxide. If cladding rupture is calculated to occur, the inside surfaces of the cladding must be included in the oxidation, beginning at the calculated time of rupture. Cladding thickness before oxidation means the radial distance from inside to outside the cladding, after any calculated rupture or swelling has occurred but before significant oxidation. Where the calculated conditions of transient pressure and temperature lead to a prediction of cladding swelling, with or without cladding rupture, the unoxidized cladding thickness must be defined as the cladding cross-sectional area, taken at a horizontal plane at the elevation of the rupture, if it occurs, or at the elevation of the highest cladding temperature if no rupture is calculated to occur, divided by the average circumference at that elevation. For ruptured cladding, the circumference does not include the rupture opening.

(3) *Maximum hydrogen generation.* The calculated total amount of hydrogen generated from the chemical reaction of the cladding with water or steam must not exceed 0.01 times the hypothetical amount that would be generated if all of the metal in the cladding cylinders surrounding the fuel, excluding the cladding surrounding the plenum volume, were to react.

(4) *Coolable geometry.* Calculated changes in core geometry must be such that the core remains amenable to cooling.

(5) *Long-term cooling.* After any calculated successful initial operation of the ECCS, the calculated core temperature must be maintained at an acceptably low value and decay heat must be removed for the extended period of time required by the long-lived radioactivity remaining in the core.

(c) As used in this section:

(1) LOCAs are hypothetical accidents that would result from the loss of reactor coolant, at a rate in excess of the capability of the reactor coolant makeup system, from breaks in pipes in the reactor coolant pressure boundary up to and including a break equivalent in size to the double-ended rupture of the largest pipe in the reactor coolant system.

(2) An evaluation model is the calculational framework for evaluating the behavior of the reactor system during a postulated LOCA. It includes one or more computer programs and all other information necessary for application of the calculational framework to a specific LOCA, such as mathematical models used, assumptions included in the programs, procedure for treating the program input and output information, specification of those portions of analysis not included in computer programs, values of parameters, and all other information necessary to specify the calculational procedure.

(d) The requirements of this section are in addition to any other requirements applicable to ECCS set forth in this part. The criteria set forth in paragraph (b) of this section, with cooling performance calculated in accordance with an acceptable evaluation model, are in implementation of the general requirements with respect to ECCS cooling performance design set forth in this part, including, in particular, criterion 35 of appendix A to this part.

■ 10. Revise § 50.46a to read as follows:

§ 50.46a Alternative acceptance criteria for emergency core cooling systems for light-water nuclear power reactors.

(a) *Definitions.* For the purposes of this section:

(1) *Changes enabled by this section* means changes to the facility, technical specifications, and procedures that satisfy the alternative ECCS analysis requirements under this section but do

not satisfy the ECCS requirements under § 50.46.

(2) *Cladding* means the material structure surrounding and containing the fissile material and providing a barrier to prevent fission product transport or release to the coolant.

(3) *Crud* means any foreign substance deposited on the surface of fuel cladding.

(4) *Entity* means an applicant for or a holder of a construction permit, operating license, combined license, standard design approval, or manufacturing license, or an applicant for a standard design certification (including such applicant after NRC issuance of a final standard design certification rule).

(5) *ECCS evaluation model* means the calculational framework for evaluating the behavior of the light-water reactor system (including fuel) during a postulated loss-of-coolant accident (LOCA). It includes one or more computer programs and all other information necessary for application of the calculational framework to a specific LOCA, such as mathematical models used, assumptions included in the programs, procedure for treating the program input and output information, specification of those portions of analysis not included in computer programs, values of parameters, and all other information necessary to specify the calculational procedure.

(6) *Loss-of-coolant accidents (LOCAs)* means the hypothetical accidents that would result from the loss of reactor coolant, at a rate in excess of the capability of the reactor coolant makeup system, from breaks in pipes in the reactor coolant pressure boundary up to and including a break equivalent in size to the double-ended rupture of the largest pipe in the reactor coolant system. LOCAs involving breaks at or below the transition break size are design basis accidents. LOCAs involving breaks larger than the transition break size are beyond-design-basis accidents.

(7) *Operating configuration* means those plant characteristics, such as power level, equipment unavailability (including unavailability caused by corrective and preventive maintenance), and equipment capability that affect plant response to a LOCA.

(8) *Quench* means the rapid cooling of the fuel cladding by liquid coolant water.

(9) *Transition break size (TBS)* for reactors authorized to operate under this part on December 31, 2015, is a break area equal to the largest cross-sectional flow area of the reactor coolant pressure boundary piping excluding the hot leg, cold leg, or crossover leg piping for a pressurized water reactor; the larger cross-sectional flow area of either the feedwater line or residual heat removal line inside containment for a boiling water reactor; or a plant-specific alternative break area. For reactors that are authorized to operate under this part after December 31, 2015, and for light-water reactors (LWRs) that are authorized to operate under part 52 of this chapter, the TBS will be determined on a plant-specific basis.

(b) *Applicability and scope.*

(1) Those entities listed in subparagraphs (i) through (vi) of this paragraph may apply under paragraph (c) of this section to use the requirements of this section. This section does not apply to a nuclear power reactor facility for which the certifications required under § 50.82(a)(1) or § 52.110(a) of this chapter have been submitted.

(i) Holders of an operating license under this part authorized to operate on December 31, 2015;

(ii) Holders of an operating license under this part authorized to operate after December 31, 2015, and whose reactor design is demonstrated under paragraph (c)(2) of this section to be similar to the designs of reactors authorized to operate under this part on December 31, 2015;

(iii) Holders of a construction permit issued under this part whose reactor design is demonstrated under paragraph (c)(2) of this section to be similar to the design of reactors authorized to operate under this part on December 31, 2015.

(iv) Holders of a combined license, standard design approval, or manufacturing license under part 52 of this chapter whose reactor design is demonstrated under paragraph (c)(2) of this section to be similar to the designs of reactors authorized to operate under this part on December 31, 2015.

(v) Applicants for a construction permit or operating license under this part whose reactor design is demonstrated under paragraph (c)(2) of this section to be similar to the designs of reactors authorized to operate under this part on December 31, 2015.

(vi) Applicants for a combined license, standard design approval, manufacturing license, or standard design certification (including such applicants after NRC issuance of a final standard design certification rule) under part 52 of this chapter whose reactor design is demonstrated under paragraph (c)(2) of this section to be similar to the designs of reactors authorized to operate under this part on December 31, 2015.

(2) The requirements of this section are in addition to any other requirements applicable to ECCS, with the exception of § 50.46. The criteria set forth in paragraph (e)(1) of this section, with cooling performance calculated in accordance with an acceptable evaluation model or analysis method under paragraphs (e)(2) and (3) of this section, are in implementation of the general requirements with respect to ECCS cooling performance design set forth in this part, including, in particular, criterion 35 of appendix A to this part.

(3) A licensee must inspect, under § 50.55a(g), for those reactor coolant pressure boundary piping whose inner diameter is greater than the TBS, an NRC-approved sampling of the similar metal piping circumferential welds in a PWR and the circumferential welds in a BWR that are classified as Category A welds before implementation of this section and in every subsequent in-service inspection interval (as defined in § 50.55a(y)). The sampling must include those circumferential welds with the highest failure potential. Credit may be taken for welds inspected as part of established inspection programs (*e.g.,* risk-informed inservice inspection programs). The effect on the TBS of any degradation identified during these inspections must be evaluated.

(c) *Application.*

(1) An entity seeking to implement this section must submit an application under § 50.34, 50.90, or part 52 of this chapter, as applicable, that contains the following information:

(i) A written evaluation demonstrating applicability of the TBS to the entity's facility or a proposed alternative TBS and a justification that the proposed TBS is consistent with the technical basis for this section. The effects of the initial plant changes proposed in the application must be considered as part of this evaluation.

(ii) As applicable, an inspection report that details the results of the inspection requirements in paragraph (b)(3) of this section and the evaluation of the impact of these results on the TBS.

(iii) Identification of the acceptable analysis method(s) for demonstrating compliance with the ECCS criteria in paragraph (e) of this section.

(iv) A description of the risk-informed evaluation used to demonstrate that the proposed changes to the facility meet the requirements in paragraph (h) of this section.

(v) For an entity other than a design certification applicant or a holder of a manufacturing license that wishes to make changes enabled by this section without prior NRC review and approval, a process to be used for evaluating the

acceptability of these changes, including:

(A) A description of the approach, methods, and decision-making process to be used for evaluating compliance with the acceptance criteria in paragraphs (h)(1), (2), and (3) of this section;

(B) A description of the probabilistic risk assessment (PRA) model and/or non-PRA risk assessment methods to be used for demonstrating compliance with paragraphs (h)(4) and (5) of this section; and

(C) A description of the approach, methods, and decision-making process to be used to evaluate the continued applicability of the TBS with the acceptance criteria used in the evaluation from paragraph (c)(1)(i) of this section for plants authorized to operate under this part on December 31, 2015, or from paragraph (c)(2) of this section for entities other than those authorized to operate under this part on December 31, 2015.

(vi) A description of non-safety equipment that is credited for demonstrating compliance with the ECCS acceptance criteria in paragraph (e) of this section.

(vii) A written evaluation demonstrating how the leak detection program in place at the facility satisfies the criteria in paragraph (d)(2) of this section.

(2) Each applicant, other than one authorized to operate under this part on December 31, 2015, seeking to implement the requirements of this section must submit, in addition to the information required by paragraphs (c)(1)(ii) through (vii) of this section, an analysis demonstrating why the proposed reactor design is similar to the designs of reactors authorized to operate under this part on December 31, 2015, such that the provisions of this section may properly apply. The analysis must also include a proposed TBS and a justification that the proposed TBS is consistent with the technical basis for this section. The effects of the initial plant changes proposed in the application must be considered as part of this evaluation.

(3) The NRC may approve an application to use this section if:

(i) The evaluation submitted under paragraph (c)(1)(i) of this section demonstrates the applicability of the TBS to the facility for reactors authorized to operate under this part on December 31, 2015;

(ii) The method(s) for demonstrating compliance with the ECCS acceptance criteria in paragraph (e)(1) of this section meet the requirements in paragraphs (e)(2) and (3) of this section;

(iii) The risk-informed evaluation used to make changes under this section is adequate for determining whether the acceptance criteria in paragraph (h) of this section have been met;

(iv) If applicable, the risk-informed evaluation process proposed for use to make changes under paragraph (h)(1) of this section is adequate for determining whether the acceptance criteria in paragraph (h) of this section have been met;

(v) For each reactor not authorized to operate on December 31, 2015, the evaluation submitted under paragraph (c)(2) of this section demonstrates that the reactor design is similar to the designs of reactors authorized to operate under this part on December 31, 2015, and the applicant demonstrates that its proposed TBS applies to its facility; and

(vi) The applicable standards and requirements of the Act and the Commission's regulations have been met.

(d) *Programmatic requirements.* An entity whose application under paragraph (c) of this section is approved by the NRC must comply with the following requirements as long as the entity is subject to the requirements in this section:

(1) The entity must maintain the ECCS evaluation models meeting the requirements in paragraphs (e)(1), (2), and (3) of this section after implementing any error corrections and changes;

(2) The entity must have leak detection systems available at the facility and must implement actions during operation as necessary to identify, monitor, and quantify leakage to ensure that adverse safety consequences do not result from leaking primary pressure boundary components that are larger than the TBS;

(3) Changes made under this section must, in addition to meeting other applicable NRC requirements, be evaluated by a risk-informed evaluation demonstrating that the acceptance criteria in paragraph (h) of this section are met;

(4) The entity must perform an evaluation to determine the effect of all planned facility changes and must not implement any facility change that would significantly increase LOCA frequencies or invalidate the evaluation demonstrating the applicability of the TBS performed pursuant to paragraph (c)(1)(i) of this section for an operating reactor licensee authorized to operate under this part on December 31, 2015, or the evaluation used to determine the plant-specific TBS performed pursuant to paragraph (c)(2) of this section for entities other than those authorized to operate under this part on December 31, 2015; and

(5) During operation, the licensees must perform the inspections prescribed in paragraph (b)(3) of this section during every subsequent inservice inspection interval (as defined in § 50.55a(y)) on the same samples inspected to satisfy paragraph (b)(3) of this section. The effect on the TBS of any additional degradation identified since the previous inspection must be evaluated.

(e) *ECCS Performance.*

(1) *Alternative ECCS acceptance criteria.* For each entity approved by the NRC to use this section, its reactor must be provided with an ECCS designed to satisfy the acceptance criteria in this paragraph in the event of, and following, a postulated LOCA. The demonstration of ECCS performance must comply with paragraph (e)(2) of this section for breaks at or below the TBS and paragraph (e)(3) of this section for breaks above the TBS.

(i) The ECCS provides sufficient coolant so that the fuel remains in a coolable geometry during and following the LOCA heatup and quench.

(ii) The ECCS provides sufficient coolant so that decay heat will be removed for the extended period of time required by the long-lived radioactivity remaining in the fuel.

(2) *ECCS evaluation performance demonstration for LOCAs involving breaks at or below the TBS.* ECCS cooling performance at or below the TBS must be calculated in accordance with an evaluation model that meets the requirements of either section I to appendix K to this part, or for realistic evaluation models, the following requirements.

(i) The evaluation model must be used for a number of postulated LOCAs of different sizes, locations (including LOCAs in piping systems with an inner diameter that is larger than the TBS), and other properties sufficient to provide assurance that the most severe postulated LOCAs involving breaks at or below the TBS are analyzed.

(ii) The evaluation model must include sufficient supporting justification to show that the analytical technique realistically describes the behavior of the reactor system during a LOCA. Comparisons to applicable experimental data must be made and uncertainties in the analysis method and inputs must be identified and assessed so that the uncertainty in the calculated results can be estimated. This uncertainty must be accounted for, so that when the calculated ECCS cooling performance is compared to the ECCS performance criteria set forth in paragraph (e)(1) of this section and

addresses the fuel system acceptance criteria and modeling requirements in paragraph (f) of this section, there is a high level of probability that the criteria would be met.

(iii) The ECCS evaluation model must address changes in fuel geometry.

(3) *ECCS performance demonstration for LOCAs involving breaks larger than the TBS.* ECCS cooling performance for LOCAs involving breaks larger than the TBS must be calculated in accordance with an evaluation model that meets the requirements of either section I to appendix K to this part or, for realistic evaluation models, the following requirements. These calculations may take credit for the availability of offsite power and do not require the assumption of a single failure. Availability of safety-related or non-safety-related equipment may be assumed if supported by plant-specific data or analysis, and provided that onsite power can be readily provided through simple manual actions to equipment that is credited in the analysis.

(i) The evaluation model must be used for a number of postulated LOCAs of different sizes, locations, and other properties sufficient to provide assurance that the most severe postulated LOCAs larger than the TBS up to the double-ended rupture of the largest pipe in the reactor coolant system are analyzed.

(ii) The evaluation model must include sufficient supporting justification to show that the analytical technique realistically describes the behavior of the reactor system during a LOCA. Comparisons to applicable experimental data must be made so that there is assurance to at least a best-estimate level that the calculated ECCS cooling performance meets the ECCS performance criteria set forth in paragraph (e)(1) of this section and addresses the fuel system acceptance criteria and modeling requirements in paragraph (f) of this section.

(iii) The ECCS evaluation model must address changes in fuel geometry.

(4) *Required documentation.* The documentation requirements of this paragraph supersede the requirements in section II, ''Required Documentation,'' of appendix K to this part for those entities that are approved to use this section.

(i) (A) A description of the ECCS evaluation model must be submitted to the NRC. The description must be sufficiently complete to permit technical review of the analytical approach, including the equations used, their approximations in difference form, the assumptions made, and the values of all parameters or the procedure for their selection.

(B) A detailed source code of each computer program, in the same form as used in the ECCS evaluation model, must be provided to the NRC upon request.

(ii) For each computer program, solution convergence must be demonstrated by studies of system modeling, noding and calculational time steps, or both.

(iii) Appropriate sensitivity studies must be performed for each ECCS evaluation model to evaluate the effect on the calculated results of variations in noding, phenomena assumed in the calculation to predominate, including pump operation or locking, and values of parameters over their applicable ranges. For items to which results are shown to be sensitive, the choices made must be justified.

(iv) To the extent practicable, predictions of the ECCS evaluation model, or portions thereof, must be compared with applicable experimental information. The technical adequacy of the calculational methods used in the ECCS evaluation models must be documented. For realistic evaluation models, the documentation must demonstrate that the performance criteria of paragraphs (e)(1) and (f) of this section are met. For appendix K models, this documentation must demonstrate compliance with required features of section I of appendix K to this part and must demonstrate that the performance criteria of paragraphs (e)(1) and (f) of this section are met.

(v) The Director of the Office of Nuclear Reactor Regulation may impose restrictions on reactor operation if the NRC finds that the submitted evaluations of ECCS cooling performance are not consistent with paragraph (e) of this section.

(f) *Fuel performance criteria.* Fuel system designs must have NRC-approved limits that:

(1) Address cladding degradation phenomena;

(2) Maintain fuel coolability;

(3) Avoid explosive concentration of combustible gas; and

(4) Demonstrate that, after any calculated successful initial operation of the ECCS, the ECCS must provide sufficient coolant to remove decay heat and prevent further cladding failure for the extended period of time required by the long-lived radioactivity remaining in the fuel.

(g) *Use of NRC-approved fuel in reactor.*

(1) *Fuel load.* A licensee that is approved to use this section may not load fuel into a reactor unless the resulting core design satisfies the ECCS performance requirements of paragraph (e) of this section and the fuel system acceptance criteria and modeling requirements in paragraph (f) of this section, or otherwise complies with technical specifications governing lead test assemblies in its license.

(2) *Operation.* If a licensee that is approved to use this section determines that fuel in the reactor no longer complies with the ECCS performance requirements of paragraph (e) of this section and the fuel system acceptance criteria and modeling requirements in paragraph (f) of this section, then the licensee must take immediate action to come into compliance with paragraph (e) or (f) of this section, as applicable.

(h) *Changes to facility, technical specifications, or procedures.* An entity that wishes to make changes enabled by this section must perform a risk-informed evaluation.

(1) An entity other than a design certification applicant or holder of a manufacturing license may make changes enabled by this section, other than changes to the technical specifications, without prior NRC approval if:

(i) The change is permitted under § 50.59 for holders of operating licenses, combined licenses that do not reference a standard design certification or standard design approval, or manufacturing license (under § 52.98(b) of this chapter), or combined licenses that reference a standard design approval; or permitted under § 52.98(c) of this chapter for holders of combined licenses that reference a standard design certification; or permitted under § 52.98(d) of this chapter for holders of combined licenses that reference a manufacturing license;

(ii) The risk-informed evaluation process approved in accordance with paragraph (c)(1)(v) of this section demonstrates that any increases in the estimated risk are minimal and the criteria in paragraph (h)(3) of this section are met; and

(iii) The change does not significantly increase LOCA frequencies or invalidate the evaluation demonstrating the applicability of the TBS to the applicant's facility, performed pursuant to paragraph (c)(1)(i) of this section for an operating reactor licensee authorized to operate under this part on December 31, 2015, or the evaluation used to establish the plant-specific TBS, performed pursuant to paragraph (c)(2) of this section for entities other than those authorized to operate under this part on December 31, 2015.

(2) For implementing changes that are not permitted under paragraph (h)(1) of

this section, the entity must submit an application containing the following:

(i) For reactor licensees, the information required under § 50.90;

(ii) Information from the risk-informed evaluation demonstrating that the total increases in core damage frequency and large early release frequency are very small, the overall risk remains small, and the criteria in paragraph (h)(3) of this section are met;

(iii) If previous changes have been made under this section, information from the risk-informed evaluation on the cumulative effect on risk of the proposed change and all previous changes made under this section. If more than one plant change is combined, including plant changes not enabled by this section, into a group for the purposes of evaluating acceptable risk increases, then the evaluation of each individual change must be performed along with the evaluation of combined changes;

(iv) Information demonstrating that the criteria in paragraph (e) of this section are met; and

(v) Information demonstrating that the proposed change will not significantly increase the LOCA frequencies or invalidate the evaluation demonstrating the applicability of the TBS to the entity's facility, performed pursuant to paragraph (c)(1)(i) of this section for an operating reactor licensee authorized to operate under this part on December 31, 2015, or the evaluation used to establish the plant-specific TBS, performed pursuant to paragraph (c)(2) of this section for entities other than those authorized to operate under this part on December 31, 2015.

(3) All changes made under this section must meet the following criteria:

(i) Adequate defense-in-depth is maintained;

(ii) Adequate safety margins are retained to account for uncertainties; and

(iii) Adequate performance-measurement programs are implemented to ensure the risk-informed evaluation continues to reflect actual plant design and operation. These programs must be designed to detect degradation of the system, structure, or component before plant safety is compromised, provide feedback of information and timely corrective actions, and monitor systems, structures, or components at a level commensurate with their safety significance.

(4) Whenever a PRA is used in the risk-informed evaluation, the PRA must, with respect to the area of evaluation that is the subject of the PRA:

(i) Address initiating events from sources both internal and external to the plant and for all modes of operation, that would affect the regulatory decision in a substantial manner;

(ii) Reasonably represent the current configuration and operating practices at the plant;

(iii) Have sufficient technical acceptability (including consideration of uncertainty) and level of detail to provide confidence that the total risk estimates and the change in total risk estimates adequately reflect the plant and the effect of the proposed change on risk; and

(iv) Be determined, through peer review, to meet industry standards for PRA acceptability that have been endorsed or otherwise found acceptable by the NRC.

(5) Whenever risk assessment methods other than PRAs are used to develop quantitative or qualitative estimates of changes to risk in the risk-informed evaluation, an integrated and systematic process must be used. All aspects of the analyses must reasonably reflect the current plant configuration and operating practices and applicable plant and industry operating experience.

(i) *Authority to impose restrictions on operation.*

The Director of the Office of Nuclear Reactor Regulation may impose restrictions on reactor operation if the NRC finds that the submitted evaluations of ECCS cooling performance are not consistent with the requirements of this section.

(j) *Reporting.* Each entity subject to the requirements of this section must comply with the requirements of this paragraph.

(1) *ECCS evaluation model: reporting.*

(i) If the applicant for or holder of a construction permit, operating license, combined license, or manufacturing license identifies any change to, or error in, an ECCS evaluation model, or the application of such a model, that does not result in any predicted response that exceeds any of the acceptance criteria specified in this section and is itself not significant as defined in paragraph (k) of this section, then each of these entities must prepare a report describing each such change or error, its estimated effect on predicted response, and the basis for the entity's determination that the change or error is not significant. This entity must submit the report to the NRC, as specified in § 50.4 or § 52.3 of this chapter, at least annually.

(ii) If the applicant for or holder of a construction permit, operating license, combined license, or manufacturing license identifies any change to, or error in, an ECCS evaluation model, or the application of such a model, that does not result in any predicted response that exceeds any of the acceptance criteria specified in this section but is significant as defined in paragraph (k) of this section, then each of these entities must prepare a report describing each such change or error, its estimated effect on predicted response, proposed corrective actions, and a proposed scope and schedule for providing a reanalysis and for implementing the corrective actions. This entity must submit the report to the NRC, as specified in § 50.4 or § 52.3 of this chapter, within 60 days of the change or discovery of the error.

(iii) If an applicant for a standard design certification (including an applicant after the Commission has adopted a final design certification regulation) or an applicant for or holder of a standard design approval under part 52 of this chapter identifies any change to, or error in, an ECCS evaluation model, or the application of such a model, that does not result in any predicted response that exceeds any of the acceptance criteria specified in this section but is significant as defined in paragraph (k) of this section, then each of these entities must document the nature of the change or error and its estimated effect on the limiting ECCS analysis.

(iv) If a licensee identifies any change to, or error in, an ECCS evaluation model or the application of such a model, that results in any of the ECCS acceptance criteria specified in this section to be exceeded at the facility, then the licensee must submit a report describing each such change or error, its estimated effect on predicted response, proposed corrective actions, and a proposed scope and schedule for providing a reanalysis and for implementing the corrective actions. The licensee must submit the report to the NRC, as specified in § 50.4 or § 52.3 of this chapter, within 60 days of the change or discovery of the error. The report required by this paragraph is in addition to any reporting required by § 50.72.

(2) *ECCS evaluation model: corrective action.*

(i) If a licensee identifies any change to, or error in, an ECCS evaluation model or the application of such a model, that results in any of the acceptance criteria specified in this section to be exceeded at the facility, then the licensee (in the case of a combined license under part 52 of this chapter, after the Commission has made the finding under § 52.103(g) of this chapter) must take immediate action to bring the facility into compliance with

the acceptance criteria. In addition, the corrective action as described in the report required by paragraph (j)(1) of this section must be implemented.

(ii) If a standard design certification applicant (including an applicant after the Commission has adopted a final design certification regulation) is required by paragraph (j)(1)(iv) of this section to submit a reanalysis, or identifies a change to, or error in an ECCS evaluation model, or in the application of such a model, that results in any predicted response that exceeds any of the acceptance criteria specified in this section, then the standard design certification applicant (including an applicant after the Commission has adopted a final design certification regulation) must propose appropriate steps to the Commission, as specified in § 52.3 of this chapter, within 60 days to demonstrate compliance with § 50.46a requirements, along with a report of the nature of the changes or errors that resulted in an inability to assure compliance and an estimate of their effect on the limiting transient.

(iii) If an applicant for or holder of a standard design approval under part 52 of this chapter is required by paragraph (j)(1)(iv) of this section to submit a reanalysis, or identifies a change to, or error in an ECCS evaluation model, or in the application of such a model, that results in any predicted response that exceeds any of the acceptance criteria specified in this section, then the standard design approval applicant or holder must propose appropriate steps to the Commission, as specified in § 52.3 of this chapter, within 60 days to demonstrate compliance with § 50.46a requirements, along with a report of the nature of the changes or errors that resulted in an inability to assure compliance and an estimate of their effect on the limiting transient.

(3) *Minimal changes: reporting.* No later than 24 months after NRC approval of the entity's application and every 24 months thereafter, the entity must submit, as specified in § 50.4 or § 52.3 of this chapter, a short description of each change involving minimal changes in risk made under paragraph (h)(1) of this section in the preceding 24 months and a brief summary of the basis for the entity's determination pursuant to paragraph (h)(1)(iii) of this section that the change does not invalidate the applicability evaluation made under paragraph (c)(1)(i) of this section for an operating reactor licensee authorized to operate under this part on December 31, 2015, or the plant-specific TBS evaluation made under paragraph (c)(2) of this section for entities other than those authorized to operate under this part on December 31, 2015.

(4) *Inspection: reporting.* Within 120 days after completing the outage when the inspections specified in paragraph (d)(5) of this section were performed, the licensee must submit a summary report detailing the results of the inspections and the evaluation of the effect on the TBS of any additional degradation identified since the previous evaluation. This report can be combined with the summary report required by § 50.55a(b)(2)(xxxii).

(k) *Significant change or error in the ECCS evaluation model.*

(1) For LOCAs at or below the TBS, a significant change or error in the ECCS evaluation model for uranium oxide and mixed uranium-plutonium oxide pellets within cylindrical zirconium-alloy cladding is one that results in:

(i) A calculated peak fuel cladding temperature different by more than 50 °F from the temperature calculated for the limiting transient using the last acceptable evaluation model, or is a cumulation of changes and errors such that the sum of the absolute magnitudes of the respective temperature changes is greater than 50 °F; or

(ii) A calculated integral time-at-temperature different by more than 1.0 percent equivalent cladding reacted from the oxidation calculated for the limiting transient using the last acceptable evaluation model, or is a cumulation of changes and errors such that the sum of the absolute magnitudes of the respective oxidation changes is greater than 1.0 percent equivalent cladding reacted.

(2) For LOCAs above the TBS, a significant change or error in the ECCS evaluation model for uranium oxide and mixed uranium-plutonium oxide pellets within cylindrical zirconium-alloy cladding is one that results in a significant reduction in the capability to meet the requirements of paragraphs (e)(1) and (f) of this section.

(3) For fuel that does not consist of uranium or mixed uranium-plutonium oxide pellets within cylindrical zirconium-alloy cladding, a significant change in the ECCS evaluation model is one that results in a significant reduction in the capability to meet the requirements of paragraphs (e)(1) and (f) of this section.

(l) *Documentation.* Following implementation of the requirements in this section, each entity subject to this section must maintain records sufficient to demonstrate compliance with the requirements in this section in accordance with § 50.71.

■ 11. Add § 50.46b under the undesignated center heading ''Standards for Licenses, Certifications, and Regulatory Approvals'' to read as follows:

§ 50.46b Acceptance criteria for reactor coolant system venting systems.

Each nuclear power reactor must be provided with high-point vents for the reactor coolant system, for the reactor vessel head, and for other systems required to maintain adequate core cooling if the accumulation of noncondensible gases would cause the loss of function of these systems. High-point vents are not required for the tubes in U-tube steam generators. Acceptable venting systems must meet the following criteria:

(a) The high-point vents must be remotely operated from the control room.

(b) The design of the vents and associated controls, instruments, and power sources must conform to appendix A and appendix B of this part.

(c) The vent system must be designed to ensure that:

(1) The vents will perform their safety functions; and

(2) There would not be inadvertent or irreversible actuation of a vent.

■ 12. In § 50.47,

■ a. In paragraph (b)(10), remove the word ''EPZ'' wherever it appears;

■ b. Revise paragraph (c)(2); and

■ c. Add paragraphs (g) and (h) to read as follows:

§ 50.47 Emergency plans.

* * * * *

(c) * * *

(2) Generally, the plume exposure pathway EPZ for nuclear power reactors shall consist of an area about 2 to 10 miles (3.2 to 16 km) in radius. For reactors with an authorized power level less than 300 MW thermal, the plume exposure pathway EPZ may be established at the site boundary. The need for and size of the EPZ may also be determined on a case-by-case basis as described in § 50.33(g)(2). The exact size and configuration of the EPZ surrounding a particular nuclear power reactor shall be determined in relation to the local emergency response needs and capabilities as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. Emergency plans must describe such actions as are appropriate to avoid or reduce dose within and beyond the EPZ or site boundary and to protect the ingestion pathway.

* * * * *

(g) A licensee desiring to change its plume exposure pathway EPZ must submit an application for a license

amendment under § 50.90 and receive NRC approval before implementing the change. Any such license amendment request must include documentation demonstrating that the applicable State, local, and Tribal governmental authorities have agreed to the EPZ change.

(h) A licensee desiring to comply with the requirements of § 50.160 in lieu of appendix E to this part, and for nuclear power reactor licensees, the planning standards of § 50.47(b), must submit an application for a license amendment under § 50.90 and receive NRC approval before implementing the change.

■ 13. In § 50.49, remove footnote 3, redesignate footnote 4 as footnote 1, and revise and republish paragraph (b) to read as follows:

§ 50.49 Environmental qualification of electric equipment important to safety for nuclear power plants.

* * * * *

(b) Electric equipment important to safety covered by this section is:

(1) Safety-related electric equipment.

(i) This equipment is that relied upon to remain functional during and following design basis events to ensure—

(A) The integrity of the reactor coolant pressure boundary;

(B) The capability to shut down the reactor and maintain it in a safe shutdown condition; or

(C) The capability to prevent or mitigate the consequences of accidents that could result in potential offsite exposures comparable to the guidelines in § 50.34(a)(1), 50.67(b)(2), or 100.11 of this chapter, as applicable.

(ii) For applications submitted on or after [DATE 180 DAYS AFTER THE EFFECTIVE DATE OF FINAL RULE] for a license, permit, standard design certification, or standard design approval under this part or part 52 of this chapter, design basis events are defined in § 50.2. This definition also applies to other licenses, permits, standard design certifications, or standard design approvals for which the NRC has approved adopting the § 50.2 definition for design basis events. In all other cases, design basis events are defined as conditions of normal operation, including anticipated operational occurrences, design basis accidents, external events, and natural phenomena for which the plant must be designed to ensure functions (b)(1)(i)(A) through (C) of this section.

(2) Non-safety-related electric equipment whose failure under postulated environmental conditions could prevent satisfactory accomplishment of safety functions specified in subparagraphs (b)(1)(i)(A) through (C) of this section by the safety-related equipment.

(3) Certain post-accident monitoring equipment.[1]

* * * * *

[1] Specific guidance concerning the types of variables to be monitored is provided in Revision 2 of Regulatory Guide 1.97, ''Instrumentation for Light-Water-Cooled Nuclear Power Plants to Assess Plant and Environs Conditions During and Following an Accident.'' Copies of the Regulatory Guide may be purchased through the U.S. Government Publishing Office by calling 202–512–1800 or by writing to the U.S. Government Publishing Office, P.O. Box 37082, Washington, DC 20013–7082.

■ 14. In § 50.54, add paragraphs (a)(5) and (q)(1)(v) and revise paragraphs (a)(1), (q)(2), (q)(3), and (t) to read as follows:

§ 50.54 Conditions of licenses.

* * * * *

(a)(1) Each nuclear power plant or fuel reprocessing plant licensee subject to the quality assurance criteria in appendix B or T of this part shall implement, under § 50.34(b)(6)(ii) or § 52.79 of this chapter, the quality assurance program or quality management system, respectively, described or referenced in the safety analysis report, including changes to that report. However, a holder of a combined license under part 52 of this chapter shall implement the quality assurance program or quality management system described or referenced in the safety analysis report applicable to operation 30 days prior to the scheduled date for the initial loading of fuel.

* * * * *

(5) Changes to the quality management system must be submitted to the NRC and receive NRC approval prior to implementation, as follows:

(i) Changes made to the quality management system as presented in the Safety Analysis Report or in a topical report must be submitted as specified in § 50.4.

(ii) The submittal of a change to the Safety Analysis Report quality management system must include all pages affected by that change and must be accompanied by a forwarding letter identifying the change, the reason for the change, and the basis for concluding that the revised quality management system incorporating the change continues to satisfy the criteria of appendix T of this part and the Safety Analysis Report quality management system commitments previously accepted by the NRC (the letter need not provide the basis for changes that correct spelling, punctuation, or editorial items).

(iii) A copy of the forwarding letter identifying the change must be maintained as a facility record for three years.

(iv) Changes to the quality management system included or referenced in the Safety Analysis Report shall be regarded as accepted by the Commission upon receipt of a letter to this effect from the appropriate reviewing office of the Commission.

* * * * *

(q) * * *

(1) * * *

(v) *Risk significant planning standard* means the most essential functions of emergency preparedness to ensure adequate protective measures are taken to protect the public in the event of a radiological emergency. For the purposes of this section, the risk significant planning standards are classification, notification, assessment, protective actions, staffing, and facilities.

(2) A holder of a license under this part, or a combined license under part 52 of this chapter after the Commission makes the finding under § 52.103(g) of this chapter, shall follow and maintain the effectiveness of an emergency plan that meets the requirements in appendix E to this part and, for nuclear power reactor licensees, the planning standards of § 50.47(b), or an emergency plan that meets the requirements in § 50.160.

(3) A licensee may make changes to its emergency plan without NRC approval only if the licensee performs and retains an analysis demonstrating that:

(i) For planning standards that are risk significant, the changes do not reduce the effectiveness of the plan and the plan, as changed, continues to meet either the risk significant requirements of § 50.160 or the applicable requirements in appendix E to this part and, for nuclear power reactor licensees, the risk significant planning standards of § 50.47(b); and

(ii) For planning standards that are not risk-significant, the plan, as changed, continues to meet the applicable requirements.

* * * * *

(t) The licensee must provide for annual evaluation of the adequacy of the interfaces between the licensee and the applicable State, local, and Tribal governments, including licensee drills, exercises, capabilities, and procedures. The results of the evaluation, along with recommendations for improvements, must be documented, reported to the

licensee's corporate and plant management, retained for a period of 5 years, and must be made available to the appropriate State, local, and Tribal governments.

* * * * *

■ 15. In § 50.55, revise paragraph (f)(1) and add paragraph (f)(5) to read as follows:

§ 50.55 Conditions of construction permits, early site permits, combined licenses, and manufacturing licenses.

* * * * *

(f)(1) Each nuclear power plant or fuel reprocessing plant construction permit holder subject to the quality assurance criteria in appendix B or T of this part shall implement, pursuant to § 50.34(a)(7) of this part, the quality assurance program description or quality management system, respectively, described or referenced in the Safety Analysis Report, including changes to that report.

* * * * *

(5) Changes to the quality management system must be submitted to the NRC and receive NRC approval prior to implementation, as follows:

(i) Changes made to the quality management system as presented in the Safety Analysis Report or in a topical report must be submitted as specified in § 50.4.

(ii) The submittal of a change to the Safety Analysis Report quality management system must include all pages affected by that change and must be accompanied by a forwarding letter identifying the change, the reason for the change, and the basis for concluding that the revised quality management system incorporating the change continues to satisfy the criteria of appendix T of this part and the Safety Analysis Report quality management system commitments previously accepted by the NRC (the letter need not provide the basis for changes that correct spelling, punctuation, or editorial items).

(iii) A copy of the forwarding letter identifying the change must be maintained as a facility record for three years.

(iv) Changes to the quality management system included or referenced in the Safety Analysis Report shall be regarded as accepted by the Commission upon receipt of a letter to this effect from the appropriate reviewing office of the Commission.

* * * * *

§ 50.55a [Amended]

■ 16. In § 50.55a, in paragraph (z) introductory text, remove the phrase ''of paragraphs (b) through (h)''.

■ 17. In § 50.57, add paragraph (d) to read as follows:

§ 50.57 Issuance of operating license.[1]

* * * * *

(d) The Commission may afford generic finality to generic aspects of the design of a utilization facility, including postulated site parameters, and requirements submitted pursuant to § 50.34(b)(14), if it finds that the proposed generic design can be constructed and operated at sites having characteristics that fall within the site parameters postulated for the design in accordance with applicable requirements and without undue risk to the health and safety of the public.

[1] The Commission may issue a provisional operating license pursuant to the regulations in this part in effect on March 30, 1970, for any facility for which a notice of hearing on an application for a provisional operating license or a notice of proposed issuance of a provisional operating license has been published on or before that date.

■ 18. In § 50.58, add paragraphs (b)(7) and (b)(8) to read as follows:

§ 50.58 Hearings and report of the Advisory Committee on Reactor Safeguards.

* * * * *

(b) * * *

(7) If an applicant requests generic finality under § 50.34(b)(14) for an operating license under this part, the Commission will include a request for generic finality as a proposed action in the notice of proposed action required by § 2.105 of this chapter.

(8) In a proceeding for issuance of a construction permit, operating license, or combined license, or in any enforcement hearing other than one initiated by the Commission under § 2.202(e)(1) of this chapter, in which an operating license issued under this subpart is referenced, the Commission must treat as resolved those matters resolved in the proceeding on the application for issuance or renewal of the referenced operating license, including, if applicable, the adequacy of a reactor design, if the referenced operating license was afforded finality pursuant to § 50.57(d).

■ 19. In § 50.59, revise paragraphs (c)(2)(viii) and (d)(1) and add paragraphs (e) and (f) to read as follows:

§ 50.59 Changes, tests, and experiments.

* * * * *

(c) * * *

(2) * * *

(viii) Result in a departure from a method of evaluation described in the FSAR (as updated) used in establishing the design bases or in the safety analyses, unless the licensee has demonstrated through a documented verification, validation, and uncertainty quantification (VVUQ) process, conducted under a VVUQ program that meets the requirements of § 50.221 and has been approved by the NRC for the intended application, that the departure from a method of evaluation described in the FSAR (as updated) meets the criteria established for credibility in the VVUQ program, including implementation of established VVUQ activities and assessments.

* * * * *

(d) (1) The licensee shall maintain records of changes in the facility, of changes in procedures, and of tests and experiments made pursuant to paragraph (c) or (f) of this section. These records must include a written evaluation which provides the bases for the determination that the change, test, or experiment does not require a license amendment pursuant to paragraph (c)(2) or (f) of this section.

* * * * *

(e) For the purposes of criteria § 50.59(c)(2)(i) and (ii), an increase may be demonstrated to not be a ''more than a minimal increase'' using quantitative risk results based on a probabilistic risk assessment of appropriate scope and quality that provides appropriate risk metrics. The change must also maintain defense-in-depth and safety margins.

(f) The holder of an operating license or a combined license that authorizes operation of a manufactured reactor may make changes in the facility as described in the final safety analysis report (as updated) and make changes in the procedures as described in the final safety analysis report (as updated) without obtaining a license amendment pursuant to § 50.90 if the changes are identical to changes approved by the Commission by amendment to the manufacturing license for the manufactured reactor and upon determining that implementation of the changes will be consistent with the basis for the Commission's approval of the amendment to the manufacturing license and not involve any additional changes that would require an amendment to its operating license or combined license.

■ 20. In § 50.67, revise and republish paragraph (b) to read as follows:

§ 50.67 Accident source term.

* * * * *

(b) *Requirements.*

(1) A licensee who seeks to revise its current accident source term in design basis radiological consequence analyses must apply for a license amendment

under § 50.90. The application must contain an evaluation of the consequences of applicable design basis accidents [1] previously analyzed in the safety analysis report.

(2) The NRC may issue the amendment only if the applicant's analysis demonstrates with reasonable assurance that:

(i) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 25 rem [2] (0.25 Sv) total effective dose equivalent (TEDE).

(ii) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage), would not receive a radiation dose in excess of 25 rem (0.25 Sv) TEDE.

(iii) The necessary design, fabrication, construction, testing, and performance criteria for structures, systems, and components important to safety are provided to permit occupancy of the control room under accident conditions without calculated radiation exposures in excess of 10 rem (0.10 Sv) TEDE or a higher design criterion limit established in accordance with paragraph (b)(3) of this section for the duration of the accident.

(3) The licensee may establish a design criterion limit higher than 10 rem (0.10 Sv) TEDE but not greater than 25 rem [3] (0.25 Sv) TEDE for compliance with paragraph (b)(2)(iii) of this section provided the licensee demonstrates that the specified limit is consistent with the plant risk profile or commensurate with the risk of the plant.

[1] The fission product release assumed for these calculations should be based upon a major accident, hypothesized for purposes of design analyses or postulated from considerations of possible accidental events, that would result in potential hazards not exceeded by those from any accident considered credible. Such accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[2] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this value constitutes an acceptable limit for emergency doses to the public under accident conditions. Rather, this 25 rem (0.25 Sv) TEDE value has been stated in this section as a reference value, which can be used in the evaluation of proposed design basis changes with respect to potential reactor accidents of exceedingly low probability of occurrence and low risk of public exposure to radiation.

[3] The use of 25 rem (0.25 Sv) TEDE as the control room criterion is not intended to imply that this value constitutes an acceptable limit for emergency doses under accident conditions. Adequate radiological protection for occupationally exposed individuals is provided by the provisions of part 20 of this chapter and § 50.47(b)(11). This criterion is provided only to assess the acceptability of design provisions, in particular engineered safety features that mitigate fission product release, under postulated DBA conditions. The conditions assumed in these analyses, although credible, are of exceedingly low probability of occurrence and do not represent actual accident sequences but are specified as conservative surrogates to create bounding conditions for assessing the acceptability of engineered safety features.

■ 21. In § 50.68, revise paragraph (b)(7) to read as follows:

§ 50.68 Criticality accident requirements.

* * * * *

(b) * * *

(7) The maximum nominal U–235 enrichment of the fresh fuel assemblies is limited to five (5.0) percent by weight or to the value specified in the operating license which must be less than twenty (20.0) percent by weight.

* * * * *

§ 50.69 [Amended]

■ 22. In § 50.69, revise paragraph (b)(1)(ii) by removing the reference ''10 CFR 50.46a(b)'' and adding in its place ''§ 50.46b(b)''.

■ 23. In § 50.71, revise paragraph (f) to read as follows:

§ 50.71 Maintenance of records, making of reports.

* * * * *

(f) Each person licensed to manufacture a nuclear power reactor under subpart F of part 52 of this chapter shall update the FSAR originally submitted as part of the application to reflect the effects[2] of all changes made in the facility or procedures as described in the FSAR; all safety analyses and evaluations performed by the licensee either in support of approved amendments to the manufacturing license or in support of conclusions that changes did not require a license amendment in accordance with § 50.59(c)(2); and any new analyses of safety issues performed by or on behalf of the licensee at the NRC's request. This submittal shall contain all the changes necessary to reflect information and analyses submitted to the Commission by the licensee or prepared by the licensee with respect to the modification under § 52.171 of this chapter or the analyses requested by the Commission under § 52.171 of this chapter. The updated information shall be appropriately located within the update to the FSAR.

* * * * *

[2] See footnote 1.

■ 24. In § 50.75,

■ a. Revise paragraphs (b), (c), and (e)

■ b. In paragraph (g)(4)(iii), remove the phrase ''10 CFR Part 20, Subpart E'' and add in its place the phrase ''subpart E to part 20 of this chapter'';

■ c. In paragraph (h)(5), remove the reference ''(h)(3)'' and add in its place ''(3)''.

The revisions are to read as follows:

§ 50.75 Reporting and recordkeeping for decommissioning planning.

* * * * *

(b) Each power reactor applicant for or holder of an operating license, and each applicant for a combined license under subpart C of part 52 of this chapter for a production or utilization facility shall submit a decommissioning report, as required by § 50.33(k).

(1)(i) For an applicant for or holder of an operating license under this part of a type and power level specified in paragraph (c) of this section, the report must contain a certification that financial assurance for decommissioning will be (for a license applicant), or has been (for a license holder), provided in an amount which may be more, but not less, than the amount stated in the table in paragraph (c)(1) of this section adjusted using a rate at least equal to that stated in paragraph (c)(2) of this section. For an applicant for a combined license under subpart C of part 52 of this chapter of a type and power level specified in paragraph (c) of this section, the report must contain a certification that financial assurance for decommissioning will be provided no later than 30 days after the Commission publishes notice in the **Federal Register** under § 52.103(a) of this chapter in an amount which may be more, but not less, than the amount stated in the table in paragraph (c)(1) of this section, adjusted using a rate at least equal to that stated in paragraph (c)(2) of this section.

(ii) The amount to be provided must be adjusted annually using a rate at least equal to that stated in paragraph (c)(2) of this section.

(iii) The amount must be covered by one or more of the methods described in paragraph (e) of this section as acceptable to the NRC.

(iv) The amount stated in the applicant's or licensee's certification may be based on a site-specific cost estimate for decommissioning the facility. As part of the certification, a copy of the financial instrument obtained to satisfy the requirements of paragraph (e) of this section must be submitted to NRC; *provided, however,*

that an applicant for or holder of a combined license need not obtain such financial instrument or submit a copy to the Commission except as provided in paragraph (e)(3) of this section.

(2)(i) For an applicant for or holder of an operating license under this part or subpart C of part 52 of this chapter of a type and power level other than that specified in paragraph (c) of this section, the report must contain a certification that financial assurance for decommissioning will be (for a license applicant), or has been (for a license holder), provided in an amount that may be based on a design-specific decommissioning cost estimate or the amount stated in the table in paragraph (c)(1) of this section adjusted using a rate at least equal to that stated in paragraph (c)(2) of this section.

(ii) A certification relying on a design-specific decommissioning cost estimate must demonstrate that there is reasonable assurance that sufficient funds necessary for safely decommissioning the facility will be available, when needed, and provide the factors used to develop the design-specific decommissioning cost estimate, including reactor technology, power level (in MWt), and costs related to labor, energy, and waste burial. Additionally, design-specific decommissioning cost estimates must include plans for adjusting levels of funds assured for decommissioning to demonstrate that a reasonable level of assurance will be provided that funds will be available when needed to cover the cost of decommissioning.

(iii) The amount to be provided must be adjusted annually using a rate at least equal to that stated in paragraph (c)(2) of this section.

(iv) The amount must be covered by one or more of the methods described in paragraph (e) of this section as acceptable to the NRC.

(v) The amount stated in the applicant's or licensee's certification may be based on a site-specific cost estimate for decommissioning the facility. As part of the certification, a copy of the financial instrument obtained to satisfy the requirements of paragraph (e) of this section must be submitted to NRC; *provided, however,* that an applicant for or holder of a combined license need not obtain such financial instrument or submit a copy to the Commission except as provided in paragraph (e)(3) of this section.

(c) Table of minimum amounts (January 1986 dollars) required to demonstrate reasonable assurance of funds for decommissioning by reactor type and power level, P (in MWt); adjustment factor.[1]

		Millions
(1)(i) For a PWR:	greater than or equal to 3400 MWt	$105
	between 1200 MWt and 3400 MWt	$(75+0.0088P)
(ii) For a BWR:	greater than or equal to 3400 MWt	$135
	between 1200 MWt and 3400 MWt	$(104+0.009P)

(2) An adjustment factor at least equal to 0.65 L + 0.13 E + 0.22 B is to be used where L and E are escalation factors for labor and energy, respectively, and are to be taken from regional data of U.S. Department of Labor Bureau of Labor Statistics and B is an escalation factor for waste burial and is to be taken from NRC report NUREG–1307, ''Report on Waste Burial Charges.''

* * * * *

(e)(1) Financial assurance is to be provided by the following methods.

(i) *Prepayment.* Prepayment is the deposit made preceding the start of operation or the transfer of a license under § 50.80 into an account segregated from applicant or licensee assets and outside the administrative control of the applicant or licensee and its subsidiaries or affiliates of cash or liquid assets such that the amount of funds would be sufficient to pay decommissioning costs at the time permanent termination of operations is expected. Prepayment may be in the form of a trust, escrow account, or Government fund with payment by, certificate of deposit, deposit of Government or other securities or other method acceptable to the NRC. This trust, escrow account, Government fund, or other type of agreement shall be established in writing and maintained at all times in the United States with an entity that is an appropriate State or Federal Government agency, or an entity whose operations in which the prepayment deposit is managed are regulated and examined by a Federal or State agency. An applicant or licensee that has prepaid funds based on a site-specific estimate under paragraph (b)(1) or (2) of this section may take credit for projected earnings on the prepaid decommissioning trust funds, using up to a 2-percent annual real rate of return from the time of future funds' collection through the projected decommissioning period, provided that the site-specific estimate is based on a period of safe storage that is specifically described in the estimate. This includes the periods of safe storage, final dismantlement, and license termination. An applicant or licensee that has prepaid funds based on a design-specific estimate under paragraph(b)(2) of this section or on the formulas in paragraph (c) of this section may take credit for projected earnings on the prepaid decommissioning funds using up to a 2-percent annual real rate of return up to the time of permanent termination of operations. An applicant or licensee may use a credit of greater than 2 percent if the applicant's or licensee's rate-setting authority has specifically authorized a higher rate. However, applicants or licensees certifying only to design-specific decommissioning cost estimates or formula amounts (*i.e.,* not a site-specific

estimate) can take a pro-rata credit during the immediate dismantlement period (*i.e.,* recognizing both cash expenditures and earnings the first 7 years after shutdown). Actual earnings on existing funds may be used to calculate future fund needs.

(ii) *External sinking fund.* An external sinking fund is a fund established and maintained by setting funds aside periodically in an account segregated from applicant or licensee assets and outside the administrative control of the applicant or licensee and its subsidiaries or affiliates in which the total amount of funds would be sufficient to pay decommissioning costs at the time permanent termination of operations is expected. An external sinking fund may be in the form of a trust, escrow account, or Government fund, with payment by certificate of deposit, deposit of Government or other securities, or other method acceptable to the NRC. This trust, escrow account, Government fund, or other type of agreement shall be established in writing and maintained at all times in the United States with an entity that is an appropriate State or Federal Government agency, or an entity whose operations in which the external sinking fund is managed are regulated and examined by a Federal or State agency. An applicant or licensee that has collected funds based on a site-specific estimate under paragraph (b)(1) or (2) of this section may take credit for projected earnings on the external sinking funds using up to a 2-percent annual real rate of return from the time of future funds' collection through the decommissioning period, provided that the site-specific estimate is based on a period of safe storage that is specifically described in the estimate. This includes the periods of safe storage, final dismantlement, and license termination. An applicant or licensee that has collected funds based on a design-specific estimate under paragraph (b)(2) of this section or on the formulas in paragraph (c) of this section may take credit for collected earnings on the decommissioning funds using up to a 2-percent annual real rate of return up to the time of permanent termination of operations. An applicant or licensee may use a credit of greater than 2 percent if the applicant's or licensee's rate-setting authority has specifically authorized a higher rate. However, applicants or licensees certifying only to design-specific decommissioning cost estimates or formula amounts (*i.e.,* not a site-specific estimate) can take a pro-rata credit during the dismantlement period (*i.e.,* recognizing both cash expenditures and earnings the first 7 years after shutdown). Actual earnings on existing funds may be used to calculate future fund needs. An applicant or licensee, whose rates for decommissioning costs cover only a portion of these costs, may make use of this method only for the portion of these costs that are collected in one of the manners described in this paragraph (e)(1)(ii). This method may be used as the exclusive mechanism relied upon for providing financial assurance for decommissioning in the following circumstances:

(A) By an applicant or licensee that recovers, either directly or indirectly, the estimated total cost of decommissioning through rates established by ''cost of service'' or similar ratemaking regulation. Public utility districts, municipalities, rural electric cooperatives, and State and Federal agencies, including associations of any of the foregoing, that establish their own rates and are able to recover their cost of service allocable to decommissioning, are assumed to meet this condition.

(B) By an applicant or licensee whose source of revenues for its external sinking fund is a ''non-bypassable charge,'' the total amount of which will provide funds estimated to be needed for decommissioning pursuant to paragraph (b), (c), or (f) of this section, or § 50.82.

(iii) *A surety method, insurance, or other guarantee method.*

(A) These methods guarantee that decommissioning costs will be paid. A surety method may be in the form of a surety bond, or letter of credit. Any surety method or insurance used to provide financial assurance for decommissioning must contain the following conditions:

(*1*) The surety method or insurance must be open-ended, or, if written for a specified term, such as 5 years, must be renewed automatically, unless 90 days or more prior to the renewal day the issuer notifies the NRC, the beneficiary, and the applicant or licensee of its intention not to renew. The surety or insurance must also provide that the full-face amount be paid to the beneficiary automatically prior to the expiration without proof of forfeiture if the applicant or licensee fails to provide a replacement acceptable to the NRC within 30 days after receipt of notification of cancellation.

(*2*) The surety or insurance must be payable to a trust established for decommissioning costs. The trustee and trust must be acceptable to the NRC. An acceptable trustee includes an appropriate State or Federal Government agency or an entity that has the authority to act as a trustee and whose trust operations are regulated and examined by a Federal or State agency.

(B) A parent company guarantee of funds for decommissioning costs based on a financial test may be used if the guarantee and test are as contained in appendix A to part 30 of this chapter.

(C) For commercial companies that issue bonds, a guarantee of funds by the applicant or licensee for decommissioning costs based on a financial test may be used if the guarantee and test are as contained in appendix C to part 30 of this chapter. For commercial companies that do not issue bonds, a guarantee of funds by the applicant or licensee for decommissioning costs may be used if the guarantee and test are as contained in appendix D to part 30 of this chapter. For non-profit entities, such as colleges, universities, and non-profit hospitals, a guarantee of funds by the applicant or licensee may be used if the guarantee and test are as contained in appendix E to part 30 of this chapter. A guarantee by the applicant or licensee may not be used in any situation in which the applicant or licensee has a parent company holding majority control of voting stock of the company.

(iv) *Statements of intent.* For a Federal applicant for or holder of a power reactor operating license, or for a Federal, State, or local government applicant or holder of an operating license for a non-power production or utilization facility, a statement of intent containing a cost estimate for decommissioning, and indicating that funds for decommissioning will be obtained when necessary.

(v) *Contractual obligations.* Contractual obligation(s) on the part of an applicant's or licensee's customer(s), the total amount of which over the duration of the contract(s) will provide the applicant's or licensee's total share of uncollected funds estimated to be needed for decommissioning pursuant to paragraph (b), (c), or (f) of this section, or § 50.82. To be acceptable to the NRC as a method of decommissioning funding assurance, the terms of the contract(s) shall include provisions that the electricity buyer(s) will pay for the decommissioning obligations specified in the contract(s), notwithstanding the operational status either of the licensed power reactor to which the contract(s) pertains or force majeure provisions. All proceeds from the contract(s) for decommissioning funding will be deposited to the external sinking fund. The NRC reserves the right to evaluate the terms of any contract(s) and the financial

qualifications of the contracting entity or entities offered as assurance for decommissioning funding.

(vi) *Other mechanisms.* Any other mechanism, or combination of mechanisms, that provides, as determined by the NRC upon its evaluation of the specific circumstances of each application or licensee submittal, assurance of decommissioning funding equivalent to that provided by the mechanisms specified in paragraphs (e)(1)(i) through (v) of this section. Applicants or licensees who do not have sources of funding described in paragraph (e)(1)(ii) of this section may use an external sinking fund in combination with a guarantee mechanism, as specified in paragraph (e)(1)(iii) of this section, provided that the total amount of funds estimated to be necessary for decommissioning is assured.

(2) The NRC reserves the right to take the following steps in order to ensure an applicant's or licensee's adequate accumulation of decommissioning funds: review, as needed, the rate of accumulation of decommissioning funds; and, either independently or in cooperation with the FERC and the applicant's or licensee's State PUC, take additional actions as appropriate on a case-by-case basis, including modification of an applicant's or licensee's schedule for the accumulation of decommissioning funds.

(3) Each holder of a combined license under subpart C of part 52 of this chapter shall, 2 years before and 1 year before the scheduled date for initial loading of fuel, consistent with the schedule required by § 52.99(a) of this chapter, submit a report to the NRC containing a certification updating the information described under paragraph (b) of this section, including a copy of the financial instrument to be used. No later than 30 days after the Commission publishes notice in the **Federal Register** under § 52.103(a) of this chapter, the licensee shall submit a report containing a certification that financial assurance for decommissioning is being provided in an amount specified in the licensee's most recent updated certification, including a copy of the financial instrument obtained to satisfy the requirements of paragraph (e) of this section.

* * * * *

[1] Amounts are based on activities related to the definition of ''Decommission'' in § 50.2 of this part and do not include the cost of removal and disposal of spent fuel or of nonradioactive structures and materials beyond that necessary to terminate the license.

■ 25. In § 50.160, revise the section heading and paragraphs (b)(1)(iv)(A)(2), (b)(3), and (c) to read as follows:

§ 50.160 Performance-based emergency preparedness standards.

* * * * *

(b) * * *

(1) * * *

(iv) * * *

(A) * * *

(*2*) Implement the emergency plan in response to a security event.

* * * * *

(3) *Emergency planning zone.* Determine and describe the boundary and physical characteristics of the EPZ in the emergency plan as required by § 50.33(g)(1) or 53.1109(g)(1) of this chapter.

* * * * *

(c) *Implementation.*

(1) An applicant for an operating license issued under this part after December 18, 2023, must establish, implement, and maintain an emergency preparedness program that meets the requirements of paragraph (b) of this section, as described in the emergency plan and license, and conduct an initial exercise to demonstrate this compliance before the issuance of an operating license for the facility described in the license application.

(2) A holder of a combined license issued under part 52 or 53 of this chapter before the Commission has made the finding under § 52.103(g) or 53.1452(g) of this chapter, must establish, implement, and maintain an emergency preparedness program that meets the requirements of paragraph (b) of this section, as described in the approved emergency plan and license, and conduct an initial exercise to demonstrate this compliance before the scheduled date for initial loading of fuel, or for a fueled manufactured reactor, before the scheduled date for initiating the removal of the features to prevent criticality required under § 53.620(d)(1) of this chapter.

(3) A licensee desiring to change its plume exposure pathway EPZ must submit an application for a license amendment under § 50.90 and receive NRC approval before implementing the change. Any such license amendment request must include documentation demonstrating that the applicable State and local governmental authorities have agreed to the EPZ change.

(4) A licensee desiring to comply with the requirements in appendix E to this part and, for nuclear power reactor licensees, the planning standards in § 50.47(b) in lieu of § 50.160 must submit an application for a license amendment under § 50.90 and receive NRC approval before implementing the change.

■ 26. Add § 50.220 under a new undesignated heading ''Risk-Informed and Performance-Based Alternatives'' consisting of § 50.220 and § 50.221 to read as follows:

Risk-Informed and Performance-Based Alternatives

§ 50.220 Use of risk-informed and performance-based alternatives to acceptance criteria.

(a) For each regulation in this part that provides specific acceptance criteria, licensees or applicants may propose, either through a license amendment request or as part of an application for an initial license, an alternative under paragraph (b) of this section. If a proposal under paragraph (b) of this section includes alternatives to acceptance criteria in more than one regulation in this part, it must analyze the cumulative effect of those changes to ensure that an appropriate level of safety is maintained.

(b) An applicant for or a holder of a construction permit or operating license under this part; or an applicant for or holder of a design approval, operating license, a combined license, or manufacturing license under this chapter; voluntarily choosing to implement this section must submit a license amendment application that contains the following information or include the following information in the initial application:

(1) The specific regulation and the acceptance criteria for which the alternative criteria are being proposed.

(2) The alternative criteria proposed in place of the acceptance criteria. If applicable, the alternative criteria must include either the selected performance targets or a description of the methodology that will be used to determine the performance targets.

(3) A description of the process followed to develop the alternative acceptance criteria. The process must:

(i) Consider results and insights from the plant- or design-specific probabilistic risk assessment (PRA) or systematic risk assessment or combination thereof to show that the alternate proposed criteria establish an equivalent level of safety to the existing acceptance criteria.

(ii) Reasonably reflect the current plant configuration and operating practices, and applicable plant, facility, and industry operational experience.

(iii) Achieve or maintain adequate defense-in-depth.

(iv) Achieve or maintain sufficient safety margins.

(v) Use an integrated panel of plant- or design-knowledgeable members whose collective expertise supports an integrated evaluation of the alternative criteria.

(vi) Include a performance monitoring program that will be used to periodically evaluate whether the alternative criteria remain valid and make timely adjustments to the design and/or operation of the plant or facility as necessary to maintain the validity.

(vii) Include an evaluation of the cumulative effect of the proposed alternative criteria with relevant NRC-approved alternative criteria.

■ 27. Add § 50.221 under the undesignated center heading ''Risk-Informed and Performance-Based Alternatives'' to read as follows:

§ 50.221 Credibility requirements for modeling and simulation.

(a) *Purpose and scope.*

(1) *Purpose.* This regulation establishes requirements for licensees or applicants to voluntarily adopt a verification, validation, and uncertainty quantification (VVUQ) program that will ensure the credibility of models and simulations (M&S), used to demonstrate compliance with NRC safety criteria for nuclear power plants.

(2) *Scope.* A VVUQ program may apply to any model or simulation whose results inform or directly support nuclear power plant safety assessments, performance criteria, regulatory decisions, or otherwise contribute to demonstrating compliance with regulatory requirements.

(b) *Definitions.* For the purpose of this section:

(1) *Credibility* means the degree to which a model's predictions for a specific purpose can be justifiably trusted such that it can be relied upon.

(2) *Verification, validation, and uncertainty quantification (VVUQ)* means activities related to verification, validation, and uncertainty quantification, as well as all other supporting tools and techniques used to establish and demonstrate the credibility of a model or simulation.

(3) *M&S risk* is defined as the combination of the likelihoods that the M&S is incorrect or misleading and the consequences of relying on the incorrect or misleading result for some decision making purpose. Because simulations inherently include multiple potential sources of error, assessing M&S risk is generally a cumulative process. M&S risk can serve as a basis for establishing a tiered review framework, organized into three levels: low, medium, and high.

(i) *Low risk.* Confirmation of the adequacy of VVUQ activities of M&S determined to have low risk may be accomplished using internal quality assurance procedures established by the licensee's or applicant's quality assurance program.

(ii) *Medium risk.* Confirmation of the adequacy of VVUQ activities of M&S determined to have medium risk may be provided by an external organization independent of the internal modeling group.

(iii) *High risk.* Confirmation of the adequacy of VVUQ activities of M&S determined to have high risk require review and approval by the NRC, generally through the submittal of license amendments or topical reports.

(c) *Credibility requirements.* The VVUQ program must establish credibility requirements. Credibility requirements address two complementary elements: the specific activities performed to establish model or simulation credibility (VVUQ Activities), and the evaluation demonstrating that the outcomes of these activities are sufficient and appropriate for the intended use of the model or simulation (VVUQ Assessments). Licensees and applicants may not adopt or rely on a model or simulation covered by the VVUQ program prior to successful completion of VVUQ activities and VVUQ assessments.

(1) *VVUQ activities.* The VVUQ program must specify the activities necessary to establish and ensure the credibility of M&S used in regulatory or safety applications for that specific VVUQ program. The specific activities required depend on the characteristics of the model or simulation, its intended application, and the associated M&S risk. When considering M&S risk, individual error sources and their associated likelihoods and consequences must be evaluated and then combined to quantify the overall risk. In addition to verification, validation, and uncertainty quantification, VVUQ programs may include a range of supporting activities. These include, but are not limited to, sensitivity analyses, scaling evaluations, comparisons against experimental or operational data, and any other relevant methods or techniques needed to adequately establish credibility.

(2) *VVUQ assessments.* The VVUQ program must require an evaluation of the outcomes of the VVUQ activities performed to determine whether they are sufficient to justify trust in the model or simulation for its specific application. This assessment must consider all relevant uncertainties and potential errors associated with the model or simulation, including but not limited to those stemming from computational methods, numerical approximations, input parameters, modeling assumptions, and comparisons to experimental or operational data. The VVUQ program must require identification of the applicability, limitations, and key assumptions inherent to the modeling or simulation approach, ensuring that the depth and rigor of the assessment appropriately reflect the intended use, scope, and associated risk of the specific model or simulation. Assessments must not only evaluate numerical or quantitative outcomes of the VVUQ activities, but also clearly interpret the significance of these outcomes within the context of their intended regulatory application.

■ 28. In appendix A to part 50,

■ a. Under the heading ''Introduction,'' in the last sentence of the last paragraph, remove the word ''must'' and add in its place the word ''may'' and remove the word ''justified.'' and add in its place the phrase ''justified within the licensing submittal without needing an exemption.''

■ b. Under the heading ''Criteria,'' criteria 17, 19, 28, 35, 38, 41, 44, and 50 are revised to read as follows:

Appendix A to Part 50—General Design Criteria for Nuclear Power Plants

* * * * *

Criterion 17—Electric power systems. An onsite electric power system and an offsite electric power system shall be provided to permit functioning of structures, systems, and components important to safety. The safety function for each system (assuming the other system is not functioning) shall be to provide sufficient capacity and capability to assure that:

(1) specified acceptable fuel design limits and design conditions of the reactor coolant pressure boundary are not exceeded as a result of anticipated operational occurrences and

(2) the core is cooled and containment integrity and other vital functions are maintained in the event of postulated accidents.

The onsite electric power supplies, including the batteries, and the onsite electric distribution system, shall have sufficient independence, redundancy, and testability to perform their safety functions assuming a single failure, except for loss-of-coolant accidents involving breaks in the reactor system coolant pressure boundary larger than the transition break size under § 50.46a, where a single failure of the onsite power supplies and electrical distribution system need not be assumed for plants under § 50.46a. For those breaks only, neither a single failure nor the unavailability of offsite power need be assumed.

Electric power from the transmission network to the onsite electric distribution

system shall be supplied by two physically independent circuits (not necessarily on separate rights of way) designed and located so as to minimize, to the extent practical, the likelihood of their simultaneous failure under operating and postulated accident and environmental conditions. A switchyard common to both circuits is acceptable. Each of these circuits shall be designed to be available in sufficient time following a loss of all onsite alternating current power supplies and the other offsite electric power circuit, to assure that specified acceptable fuel design limits and design conditions of the reactor coolant pressure boundary are not exceeded. One of these circuits shall be designed to be available within a few seconds following a loss-of-coolant accident to assure that core cooling, containment integrity, and other vital safety functions are maintained.

Provisions shall be included to minimize the probability of losing electric power from any of the remaining supplies as a result of, or coincident with, the loss of power generated by the nuclear power unit, the loss of power from the transmission network, or the loss of power from the onsite electric power supplies.

* * * * *

Criterion 19—Control room. A control room shall be provided from which actions can be taken to operate the nuclear power unit safely under normal conditions and to maintain it in a safe condition under accident conditions, including loss-of-coolant accidents. The necessary design, fabrication, construction, testing, and performance criteria for structures, systems, and components important to safety are provided to permit occupancy of the control room under accident conditions without calculated radiation exposures in excess of 10 rem (0.10 Sv) whole body, or its equivalent to any part of the body, or a higher design criteria limit established in accordance with paragraph (2) of this section for the duration of the accident. Equipment at appropriate locations outside the control room shall be provided

(1) with a design capability for prompt hot shutdown of the reactor, including necessary instrumentation and controls to maintain the unit in a safe condition during hot shutdown;

(2) with a potential capability for subsequent cold shutdown of the reactor through the use of suitable procedures. Applicants for and holders of construction permits and operating licenses under this part who apply on or after January 10, 1997; applicants for standard design approvals or certifications under part 52 of this chapter who apply on or after January 10, 1997; applicants for and holders of combined licenses or manufacturing licenses under part 52 of this chapter who do not reference a standard design approval or certification; or holders of operating licenses using an alternative source term under § 50.67, shall meet the requirements of this criterion. The necessary design, fabrication, construction, testing, and performance criteria for structures, systems, and components important to safety are provided to permit occupancy of the control room under accident conditions without personnel receiving calculated radiation exposures in excess of 10 rem (0.10 Sv) total effective dose equivalent (TEDE) or a higher design criterion limit established in accordance with paragraph (3) of this section for the duration of the accident; and

(3) with a design criterion limit higher than 10 rem (0.10 Sv) TEDE but not greater than 25 rem [3] (0.25 Sv) TEDE for compliance with paragraph (2) of this section provided the licensee demonstrates that the specified limit is consistent with the plant risk profile or commensurate with the risk of the plant.

* * * * *

Criterion 28—Reactivity limits. The reactivity control systems shall be designed with appropriate limits on the potential amount and rate of reactivity increase to assure that the effects of postulated reactivity accidents can neither

(1) result in damage to the reactor coolant pressure boundary greater than limited local yielding nor

(2) sufficiently disturb the core, its support structures or other reactor pressure vessel internals to impair significantly the capability to cool the core. These postulated reactivity accidents shall include the maximum reactivity insertion and rate resulting from a failure or malfunction of the reactivity control systems, steam line rupture, changes in reactor coolant temperature and pressure, and cold-water addition.

* * * * *

Criterion 35—Emergency core cooling. A system to provide abundant emergency core cooling shall be provided. The system safety function shall be to transfer heat from the reactor core following any loss of reactor coolant at a rate such that

(1) fuel and clad damage that could interfere with continued effective core cooling is prevented and

(2) clad metal-water reaction is limited to negligible amounts.

Suitable redundancy in components and features, and suitable interconnections, leak detection, isolation, and containment capabilities shall be provided to assure that for onsite electric power system operation (assuming offsite power is not available) and for offsite electric power system operation (assuming onsite power is not available) the system safety function can be accomplished, assuming a single failure, except for loss-of-coolant accidents involving breaks in the reactor coolant system boundary larger than the transition break size under § 50.46a. For those breaks only, neither a single failure nor the unavailability of offsite power need be assumed.

* * * * *

Criterion 38—Containment heat removal. A system to remove heat from the reactor containment shall be provided. The system safety function shall be to reduce rapidly, consistent with the functioning of other associated systems, the containment pressure and temperature following any loss-of-coolant accident and maintain them at acceptably low levels.

Suitable redundancy in components and features, and suitable interconnections, leak detection, isolation, and containment capabilities shall be provided to assure that for onsite electric power system operation (assuming offsite power is not available) and for offsite electric power system operation (assuming onsite power is not available) the system safety function can be accomplished, assuming a single failure, except for analysis of loss-of-coolant accidents involving breaks in the reactor coolant pressure boundary larger than the transition break size under § 50.46a. For those breaks only, neither a single failure nor the unavailability of offsite power need be assumed.

* * * * *

Criterion 41—Containment atmosphere cleanup. Systems to control fission products, hydrogen, oxygen, and other substances which may be released into the reactor containment shall be provided as necessary to reduce, consistent with the functioning of other associated systems, the concentration and quality of fission products released to the environment following postulated accidents, and to control the concentration of hydrogen or oxygen and other substances in the containment atmosphere following postulated accidents to assure that containment integrity is maintained.

Each system shall have suitable redundancy in components and features, and suitable interconnections, leak detection, isolation, and containment capabilities to assure that for onsite electric power system operation (assuming offsite power is not available) and for offsite electric power system operation (assuming onsite power is not available) its safety function can be accomplished, assuming a single failure, except for analysis of loss-of-coolant accidents involving breaks in the reactor coolant pressure boundary larger than the transition break size under § 50.46a. For those breaks only, neither a single failure nor the unavailability of offsite power need be assumed.

* * * * *

Criterion 44—Cooling water. A system to transfer heat from structures, systems, and components important to safety, to an ultimate heat sink shall be provided. The system safety function shall be to transfer the combined heat load of these structures, systems, and components under normal operating and accident conditions.

Suitable redundancy in components and features, and suitable interconnections, leak detection, and isolation capabilities shall be provided to assure that for onsite electric power system operation (assuming offsite power is not available) and for offsite electric power system operation (assuming onsite power is not available) the system safety function can be accomplished, assuming a single failure, except for analysis of loss-of-coolant accidents involving breaks in the reactor coolant pressure boundary larger than the transition break size under § 50.46a. For those breaks only, neither a single failure nor the unavailability of offsite power need be assumed.

* * * * *

Criterion 50—Containment design basis. The reactor containment structure, including access openings, penetrations, and the containment heat removal system shall be designed so that the containment structure and its internal compartments can

accommodate, without exceeding the design leakage rate and with sufficient margin, the calculated pressure and temperature conditions resulting from any loss-of-coolant accident. This margin shall reflect consideration of

(1) the effects of potential energy sources which have not been included in the determination of the peak conditions, such as energy in steam generators and as required by § 50.44 energy from metal-water and other chemical reactions that may result from degradation but not total failure of emergency core cooling functioning,

(2) the limited experience and experimental data available for defining accident phenomena and containment responses, and

(3) the conservatism of the calculational model and input parameters.

For reactors designed to comply with § 50.46a, the structural and leak tight integrity of the reactor containment structure, including access openings, penetrations, and its internal compartments, shall be maintained for realistically calculated pressure and temperature conditions resulting from any loss-of-coolant accident larger than the transition break size.

* * * * *

[3] The use of 25 rem (0.25 Sv) whole body, or its equivalent to any part of the body as the control room criterion is not intended to imply that this value constitutes an acceptable limit for emergency doses under accident conditions. This criterion is provided only to assess the acceptability of design provisions, in particular engineered safety features that mitigate fission product release under postulated DBA conditions. The conditions assumed in these analyses, although credible, are of exceedingly low probability of occurrence and do not represent actual accident sequences but are specified as conservative surrogates to create bounding conditions for assessing the acceptability of engineered safety features. Adequate radiological protection for occupationally exposed individuals is provided by the provisions of part 20 of this chapter and § 50.47(b)(11).

■ 29. In appendix E to part 50,

■ a. Revise section I;

■ b. Remove and reserve section II;

■ c. Revise paragraphs IV.3., IV.4., IV.D.2., IV.D.3., IV.E.8.b. introductory text, IV.E.9.d., IV.F.2. introductory text, IV.F.2.a., and IV.F.2.c. second sentence of the introductory text;

■ d. Remove and reserve paragraphs IV.5. through 7.;and

■ c. Revise footnote 1 to read as follows:

Appendix E to Part 50—Emergency Planning and Preparedness for Production and Utilization Facilities

* * * * *

I. Introduction

1. Each applicant for an operating license is required by § 50.34(b) or § 53.1369 of this chapter to include in the final safety analysis report plans for coping with emergencies. Each applicant for a combined license under subpart C of part 52 of this chapter or subpart H of part 53 of this chapter is required by § 52.79 or § 53.1416 of this chapter to include in the application plans for coping with emergencies. Each applicant for an early site permit under subpart A of part 52 or under subpart H of part 53 of this chapter may submit plans for coping with emergencies under § 52.17 or § 53.1146 of this chapter.

2. This appendix establishes minimum requirements for emergency plans for use in attaining an acceptable state of emergency preparedness. These plans shall be submitted as part of the final safety analysis report for an operating license. These plans, or major features thereof, may be submitted as part of the site safety analysis report for an early site permit.

3. The potential radiological hazards to the public associated with the operation of non-power production or utilization facilities licensed under this part and fuel facilities licensed under part 70 of this chapter involve considerations different than those associated with nuclear power reactors. Consequently, the size of Emergency Planning Zones [1] (EPZs) for facilities other than power reactors and the degree to which compliance with the requirements of this section and sections III, IV, and V of this appendix is necessary, will be determined on a case-by-case basis.[2]

4. Notwithstanding the above paragraphs, in the case of an operating license authorizing only fuel loading and/or low power operations up to 5 percent of rated power, no NRC or FEMA review, findings, or determinations concerning the state of offsite emergency preparedness or the adequacy of and the capability to implement State and local offsite emergency plans, as defined in this appendix, are required prior to the issuance of such a license.

5. For power reactors with site-boundary EPZs or no EPZ, the degree to which compliance with the requirements of this section and sections III, IV, and V of this appendix is necessary, will be determined on a case-by-case basis.

6. The Tennessee Valley Authority Watts Bar Nuclear Plant, Unit 2, holding a construction permit under the provisions of part 50 of this chapter, shall meet the requirements of the final rule issued November 23, 2011, as applicable to operating nuclear power reactor licensees.

7. For a fueled manufactured reactor licensed under part 53 of this chapter, the date for initiating the removal of the features to prevent criticality required under § 53.620(d)(1) is equivalent to the initial loading of fuel in this appendix.

II. [Reserved]

* * * * *

IV. * * *

3. Nuclear power reactor licensees shall use evacuation time estimates (ETEs) and updates to the ETEs in the formulation of predetermined, prompt protective action recommendations and shall provide the ETEs and ETE updates to State and local governmental authorities for use in developing offsite predetermined, prompt protective action strategies.

4. Within 365 days of the date of the availability of the most recent decennial census data from the U.S. Census Bureau, nuclear power reactor licensees shall develop an ETE analysis using this decennial data and submit it under § 50.4 or § 53.040 of this chapter to the NRC. These licensees shall submit this ETE analysis to the NRC at least 180 days before using it to form predetermined, prompt protective action recommendations and providing it to State and local governmental authorities for use in developing offsite predetermined, prompt protective action strategies.

5. [Reserved]

6. [Reserved]

7. [Reserved]

* * * * *

D. * * *

2. Provisions shall be described for yearly dissemination to the public within the plume exposure pathway EPZ of basic emergency planning information, such as the methods and times required for public notification and the protective actions planned if an accident occurs, general information as to the nature and effects of radiation, and a listing of media sources that will be used for dissemination of information during an emergency. Signs or other measures shall also be used to disseminate to any transient population within the plume exposure pathway EPZ appropriate information that would be helpful if an accident occurs.

3. A licensee shall have the capability to notify responsible State and local governmental agencies within 15 minutes after declaring an emergency. The licensee shall demonstrate that the appropriate governmental authorities have the capability to make a public alerting and notification decision promptly on being informed by the licensee of an emergency condition. Prior to initial operation greater than 5 percent of rated thermal power of the first reactor at a site, each nuclear power reactor licensee shall demonstrate that means have been established for alerting and providing prompt instructions to the public within the plume exposure pathway EPZ. The design objective of the alert and notification system (ANS) shall be to have the capability to essentially complete the initial alerting and initiate notification of the public within the plume exposure pathway EPZ within about 15 minutes. The use of this alerting and notification capability will range from immediate alerting and notification of the public (within 15 minutes of the time that State and local officials are notified that a situation exists requiring urgent action) to the more likely events where there is substantial time available for the appropriate governmental authorities to make a judgment whether or not to activate the ANS. The alerting and notification capability shall additionally include means for a backup method of ANS capable of being used in the event the primary method of alerting and notification is unavailable during an emergency to alert or notify all or portions of the plume exposure pathway EPZ population. Alternatively, if the ANS capability, as documented in the ANS Design Report, demonstrates that the primary method of alerting and notifying is robust and has multiple methods implemented in parallel, an independent backup method is

unnecessary. If a backup method is necessary, it shall have the capability to alert and notify the public within the plume exposure pathway EPZ, but does not need to meet the 15-minute design objective for the primary prompt public alert and notification system. When there is a decision to activate the alert and notification system, the appropriate governmental authorities will determine whether to activate the entire alert and notification system simultaneously or in a graduated or staged manner. The responsibility for activating such a public alert and notification system shall remain with the appropriate governmental authorities.

E. * * *

8. * * *

b. For a nuclear power reactor licensee's emergency operations facility required by paragraph 8.a of this section, either a facility located outside the EPZ or a backup facility outside the EPZ if the primary facility is within the EPZ or onsite. An emergency operations facility may serve more than one nuclear power reactor site. A licensee desiring to locate an emergency operations facility more than 25 miles from a nuclear power reactor site shall request prior Commission approval by submitting an application for an amendment to its license. For an emergency operations facility located more than 25 miles from a nuclear power reactor site, provisions must be made for locating NRC and offsite responders closer to the nuclear power reactor site so that NRC and offsite responders can interact face-to-face with emergency response personnel entering and leaving the nuclear power reactor site. Provisions for locating NRC and offsite responders closer to a nuclear power reactor site that is more than 25 miles from the emergency operations facility must include the following:

* * * * *

9. * * *

d. Provisions for communications by the licensee with the NRC Headquarters Operations Center from the nuclear power reactor control room, the onsite technical support center, and the emergency operations facility, as applicable. Such communications shall be tested monthly.

* * * * *

F. * * *

2. The plan shall describe provisions for the conduct of emergency preparedness drills and exercises.[3] Licensees must submit scenarios under § 50.4 or § 53.040 of this chapter no later than 60 days before use in a required drill or exercise. These scenarios must document the applicable regulation(s) the scenario is intended to meet.

a. A full participation [4] exercise which tests as much of the licensee, State, and local emergency plans as is reasonably achievable without mandatory public participation shall be conducted for each site at which a power reactor is located in order to validate the effectiveness of the onsite, and if necessary, the offsite emergency plans and offsite coordination.

(i) For an operating license issued under part 50 or part 53 of this chapter, and if there are no preexisting licensed power reactors at this site, this exercise must be conducted before the issuance of the first operating license for full power (one authorizing operation above 5 percent of rated thermal power) of the first reactor and must include participation by each State and local government within the plume exposure pathway EPZ, as applicable. If the applicant currently has an operating reactor at the site with similar onsite and offsite emergency plan elements, this exercise may be included within the operating reactor licensee's existing exercise schedules.

(ii) For a combined license issued under part 52 or part 53 of this chapter, this exercise must be conducted before the scheduled date for initial loading of fuel. If FEMA identifies one or more deficiencies in the state of offsite emergency preparedness as the result of the first full participation exercise, or if the Commission finds that the state of emergency preparedness does not provide reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency, the provisions of § 50.54(gg) apply.

(iii) For a combined license issued under part 52 or part 53 of this chapter, if the applicant currently has an operating reactor at the site with similar onsite and offsite emergency plan elements, this exercise may be included within the operating reactor licensee's existing exercise schedule. If the onsite emergency plan elements are not similar, then paragraph 2.a.(ii) of this section applies.

* * * * *

c. * * * Where the offsite authority has a role under a radiological response plan for more than one site, it shall fully participate in one exercise every two years and shall, at least, partially participate in other offsite plan exercises in this period.[5] * * *

* * * * *

[1] EPZs for power reactors are discussed in NUREG–0396; EPA 520/1–78–016, ''Planning Basis for the Development of State and Local Government Radiological Emergency Response Plans in Support of Light Water Nuclear Power Plants,'' December 1978.

[2] Regulatory Guide 2.6, ''Emergency Planning for Research and Test Reactors and Other Non-Power Production and Utilization Facilities,'' may be used as guidance for the acceptability of non-power production or utilization facility emergency response plans.

[3] Use of site-specific simulators or computers is acceptable for any exercise.

[4] Full participation when used in conjunction with emergency preparedness exercises for a particular site means appropriate offsite local and State authorities and licensee personnel physically and actively take part in testing their integrated capability to adequately assess and respond to an accident at a commercial nuclear power plant. Full participation includes testing major observable portions of the onsite and offsite emergency plans and mobilization of State, local and licensee personnel and other resources in sufficient numbers to verify the capability to respond to the accident scenario.

[5] Partial participation when used in conjunction with emergency preparedness exercises for a particular site means appropriate offsite authorities shall actively take part in the exercise sufficient to test direction and control functions; *i.e.,* (a) protective action decision making related to emergency action levels, and (b) communication capabilities among affected State and local authorities and the licensee.

* * * * *

■ 30. In appendix K to part 50,

■ a. Amend section I by revising paragraph C.6. by removing the text ''BWR's'' and adding, in its place, the text ''BWRs''.

■ b. Amend section II by adding paragraph 6 to read as follows:

Appendix K to Part 50—ECCS Evaluation Models

* * * * *

II. * * *

6. If an entity is approved to implement § 50.46a, then the documentation requirements in § 50.46a(e) apply and supersede the requirements of section II of this appendix for that entity and associated regulatory approval.

■ 31. Add appendix T to read as follows:

Appendix T to Part 50—Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants

I. Introduction and Scope

Nuclear power plants and fuel reprocessing plants include structures, systems, and components (SSCs) that prevent or mitigate the consequences of postulated accidents that could cause undue risk to the health and safety of the public. This appendix establishes quality assurance requirements for the design, manufacture, construction, and operation of those SSCs for applicants of these facilities that meet certain eligibility criteria. Those applicants may elect to use this appendix as an alternative to the quality assurance requirements in appendix B to this part, ''Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants.'' To reference this appendix in an application for a construction permit, operating license, or combined license, an applicant must demonstrate it meets the following criteria:

A. The application is for an nth-of-a-kind construction permit, operating license, or combined license that identifies the first-of-a-kind reference plant in the application and any departures from the first-of-a-kind reference plant;

B. Departures from the first-of-a-kind reference plant do not change the classification, design, and method of manufacture, construction, operation, including the design and operational controls, of structures, systems, and components within the scope of this appendix; and

C. Procedures and work processes for implementing the requirements in this appendix, including a mechanism to identify and promptly correct adverse changes in performance reliability of SSCs within the scope of this appendix, have been established and included in the application.

II. Definitions

First-of-a-kind (FOAK) means those nuclear power plants and fuel reprocessing plants that are the initial implementation of a reactor design or technology or fuel reprocessing plant design that has not been previously constructed and operated at commercial scale.

Functional design criteria means metrics for the performance of SSCs. For SR SSCs, these criteria define performance metrics necessary to demonstrate compliance with the safety criteria in § 53.210. For NSRSS SSCs, these criteria define performance metrics necessary to demonstrate compliance with the safety criteria in § 53.220.

Non-safety-related but safety-significant (NSRSS) structures, systems, and components (SSCs) means those SSCs that are not safety-related but are relied on to achieve adequate defense in depth or perform risk-significant functions and warrant special treatment.

Nth-of-a-kind (NOAK) means those nuclear power plants and fuel reprocessing plants that are subsequent implementations of a reactor design or technology or fuel reprocessing plant design that reference the FOAK plant after the FOAK has been designed, constructed, and operated.

Quality assurance means all those planned and systematic actions necessary to provide adequate confidence that a structure, system, or component will perform satisfactorily in service. Quality assurance includes quality control, which comprises those actions related to the physical characteristics of a material, structure, component, or system to ensure the material, structure, component, or system will meet predetermined requirements.

Quality assurance program means the overall program established to assign responsibilities and authorities, define policies and requirements, and provide for the performance and assessment of work.

Quality management system means a structured framework that documents an organization's processes, procedures, and responsibilities for ensuring quality.

III. General Requirements

A. *Integrated Quality Assurance Program.* The applicant must establish a quality assurance program, document the quality assurance program in the quality management system, and submit the quality management system to the NRC for review and approval. The quality management system must meet the requirements found in Section IV of this appendix. The applicant must implement the approved quality management system. A quality assurance program must be established that ensures that safety-related SSCs, as defined in § 50.2, and NSRSS SSCs, for applications under parts 50 and 52 of this chapter, and safety-related SSCs, as defined in § 53.020, and NSRSS SSCs, for applications under part 53 of this chapter, are designed, fabricated, erected, and tested to quality standards commensurate with the importance of the safety functions those structures, systems, and components perform. In describing the quality assurance program, the quality management system must identify, at the minimum, and explain in detail:

1. All relevant responsibilities and accountabilities of personnel performing functions related to implementation of the quality assurance program, including any delegation of such functions.

2. Measures for ensuring that—

i. the design bases requirements, for those applications under parts 50 and 52 of this chapter, and functional design criteria, for those applications under part 53, of the SSCs within the scope of the quality management system are adequately translated into technical specifications, drawings, procedures, and instructions;

ii. the design is verified to meet technical, quality, and regulatory requirements; and

iii. the as-built and as-operated SSCs are validated to meet the intended function and safety margin.

3. Bidirectional communication pathways for ensuring that all relevant requirements, expectations, concerns, and issues are transmitted through contractual obligations and other means between the applicant or licensee and vendors and third-party suppliers, as appropriate.

4. Measures to—

i. ensure that procured SSCs and related services meet technical and quality requirements; and

ii. to assess the capability of vendors or third-party suppliers that supply the SSCs and related services to meet expectations for product, service, or operational quality.

5. Measures established to—

i. verify and validate that products and services meet the technical and quality requirements of the procured products and services; and

ii. audit the vendors or third-party suppliers that are providing the products and services.

6. Processes implemented to identify, correct, and prevent reoccurrence of issues and failures that could adversely impact quality, safety, and regulatory compliance.

7. Recordkeeping and documentation protocols for the quality assurance program that support demonstrating that SSCs are properly designed, fabricated, erected, and tested to quality standards commensurate with the importance of the safety functions those components perform.

B. *Quality Assurance Program Development and Implementation.* The quality assurance program, as documented in the quality management system, must:

1. Contain a graded approach for all quality assurance activities based on the safety significance of the applicable covered SSCs. A graded approach must be used to implement the requirements of the quality assurance program.

i. The implementation of a graded approach must ensure quality assurance efforts are focused in proportion to the risks associated with a product, process, or project.

ii. A graded approach must provide a process for ensuring that the level of analysis, documentation, and actions used to comply with a requirement are commensurate with:

a. The relative importance to safety, safeguards, and security of each structure, system, and component that is governed by the quality assurance program.

b. The magnitude of any hazard involved.

c. The life-cycle stage of a facility.

d. The type of facility.

e. The particular characteristics of a facility.

f. The relative importance to radiological hazards.

g. Any other relevant factors.

iii. The basis of any graded approach must be documented for each applicable quality assurance requirement of this regulation and must be submitted as part of an application. The graded approach may not be used to negate any other applicable requirements.

2. The quality management system must describe how the requirements in Section IV of this appendix are met.

3. The applicable quality assurance requirements must be included in procurement documents from the applicant to all relevant contractors, vendors, suppliers, and third-parties.

4. Document the selection of American Society of Mechanical Engineers (ASME) Nuclear Quality Assurance (NQA)–1, ''Quality Assurance Requirements for Nuclear Facility Applications'' in accordance with § 50.55a(a)(1)(v)(B) or another appropriate industry standard.

i. The necessary level of detail from the standard(s) must be described to achieve quality consistent with regulatory requirements.

ii. Gaps between the selected industry standard(s) and Section IV of this appendix must be addressed within the quality management system.

IV. Quality Assurance Requirements

A. *Quality Assurance Criteria.* For all applications under this appendix, the quality assurance program must establish, identify, and implement processes for meeting the following criteria.

1. Criterion 1—Management: Program.

i. Establish an organizational structure, functional responsibilities, levels of authority, and interfaces for those managing, performing, and assessing quality assurance activities conducted pursuant to this appendix.

ii. Establish management processes, including planning, scheduling, and providing resources, for quality assurance activities conducted pursuant to this appendix.

2. Criterion 2—Management: Personnel Training and Qualification.

i. Ensure that personnel receive training and qualifications to be capable of performing their assigned work for activities covered by this appendix.

ii. Ensure continuing training to personnel to maintain their job proficiency for activities covered by this appendix.

3. Criterion 3—Management: Quality Improvement.

i. Ensure detection and prevention of quality problems for SSCs and activities covered by this appendix.

ii. Identify, control, and correct materials, parts, or components that do not meet established requirements.

iii. Identify the causes of problems and include prevention of recurrence as a part of corrective action planning.

iv. Identify and select opportunities for improvement for the quality assurance program.

4. Criterion 4—Management: Documents and the Associated Records.

i. Prepare, review, approve, issue, use, and revise documents to prescribe processes, specify requirements, or establish designs for SSCs and activities covered by this appendix.

ii. Specify, prepare, review, approve, and maintain these documents as records.

5. Criterion 5—Performance: Work Processes.

i. Perform work consistent with technical standards, administrative controls, and other hazard controls adopted to meet regulatory requirements using approved instructions, procedures, or other appropriate means.

ii. Identify and control materials, parts, and components, including partially fabricated assemblies, to ensure proper use.

iii. Maintain material and equipment to prevent damage, loss, or deterioration.

iv. Calibrate and maintain equipment used for activities affecting quality.

6. Criterion 6—Performance: Design.

i. Design of SSCs and design processes using sound engineering or scientific principles and appropriate standards.

ii. Incorporate applicable requirements, design bases, as defined in § 50.2, and functional design criteria in design work and design changes.

iii. Identify and control design interfaces.

iv. Verify and validate the adequacy of the design of structures, systems, and components using individuals or groups other than those who performed the work.

v. Verify the adequacy of the design of structures, systems, and components before approval and implementation of the design.

vi. Validate the design of the structure, system and components before relying on the structures, systems, and components to perform their intended safety function.

7. Criterion 7—Performance: Procurement.

i. Procure items and services that meet established requirements and verify items and services perform as specified.

ii. Evaluate and select prospective suppliers on the basis of specified criteria that will ensure the requirements of this appendix are met.

iii. Ensure that approved suppliers continue to provide acceptable items and services.

8. Criterion 8—Performance: Inspection and Acceptance Testing.

i. Inspect and test specified items, services, and processes using established acceptance and performance criteria.

ii. Calibrate and maintain equipment used for inspections and tests.

9. Criterion 9—Performance: Maintenance of structures, systems, and components. Control the storage of structures, systems, and components consistent with appropriate cleanliness and environmental standards.

10. Criterion 10—Assessment: Management Assessment. Ensure that managers assess their management processes and identify and correct problems that hinder the organization from achieving its objectives.

11. Criterion 11—Assessment: Independent Assessment.

i. Plan and conduct independent assessments to measure item and service quality, the adequacy of work performance, and to promote improvement.

ii. Establish sufficient authority and freedom from line management for independent assessment teams.

iii. Ensure personnel who perform independent assessments are technically qualified and knowledgeable in the areas to be assessed.

B. *Quality Assurance for Software Used in Design and Analysis, and Digital Items Important to Safety.* Processes for software quality assurance must be identified, established, and implemented within the quality assurance program and documented in the quality management system.

1. Software quality assurance processes must be applied to software used—

i. in digital items for SSCs within the scope of this appendix;

ii. for design verification for SSCs within the scope of this appendix; and

iii. for design analysis of SSCs within the scope of this appendix.

2. Software used for the applications identified in paragraph 1 of this section must be documented, managed, and controlled throughout its life cycle to ensure that the safety functions will be performed under design basis conditions.

3. Appropriate national or international software engineering standard(s) must be used (*e.g.,* ASME, Institute for Electrical and Electronics Engineers (IEEE), National Institutes of Standards and Technology (NIST), American Nuclear Society (ANS), etc.). These standards may include combinations of standards.

PART 51—ENVIRONMENTAL PROTECTION REGULATIONS FOR DOMESTIC LICENSING AND RELATED REGULATORY FUNCTIONS

■ 32. The authority citation for part 51 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 161, 193 (42 U.S.C. 2201, 2243); Energy Reorganization Act of 1974, secs. 201, 202 (42 U.S.C. 5841, 5842); National Environmental Policy Act of 1969 (42 U.S.C. 4332, 4334, 4335); Nuclear Waste Policy Act of 1982, secs. 144(f), 121, 135, 141, 148 (42 U.S.C. 10134(f), 10141, 10155, 10161, 10168); 44 U.S.C. 3504 note.

Sections 51.20, 51.30, 51.60, 51.80, and 51.97 also issued under Nuclear Waste Policy Act secs. 135, 141, 148 (42 U.S.C. 10155, 10161, 10168).

Section 51.22 also issued under Atomic Energy Act sec. 274 (42 U.S.C. 2021) and under Nuclear Waste Policy Act sec. 121 (42 U.S.C. 10141).

Sections 51.43, 51.67, and 51.109 also issued under Nuclear Waste Policy Act sec. 114(f) (42 U.S.C. 10134(f)).

■ 33. In 51.4, revise the definition for ''*Construction*'' to read as follows:

§ 51.4 Definitions.

* * * * *

Construction means:

(1) For production and utilization facilities, the activities in paragraph (1)(i) of this definition.

(i) Activities constituting construction are the driving of piles, subsurface preparation, placement of backfill, concrete, or permanent retaining walls within an excavation, installation of foundations, or in-place assembly, erection, fabrication, or testing, which are for:

(A) Safety-related structures, systems, or components (SSCs) of a facility, as defined in § 50.2 of this chapter;

(B) SSCs that perform safety-significant functions; and

(C) SSCs necessary to comply with part 73 of this chapter.

(ii) With respect to production or utilization facilities, other than testing facilities and nuclear power plants, required to be licensed under section 104a. or section 104c. of the Act, construction does not include the erection of buildings which will be used for activities other than operation of a facility and which may also be used to house a facility (*e.g.,* the construction of a college laboratory building with space for installation of a training reactor).

(iii) Any activities that are determined to be outside the scope of those defined in the definition of construction in § 51.4 and that are undertaken by an applicant or on its behalf are entirely at the risk of the applicant and has no bearing on the issuance of an environmental assessment, environmental impact statement or finding of no significant impact with respect to NRC's regulated activities under the requirements of the Act, and rules, regulations issued under the Act.

(2) For materials licenses, taking any site-preparation activity at the site of a facility subject to the regulations in parts 30, 36, 40, and 70 of this chapter that has a reasonable nexus to radiological health and safety or the common defense and security; provided, however, that construction does not mean taking any other action that has no reasonable nexus to radiological health and safety or the common defense and security.

* * * * *

■ 34. In § 51.51, revise table note 1 of table S–3 to read as follows:

§ 51.51 Uranium fuel cycle environmental data—Table S–3.

* * * * *

(b) * * *

TABLE S–3—TABLE OF URANIUM FUEL CYCLE ENVIRONMENTAL DATA [1]

[Normalized to model LWR annual fuel requirement [WASH–1248] or reference reactor year [NUREG–0116]] [See footnotes at end of this table]

* * * * * * *

[1] In some cases where no entry appears it is clear from the background documents that the matter was addressed and that, in effect, the table should be read as if a specific zero entry had been made. However, there are other areas that are not addressed at all in the table. Table S–3 does not include health effects from the effluents described in the table or estimates of releases of Radon-222 from the uranium fuel cycle or estimates of Technetium-99 released from waste management or reprocessing activities. These issues may be the subject of litigation in the individual licensing proceedings.

Data supporting this table are given in the ''Environmental Survey of the Uranium Fuel Cycle,'' WASH–1248, April 1974; the ''Environmental Survey of the Reprocessing and Waste Management Portion of the LWR Fuel Cycle,'' NUREG–0116 (Supp.1 to WASH–1248); the ''Public Comments and Task Force Responses Regarding the Environmental Survey of the Reprocessing and Waste Management Portions of the LWR Fuel Cycle,'' NUREG–0216 (Supp. 2 to WASH–1248); and in the record of the final rulemaking pertaining to Uranium Fuel Cycle Impacts from Spent Fuel Reprocessing and Radioactive Waste Management, Docket RM–50–3. The contributions from reprocessing, waste management and transportation of wastes are maximized for either of the two fuel cycles (uranium only and no recycle). The contribution from transportation excludes transportation of cold fuel to a reactor and of irradiated fuel and radioactive wastes from a reactor which are considered in table S–4 of § 51.20(g). The contributions from the other steps of the fuel cycle are given in columns A–E of table S–3A of WASH–1248.

The analysis in NUREG–2249, ''Generic Environmental Impact Statement for Licensing of New Nuclear Reactors—Final Report,'' December 2025, extends this table up to an enrichment of 20.0 weight percent uranium-235 for environmental effects of uranium recovery (which replaced uranium mining and milling), the production of uranium hexafluoride, gaseous centrifuge isotopic enrichment (which replaced gaseous diffusion isotopic enrichment), and fuel fabrication. The analysis in NUREG–2266, ''Environmental Evaluation of Accident Tolerant Fuels with Increased Enrichment and Higher Burnup Levels,'' July 2024, extends the assembly averaged level of burnup of the irradiated fuel from the reactor of up to 80,000 megawatt-days per metric ton as related to uranium fuel cycle activities.

* * * * *

■ 35. Revise and republish § 51.52 to read as follows:

§ 51.52 Environmental effects of transportation of fuel and waste—Table S–4.

Under § 51.50, every environmental report prepared for the construction permit stage or early site permit stage or combined license stage of a light-water-cooled and other than light-water-cooled nuclear power reactor, and submitted after February 4, 1975, must contain a statement concerning transportation of fuel and radioactive wastes to and from the reactor. That statement must indicate that the reactor and this transportation meet either all of the conditions in paragraph (a) of this section or all of the conditions of paragraph (b) of this section.

(a)

(1) The reactor has a core thermal power level not exceeding 3,800 megawatts;

(2) The reactor fuel is in the form of sintered uranium dioxide pellets having a uranium-235 enrichment not exceeding 8% by weight, and the pellets are encapsulated in zircaloy rods;

(3) The average level of irradiation of the irradiated fuel from the reactor does not exceed 80,000 megawatt-days per metric ton, and no irradiated fuel assembly is shipped until at least 90 days after it is discharged from the reactor;

(4) With the exception of irradiated fuel, all radioactive waste shipped from the reactor is packaged and in a solid form;

(5) Unirradiated fuel is shipped to the reactor by truck; irradiated fuel is shipped from the reactor by truck, rail, or barge; and radioactive waste other than irradiated fuel is shipped from the reactor by truck or rail; and

(6) The environmental impacts of transportation of fuel and waste to and from the reactor, with respect to normal conditions of transport and possible accidents in transport, are as set forth in summary table S–4 in paragraph (c) of this section; and the values in the table represent the contribution of the transportation to the environmental costs of licensing the reactor.

(b) For light-water-cooled and other than light-water-cooled reactors not meeting the conditions of paragraph (a) of this section, the statement must contain a full description and detailed analysis of the environmental effects of transportation of fuel and wastes to and from the reactor, including values for the environmental impact under normal conditions of transport and for the environmental risk from accidents in transport. The statement must indicate that the values determined by the analysis represent the contribution of such effects to the environmental costs of licensing the reactor.

(c)

BILLING CODE 7590–01–P

Summary Table S–4—Environmental Impact of Transportation of Fuel and Waste To and From One Nuclear Power Reactor [1], [2] Normal Conditions of Transport

	Environmental impact
Heat (per irradiated fuel cask in transit)	250,000 Btu/hr
Weight (governed by Federal or State restrictions)	80,000 lb per truck; up to 210 tons per cask per rail car
Traffic density:	
Truck	Less than 1 per day
Rail	Less than 3 per month

Exposed population	Estimated number of persons exposed	Range of doses to exposed individuals[3] (per reactor year)
Transportation workers	200	0.01 to 300 millirem
General public:		
Onlookers	107,000	0.003 to 1.3 millirem
Along Route	1,362,000	0.0001 to 0.06 millirem

Accidents in Transport

	Environmental risk
Radiological effects	Small[4]
Common (nonradiological) causes	1 fatal injury in 100 reactor years; 1 nonfatal injury in 10 reactor years.

[1] Data supporting this table are given in the Commission's "Environmental Survey of Transportation of Radioactive Materials to and from Nuclear Power Plants," WASH–1238, December 1972; and Supp. 1 of NUREG–75/038, April 1975. Both documents are available for inspection and copying at the Commission's Public Document Room, One White Flint North, 11555 Rockville Pike (first floor), Rockville, Maryland 20852 and may be obtained from National Technical Information Service, Springfield, VA 22161. The WASH–1238 is available from NTIS at a cost of $5.45 (microfiche, $2.25) and NUREG–75/038 is available at a cost of $3.25 (microfiche, $2.25).

[2] The analysis in NUREG-2266, "Environmental Evaluation of Accident Tolerant Fuels with Increased Enrichment and Higher Burnup Levels," July 2024, extends this table up to an enrichment of 8 weight percent uranium-235 and the assembly averaged level of irradiation of the irradiated fuel from the reactor of up to 80,000 megawatt-days per metric ton for UO_2 fuel and increases the estimated number of general public members exposed to radiation for the environmental impact of transportation of fuel and waste to and from one nuclear power reactor. The analysis in NUREG-2249, "Generic Environmental Impact Statement for Licensing of New Nuclear Reactors - Final Report," December 2025, extends this table to TRISO fuel with peak pellet burnup of up to133,000 MWd/MTU.

[3] The Federal Radiation Council has recommended that the radiation doses from all sources of radiation other than natural background and medical exposures should be limited to 5,000 millirem per year for individuals as a result of occupational exposure and should be limited to 500 millirem per year for individuals in the general population. The dose to individuals due to average natural background radiation is about 130 millirem per year.

[4] The environmental risk of radiological effects stemming from transportation accidents is small regardless of whether it is being applied to a single reactor or a multireactor site. Radioactive material would not be released in an accident if the fuel is contained in an inner welded canister inside the transport package. Only rail transport packages without inner welded canisters would release radioactive material and only then in exceptionally severe accidents.

BILLING CODE 7590–01–C

PART 52—LICENSES, CERTIFICATIONS, AND APPROVALS FOR NUCLEAR POWER PLANTS

■ 36. The authority citation for part 52 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 103, 104, 147, 149, 161, 181, 182, 183, 185, 186, 189, 223, 234 (42 U.S.C. 2133, 2134, 2167, 2169, 2201, 2231, 2232, 2233, 2235, 2236, 2239, 2273, 2282); Energy Reorganization Act of 1974, secs. 201, 202, 206, 211 (42 U.S.C. 5841, 5842, 5846, 5851); 44 U.S.C. 3504 note.

■ 37. In § 52.1, in paragraph (a), add in alphabetical order the definitions ''*Tier 1*'', ''*Tier 2*'', and ''*Tier 2**'' to read as follows:

§ 52.1 Definitions.

(a) * * *

Tier 1 means, for design certifications issued after [EFFECTIVE DATE OF FINAL RULE], the qualitative and functional-level portion of the design-related information contained in the generic design control document, including ITAAC, that is approved and certified by a standard design certification. The design descriptions, interface requirements, and site parameters are derived from Tier 2 information. For design certifications issued prior to [EFFECTIVE DATE OF FINAL RULE], see the definition of this term in the applicable appendix to this part.

Tier 2 means, for design certifications issued after [EFFECTIVE DATE OF FINAL RULE], the portion of the design-related information contained in the generic design control document that is approved, but not certified, by a standard design certification. Compliance with Tier 2 is required, but generic changes to, and plant specific departures from, Tier 2 are governed by the process set out in the applicable appendix to this part. Compliance with Tier 2 provides a sufficient, but not the only acceptable, method for complying with Tier 1. Compliance methods differing from Tier 2 must satisfy the change process in the applicable appendix to this part. Regardless of these differences, an applicant or licensee must meet the requirement in the applicable appendix to this part to reference Tier 2 when referencing Tier 1. For design certifications issued prior to [EFFECTIVE DATE OF FINAL RULE], see the definition of this term in the applicable appendix to this part.

*Tier 2** means, for design certifications issued after [EFFECTIVE DATE OF FINAL RULE], the portion of the Tier 2 information containing the qualitative and functional-level portion of design-related information, designated as such in the generic design control document, that is subject to the change process for such information that is specified in a standard design certification rule. After a plant first achieves full power, Tier 2* information in the plant-specific design control document for that plant reverts to Tier 2 status and is thereafter subject to the change and departure provisions for Tier 2 information. For design certifications issued prior to [EFFECTIVE DATE OF FINAL RULE], see the definition of this term in the applicable appendix to this part.

* * * * *

§ 52.15 [Amended]

■ 38. In § 52.15, in paragraph (c), remove the word ''renewal'' and add in its place the word ''amendment''.

■ 39. In § 52.17, revise paragraph (a)(1)(ix) and footnotes 1 and 2 to read as follows:

§ 52.17 Contents of applications; technical information.

(a) * * *

(1) * * *

(ix) A description and safety assessment of the site on which a facility is to be located. The assessment must contain an analysis and evaluation of the major structures, systems, and components of the facility that bear significantly on the acceptability of the site under the radiological consequence evaluation factors identified in paragraphs (a)(1)(ix)(A) and (a)(1)(ix)(B) of this section. In performing this assessment, an applicant shall assume a fission product release [1] assuming that the facility is operated at the ultimate power level contemplated. The applicant shall perform an evaluation and analysis of the postulated fission product release, using the expected demonstrable leakage rates from potential flow paths and any fission product cleanup systems intended to mitigate the consequences of the accidents, together with applicable site characteristics, including site meteorology, to evaluate the offsite radiological consequences. Site characteristics must comply with part 100 of this chapter. The evaluation must determine that:

(A) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 25 rem [2] (0.25 Sv) total effective dose equivalent (TEDE).

(B) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of 25 rem (0.25 Sv) TEDE;

* * * * *

[1] The fission product release assumed for this evaluation should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents. These accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[2] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this number constitutes an acceptable limit for an emergency dose to the public under accident conditions. Rather, this dose value has been set forth in this section as a reference value, which can be used in the evaluation of plant design features with respect to postulated reactor accidents, to assure that these designs provide assurance of low risk of public exposure to radiation, in the event of an accident.

■ 40. Revise § 52.18 to read as follows:

§ 52.18 Standards for review of applications.

Applications for the initial issuance of an early site permit filed under this subpart will be reviewed according to the applicable standards set out in part 50 of this chapter and its appendices and part 100 of this chapter. In addition, the Commission shall prepare an environmental impact statement during review of the application, in accordance with the provisions of part 51 of this chapter. The Commission shall determine, after consultation with Federal Emergency Management Agency, as applicable, whether the information required of the applicant by § 52.17(b)(1) shows that there is not a significant impediment to the development of emergency plans that cannot be mitigated or eliminated by measures proposed by the applicant, whether any major features of emergency plans submitted by the applicant under § 52.17(b)(2)(i) are acceptable in accordance with either the requirements in § 50.160 of this chapter, or the requirements in appendix E to part 50 of this chapter and § 50.47(b) of this chapter, and whether any emergency plans submitted by the applicant under § 52.17(b)(2)(ii) provide reasonable assurance that adequate protective measures can and will be taken in the event of a radiological emergency.

§ 52.25 [Amended]

■ 41. In § 52.25, in the first sentence, remove the phrase ''performed and the site is not referenced in an application

for a construction permit or a combined license issued under subpart C of this part while the permit remains valid,'' and add in its place the phrase ''performed, and the early site permit holder has applied for termination,''.

■ 42. In § 52.26, revise paragraph (a) and remove and reserve paragraph (b) to read as follows:

§ 52.26 Duration of permit.

(a) An early site permit issued under this subpart will be issued with no fixed term.

(b) [Reserved]

* * * * *

■ 43. Revise § 52.29 to read as follows:

§ 52.29 Application for amendment to update an early site permit.

(a) An early site permit holder may choose to submit an application to amend an early site permit to update the data and information on which the permit is based at any time after issuance of the early site permit. The early site permit holder may provide updated information on as many issues as the early site permit holder chooses and may request to extend the period for which the agency will afford those issues finality up to 20 additional years from the date of the amendment's issuance. The early site permit holder may request such an extension for an already extended permit. The application must meet the requirements of §§ 50.90 and 50.92 of this chapter.

(b) An application submitted under paragraph (a) of this section must contain all information necessary to bring up to date the information and data contained in the previous application for those issues the early site permit holder has chosen to update.

(c) Each application must include an environmental report as required by part 51 of this chapter, or a request and justification for a categorical exclusion under part 51 of this chapter.

(d) Any person whose interest may be affected by the update of the permit may request a hearing on the application for the update. The request for a hearing must comply with § 2.309 of this chapter. If a hearing is granted, notice of the hearing will be published in accordance with § 2.309 of this chapter.

■ 44. Revise § 52.31 to read as follows:

§ 52.31 Issuance of amendment to update an early site permit.

The Commission shall grant amendment of an early site permit only if it determines that:

(a) The site complies with the Act, the Commission's regulations, and orders applicable and in effect at the time the site permit was originally issued, except early site permits issued before [EFFECTIVE DATE OF THE FINAL RULE] are no longer subject to § 52.26(a); and

(b) Any new requirements the Commission may wish to impose are necessary for adequate protection to public health and safety or common defense and security.

§ 52.33 [Removed and Reserved]

■ 45. Remove and reserve § 52.33.

■ 46. Revise § 52.35 to read as follows:

§ 52.35 Use of site for other purposes.

(a) A site for which an early site permit has been issued under this subpart may be used for purposes other than those described in the permit, including the location of other types of energy facilities. The permit holder shall inform the Director, Office of Nuclear Reactor Regulation (Director), of any significant uses for the site which have not been approved in the early site permit. The information about the activities must be given to the Director at least 30 days in advance of any actual construction or site modification for the activities. The information provided could be the basis for imposing new requirements on the permit, in accordance with the provisions of § 52.39.

(b) If the permit holder no longer intends to use the site for a nuclear power plant or for other reasons no longer wishes to hold the permit, as described in the request, the permit holder may at any time request the Director to terminate the early site permit. The request to terminate the permit must comply with the filing requirements of §§ 52.3 and 50.30 of this chapter, and identify the applicable requirements for site redress of § 52.25. Upon request, the Director may terminate the permit.

(c) Termination of the early site permit does not bar the permit holder or another applicant from filing a new application for the site.

■ 47. In § 52.39,

■ a. In paragraph (a)(1), remove the references ''§§ 52.26 or 52.33'' and add in its place the reference ''§ 52.26'';

■ b. In paragraph (a)(2) introductory text, remove the word ''renewal'' and add in its place the word ''amendment'';

■ c. Revise paragraphs (c)(1)(iv) and (v);

■ d. Add paragraph (c)(1)(vi);

■ e. In paragraph (d), remove the word ''renewed'' and add in its place the word ''amended''; and

■ f. In paragraph (e), remove the references ''10 CFR 50.90 and 50.92'' and add in its place the references ''§§ 50.90, 50.92, and 52.29 of this chapter''.

The revisions and additions are to read as follows:

§ 52.39 Finality of early site permit determinations.

* * * * *

(c) * * *

(1) * * *

(iv) New or additional information is provided in the application that substantially alters the bases for a previous NRC conclusion or constitutes a sufficient basis for the Commission to modify or impose new terms and conditions related to emergency preparedness;

(v) The information as required in the site safety analysis report in accordance with § 52.17(a)(1)(vi) through (ix) has not been updated after 20 years from the date of early site permit issuance or a previous update of the permit by amendment, whichever is later; and

(vi) (A) Any significant environmental issue that was not resolved in the early site permit proceeding;

(B) For an application that references an early site permit issued or updated by amendment, whichever is later, no more than 20 years before the submission of the application, any issue involving the impacts of construction and operation of the facility that was resolved in the early site permit proceeding for which significant new information has been identified; or

(C) For an application that references an early site permit, issued or updated by amendment, whichever is later, more than 20 years before submission of the application, any issue involving the impacts of construction and operation of the facility regardless of whether the early site permit proceeding resolved the issue.

* * * * *

■ 48. In § 52.47,

■ a. Revise paragraph (a)(2)(iv);

■ b. In paragraph (a)(4), remove the last sentence; and

■ c. Redesignate footnotes 3 and 4 as footnotes 1 and 2 and revise footnotes 1 and 2 to read as follows:

§ 52.47 Contents of applications; technical information.

* * * * *

(a) * * *

(2) * * *

(iv) The safety features that are to be engineered into the facility and those barriers that must be breached as a result of an accident before a release of radioactive material to the environment can occur. Special attention must be directed to plant design features intended to mitigate the radiological consequences of accidents. In performing this assessment, an

applicant shall assume a fission product release [1] assuming that the facility is operated at the ultimate power level contemplated. The applicant shall perform an evaluation and analysis of the postulated fission product release, using the expected demonstrable leakage rates from potential flow paths and any fission product cleanup systems intended to mitigate the consequences of the accidents, together with applicable postulated site parameters, including site meteorology, to evaluate the offsite radiological consequences. The evaluation must determine that:

(A) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 25 rem [2] (0.25 Sv) total effective dose equivalent (TEDE);

(B) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of 25 rem (0.25 Sv) TEDE;

* * * * *

[1] The fission product release assumed for this evaluation should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents. These accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[2] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this number constitutes an acceptable limit for an emergency dose to the public under accident conditions. Rather, this dose value has been set forth in this section as a reference value, which can be used in the evaluation of plant design features with respect to postulated reactor accidents, to assure that these designs provide assurance of low risk of public exposure to radiation, in the event of an accident.

■ 49. In § 52.54, revise paragraph (a) introductory text and paragraph (b) to read as follows:

§ 52.54 Issuance of standard design certification.

(a) After conducting a rulemaking proceeding under § 52.51 on an application for a standard design certification and receiving the report to be submitted by the Advisory Committee on Reactor Safeguards under § 52.53, the Commission may issue a standard design certification in the form of a rule for the design that is the subject of the application, if the Commission determines that:

* * * * *

(b) The standard design certification rule must specify the site parameters, design characteristics, and any additional requirements and restrictions of the standard design certification rule. A standard design certification rule that was reviewed and approved as meeting the requirements of § 50.46a of this chapter must specify the criteria governing departures that a referencing combined license must meet. The criteria must ensure that the safety bases for the NRC's approval of the certified design's compliance with § 50.46a of this chapter (including applicability of the transition break size) continue to apply despite the departure.

* * * * *

■ 50. In § 52.63,

■ a. In paragraph (a)(1)(v) at the end of the sentence, add the word ''or'' after ''information;'';

■ b. In paragraph (a)(1)(vi) at the end of the sentence, remove the phrase ''security; or'' and add in its place the word ''security.'';

■ c. Remove paragraph (a)(1)(vii); and

■ d. Revise paragraphs (a)(4)(ii) and (b)(1) to read as follows:

§ 52.63 Finality of standard design certifications.

(a) * * *

(4) * * *

(ii) Special circumstances as defined in § 52.7 are present.

* * * * *

(b)

(1) An applicant or licensee who references a design certification rule may request an exemption from one or more elements of the certification information if one is required by the applicable change process within the referenced design certification rule. The Commission may grant such a request only if it determines that the exemption will comply with the requirements of § 52.7. The granting of an exemption on request of an applicant is subject to litigation in the same manner as other issues in the operating license or combined license hearing.

* * * * *

■ 51. In § 52.79,

■ a. Revise and republish paragraphs (a)(1)(vi), (a)(2)(iv), (a)(5), (a)(21), (a)(25), (a)(27), (a)(36)(i), and (b);

■ b. Add paragraph (a)(48); and

■ c. Redesignate footnotes 5 through 8 as footnotes 1 through 4 and revise footnotes 1 through 4 to read as follows:

§ 52.79 Contents of applications; technical information in final safety analysis report.

(a) * * *

(1) * * *

(vi) A description and safety assessment of the site on which the facility is to be located. The assessment must contain an analysis and evaluation of the major structures, systems, and components of the facility that bear significantly on the acceptability of the site under the radiological consequence evaluation factors identified in paragraphs (a)(1)(vi)(A) and (a)(1)(vi)(B) of this section. In performing this assessment, an applicant shall assume a fission product release [1] assuming that the facility is operated at the ultimate power level contemplated. The applicant shall perform an evaluation and analysis of the postulated fission product release, using the expected demonstrable leakage rates from potential flow paths and any fission product cleanup systems intended to mitigate the consequences of the accidents, together with applicable site characteristics, including site meteorology, to evaluate the offsite radiological consequences. Site characteristics must comply with part 100 of this chapter. The evaluation must determine that:

(A) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 25 rem [2] (0.25 Sv) total effective dose equivalent (TEDE).

(B) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of 25 rem (0.25 Sv) TEDE; and

(2) * * *

(iv) The safety features that are to be engineered into the facility and those barriers that must be breached as a result of an accident before a release of radioactive material to the environment can occur. Special attention must be directed to plant design features intended to mitigate the radiological consequences of accidents. In performing this assessment, an applicant shall assume a fission product release [3] assuming that the facility is operated at the ultimate power level contemplated;

* * * * *

(5) An analysis and evaluation of the design and performance of structures, systems, and components with the objective of assessing the risk to public health and safety resulting from operation of the facility and including determination of the margins of safety

during normal operations and transient conditions anticipated during the life of the facility, and the adequacy of structures, systems, and components provided for the prevention of accidents and the mitigation of the consequences of accidents.

* * * * *

(21) Emergency plans complying with either the requirements in § 50.160 of this chapter, or the requirements in appendix E to part 50 of this chapter and § 50.47(b) of this chapter;

* * * * *

(25) A description of the quality assurance program or a quality management system, applied to the design, and to be applied to the fabrication, construction, and testing, of the structures, systems, and components of the facility. Appendix B to part 50 of this chapter sets forth the requirements for quality assurance programs for nuclear power plants. The description of the quality assurance program for a nuclear power plant must include a discussion of how the applicable requirements of appendix B to part 50 of this chapter have been and will be satisfied, including a discussion of how the quality assurance program will be implemented or for eligible combined license applications. Appendix T to part 50 of this chapter, ''Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' sets forth streamlined requirements for quality assurance programs for nuclear power plants and fuel reprocessing plants that an eligible combined license applicant may voluntarily use as an alternative to appendix B to part 50 of this chapter. The quality management system, required by appendix T to part 50 of this chapter, for a nuclear power plant or fuel reprocessing plant shall include discussions of how the applicable requirements of appendix T to part 50 of this chapter will be satisfied;

* * * * *

(27) Managerial and administrative controls to be used to assure safe operation. Appendix B to part 50 of this chapter sets forth the requirements for these controls for nuclear power plants. The information on the controls to be used for a nuclear power plant shall include a discussion of how the applicable requirements of appendix B to part 50 of this chapter will be satisfied. Appendix T to part 50 of this chapter, ''Streamlined Quality Assurance Criteria for Nuclear Power Plants and Fuel Reprocessing Plants,'' sets forth streamlined requirements for such controls for nuclear power plants and fuel reprocessing plants that an eligible combined license applicant may voluntarily use as an alternative to appendix B to part 50 of this chapter. The quality management system, required by appendix T to part 50 of this chapter, for a nuclear power plant or fuel reprocessing plant shall include discussions of how the applicable requirements of appendix T to part 50 of this chapter will be satisfied;

* * * * *

(36) (i) A safeguards contingency plan in accordance with the criteria set forth in appendix C to part 73 of this chapter. The safeguards contingency plan shall include plans for dealing with threats, thefts, and radiological sabotage, as defined in part 73 of this chapter, relating to the special nuclear material and nuclear facilities licensed under this chapter and in the applicant's possession and control. Each application for this type of license shall include the information contained in the applicant's safeguards contingency plan.[4] (Implementing procedures required for this plan need not be submitted for approval.)

* * * * *

(48) An applicant may include in its application a request for generic finality, to generic aspects of the design under this part, such that information in the application, if approved by the NRC, is considered resolved in other proceedings where information approved for generic finality is referenced. An application for a combined license that requests generic finality must include applicable site parameters postulated for the design, including the design-basis external hazard levels for the relevant external hazards, and an analysis and evaluation of the design in terms of those site parameters.

(b) If the combined license application references an early site permit, then the following requirements apply:

(1) The final safety analysis report need not contain information or analyses submitted to the Commission in connection with the early site permit, provided, however, that the final safety analysis report must either include or incorporate by reference the early site permit site safety analysis report and must contain, in addition to the information and analyses otherwise required, information sufficient to demonstrate that the design of the facility falls within the site characteristics and design parameters specified in the early site permit.

(2) If the final safety analysis report does not demonstrate that design of the facility falls within the site characteristics and design parameters, the application shall include a request for a variance that complies with the requirements of §§ 52.39 and 52.93.

(3) If the early site permit site safety analysis report information required by § 52.17(a)(1)(vi) through (ix) has not been updated after 20 years from the date of early site permit issuance or a previous update of the permit by amendment, whichever is later, the combined license application shall include updated information and revised analyses, as necessary, in the final safety analysis report. The referencing application need not update the postulated source term stated in the early site permit if it falls within the source term derived from the design. If the postulated source term stated in the early site permit does not fall within the source term derived from the design, the referencing application must propose a variance from the early site permit that complies with the requirements of §§ 52.39 and 52.93.

(4) The final safety analysis report must demonstrate that all terms and conditions that have been included in the early site permit, other than those imposed under § 50.36b of this chapter, will be satisfied by the date of issuance of the combined license. Any terms or conditions of the early site permit that could not be met by the time of issuance of the combined license, must be set forth as terms or conditions of the combined license.

(5) If the early site permit approves complete and integrated emergency plans, or major features of emergency plans, then the final safety analysis report must include any new or additional information that updates and corrects the information that was provided under § 52.17(b), and discuss whether the new or additional information materially changes the bases for compliance with the applicable requirements. The application must identify changes to the emergency plans or major features of emergency plans that have been incorporated into the proposed facility emergency plans and that constitute or would constitute a reduction in effectiveness under § 50.54(q) of this chapter.

(6) If complete and integrated emergency plans are approved as part of the early site permit, new certifications meeting the requirements of paragraph (a)(22) of this section are not required.

* * * * *

[1] The fission product release assumed for this evaluation should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad

range of design basis accidents. These accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[2] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this number constitutes an acceptable limit for an emergency dose to the public under accident conditions. Rather, this dose value has been set forth in this section as a reference value, which can be used in the evaluation of plant design features with respect to postulated reactor accidents, to assure that these designs provide assurance of low risk of public exposure to radiation, in the event of an accident.

[3] The fission product release assumed for this evaluation should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents. These accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[4] A physical security plan that contains all the information required in both § 73.55 of this chapter and appendix C to 10 CFR part 73 satisfies the requirement for a contingency.

■ 52. Revise § 52.85 to read as follows:

§ 52.85 Administrative review of applications; hearings.

(a) A proceeding on a combined license is subject to all applicable procedural requirements contained in part 2 of this chapter, including the requirements for docketing (§ 2.101 of this chapter) and issuance of a notice of hearing (§ 2.104 of this chapter). If an applicant requests a Commission finding on certain ITAAC with the issuance of the combined license, then those ITAAC will be identified in the notice of hearing. All hearings on combined licenses are governed by the procedures contained in part 2 of this chapter.

(b) If an applicant requests generic finality under § 52.79(a)(48), the Commission will include a request for generic finality as a proposed action in the notice of hearing required by § 2.104 of this chapter.

§ 52.93 [Amended]

■ 53. In § 52.93, in paragraph (c) remove the last sentence.

■ 54. In § 52.97, add paragraph (d) to read as follows:

§ 52.97 Issuance of combined licenses.

* * * * *

(d) The Commission may afford generic finality to generic aspects of the design of a utilization facility, including postulated site parameters, and requirements submitted pursuant to § 52.79(a)(48), if it finds that the proposed generic design can be constructed and operated at sites having characteristics that fall within the site parameters postulated for the design in accordance with applicable requirements and without undue risk to the health and safety of the public.

■ 55. In § 52.98, revise paragraph (b), remove and reserve paragraph (d), and add paragraph (h) to read as follows:

§ 52.98 Finality of combined licenses; information requests.

* * * * *

(b) If the combined license does not reference a design certification, then a licensee may make changes in the facility as described in the final safety analysis report (as updated), make changes in the procedures as described in the final safety analysis report (as updated), and conduct tests or experiments not described in the final safety analysis report (as updated) under the applicable change processes in part 50 of this chapter (*e.g.,* § 50.54, § 50.59, or § 50.90 of this chapter).

* * * * *

(d) [Reserved]

* * * * *

(h) In a proceeding for the issuance of a construction permit, operating license, or combined license, or in any enforcement hearing other than one initiated by the Commission under paragraph (a) of this section, in which a combined license issued under this subpart is referenced, the Commission must treat as resolved those matters resolved in the proceeding on the application for issuance or renewal of the referenced combined license, including, if applicable, the adequacy of a reactor design where the referenced combined license was afforded finality pursuant to § 52.97(d).

■ 56. In § 52.137,

■ a. Revise and republish paragraph (a)(2)(iv);

■ b. In paragraph (a)(4), remove the word ''SSC'' and add in its place the word ''SSCs'' and remove the last sentence; and

■ c. Redesignate footnotes 9 and 10 as footnotes 1 and 2 and revise footnotes 1 and 2 to read as follows:

§ 52.137 Contents of applications; technical information.

* * * * *

(a) * * *

(2) * * *

(iv) The safety features that are to be engineered into the facility and those barriers that must be breached as a result of an accident before a release of radioactive material to the environment can occur. Special attention must be directed to plant design features intended to mitigate the radiological consequences of accidents. In performing this assessment, an applicant shall assume a fission product release [1] assuming that the facility is operated at the ultimate power level contemplated. The applicant shall perform an evaluation and analysis of the postulated fission product release, using the expected demonstrable leakage rates from potential flow paths and any fission product cleanup systems intended to mitigate the consequences of the accidents, together with applicable postulated site parameters, including site meteorology, to evaluate the offsite radiological consequences. The evaluation must determine that:

(A) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 25 rem [2] (0.25 Sv) total effective dose equivalent (TEDE); and

(B) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of 25 rem (0.25 Sv) TEDE;

* * * * *

[1] The fission product release assumed for this evaluation should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents. These accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[2] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this number constitutes an acceptable limit for an emergency dose to the public under accident conditions. Rather, this dose value has been set forth in this section as a reference value, which can be used in the evaluation of plant design features with respect to postulated reactor accidents, to assure that these designs provide assurance of low risk of public exposure to radiation, in the event of an accident.

■ 57. In § 52.157,

■ a. Revise and republish paragraph (d);

■ b. In paragraph (f)(1), remove the last sentence;

■ c. Redesignate footnotes 11 and 12 as footnotes 1 and 2 and revise footnotes 1 and 2.

The addition and revisions are to read as follows:

§ 52.157 Contents of applications; technical information in final safety analysis report.

* * * * *

(d) The safety features that are engineered into the reactor and those barriers that must be breached as a result of an accident before a release of radioactive material to the environment can occur. Special attention must be directed to reactor design features intended to mitigate the radiological consequences of accidents. In performing this assessment, an applicant shall assume a fission product release [1] assuming that the facility is operated at the ultimate power level contemplated. The applicant shall perform an evaluation and analysis of the postulated fission product release, using the expected demonstrable leakage rates from potential flow paths and any fission product cleanup systems intended to mitigate the consequences of the accidents, together with applicable postulated site parameters, including site meteorology, to evaluate the offsite radiological consequences. The evaluation must determine that:

(1) An individual located at any point on the boundary of the exclusion area for any 2-hour period following the onset of the postulated fission product release, would not receive a radiation dose in excess of 25 rem [2] (0.25 Sv) total effective dose equivalent (TEDE); and

(2) An individual located at any point on the outer boundary of the low population zone, who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a radiation dose in excess of 25 rem (0.25 Sv) TEDE;

* * * * *

[1] The fission product release assumed for this evaluation should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents. These accidents have generally been assumed to result in substantial meltdown of the core with subsequent release of appreciable quantities of fission products.

[2] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this number constitutes an acceptable limit for an emergency dose to the public under accident conditions. Rather, this dose value has been set forth in this section as a reference value, which can be used in the evaluation of plant design features with respect to postulated reactor accidents, to assure that these designs provide assurance of low risk of public exposure to radiation, in the event of an accident.

■ 58. Revise and republish § 52.158 to read as follows:

§ 52.158 Contents of application; additional technical information.

(a) *Inspections, tests, analyses, and acceptance criteria (ITAAC).* (1) The application must contain the proposed inspections, tests, and analyses that the licensee who will be operating the reactor shall perform, and the acceptance criteria that are necessary and sufficient to provide reasonable assurance that, if the inspections, tests, and analyses are performed and the acceptance criteria met:

(i) The reactor has been manufactured in conformity with the manufacturing license, the provisions of the Act, and the Commission's rules and regulations; and

(ii) The manufactured reactor will be operated in conformity with the approved design and any license authorizing operation of the manufactured reactor.

(2) If the application references a standard design certification, the ITAAC contained in the certified design must apply to those portions of the facility design which are covered by the design certification.

(3) If the application references a standard design certification, the application may include a notification that a required inspection, test, or analysis in the design certification ITAAC has been successfully completed and that the corresponding acceptance criterion has been met. The **Federal Register** notification required by § 52.163 must indicate that the application includes this notification.

(b) *Environmental report.* (1) The application must contain an environmental report as required by § 51.54 of this chapter.

(2) If the manufacturing license application references a standard design certification, the environmental report need not contain a discussion of severe accident mitigation design alternatives for the reactor.

(c) *Optional operational programs.* An applicant may include in its application descriptions of essentially complete programmatic controls, operational programs, or operational requirements beyond those required by § 52.157 in order to satisfy requirements for license applications that may reference a manufacturing license. If approved by the NRC as part of the manufacturing license, such programmatic controls, operational programs, and operational requirements would have finality under § 52.171.

■ 59. In § 52.171, revise paragraphs (a)(1) and (b) to read as follows:

§ 52.171 Finality of manufacturing licenses; information requests.

(a)(1) Notwithstanding any provision in § 50.109 of this chapter, during the term of a manufacturing license the Commission may not modify, rescind, or impose new requirements on the design of the nuclear power reactor being manufactured; the requirements for the manufacture of the nuclear power reactor; or the programmatic controls, operational programs, or operational requirements; unless the Commission determines that a modification is necessary to bring the design of the reactor or its manufacture into compliance with the Commission's requirements applicable and in effect at the time the manufacturing license was issued, or to provide reasonable assurance of adequate protection to public health and safety or common defense and security.

* * * * *

(b)(1) The holder of a manufacturing license may make a change to the facility or procedures as described in the final safety analysis report (as updated) associated with the manufacturing license without obtaining a license amendment pursuant to § 50.90 of this chapter if the change meets the criteria in § 50.59(c)(1) of this chapter. If needed, applications for amending an ML must be submitted and processed in accordance with §§ 50.90, 50.91, and 50.92 of this chapter.

(2) An applicant who references or uses a nuclear power reactor manufactured under a manufacturing license under this subpart may request a departure from the design characteristics, site parameters, terms and conditions, or approved design of the manufactured reactor. The granting of a departure on request of an applicant is subject to litigation in the same manner as other issues in the construction permit or combined license hearing.

* * * * *

§ 52.173 [Amended]

■ 60. In § 52.173, remove the phrase ''15 years'' and add in its place ''40 years''.

§ 52.181 [Amended]

■ 61. In § 52.181, remove the phrase ''15 years'' and add in its place ''40 years''.

■ 62. Revise subpart G consisting of § 52.220 and add § 52.220 to read as follows:

Subpart G—Risk-Informed and Performance-Based Alternatives

§ 52.220 Use of risk-informed and performance-based alternatives to acceptance criteria.

For each regulation in this part that provides specified acceptance criteria, applicants may propose an alternative following the requirements in § 50.220 of this chapter.

■ 63. In appendix A to part 52, revise paragraphs II.D., II.F., VI.B.4., VI.B.6., VIII.A., and VIII.B. to read as follows:

Appendix A to Part 52—Design Certification Rule for the U.S. Advanced Boiling Water Reactor

* * * * *

II. * * *

D. *Tier 1* means the portion of the design-related information contained in the generic DCD that is approved and certified by this appendix (Tier 1 information). The design descriptions, interface requirements, and site parameters are derived from Tier 2 information. Tier 1 information includes:

1. Definitions and general provisions, which are located in the following sections of the ABWR Design Control Document, Revision 7: Section 1.0, ''Introduction''; Section 1.1, ''Definitions''; Section 1.2, ''General Provisions''; Appendix A, ''Legend for Figures''; Appendix B, ''Abbreviations and Acronyms Used in the ABWR Certified Design Material''; and Appendix C, ''Conversion to ASME Standard Units'';

2. Design descriptions, which are located in the following sections of the ABWR Design Control Document, Revision 7, and any figures and non-ITAAC tables referenced in these sections: Section 2.0, ''Certified Design for ABWR Systems,'' and Section 3.0, ''Additional Certified Design Material'';

3. Inspections, tests, analyses, and acceptance criteria (ITAAC), which are located in the inspections, tests, analyses column and the acceptance criteria column of the following tables of the ABWR Design Control Document, Revision 7: Tables 2.1.1d, 2.1.2, 2.1.3, 2.2.1, 2.2.2, 2.2.3, 2.2.4, 2.2.5, 2.2.6, 2.2.7, 2.2.8, 2.2.9, 2.2.10, 2.2.11, 2.3.1, 2.3.2, 2.3.3, 2.4.1, 2.4.2, 2.4.3, 2.4.4, 2.5.5, 2.5.6, 2.6.1, 2.6.2, 2.6.3, 2.7.1b, 2.7.3, 2.7.5, 2.8.4, 2.9.1, 2.10.1, 2.10.2a, 2.10.2b, 2.10.4, 2.10.7, 2.10.9, 2.10.13, 2.10.21, 2.10.22, 2.10.23, 2.11.1, 2.11.2, 2.11.3d, 2.11.4, 2.11.5, 2.11.6, 2.11.9, 2.11.10, 2.11.11, 2.11.12, 2.11.13, 2.11.20, 2.11.23, 2.12.1, 2.12.10, 2.12.11, 2.12.12, 2.12.13, 2.12.14, 2.12.15, 2.12.16, 2.12.17, 2.14.1, 2.14.4, 2.14.6, 2.14.7, 2.14.8, 2.14.9, 2.15.3, 2.15.5a, 2.15.5b, 2.15.5c, 2.15.5d, 2.15.5e, 2.15.5f, 2.15.5g, 2.15.5h, 2.15.5i, 2.15.5j, 2.15.5k, 2.15.5l, 2.15.5m, 2.15.6, 2.15.10, 2.15.11, 2.15.12, 2.15.13, 2.15.14, 2.15.15, 2.16.2, 2.17.1, 3.1, 3.2a, 3.2b, 3.3, 3.4, and 3.6.

4. Significant site parameters, which are located in the following section of the ABWR Design Control Document, Revision 7: Section 5.0, ''Site Parameters''; and

5. Significant interface requirements, which are located in the following section of the ABWR Design Control Document, Revision 7: Section 4.0, ''Interface Requirements.''

* * * * *

F. *Tier 2** means the portion of the Tier 2 information, designated as such in the generic DCD, which is subject to the change process in paragraph VIII.B.6 of this appendix. After a plant first achieves full power, Tier 2* information in the plant-specific design control document for that plant reverts to Tier 2 status and is thereafter subject to the departure provisions in paragraph VIII.B.5 of this appendix.

* * * * *

VI. * * *

B. * * *

4. All exemptions from the DCD under and in compliance with the change processes in paragraphs VIII.A.4, VIII.A.6, and VIII.B.4 of this appendix, but only for that plant;

* * * * *

6. Except as provided in paragraph VIII.B.5.g of this appendix, all departures from Tier 1 and Tier 2 under and in compliance with the change processes in paragraphs VIII.A.5 and VIII.B.5 of this appendix that do not require prior NRC approval, but only for that plant; and

* * * * *

VIII. * * *

A. Tier 1 Information

1. Generic changes to Tier 1 information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 1 information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under paragraph A.3, A.4, A.5, A.6, or A.7 of this section.

3. Departures from Tier 1 information that are required by the Commission through plant-specific orders are governed by the requirements in § 52.63(a)(4).

4. Exemptions from Tier 1 information on definitions and general provisions, significant site parameters, and significant interface requirements are governed by the requirements in §§ 52.63(b)(1) and 52.98(f). The Commission will deny a request for an exemption from Tier 1, if it finds that the design change will result in a significant decrease in the level of safety otherwise provided by the design.

5. An applicant or licensee who references this appendix may depart from Tier 1 design description information, without NRC approval, unless the proposed departure requires an exemption under paragraph A.6 of this section.

6. A proposed departure from Tier 1 design descriptions would require an exemption if it would:

a. Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

b. Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component (SSC) important to safety and previously evaluated in the plant-specific DCD;

c. Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

d. Result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the plant-specific DCD;

e. Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

f. Create a possibility for a malfunction of an SSC important to safety with a different result than any evaluated previously in the plant-specific DCD;

g. Result in a design basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered;

h. Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses;

i. Result in a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

j. Result in a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

7. A licensee who references this appendix may not depart from Tier 1 ITAAC without prior NRC approval. A request for a departure will be treated as a request for a license amendment under § 50.90 of this chapter and does not require an exemption from this appendix.

8. After the plant first achieves full power, licensee-initiated plant-specific departures from Tier 1 information are subject to the same requirements as licensee-initiated plant-specific departures from Tier 2 information.

B. Tier 2 and Tier 2* Information

1. Generic changes to Tier 2 or Tier 2* information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 2 or Tier 2* information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under paragraph B.3, B.4, B.5, or B.6 of this section.

3. The Commission may not require new requirements on Tier 2 or Tier 2* information by plant-specific order, while this appendix is in effect under § 52.55 or § 52.61, unless:

a. A modification is necessary to secure compliance with the Commission's regulations applicable and in effect at the time this appendix was approved, as set forth in Section V of this appendix, or to ensure adequate protection of the public health and safety or the common defense and security; and

b. Special circumstances as defined in § 50.12(a) of this chapter are present.

4. An applicant or licensee who references this appendix may request an exemption from Tier 2 or Tier 2* information. The Commission may grant such a request only if it determines that the exemption will comply with the requirements of § 50.12(a) of this chapter. The Commission will deny a request for an exemption from Tier 2 or Tier 2*, if it finds that the design change will result in a significant decrease in the level of

safety otherwise provided by the design. The granting of an exemption to an applicant must be subject to litigation in the same manner as other issues material to the license hearing. The granting of an exemption to a licensee must be subject to an opportunity for a hearing in the same manner as license amendments.

5. a. An applicant or licensee who references this appendix may depart from Tier 2 information, without prior NRC approval, unless the proposed departure involves a change to or departure from Tier 1 information (if prior NRC approval is required by paragraph A of this section), Tier 2* information, or the TS, or requires a license amendment under paragraph B.5.b or B.5.c of this section. When evaluating the proposed departure, an applicant or licensee shall consider all matters described in the plant-specific DCD.

b. A proposed departure from Tier 2, other than one affecting resolution of a severe accident issue identified in the plant-specific DCD or one affecting information required by § 52.47(a)(28) to address aircraft impacts, requires a license amendment if it would:

(1) Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

(2) Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component important to safety and previously evaluated in the plant-specific DCD;

(3) Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

(4) Result in more than a minimal increase in the consequences of a malfunction of a structure, system, or component important to safety previously evaluated in the plant-specific DCD;

(5) Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

(6) Create a possibility for a malfunction of a structure, system, or component important to safety with a different result than any evaluated previously in the plant-specific DCD;

(7) Result in a design-basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered; or

(8) Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses.

c. A proposed departure from Tier 2, affecting resolution of a severe accident design feature identified in the plant-specific DCD, requires a license amendment if:

(1) There is a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

(2) There is a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

d. A proposed departure from Tier 2 information required by § 52.47(a)(28) to address aircraft impacts shall consider the effect of the changed design feature or functional capability on the original aircraft impact assessment required by § 50.150(a) of this chapter. The applicant or licensee shall describe, in the plant-specific DCD, how the modified design features and functional capabilities continue to meet the aircraft impact assessment requirements in § 50.150(a)(1) of this chapter.

e. If a departure requires a license amendment under paragraph B.5.b or B.5.c of this section, it is governed by § 50.90 of this chapter.

f. A departure from Tier 2 information that is made under paragraph B.5 of this section does not require an exemption from this appendix.

g. A party to an adjudicatory proceeding for either the issuance, amendment, or renewal of a license or for operation under § 52.103(a), who believes that an applicant or licensee who references this appendix has not complied with paragraph VIII.B.5 of this appendix when departing from Tier 2 information, may petition to admit into the proceeding such a contention. In addition to complying with the general requirements of § 2.309 of this chapter, the petition must demonstrate that the departure does not comply with paragraph VIII.B.5 of this appendix. Further, the petition must demonstrate that the change bears on an asserted noncompliance with an ITAAC acceptance criterion in the case of a § 52.103 preoperational hearing, or that the change bears directly on the amendment request in the case of a hearing on a license amendment. Any other party may file a response. If, on the basis of the petition and any response, the presiding officer determines that a sufficient showing has been made, the presiding officer shall certify the matter directly to the Commission for determination of the admissibility of the contention. The Commission may admit such a contention if it determines the petition raises a genuine issue of material fact regarding compliance with paragraph VIII.B.5 of this appendix.

6. a. An applicant who references this appendix may not depart from Tier 2* information, which is designated with brackets, italicized text, and an asterisk in the generic DCD, without NRC approval. The departure will not be considered a resolved issue, within the meaning of Section VI of this appendix and § 52.63(a)(5).

b. A licensee who references this appendix may not depart from the following Tier 2* matters without prior NRC approval. A request for a departure will be treated as a request for a license amendment under § 50.90 of this chapter.

(1) Fuel burnup limit (4.2).

(2) Fuel design evaluation (4.2.3).

(3) Fuel licensing acceptance criteria (Appendix 4B).

(4) ASME Boiler & Pressure Vessel Code, Section III.

(5) ACI 349 and ANSI/AISC N–690.

(6) Motor-operated valves.

(7) Equipment seismic qualification methods.

(8) Piping design acceptance criteria.

(9) Fuel system and assembly design (4.2), except burnup limit.

(10) Nuclear design (4.3).

(11) Equilibrium cycle and control rod patterns (Appendix 4A).

(12) Control rod licensing acceptance criteria (Appendix 4C).

(13) Instrument setpoint methodology.

(14) EMS performance specifications and architecture.

(15) SSLC hardware and software qualification.

(16) Self-test system design testing features and commitments.

(17) Human factors engineering design and implementation process.

c. After the plant first achieves full power, all Tier 2* matters revert to Tier 2 status and are thereafter subject to the departure provisions in paragraph B.5 of this section.

d. Departures from Tier 2* information that are made under paragraph B.6 of this section do not require an exemption from this appendix.

* * * * *

■ 64. In appendix D to part 52, remove and reserve section IX, and revise paragraphs II.D., II.F., VI.B.4., VI.B.6, VIII.A., and VIII.B. to read as follows:

Appendix D to Part 52—Design Certification Rule for the AP1000 Design

* * * * *

II. * * *

D. *Tier 1* means the portion of the design-related information contained in the generic DCD that is approved and certified by this appendix (Tier 1 information). The design descriptions, interface requirements, and site parameters are derived from Tier 2 information. Tier 1 information includes:

1. Definitions and general provisions, which are located in the following section of the AP1000 Design Control Document, Revision 19, and amendments thereto in Supplemental Information to Support the AP1000 Design Certification Extension, APP–GW–GL–705 Rev. 0: Section 1, ''Introduction'';

2. Design descriptions, which are located in the sections of the AP1000 Design Control Document, Revision 19, identified in Table 1 to Paragraph D of this appendix, and amendments thereto in Supplemental Information to Support the AP1000 Design Certification Extension, APP–GW–GL–705 Rev. 0 and any figures and non-ITAAC tables referenced in these sections:

6. Except as provided in paragraph VIII.B.5.g of this appendix, all departures from Tier 1, Tier 2, and Tier 2* under and in compliance with the change processes in paragraphs VIII.A.5 and VIII.B.5 of this appendix that do not require prior NRC approval, but only for that plant; and

* * * * *

VIII. * * *

A. Tier 1 information.

1. Generic changes to Tier 1 information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 1 information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under

paragraphs A.3, A.4, A.5, A.6, or A.7 of this section.

3. Departures from Tier 1 information that are required by the Commission through plant-specific orders are governed by the requirements in § 52.63(a)(4).

4. Exemptions from Tier 1 information on definitions and general provisions, significant site parameters, and significant interface requirements are governed by the requirements in §§ 52.63(b)(1) and 52.98(f). The Commission will deny a request for an exemption from Tier 1, if it finds that the design change will result in a significant decrease in the level of safety otherwise provided by the design.

5. An applicant or licensee who references this appendix may depart from Tier 1 design description information, without NRC approval, unless the proposed departure requires an exemption under paragraph A.6 of this section.

6. A proposed departure from Tier 1 design descriptions would require an exemption if it would:

a. Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

b. Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component (SSC) important to safety and previously evaluated in the plant-specific DCD;

c. Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

d. Result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the plant-specific DCD;

e. Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

f. Create a possibility for a malfunction of an SSC important to safety with a different result than any evaluated previously in the plant-specific DCD;

g. Result in a design basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered;

h. Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses;

i. Result in a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

j. Result in a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

7. A licensee who references this appendix may not depart from Tier 1 ITAAC without prior NRC approval. A request for a departure will be treated as a request for a license amendment under § 50.90 of this chapter and does not require an exemption from this appendix.

8. After the plant first achieves full power, licensee-initiated plant-specific departures from Tier 1 information are subject to the same requirements as licensee-initiated plant-specific departures from Tier 2 information.

B. Tier 2 and Tier 2* information.

1. Generic changes to Tier 2 or Tier 2* information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 2 or Tier 2* information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under paragraphs B.3, B.4, or B.5 of this section.

3. The Commission may not require new requirements on Tier 2 or Tier 2* information by plant-specific order while this appendix is in effect under § 52.55 or § 52.61, unless:

a. A modification is necessary to secure compliance with the Commission's regulations applicable and in effect at the time this appendix was approved, as set forth in Section V of this appendix, or to ensure adequate protection of the public health and safety or the common defense and security; and

b. Special circumstances as defined in § 50.12(a) of this chapter are present.

4. An applicant or licensee who references this appendix may request an exemption from Tier 2 or Tier 2* information. The Commission may grant such a request only if it determines that the exemption will comply with the requirements of § 50.12(a) of this chapter. The Commission will deny a request for an exemption from Tier 2 or Tier 2*, if it finds that the design change will result in a significant decrease in the level of safety otherwise provided by the design. The grant of an exemption to an applicant must be subject to litigation in the same manner as other issues material to the license hearing. The grant of an exemption to a licensee must be subject to an opportunity for a hearing in the same manner as license amendments.

5. a. An applicant or licensee who references this appendix may depart from Tier 2 or Tier 2* information, without prior NRC approval, unless the proposed departure involves a change to or departure from Tier 1 information (if prior NRC approval is required by paragraph A of this section) or the TS, or requires a license amendment under paragraphs B.5.b or B.5.c of this section. When evaluating the proposed departure, an applicant or licensee shall consider all matters described in the plant-specific DCD.

b. A proposed departure from Tier 2 or Tier 2*, other than one affecting resolution of a severe accident issue identified in the plant-specific DCD or one affecting information required by § 52.47(a)(28) to address § 50.150 of this chapter, requires a license amendment if it would:

(1) Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

(2) Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component (SSC) important to safety and previously evaluated in the plant-specific DCD;

(3) Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

(4) Result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the plant-specific DCD;

(5) Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

(6) Create a possibility for a malfunction of an SSC important to safety with a different result than any evaluated previously in the plant-specific DCD;

(7) Result in a design basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered; or

(8) Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses.

c. A proposed departure from Tier 2 or Tier 2* affecting resolution of a severe accident design feature identified in the plant-specific DCD, requires a license amendment if:

(1) There is a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

(2) There is a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

d. If an applicant or licensee proposes to depart from the information required by § 52.47(a)(28) to be included in the FSAR for the standard design certification, then the applicant or licensee shall consider the effect of the changed feature or capability on the original assessment required by § 50.150(a) of this chapter. The applicant or licensee must also document how the modified design features and functional capabilities continue to meet the assessment requirements in § 50.150(a)(1) of this chapter in accordance with Section X of this appendix.

e. If a departure requires a license amendment under paragraph B.5.b or B.5.c of this section, it is governed by § 50.90 of this chapter.

f. A departure from Tier 2 or Tier 2* information that is made under paragraph B.5 of this section does not require an exemption from this appendix.

g. A party to an adjudicatory proceeding for either the issuance, amendment, or renewal of a license or for operation under § 52.103(a), who believes that an applicant or licensee who references this appendix has not complied with paragraph VIII.B.5 of this appendix when departing from Tier 2 information, may petition to admit into the proceeding such a contention. In addition to compliance with the general requirements of § 2.309 of this chapter, the petition must demonstrate that the departure does not comply with paragraph VIII.B.5 of this appendix. Further, the petition must demonstrate that the change bears on an asserted noncompliance with an ITAAC acceptance criterion in the case of a § 52.103 preoperational hearing, or that the change bears directly on the amendment request in the case of a hearing on a license amendment. Any other party may file a response. If, on the basis of the petition and

any response, the presiding officer determines that a sufficient showing has been made, the presiding officer shall certify the matter directly to the Commission for determination of the admissibility of the contention. The Commission may admit such a contention if it determines the petition raises a genuine issue of material fact regarding compliance with paragraph VIII.B.5 of this appendix.

* * * * *

■ 65. In appendix E to part 52, revise paragraphs II.D., II.F, VI.B.4., VI.B.6., VIII.A., and VIII.B. to read as follows:

Appendix E to Part 52—Design Certification Rule for the ESBWR Design

* * * * *

II. * * *

D. *Tier 1* means the portion of the design-related information contained in the generic DCD that is approved and certified by this appendix (Tier 1 information). The design descriptions, interface requirements, and site parameters are derived from Tier 2 information. Tier 1 information includes:

1. Definitions and general provisions, which are located in the following sections of the ESBWR Design Control Document, Revision 10: Section 1, ''Introduction,'' Section 1.1, ''Definitions and General Provisions,'' Section 1.2, ''Figure Legend,'' Section 1.3, ''Table Legend,'' and Section 1.4, ''Design Acceptance Criteria'';

2. Design descriptions, which are located in the following sections of the ESBWR Design Control Document, Revision 10, and any figures and non-ITAAC tables referenced in these sections: Section 2, ''Design Descriptions and ITAAC,'' and Section 3, ''Non-System Based Material'';

3. Inspections, tests, analyses, and acceptance criteria (ITAAC), which are located in the inspections, tests, analyses column and the acceptance criteria column of the following tables of the ESBWR Design Control Document, Revision 10: Tables 2.1.1–3, 2.1.2–3, 2.2.1–6, 2.2.2–7, 2.2.3–4, 2.2.4–6, 2.2.5–4, 2.2.6–3, 2.2.7–4, 2.2.9–3, 2.2.12–5, 2.2.13–4, 2.2.14–4, 2.2.15–2, 2.2.16–4, 2.3.1–2, 2.3.2–2, 2.4.1–3, 2.4.2–3, 2.5.5–1, 2.5.6–1, 2.5.10–1, 2.6.1–2, 2.6.2–2, 2.10.1–2, 2.10.2–2, 2.10.3–1, 2.11.1–1, 2.11.2–1, 2.11.4–2, 2.11.5–1, 2.11.6–1, 2.11.7–1, 2.12.3–1, 2.12.5–1, 2.12.7–1, 2.13.1–2, 2.13.3–2, 2.13.4–2, 2.13.5–2, 2.13.8–1, 2.13.9–1, 2.15.1–2, 2.15.3–2, 2.15.4–2, 2.15.5–2, 2.15.7–2, 2.15.8–1, 2.16.1–1, 2.16.2–2, 2.16.2–4, 2.16.2–6, 2.16.2–7, 2.16.2–9, 2.16.2–10, 2.16.3–2, 2.16.3.1–1, 2.16.4–1, 2.16.5–2, 2.16.6–2, 2.16.7–2, 2.16.8–1, 2.16.9–1, 2.16.10–1, 2.16.11–1, 2.16.12–1, 2.16.13–1, 2.16.14–1, 2.19–1, 3.1–1, 3.3–2, 3.4–1, 3.6–1, 3.7–1, and 3.8–2.

4. Significant site parameters, which are located in the following section of the ESBWR Design Control Document, Revision 10: Section 5, ''Site Parameters''; and

5. Significant interface requirements, which are located in the following section of the ESBWR Design Control Document, Revision 10: Section 4, ''Interface Material.''

* * * * *

F. *Tier 2** means the portion of the Tier 2 information, designated as such in the generic DCD, which is subject to the change process in paragraph VIII.B.6 of this appendix. After a plant first achieves full power, Tier 2* information in the plant-specific design control document for that plant reverts to Tier 2 status and is thereafter subject to the departure provisions in paragraph VIII.B.5 of this appendix.

* * * * *

VI. * * *

B. * * *

4. All exemptions from the DCD under and in compliance with the change processes in paragraphs VIII.A.4, VIII.A.6, and VIII.B.4 of this appendix, but only for that plant;

* * * * *

6. Except as provided in paragraph VIII.B.5.g of this appendix, all departures from Tier 1 and Tier 2 under and in compliance with the change processes in paragraphs VIII.A.5 and VIII.B.5 of this appendix that do not require prior NRC approval, but only for that plant; and

* * * * *

VIII. * * *

A. Tier 1 information

1. Generic changes to Tier 1 information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 1 information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under paragraphs A.3, A.4, A.5, A.6, or A.7 of this section.

3. Departures from Tier 1 information that are required by the Commission through plant-specific orders are governed by the requirements in § 52.63(a)(4).

4. Exemptions from Tier 1 information on definitions and general provisions, significant site parameters, and significant interface requirements are governed by the requirements in §§ 52.63(b)(1) and 52.98(f). The Commission will deny a request for an exemption from Tier 1, if it finds that the design change will result in a significant decrease in the level of safety otherwise provided by the design.

5. An applicant or licensee who references this appendix may depart from Tier 1 design description information, without NRC approval, unless the proposed departure requires an exemption under paragraph A.6 of this section.

6. A proposed departure from Tier 1 design descriptions would require an exemption if it would:

a. Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

b. Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component (SSC) important to safety and previously evaluated in the plant-specific DCD;

c. Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

d. Result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the plant-specific DCD;

e. Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

f. Create a possibility for a malfunction of an SSC important to safety with a different result than any evaluated previously in the plant-specific DCD;

g. Result in a design basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered;

h. Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses;

i. Result in a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

j. Result in a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

7. A licensee who references this appendix may not depart from Tier 1 ITAAC without prior NRC approval. A request for a departure will be treated as a request for a license amendment under § 50.90 of this chapter and does not require an exemption from this appendix.

8. After the plant first achieves full power, licensee-initiated plant-specific departures from Tier 1 information are subject to the same requirements as licensee-initiated plant-specific departures from Tier 2 information.

B. Tier 2 and Tier 2* information

1. Generic changes to Tier 2 or Tier 2* information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 2 or Tier 2* information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under paragraphs B.3, B.4, B.5, or B.6 of this section.

3. The Commission may not require new requirements on Tier 2 or Tier 2* information by plant-specific order while this appendix is in effect under § 52.55 or § 52.61, unless:

a. A modification is necessary to secure compliance with the Commission's regulations applicable and in effect at the time this appendix was approved, as set forth in Section V of this appendix, or to ensure adequate protection of the public health and safety or the common defense and security; and

b. Special circumstances as defined in § 50.12(a) of this chapter are present.

4. An applicant or licensee who references this appendix may request an exemption from Tier 2 or Tier 2* information. The Commission may grant such a request only if it determines that the exemption will comply with the requirements of § 50.12(a) of this chapter. The Commission will deny a request for an exemption from Tier 2 or Tier 2*, if it finds that the design change will result in a significant decrease in the level of safety otherwise provided by the design. The grant of an exemption to an applicant must be subject to litigation in the same manner as other issues material to the license

hearing. The grant of an exemption to a licensee must be subject to an opportunity for a hearing in the same manner as license amendments.

5. a. An applicant or licensee who references this appendix may depart from Tier 2 information, without prior NRC approval, unless the proposed departure involves a change to or departure from Tier 1 information (if prior NRC approval is required by paragraph A of this section), Tier 2* information, or the TS, or requires a license amendment under paragraph B.5.b or B.5.c of this section. When evaluating the proposed departure, an applicant or licensee shall consider all matters described in the plant-specific DCD.

b. A proposed departure from Tier 2, other than one affecting resolution of a severe accident issue identified in the plant-specific DCD or one affecting information required by § 52.47(a)(28) to address aircraft impacts, requires a license amendment if it would:

(1) Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

(2) Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component (SSC) important to safety and previously evaluated in the plant-specific DCD;

(3) Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

(4) Result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the plant-specific DCD;

(5) Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

(6) Create a possibility for a malfunction of an SSC important to safety with a different result than any evaluated previously in the plant-specific DCD;

(7) Result in a design-basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered; or

(8) Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses.

c. A proposed departure from Tier 2 affecting resolution of a severe accident design feature identified in the plant-specific DCD, requires a license amendment if:

(1) There is a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

(2) There is a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

d. A proposed departure from Tier 2 information required by § 52.47(a)(28) to address aircraft impacts shall consider the effect of the changed design feature or functional capability on the original aircraft impact assessment required by § 50.150(a) of this chapter. The applicant or licensee shall describe in the plant-specific DCD how the modified design features and functional capabilities continue to meet the aircraft impact assessment requirements in § 50.150(a)(1) of this chapter.

e. If a departure requires a license amendment under paragraph B.5.b or B.5.c of this section, it is governed by § 50.90 of this chapter.

f. A departure from Tier 2 information that is made under paragraph B.5 of this section does not require an exemption from this appendix.

g. A party to an adjudicatory proceeding for either the issuance, amendment, or renewal of a license or for operation under § 52.103(a), who believes that an applicant or licensee who references this appendix has not complied with paragraph VIII.B.5 of this appendix when departing from Tier 2 information, may petition to admit into the proceeding such a contention. In addition to compliance with the general requirements of § 2.309 of this chapter, the petition must demonstrate that the departure does not comply with paragraph VIII.B.5 of this appendix. Further, the petition must demonstrate that the change bears on an asserted noncompliance with an ITAAC acceptance criterion in the case of a § 52.103 preoperational hearing, or that the change bears directly on the amendment request in the case of a hearing on a license amendment. Any other party may file a response. If, on the basis of the petition and any response, the presiding officer determines that a sufficient showing has been made, the presiding officer shall certify the matter directly to the Commission for determination of the admissibility of the contention. The Commission may admit such a contention if it determines the petition raises a genuine issue of material fact regarding compliance with paragraph VIII.B.5 of this appendix.

6. a. An applicant who references this appendix may not depart from Tier 2* information, which is designated with italicized text or brackets and an asterisk in the generic DCD, without NRC approval. The departure will not be considered a resolved issue, within the meaning of Section VI of this appendix and § 52.63(a)(5).

b. A licensee who references this appendix may not depart from the following Tier 2* matters without prior NRC approval. A request for a departure will be treated as a request for a license amendment under § 50.90 of this chapter.

(1) Fuel mechanical and thermal-mechanical design evaluation reports, including fuel burnup limits.

(2) Control rod mechanical and nuclear design reports.

(3) Fuel nuclear design report.

(4) Critical power correlation.

(5) Fuel licensing acceptance criteria.

(6) Control rod licensing acceptance criteria.

(7) Mechanical and structural design of spent fuel storage racks.

(8) Steam dryer pressure load analysis methodology.

(9) ASME Boiler and Pressure Vessel Code, Section III, Subsections NE (Division 1) and CC (Division 2) for containment vessel design.

(10) American Concrete Institute 349 and American National Standards Institute/American Institute of Steel Construction—N690.

(11) Power-operated valves.

(12) Equipment seismic qualification methods.

(13) Piping design acceptance criteria.

(14) Instrument setpoint methodology.

(15) Safety-Related Distribution Control and Information System performance specification and architecture.

(16) Safety System Logic and Control hardware and software.

(17) Human factors engineering design and implementation.

(18) First of a kind testing for reactor stability (first plant only).

(19) Reactor precritical heatup with reactor water cleanup/shutdown cooling (first plant only).

(20) Isolation condenser system heatup and steady state operation (first plant only).

(21) Power maneuvering in the feedwater temperature operating domain (first plant only).

(22) Load maneuvering capability (first plant only).

(23) Defense-in-depth stability solution evaluation test (first plant only).

c. After the plant first achieves full power, all Tier 2* matters revert to Tier 2 status and are thereafter subject to the departure provisions in paragraph B.5 of this section.

d. Departures from Tier 2* information that are made under paragraph B.6 of this section do not require an exemption from this appendix.

* * * * *

■ 66. In appendix F to part 52, revise paragraphs II.D., VI.B.4., VI.B.6., VIII.A., VIII.B.5.a., and VIII.B.5.c.

Appendix F to Part 52—Design Certification Rule for the APR1400 Design

* * * * *

II. * * *

D. *Tier 1* means the portion of the design-related information contained in the generic DCD that is approved and certified by this appendix (Tier 1 information). The design descriptions, interface requirements, and site parameters are derived from Tier 2 information. Tier 1 information includes:

1. Definitions and general provisions, which are located in the following section of the APR1400 Design Control Document Tier 1, Revision 3: Section 1.0, ''Introduction'';

2. Design descriptions, which are located in the sections of the APR1400 Design Control Document Tier 1, Revision 3, identified in Table 1 to Paragraph D of this appendix, and any figures and non-ITAAC tables referenced in these sections:

Table 1 to Paragraph D

Section	Title
2.2	Structural and System Engineering
2.3	Piping Systems and Components
2.4	Reactor Systems
2.5	Instrumentation and Control
2.6	Electric Power
2.7	Plant Systems
2.8	Radiation Protection
2.9	Human Factors Engineering
2.10	Emergency Planning
2.11	Containment System
2.12	Physical Security Hardware
2.13	Design Reliability Assurance Program

3. Inspections, tests, analyses, and acceptance criteria (ITAAC), which are located in the inspections, tests, analyses column, and the acceptance criteria column of the following tables of the APR1400 Design Control Document Tier 1, Revision 3: Tables 2.2.1–3, 2.2.2–2, 2.2.3–1, 2.2.4–1, 2.2.5–1, 2.2.6–2, 2.2.7–2, 2.2.8–1, 2.2.9–1, 2.3–3, 2.4.1–4, 2.4.2–4, 2.4.3.4, 2.4.4–4, 2.4.5–4, 2.4.6–4, 2.4.7–1, 2.5.1–5, 2.5.2–5, 2.5.3–3, 2.5.4–5, 2.5.5–2, 2.6.1–3, 2.6.2–3, 2.6.3–3, 2.6.4–3, 2.6.5–1, 2.6.6–1, 2.6.7–1, 2.6.8–1, 2.6.9–1, 2.7.1.1–1, 2.7.1.2–4, 2.7.1.4–4, 2.7.1.5–4, 2.7.1.8–3, 2.7.2.1–4, 2.7.2.2–4, 2.7.2.3–4, 2.7.2.4–1, 2.7.2.5–4, 2.7.2.6–4, 2.7.3.1–3, 2.7.3.2–3, 2.7.3.3–3, 2.7.3.5–3, 2.7.3.6–1, 2.7.4.1–1, 2.7.4.2–1, 2.7.4.3–4, 2.7.4.4–2, 2.7.4.5–1, 2.7.5.2–3, 2.7.6.1–2, 2.7.6.2–4, 2.7.6.3–2, 2.7.6.4–3, 2.7.6.5–3, 2.8–2, 2.9–1, 2.10–1, 2.11.1–2, 2.11.2–4, 2.11.3–2, 2.11.4–3, 2.12–1, and 2.13–1.

4. Significant site parameters, which are located in the following section of the APR1400 Design Control Document Tier 1, Revision 3: Section 2.1, ''Site Parameters''; and

5. Significant interface requirements, which are located in the following section of the APR1400 Design Control Document Tier 1, Revision 3: Section 3.0, ''Interface Requirement.''

* * * * *

VI. * * *

B. * * *

4. All exemptions from the DCD under and in compliance with the change processes in paragraphs VIII.A.4, VIII.A.6, and VIII.B.4 of this appendix, but only for that plant;

* * * * *

6. Except as provided in paragraph VIII.B.5.g of this appendix, all departures from Tier 1 and Tier 2 under and in compliance with the change processes in paragraphs VIII.A.5 and VIII.B.5 of this appendix that do not require prior NRC approval, but only for that plant; and

* * * * *

VIII. * * *

A. Tier 1 Information

1. Generic changes to Tier 1 information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 1 information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under paragraphs A.3, A.4, A.5, A.6, or A.7 of this section.

3. Departures from Tier 1 information that are required by the Commission through plant-specific orders are governed by the requirements in § 52.63(a)(4).

4. Exemptions from Tier 1 information on definitions and general provisions, significant site parameters, and significant interface requirements are governed by the requirements in §§ 52.63(b)(1) and 52.98(f). The Commission will deny a request for an exemption from Tier 1, if it finds that the design change will result in a significant decrease in the level of safety otherwise provided by the design.

5. An applicant or licensee who references this appendix may depart from Tier 1 design description information, without NRC approval, unless the proposed departure requires an exemption under paragraph A.6 of this section.

6. A proposed departure from Tier 1 design descriptions would require an exemption if it would:

a. Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

b. Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component (SSC) important to safety and previously evaluated in the plant-specific DCD;

c. Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

d. Result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the plant-specific DCD;

e. Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

f. Create a possibility for a malfunction of an SSC important to safety with a different result than any evaluated previously in the plant-specific DCD;

g. Result in a design basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered;

h. Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses.

i. Result in a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

j. Result in a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

7. A licensee who references this appendix may not depart from Tier 1 ITAAC without prior NRC approval. A request for a departure will be treated as a request for a license amendment under § 50.90 of this chapter and does not require an exemption from this appendix.

8. After the plant first achieves full power, licensee-initiated plant-specific departures from Tier 1 information are subject to the same requirements as licensee-initiated plant-specific departures from Tier 2 information.

B. * * *

5. a. An applicant or licensee who references this appendix may depart from Tier 2 information, without prior NRC approval, unless the proposed departure involves a change to or departure from Tier 1 information (if prior NRC approval is required by paragraph A of this section) or the TS, or requires a license amendment under paragraph B.5.b or B.5.c of this section. When evaluating the proposed departure, an applicant or licensee shall consider all matters described in the plant-specific DCD.

* * * * *

c. A proposed departure from Tier 2, affecting resolution of a severe accident design feature identified in the plant-specific DCD, requires a license amendment if:

(1) There is a substantial increase in the probability of a severe accident such that a particular severe accident previously

reviewed and determined to be not credible could become credible; or

(2) There is a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

* * * * *

■ 67. In appendix G to part 52, revise paragraphs II.D., V.B.1., V.B.9., VI.B.4, V.B.6., VIII.A., VIII.B.5.a., and VIII.B.5.c. to read as follows:

Appendix G to Part 52—Design Certification Rule for NuScale

* * * * *

II. * * *

D. *Tier 1* means the portion of the design-related information contained in the generic DCD that is approved and certified by this appendix (Tier 1 information). The design descriptions, interface requirements, and site parameters are derived from Tier 2 information. Tier 1 information includes:

1. Definitions and general provisions, which are located in the following sections of the NuScale Standard Plant Design Certification Application, Certified Design Descriptions and Inspections, Tests, Analyses, & Acceptance Criteria (ITAAC), Part 2—Tier 1, Revision 5: Section 1.0, ''Introduction,'' Section 1.1, ''Definitions,'' and Section 1.2, ''General Provisions'';

2. Design descriptions, which are located in the following chapters of the NuScale Standard Plant Design Certification Application, Certified Design Descriptions and Inspections, Tests, Analyses, & Acceptance Criteria (ITAAC), Part 2—Tier 1, Revision 5 and any figures and non-ITAAC tables referenced in these sections: Chapter 2, ''Unit Specific Structures, Systems, and Components Design Descriptions and Inspections, Tests, Analyses, and Acceptance Criteria,'' and Chapter 3, ''Shared Structures, Systems, and Components and Non-Structures, Systems, and Components Design Descriptions and Inspections, Tests, Analyses, and Acceptance Criteria'';

3. Inspections, tests, analyses, and acceptance criteria (ITAAC), which are located in the inspections, tests, analyses column and the acceptance criteria column of the following tables of the NuScale Standard Plant Design Certification Application, Certified Design Descriptions and Inspections, Tests, Analyses, & Acceptance Criteria (ITAAC), Part 2—Tier 1, Revision 5: Tables 2.1–4, 2.2–3, 2.3–1, 2.5–7, 2.6–1, 2.7–2, 2.8–2, 3.0–1, 3.1–2, 3.2–2, 3.3–1, 3.4–1, 3.5–1, 3.6–2, 3.7–1, 3.8–1, 3.9–2, 3.10–2, 3.11–2, 3.12–2, 3.13–1, 3.14–2, 3.15–1, 3.16–1, 3.17–2, and 3.18–2.

4. Significant site parameters, which are located in the following chapter of the NuScale Standard Plant Design Certification Application, Certified Design Descriptions and Inspections, Tests, Analyses, & Acceptance Criteria (ITAAC), Part 2—Tier 1, Revision 5: Chapter 5, ''Site Parameters''; and

5. Significant interface requirements which are located in the following chapter of the NuScale Standard Plant Design Certification Application, Certified Design Descriptions and Inspections, Tests, Analyses, & Acceptance Criteria (ITAAC), Part 2—Tier 1, Revision 5: Chapter 4, ''Interface Requirements.''

* * * * *

V. * * *

B. * * *

1. Paragraph (f)(2)(vi) of 10 CFR 50.34 and 10 CFR 50.46b—High point venting for the reactor coolant system and reactor pressure vessel head.

* * * * *

9. Appendix A of 10 CFR part 50—Electric Power Systems GDCs: * * *

* * * * *

VI. * * *

B. * * *

4. All exemptions from the DCD under and in compliance with the change processes in paragraphs VIII.A.4, VIII.A.6, and VIII.B.4 of this appendix, but only for that plant;

* * * * *

6. Except as provided in paragraph VIII.B.5.g of this appendix, all departures from Tier 1 and Tier 2 under and in compliance with the change processes in paragraphs VIII.A.5 and VIII.B.5 of this appendix that do not require prior NRC approval, but only for that plant; and

* * * * *

VIII. * * *

A. Tier 1 Information

1. Generic changes to Tier 1 information are governed by the requirements in § 52.63(a)(1).

2. Generic changes to Tier 1 information are applicable to all applicants or licensees who reference this appendix, except those for which the change has been rendered technically irrelevant by action taken under paragraphs A.3, A.4, A.5, A.6, or A.7 of this section.

3. Departures from Tier 1 information that are required by the Commission through plant-specific orders are governed by the requirements in § 52.63(a)(4).

4. Exemptions from Tier 1 information on definitions and general provisions, significant site parameters, and significant interface requirements are governed by the requirements in §§ 52.63(b)(1) and 52.98(f). The Commission will deny a request for an exemption from Tier 1, if it finds that the design change will result in a significant decrease in the level of safety otherwise provided by the design.

5. An applicant or licensee who references this appendix may depart from Tier 1 design description information, without NRC approval, unless the proposed departure requires an exemption under paragraph A.6 of this section.

6. A proposed departure from Tier 1 design descriptions would require an exemption if it would:

a. Result in more than a minimal increase in the frequency of occurrence of an accident previously evaluated in the plant-specific DCD;

b. Result in more than a minimal increase in the likelihood of occurrence of a malfunction of a structure, system, or component (SSC) important to safety and previously evaluated in the plant-specific DCD;

c. Result in more than a minimal increase in the consequences of an accident previously evaluated in the plant-specific DCD;

d. Result in more than a minimal increase in the consequences of a malfunction of an SSC important to safety previously evaluated in the plant-specific DCD;

e. Create a possibility for an accident of a different type than any evaluated previously in the plant-specific DCD;

f. Create a possibility for a malfunction of an SSC important to safety with a different result than any evaluated previously in the plant-specific DCD;

g. Result in a design basis limit for a fission product barrier as described in the plant-specific DCD being exceeded or altered;

h. Result in a departure from a method of evaluation described in the plant-specific DCD used in establishing the design bases or in the safety analyses.

i. Result in a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

j. Result in a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

7. A licensee who references this appendix may not depart from Tier 1 ITAAC without prior NRC approval. A request for a departure will be treated as a request for a license amendment under § 50.90 of this chapter and does not require an exemption from this appendix.

8. After the plant first achieves full power, licensee-initiated plant-specific departures from Tier 1 information are subject to the same requirements as licensee-initiated plant-specific departures from Tier 2 information.

* * * * *

B. * * *

5.

a. An applicant or licensee who references this appendix may depart from Tier 2 information, without prior NRC approval, unless the proposed departure involves a change to or departure from Tier 1 information (if prior NRC approval is required by paragraph A of this section) or the TS, or requires a license amendment under paragraph B.5.b or B.5.c of this section. When evaluating the proposed departure, an applicant or licensee shall consider all matters described in the plant-specific DCD.

* * * * *

c. A proposed departure from Tier 2, affecting resolution of a severe accident design feature identified in the plant-specific DCD, requires a license amendment if:

(1) There is a substantial increase in the probability of a severe accident such that a particular severe accident previously reviewed and determined to be not credible could become credible; or

(2) There is a substantial increase in the consequences to the public of a particular severe accident previously reviewed.

* * * * *

PART 53—RISK-INFORMED, TECHNOLOGY-INCLUSIVE REGULATORY FRAMEWORK FOR COMMERCIAL NUCLEAR PLANTS

■ 68. The authority citation for part 53 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 11, 101, 103, 108, 122, 147, 161, 181, 182, 183, 184, 185, 186, 187, 189, 223, 234 (42 U.S.C. 2014, 2131, 2132, 2133, 2134, 2135, 2138, 2152, 2167, 2169, 2201, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2239, 2273, 2282); Energy Reorganization Act of 1974, secs. 201, 202, 206, 211 (42 U.S.C. 5841, 5842, 5846, 5851); Nuclear Waste Policy Act of 1982, sec. 306 (42 U.S.C. 10226); National Environmental Policy Act of 1969 (42 U.S.C. 4332); 44 U.S.C. 3504 note; Pub. L. 115–439, 132 Stat. 5571.

■ 69. In § 53.020, revise the definitions for ''*Construction*'' and ''*Quality Assurance (QA)*'' to read as follows:

§ 53.020 Definitions.

* * * * *

Construction means those activities which are conducted on-site to build the commercial nuclear plant, including the driving of piles; subsurface preparation; placement of backfill, concrete, or permanent retaining walls within an excavation; installation of foundations; or in-place assembly, erection, fabrication, or testing, which are for:

(1) Safety-related (SR) SSCs and those non-safety-related but safety-significant (NSRSS) SSCs of a facility for which special treatment includes requirements on design or installation, including associated quality assurance measures;

(2) SSCs necessary to comply with 10 CFR part 73.

* * * * *

Quality assurance (QA) means all those planned and systematic actions necessary to ensure that a structure, system, or component will perform satisfactorily in service. Quality assurance includes quality control, which comprises those QA actions related to the physical characteristics of a material, structure, component, or system which provide a means to ensure the material, structure, component, or system meets predetermined requirements.

* * * * *

■ 70. In § 53.040, revise paragraph (b)(7)(ii) and add (b)(7)(iii) to read as follows:

§ 53.040 Written communications.

* * * * *

(b) * * *

(7) * * *

(ii) A change to an NRC-accepted QA topical report or quality management system topical report from non-licensees (*i.e.,* architect/engineers, nuclear steam supply system suppliers, fuel suppliers, constructors, etc.) must be submitted to the NRC's Document Control Desk. If the communication is on paper, the signed original must be sent.

(iii) A change to the Safety Analysis report quality management system under § 53.1565, or a change to a licensee's NRC-accepted quality management system topical report under § 53.1565, must be submitted to the NRC's Document Control Desk, with a copy to the appropriate Regional Office, and a copy to the appropriate NRC Resident Inspector if one has been assigned to the site of the facility or the place of manufacture of a reactor licensed under this part. If the communication is on paper, the submission to the Document Control Desk must be the signed original.

* * * * *

■ 71. In § 53.460, revise paragraphs (b)(1) and (b)(2) to read as follows:

§ 53.460 Safety categorization and special treatments.

* * * * *

(b) * * *

(1) The special treatments for SR SSCs must include meeting the applicable quality assurance requirements from appendix B of part 50 of this chapter or, for eligible applicants, applicable quality assurance requirements from appendix T of part 50 of this chapter.

(2) The special treatments for NSRSS SSCs and special treatments for SR SSCs beyond those required under paragraph (b)(1) of this section may include meeting selected quality assurance requirements from appendix B of part 50 of this chapter or, for eligible applicants, meeting selected quality assurance requirements from appendix T of part 50 of this chapter when such treatment is needed to address performance requirements, equipment reliability, or uncertainties.

* * * * *

■ 72. In § 53.500, revise paragraph (b) to read as follows:

§ 53.500 General siting and siting assessment.

* * * * *

(b) Activities performed to identify site characteristics or otherwise needed to determine site-specific contributors to functional design criteria or analysis assumptions under subpart C of this part satisfy the applicable special treatment requirements of § 53.460, including, where applicable, the quality assurance requirements from appendix B of part 50 of this chapter or, for eligible applicants, meeting applicable quality assurance requirements from appendix T of part 50 of this chapter.

■ 73. In § 53.610, revise paragraph (b) introductory text to read as follows:

§ 53.610 Construction.

* * * * *

(b) *Construction activities.* No person may begin the construction of a commercial nuclear plant on a site on which the facility is to be operated under this part until that person has been issued either a CP or COL, an early site permit authorizing activities under § 53.1130, or a general license or LWA authorizing activities under § 53.1130.

* * * * *

■ 74. In § 53.855, add paragraphs (c) and (d) to read as follows:

§ 53.855 Emergency preparedness.

* * * * *

(c) A licensee desiring to change its plume exposure pathway EPZ must submit an application for a license amendment under § 53.1510 and receive NRC approval before implementing the change. Any such license amendment request must include documentation demonstrating that the applicable State, local, and Tribal governmental authorities have agreed to the EPZ change.

(d) A licensee desiring to change its emergency plan to comply with either the requirements of § 50.160 of this chapter or appendix E to part 50 of this chapter and the planning standards of § 50.47(b) of this chapter, must submit an application for a license amendment under § 53.1510 and receive NRC approval before implementing the change.

■ 75. Revise § 53.865 to read as follows:

§ 53.865 Quality assurance.

Each holder of an OL or COL under this part must develop, implement, and maintain a quality assurance program in accordance with appendix B of part 50 of this chapter or, for eligible OL or COL holders, a quality management system in accordance with appendix T of part 50 of this chapter. A written quality assurance program manual must be developed and used to guide the conduct of the program.

■ 76. In § 53.1010, revise paragraph (b)(2) to read as follows:

§ 53.1010 Financial assurance for decommissioning.

* * * * *

(b) * * *

(2) The amount of financial assurance for decommissioning to be provided may be based on a design-specific or site-specific cost estimate for

decommissioning the facility under § 53.1020.

* * * * *

■ 77. Revise § 53.1020 to read as follows:

§ 53.1020 Cost estimates for decommissioning.

(a) A certification relying on a design-specific decommissioning cost estimate must demonstrate that there is reasonable assurance that sufficient funds necessary for safely decommissioning the facility will be available, when needed, and provide the factors used to develop the design-specific decommissioning cost estimate, including reactor technology, power level (in MWt), and costs related to labor, energy, and waste burial. The amount to be provided must also address the approach to annual adjustments required by § 53.1030. Finally, design-specific decommissioning cost estimates must include plans for adjusting levels of funds assured for decommissioning to demonstrate that a reasonable level of assurance will be provided that funds will be available when needed to cover the cost of decommissioning.

(b) Site-specific decommissioning cost estimates (DCEs) must be in an amount that may be more, but not less, than the amount stated in paragraph (a) of this section. Site-specific DCEs must account for the engineering, labor, equipment, transportation, disposal, and related charges needed to support termination of the license. They must include the costs for decontaminating structures, systems, and components and the site environs; removal of contaminated components and materials from the plant and the site environs; disposal of removed components and materials in appropriate facilities; and any other activities supporting the release of the property and termination of the license. They must also address the approach to annual adjustments required by § 53.1030. Finally, site-specific DCEs must include plans for adjusting levels of funds assured for decommissioning to demonstrate that a reasonable level of assurance will be provided that funds will be available when needed to cover the cost of decommissioning.

■ 78. Revise § 53.1040 to read as follows:

§ 53.1040 Methods for providing financial assurance for decommissioning.

Financial assurance for decommissioning is to be provided by the following methods.

(a) *Prepayment.* Prepayment is the deposit made preceding the start of operation or the transfer of a license under § 53.1570 into an account segregated from applicant or licensee assets and outside the administrative control of the applicant or licensee and its subsidiaries or affiliates of cash or liquid assets such that the amount of funds would be sufficient to pay decommissioning costs. Prepayment may be in the form of a trust, escrow account, or Government fund with payment by certificate of deposit, deposit of government or other securities, or other method acceptable to the NRC. This trust, escrow account, Government fund, or other type of agreement must be established in writing and maintained at all times in the United States with an entity that is an appropriate State or Federal government agency, or an entity whose operations in which the prepayment deposit is managed are regulated and examined by a Federal or State agency. An applicant or licensee that has prepaid funds based on a design-specific or site-specific decommissioning cost estimate under § 53.1020 may take credit for projected earnings on the prepaid decommissioning trust funds, using up to a 2 percent annual real rate of return through the time of termination of the license. An applicant or licensee may use a credit of greater than 2 percent if the applicant's or licensee's rate-setting authority has specifically authorized a higher rate. However, applicants or licensees certifying only to design-specific decommissioning cost estimates can take a pro-rata credit during the dismantlement period (*i.e.,* recognizing both cash expenditures and earnings the first 7 years after shutdown). Actual earnings on existing funds may be used to calculate future fund needs.

(b) *External sinking fund.* An external sinking fund is a fund established and maintained by setting funds aside periodically in an account segregated from applicant or licensee assets and outside the administrative control of the applicant or licensee and its subsidiaries or affiliates in which the total amount of funds would be sufficient to pay decommissioning costs. An external sinking fund may be in the form of a trust, escrow account, or Government fund, with payment by certificate of deposit, deposit of government or other securities, or other method acceptable to the NRC. This trust, escrow account, Government fund, or other type of agreement must be established in writing and maintained at all times in the United States with an entity that is an appropriate State or Federal government agency, or an entity whose operations in which the external sinking fund is managed are regulated and examined by a Federal or State agency. An applicant or licensee that has collected funds based on a design-specific or site-specific decommissioning cost estimate under § 53.1020 may take credit for projected earnings on the external sinking funds using up to a 2 percent annual real rate of return from the time of future funds' collection through the time of termination of the license. An applicant or licensee may use a credit of greater than 2 percent if the applicant's or licensee's rate-setting authority has specifically authorized a higher rate. However, applicants or licensees certifying only to design-specific decommissioning cost estimates can take a pro-rata credit during the dismantlement period (*i.e.,* recognizing both cash expenditures and earnings the first 7 years after shutdown). Actual earnings on existing funds may be used to calculate future fund needs. An applicant or licensee whose rates for decommissioning costs cover only a portion of these costs may make use of this method only for the portion of these costs that are collected in one of the manners described in this paragraph (b). This method may be used as the exclusive mechanism relied upon for providing financial assurance for decommissioning in the following circumstances:

(1) By an applicant or licensee that recovers, either directly or indirectly, the estimated total cost of decommissioning through rates established by ''cost of service'' or similar ratemaking regulation. Public utility districts, municipalities, rural electric cooperatives, and State and Federal agencies, including associations of any of the foregoing, that establish their own rates and are able to recover their cost of service allocable to decommissioning, are deemed to satisfy this condition.

(2) By an applicant or licensee whose source of revenues for its external sinking fund is a ''non-bypassable charge,'' the total amount of which will provide funds estimated to be needed for decommissioning pursuant to § 53.1020, § 53.1060, or § 53.1575.

(c) *A surety method, insurance, or other guarantee method.*

(1) These methods guarantee that decommissioning costs will be paid. A surety method may be in the form of a surety bond, or letter of credit. Any surety method or insurance used to provide financial assurance for decommissioning must contain the following conditions:

(i) The surety method or insurance must be open-ended, or, if written for a

specified term, such as 5 years, must be renewed automatically, unless 90 days or more prior to the renewal day the issuer notifies the NRC, the beneficiary, and the applicant or licensee of its intention not to renew. The surety or insurance must also provide that the full-face amount be paid to the beneficiary automatically prior to the expiration without proof of forfeiture if the applicant or licensee fails to provide a replacement acceptable to the NRC within 30 days after receipt of notification of cancellation.

(ii) The surety or insurance must be payable to a trust established for decommissioning costs. The trustee and trust must be acceptable to the NRC. An acceptable trustee includes an appropriate State or Federal government agency or an entity that has the authority to act as a trustee and whose trust operations are regulated and examined by a Federal or State agency.

(2) A parent company guarantee of funds for decommissioning costs based on a financial test may be used if the guarantee and test are as contained in appendix A to 10 CFR part 30.

(3) For commercial companies that issue bonds, a guarantee of funds by the applicant or licensee for decommissioning costs based on a financial test may be used if the guarantee and test are as contained in appendix C to 10 CFR part 30. For commercial companies that do not issue bonds, a guarantee of funds by the applicant or licensee for decommissioning costs may be used if the guarantee and test are as contained in appendix D to 10 CFR part 30. A guarantee by the applicant or licensee may not be used in any situation in which the applicant or licensee has a parent company holding majority control of voting stock of the company.

(d) *Funding method for Federal licensees.* For a Federal licensee, a statement of intent containing a cost estimate for decommissioning and indicating that funds for decommissioning will be obtained when necessary.

(e) *Contractual funding method.* Contractual obligation(s) on the part of an applicant's or licensee's customer(s), the total amount of which over the duration of the contract(s) will provide the applicant's or licensee's total share of uncollected funds estimated to be needed for decommissioning pursuant to § 53.1020, § 53.1060, or § 53.1575. To be acceptable to the NRC as a method of decommissioning funding assurance, the terms of the contract(s) must include provisions that the buyer(s) of electricity or other products will pay for the decommissioning obligations specified in the contract(s), notwithstanding the operational status either of the licensed plant to which the contract(s) pertains or force majeure provisions. All proceeds from the contract(s) for decommissioning funding will be deposited to the external sinking fund. The NRC reserves the right to evaluate the terms of any contract(s) and the financial qualifications of the contracting entity or entities offered as assurance for decommissioning funding.

(f) *Other funding mechanisms.* Any other mechanism, or combination of mechanisms, that provides, as determined by the NRC upon its evaluation of the specific circumstances of each application or licensee submittal, assurance of decommissioning funding equivalent to that provided by the mechanisms specified in paragraphs (a) through (e) of this section. Applicants or licensees who do not have sources of funding described in paragraph (b) of this section may use an external sinking fund in combination with a guarantee mechanism, as specified in paragraph (c) of this section, provided that the total amount of funds estimated to be necessary for decommissioning is assured.

■ 79. Revise § 53.1050 to read as follows:

§ 53.1050 NRC oversight.

The NRC reserves the right to take the following steps in order to ensure an applicant's or licensee's adequate accumulation of decommissioning funds: review, as needed, the rate of accumulation of decommissioning funds and, either independently or in cooperation with FERC and the applicant's or licensee's State Public Utility Commission, take additional actions as appropriate on a case-by-case basis, including modification of an applicant's or licensee's schedule for the accumulation of decommissioning funds.

■ 80. In § 53.1109, revise paragraph (g) to read as follows:

§ 53.1109 Contents of applications; general information.

* * * * *

(g)(1) If the application is for an OL or COL for a commercial nuclear plant, or if the application is for an early site permit for a commercial nuclear plant and contains plans for coping with emergencies under § 53.1146(b)(2)(ii), the applicant must coordinate radiological emergency preparedness activities with offsite organizations with responsibilities for coping with emergencies including State, local, and Tribal governmental agencies, as applicable. Specifically, the applicant must ensure that these response organizations are aware of the potential radiological consequences of the facility and have been consulted on appropriate protective measures including the extent of any emergency planning zone (EPZ) for implementing predetermined, prompt protective measures. The application must include information that describes the extent of the applicant's interaction with these response organizations. If the application is for an early site permit that, under § 53.1146(b)(2)(i), proposes major features of the emergency plans describing the EPZs, then the descriptions of the EPZs must meet the requirements of this paragraph (g)(1). Generally, the plume exposure pathway EPZ for a commercial nuclear plant must consist of an area about 2 to 10 miles (3.2 to 16 km) in radius. For reactors with an authorized power level less than 300 MW thermal, the plume exposure pathway EPZ may be established at the site boundary. The need for and size of the EPZ may also be determined on a case-by-case basis as described in § 53.1109(g)(2). The exact size and configuration of the EPZs surrounding a particular commercial nuclear plant must be determined in relation to the local emergency response needs and capabilities as they are affected by such conditions as demography, topography, land characteristics, access routes, and jurisdictional boundaries. Emergency plans must describe such actions as are appropriate to avoid or reduce dose within and beyond the EPZ or site boundary and to protect the ingestion pathway.

(2) For a case-by-case EPZ determination, the applicant or licensee must submit an analysis used to determine whether the criteria in § 53.1109(g)(2)(i)(A) and (B) are met and, if they are met, the size of the plume exposure pathway EPZ.

(i) The plume exposure pathway EPZ is the area within which:

(A) Dose to an individual is projected to exceed 1 rem (10 millisieverts) total effective dose equivalent over 96 hours from the release of radioactive materials from the facility considering accident likelihood and source term, timing of the accident sequence, and meteorology; and

(B) Pre-determined, prompt protective measures are necessary.

(ii) [Reserved]

* * * * *

■ 81. In 53.1130, revise the section heading and paragraphs (a)(3)(ii), (b)(1)(i), and (c) and add paragraph (e) to read as follows:

§ 53.1130 Limited work authorizations, general licenses.

(a) * * *

(3) * * *

(ii) Information to demonstrate the applicability of a categorical exclusion, or if a categorical exclusion is not applicable, an environmental report in accordance with part 51 of this chapter; and

* * * * *

(b) * * *

(1) * * *

(i) The NRC staff issues the final documentation required under NEPA and all applicable Federal environmental consultations have been complete, in accordance with part 51 of this chapter;

* * * * *

(c) *Effect of limited work authorization.*

(1) Any activities undertaken under an LWA are entirely at the risk of the applicant and, except as to the matters determined under paragraph (b)(1) of this section, the issuance of the LWA has no bearing on the issuance of a CP or COL with respect to the requirements of the Act and rules, regulations, or orders issued under the Act. The environmental impact statement for a CP or COL application for which an LWA was previously issued will not address, and the presiding officer in a contested hearing will not consider, the sunk costs of the holder of the LWA in determining the proposed action (*i.e.,* issuance of the CP or COL).

(2) Any activities that are determined to be outside the scope of those defined in the definition of construction in § 53.020 and that are undertaken by an applicant or on its behalf are entirely at the risk of the applicant and have no bearing on the issuance of a license with respect to the requirements of the Act, and rules, regulations, or orders issued under the Act.

* * * * *

(e) *Issuance of general license.* A general license is hereby issued to an applicant for a construction permit or combined license for a utilization facility under this part for construction activities on a site that is specified in the application, subject to the following conditions:

(1) The applicant has submitted and the Commission has docketed a CP or COL application for a commercial nuclear plant under this part that meets the following criteria;

(i) The application references a reactor design for which the Commission issued an operating license under this part or issued a combined license under this part and made the finding under § 53.1452(g) and for which the Commission afforded generic finality under § 53.1387(e) or § 53.1440(d); and

(ii) The operating license or combined license described in paragraph (e)(1)(i) of this section met the criteria for a categorical exclusion or resulted in a finding of no significant impact from an environmental assessment in accordance with part 51 of this chapter;

(iii) The application utilizing the general license includes a plan for redress of any adverse environmental impact from conduct of activities under the general license should such redress be necessary; and

(iv) The application must contain information demonstrating that the site characteristics are bounded by the site parameters postulated for the approval of generic finality.

(2) The applicant may perform construction only upon notification to the NRC Director of NRR using instructions in § 53.040 before the start of construction. The notice must state that all applicable permits, licenses, approvals, and other entitlements in connection with the proposed action have been obtained. The notice may be in the form of a letter, but must contain the applicant's name, address, and the name and means of contacting a person responsible for providing additional information concerning construction under this general license;

(3) All applicable Federal environmental consultations have been completed;

(4) The general license only authorizes construction of those generic aspects of the design of the commercial nuclear plant for which the Commission afforded generic finality and does not authorize installation of the reactor vessel, the reactor coolant system, or associated reactivity control and heat removal systems;

(5) The applicant must allow for NRC inspections that the Commission deems necessary related to activities performed under the general license; and

(6) Any activities undertaken by the applicant or on its behalf under the general license are entirely at the risk of the applicant and have no bearing on the issuance of a license with respect to the requirements of the Act, and rules, regulations, or orders issued under the Act.

■ 82. Revise § 53.1161 to read as follows:

§ 53.1161 Extent of activities permitted.

If the activities authorized by § 53.1158(c) are performed and the early site permit holder has applied for termination, then the early site permit remains in effect solely for the purpose of site redress, and the holder of the permit must redress the site under the terms of the site redress plan required by § 53.1146(c). If, before redress is complete, a use not envisaged in the redress plan is found for the site or parts thereof, the holder of the permit must carry out the redress plan to the greatest extent possible consistent with the alternate use.

■ 83. In § 53.1164, revise paragraph (a) and remove and reserve paragraph (b) to read as follows:

§ 53.1164 Duration of permit.

(a) An early site permit issued under this subpart will be issued with no fixed term.

(b) [Reserved]

* * * * *

■ 84. Revise § 53.1173 to read as follows:

§ 53.1173 Application for amendment to update an early site permit.

(a) An early site permit holder may choose to submit an application to amend an early site permit to update the data and information on which the permit is based at any time after issuance of the early site permit. The early site permit holder may provide updated information on as many issues as the early site permit holder chooses and may request to extend the period for which the agency will afford those issues finality up to 20 additional years from the date of the amendment's issuance. The early site permit holder may request such an extension for an already extended permit. The application must meet the requirements of §§ 53.1510 and 53.1520.

(b) An application submitted under paragraph (a) of this section must contain all information necessary to bring up to date the information and data contained in the previous application for those issues the early site permit holder has chosen to update.

(c) Each application must include a complete environmental report as required by part 51 of this chapter, or a request and justification for a categorical exclusion under part 51 of this chapter.

(d) Any person whose interest may be affected by the update of the permit may request a hearing on the application for the update. The request for a hearing must comply with § 2.309 of this chapter. If a hearing is granted, notice of the hearing will be published in accordance with § 2.309 of this chapter.

■ 85. Revise § 53.1176 to read as follows:

§ 53.1176 Issuance of amendment to update an early site permit.

The Commission shall grant amendment of an early site permit only if it determines that:

(a) The site complies with the Act, the Commission's regulations, and orders applicable and in effect at the time the site permit was originally issued; and

(b) Any new requirements the Commission may wish to impose are necessary for adequate protection to public health and safety or common defense and security.

§ 53.1179 [Removed and Reserved]

■ 86. Remove and reserve § 53.1179.

■ 87. Revise § 53.1182 to read as follows:

§ 53.1182 Use of site for other purposes.

(a) A site for which an early site permit has been issued under this part may be used for purposes other than those described in the permit, including the location of other types of energy facilities. The permit holder must inform the Director, Office of Nuclear Reactor Regulation (Director), of any significant uses for the site which have not been approved in the early site permit. The information about the activities must be given to the Director at least 30 days in advance of any actual construction or site modification for the activities. The information provided could be the basis for imposing new requirements on the permit, under the provisions of § 53.1188.

(b) If the permit holder no longer intends to use the site for a nuclear power plant or for other reasons no longer wishes to hold the permit, as described in the request, the permit holder may at any time request the Director to terminate the early site permit. The request to terminate the permit must comply with the filing requirements of §§ 53.040 and 53.1100 and identify the applicable requirements for site redress of § 53.1161. Upon request, the Director may terminate the permit.

(c) Termination of the early site permit does not bar the permit holder or another applicant from filing a new application for the site.

■ 88. In § 53.1188,

■ a. In paragraph (a)(1), remove the phrase ''or § 53.1179'';

■ b. In paragraph (a)(2), wherever it appears remove the word ''renewal'' and add in its place the word ''amendment'';

■ c. Revise and republish paragraph (c)(1);

■ d. In paragraph (d), remove the word ''renewed'' and in its place the word ''amended'';

■ e. In paragraph (e), in the last sentence add in sequential order the reference ''53.1173''.

The revision is to read as follows:

§ 53.1188 Finality of early site permit determinations.

* * * * *

(c) * * *

(1) In any proceeding for the issuance of a CP, OL, or COL referencing an early site permit, contentions on the following matters may be litigated in the same manner as other issues material to the proceeding:

(i) The nuclear reactor proposed to be built does not fit within one or more of the site characteristics or design parameters included in the early site permit;

(ii) One or more of the terms and conditions of the early site permit have not been met;

(iii) A variance requested under paragraph (d) of this section is unwarranted or should be modified;

(iv) New or additional information is provided in the application that substantially alters the bases for a previous NRC conclusion or constitutes a sufficient basis for the Commission to modify or impose new terms and conditions related to emergency preparedness;

(v) The information as required in the site safety analysis report in accordance with § 53.1146(a)(1)(vi) through (ix) has not been updated after 20 years from the date of early site permit issuance or a previous update of the permit by amendment, whichever is later, or

(vi)(A) Any significant environmental issue that was not resolved in the early site permit proceeding;

(B) For an application that references an early site permit issued or updated by amendment, whichever is later, no more than 20 years before the submission of the application, any issue involving the impacts of construction and operation of the facility that was resolved in the early site permit proceeding for which significant new information has been identified; and

(C) For an application that references an early site permit, issued or updated by amendment, whichever is later, more than 20 years before submission of the application, any issue involving the impacts of construction and operation of the facility regardless of whether the early site permit proceeding resolved the issue.

* * * * *

■ 89. In § 53.1263,

■ a. Revise paragraphs (a)(1)(v) and (vi), and remove paragraph (a)(1)(vii);

■ b. In paragraph (a)(4)(ii), remove the last sentence; and

■ c. Revise paragraph (b).

The revisions are to read as follows:

§ 53.1263 Finality of standard design certifications.

(a)(1) * * *

(v) Is necessary to correct material errors in the certification information; or

(vi) Substantially increases overall safety, reliability, or security of facility design, construction, or operation, and the direct and indirect costs of implementation of the rule change are justified in view of this increased safety, reliability, or security.

* * * * *

(b) An applicant who references a design certification rule may request an exemption from one or more elements of the certification information, if one is required per § 53.1525. The Commission may grant such a request only if it determines that the exemption will comply with the requirements of § 53.080. The granting of an exemption on request of an applicant is subject to litigation in the same manner as other issues in the OL or COL hearing.

* * * * *

■ 90. In § 53.1282, add paragraph (e) to read as follows:

§ 53.1282 Contents of applications for manufacturing licenses; other application content.

* * * * *

(e) *Optional operational programs.* An applicant may include in its application descriptions of essentially complete programmatic controls, operational programs, or operational requirements beyond those required by § 53.1279 in order to satisfy requirements for license applications that may reference a manufacturing license. If approved by the NRC as part of the manufacturing license, such programmatic controls, operational programs, and operational requirements would have finality under § 53.1288.

■ 91. In § 53.1288, revise paragraphs (a)(1) and (b) to read as follows:

§ 53.1288 Finality of manufacturing licenses.

(a)(1) During the term of an ML issued under this part, the Commission may not modify, rescind, or impose new requirements on the design of the manufactured reactor; the requirements for the manufacture of the manufactured reactor; or the programmatic controls, operational programs, or operational requirements, unless the Commission determines that a modification is necessary to bring the design of the reactor or its manufacture into compliance with the Commission's requirements applicable and in effect at

the time the ML was issued, or to provide reasonable assurance of adequate protection to public health and safety or common defense and security.

* * * * *

(b) An applicant who references or uses a manufactured reactor manufactured under an ML under this part may include in the application a request for a departure from the design characteristics, site parameters, terms and conditions, or approved design of the manufactured reactor. The granting of a departure on request of an applicant is subject to litigation in the same manner as other issues in the COL or CP hearing.

■ 92. In § 53.1309, revise paragraph (a)(2)(i) and remove and reserve paragraph (a)(4) to read as follows:

§ 53.1309 Contents of applications for construction permits; technical information.

* * * * *

(a) * * *

(2) * * *

(i) *Quality assurance program.* A description of the QAP or, for eligible applicants, the quality management system to be applied to the design, fabrication, construction, and testing of the SSCs of the facility under § 53.610(a)(6), including a discussion of how the requirements of appendix B of part 50 of this chapter or, for eligible applicants, how the requirements of appendix T of part 50 of this chapter will be satisfied.

* * * * *

(4) [Reserved]

* * * * *

■ 93. In § 53.1369, revise paragraph (l) and add paragraph (bb) to read as follows:

§ 53.1369 Contents of applications for operating licenses; technical information.

* * * * *

(l) *Quality assurance.* A description of the QAP or, for eligible applicants, the quality management system that demonstrates compliance with the requirements under § 53.865.

* * * * *

(bb) *Requests for generic finality.* An applicant may include in its application a request for generic finality, to generic aspects of the design under this part, such that information in the application, if approved by the NRC, is considered resolved in other proceedings where information approved for generic finality is referenced. An application for an operating license that requests generic finality must include applicable site parameters postulated for the design, including the design-basis external hazard levels for the relevant external hazards, and an analysis and evaluation of the design in terms of those site parameters.

■ 94. In § 53.1375, revise paragraph (b) to read as follows:

§ 53.1375 Review of applications.

* * * * *

(b) *Administrative review of applications; hearings.*

(1) A proceeding on an OL is subject to all applicable procedural requirements contained in 10 CFR part 2, including the requirements for docketing (§ 2.101 of this chapter) and issuance of a notice of hearing (§ 2.104 of this chapter). All hearings on OLs are governed by the procedures contained in 10 CFR part 2.

(2) If an applicant requests generic finality under § 53.1369(bb) for an OL under this part, the Commission will include a request for generic finality as a proposed action in the notice of proposed action required by § 2.105 of this chapter.

■ 95. In § 53.1387, add paragraph (e) to read as follows:

§ 53.1387 Issuance of operating licenses.

* * * * *

(e) The Commission may afford generic finality to generic aspects of the design of a commercial nuclear plant under this part, including postulated site parameters, and requirements submitted pursuant to § 53.1369(bb), if it finds that the proposed generic design can be constructed and operated at sites having characteristics that fall within the site parameters postulated for the design in accordance with applicable requirements and without undue risk to the health and safety of the public.

■ 96. Revise § 53.1390 to read as follows:

§ 53.1390 Finality of operating licenses.

(a) After issuance of an OL, the Commission may not modify, add, or delete any term or condition of the OL, except in accordance with the provisions of § 53.1590.

(b) In a proceeding for the issuance of a CP, OL, or COL, or in any enforcement hearing other than one initiated by the Commission under paragraph (a) of this section, in which an OL issued under § 53.1387 is referenced, the Commission must treat as resolved those matters resolved in the proceeding on the application for issuance or renewal of the referenced OL including, if applicable, the adequacy of a reactor design, where the referenced OL was afforded finality pursuant to § 53.1387(e).

■ 97. In § 53.1416, revise paragraphs (a)(12) and (d) and add paragraph (i) to read as follows:

§ 53.1416 Contents of applications for combined licenses; technical information.

* * * * *

(a) * * *

(12) *Quality assurance.* A description of the QAP or, for eligible applicants, the quality management system under § 53.865.

* * * * *

(d) If the COL application references an early site permit, then the following requirements apply:

(1) The FSAR need not contain information or analyses submitted to the Commission in connection with the early site permit provided that the FSAR must either include or incorporate by reference the early site permit Site Safety Analysis Report and contain, in addition to the information and analyses otherwise required, information sufficient to demonstrate that the design of the facility falls within the site characteristics and design parameters specified in the early site permit.

(2) If the FSAR does not demonstrate that design of the facility falls within the site characteristics and design parameters, the application must include a request for a variance that complies with the requirements of §§ 53.1188(d) and 53.1437.

(3) If the early site permit site safety analysis report information required by § 53.1146(a)(1)(vi) through (ix) has not been updated after 20 years from the date of early site permit issuance or a previous update of the permit by amendment, whichever is later; the combined license application shall include updated information and revised analyses, as necessary, in the final safety analysis report.

(4) The FSAR must demonstrate that all terms and conditions that have been included in the early site permit will be satisfied by the date of issuance of the COL. Any terms or conditions of the early site permit that could not be met by the time of issuance of the COL must be set forth as terms or conditions of the COL.

(5) If the early site permit approves complete and integrated emergency plans, or major features of emergency plans, then the FSAR must include any new or additional information that updates and corrects the information that was provided under § 53.1146(b)(2) and discuss whether the new or additional information materially changes the bases for compliance with the applicable requirements. The application must identify changes to the emergency plans or major features of emergency plans that have been incorporated into the proposed facility emergency plans and that constitute or

would constitute a change in an emergency plan that results in reducing the licensee's capability to perform an emergency planning function in the event of a radiological emergency.

(6) If complete and integrated emergency plans are approved as part of the early site permit, new certifications meeting the requirements of paragraph (a)(9)(i) of this section are not required.

* * * * *

(i) An applicant may include in its application a request for generic finality, to generic aspects of the design under this part, such that information in the application, if approved by the NRC, is considered resolved in other proceedings where information approved for generic finality is referenced. An application for a combined license that requests generic finality must include applicable site parameters postulated for the design under this part, including the design-basis external hazard levels for the relevant external hazards, and an analysis and evaluation of the design in terms of those site parameters.

■ 98. In § 53.1422, revise paragraph (b) to read as follows:

§ 53.1422 Review of applications.

* * * * *

(b) *Administrative review of applications; hearings.*

(1) A proceeding on a COL is subject to all applicable procedural requirements contained in 10 CFR part 2, including the requirements for docketing (§ 2.101 of this chapter) and issuance of a notice of hearing (§ 2.104 of this chapter). If an applicant requests a Commission finding on certain ITAAC with the issuance of the COL, then those ITAAC will be identified in the notice of hearing. All contested hearings on COLs are governed by the procedures contained in 10 CFR part 2.

(2) If an applicant requests generic finality under § 53.1416(i) for a COL under this part, the Commission will include a request for generic finality as a proposed action in the notice of hearing required by § 2.104 of this chapter.

§ 53.1437 [Amended]

■ 99. In § 53.1437, in paragraph (c), remove the last sentence.

■ 100. In § 53.1440, add paragraph (d) to read as follows:

§ 53.1440 Issuance of combined licenses.

* * * * *

(d) The Commission may afford generic finality to generic aspects of the design of a commercial nuclear plant under this part, including postulated site parameters, and requirements submitted pursuant to § 53.1416(i), if it finds that the proposed generic design can be constructed and operated at sites having characteristics that fall within the site parameters postulated for the design in accordance with applicable requirements and without undue risk to the health and safety of the public.

■ 101. In § 53.1443, add paragraph (g) to read as follows:

§ 53.1443 Finality of combined licenses.

* * * * *

(g) In a proceeding for the issuance of a CP, OL, or COL, or in any enforcement hearing other than one initiated by the Commission under paragraph (a) of this section, in which a COL issued under § 53.1440 is referenced, the Commission must treat as resolved those matters resolved in the proceeding on the application for issuance or renewal of the referenced COL including, if applicable, the adequacy of a reactor design, where the referenced COL was afforded finality pursuant to § 53.1440(d).

■ 102. In § 53.1525, revise paragraphs (a) and (b) to read as follows:

§ 53.1525 Revising certification information within a design certification rule.

(a) A holder of a license who references a design certification rule issued under this part must request a license amendment in accordance with §§ 53.1510, 53.1515, and 53.1520 if proposing to change certification information that has been incorporated into the license.

(b) For certification information that has not been incorporated into the license, a holder of a license who references a design certification rule issued under this part may make changes to the certification information without requesting an exemption, if the changes meet the criteria in § 53.1550(a)(1) and (2) using the specifications in § 53.1550(b)(2) and (3). If an exemption is requested, the Commission may grant such a request only if it determines that the exemption will comply with the requirements of § 53.080.

* * * * *

■ 103. In § 53.1530, in paragraph (a) revise the last sentence to read as follows:

§ 53.1530 Revising information within a Final Safety Analysis Report associated with a manufacturing license.

* * * In those cases where an ML references a design certification rule, the provisions of § 53.1525 apply.

* * * * *

■ 104. Revise § 53.1535 to read as follows:

§ 53.1535 Amendments and exemptions during construction.

(a) The holder of a CP or limited work authorization (LWA) under this part may request an amendment to the CP or LWA in order to gain Commission approval of the safety of selected design features or specifications, including proposed departures from a design certification rule or ML. Amendments to CPs or LWAs under this part must be requested and processed under §§ 53.1510 and 53.1520. The holder of a CP or LWA under this part may also request an exemption, if required by § 53.1525, to depart from a design certification rule.

(b) The holder of a COL under this part for which the NRC has not yet made a finding in accordance with § 53.1452(g) must request exemptions required by § 53.1525 and amendments required by § 53.1525 or 53.1550 no later than 45 days from the date the licensee begins the construction of the SSCs to implement the change or departure requiring NRC approval. The licensee proceeds with such changes at its own risk recognizing that there is a possibility that the exemption or amendment will not be granted.

■ 105. Revise § 53.1550 to read as follows:

§ 53.1550 Evaluating changes to facility as described in Final Safety Analysis Reports.

(a) The holder of an OL or COL may make changes in the facility as described in the FSAR (as updated) and make changes in the procedures as described in the FSAR (as updated) without obtaining an exemption pursuant to § 53.1525 or license amendment pursuant to § 53.1510 only if—

(1) A change to the technical specifications or other certification information incorporated in the license is not required; and

(2) The change meets all of the following criteria:

(i) Does not result in an increase to the frequency or consequences of an event sequence such that an event sequence not previously identified as risk significant becomes risk significant by the analyses performed in accordance with § 53.450(e).

(ii) Does not result in an increase to the frequency or consequences of an event sequence such that an event sequence exceeds the licensing-basis event evaluation criteria required to be established in accordance with § 53.450(e).

(iii) Does not involve either of the following:

(A) A change to the NRC-approved comprehensive risk metric(s) or

associated risk performance objective under § 53.220(b), or

(B) An increase to the frequency or consequences of one or more event sequences such that any calculated comprehensive risk metric exceeds the associated risk performance objective established in accordance with § 53.220.

(iv) Does not involve a departure from a method of evaluation described in the FSAR (as updated) used in assessing design basis accidents in accordance with § 53.450(f) unless the results of the analysis under § 53.450(f) are conservative or essentially the same; the revised method of evaluation has been previously approved by the NRC for the intended application; the revised method of evaluation can be used under an NRC-endorsed consensus code or standard; or the licensee has demonstrated through a documented verification, validation, and uncertainty quantification (VVUQ) process, conducted under a VVUQ program that meets the requirements of § 50.221 of this chapter and has been approved by the NRC for the intended application, that the departure from a method of evaluation described in the FSAR (as updated) meets the criteria established for credibility in the VVUQ program.

(v) Does not result in a change to the safety classification of an SSC from non-safety-related to safety-related, from non-safety-related but safety-significant to safety-related, or from safety-related to either non-safety-related but safety-significant or non-safety-related.

(vi) Does not result in more than a minimal decrease in defense in depth.

(vii) For commercial nuclear plants licensed under this part for which alternative evaluation criteria are adopted in accordance with § 53.470, does not result in a change to the frequency or consequences of event sequences such that the alternate evaluation criteria are exceeded.

(viii) Does not result in the identification of a new design-basis accident in accordance with § 53.450(f).

(ix) Does not result in more than a minimal increase in the consequences of any design-basis accident.

(3) In implementing this paragraph (a), the FSAR (as updated) is considered to include FSAR changes since submittal of the last update of the FSAR under § 53.1545.

(4) The provisions in this section do not apply to changes to the facility or procedures when the applicable regulations establish more specific criteria for accomplishing such changes.

(b)(1) A licensee who references a design certification rule may make departures from the standard design, without prior Commission approval, unless the proposed departure involves a change to the design as described in the rule certifying the design, in which case the requirements of § 53.1525 are applicable.

(2) The licensee must maintain records of all departures from the certified design of the facility and these records must be maintained and available for audit until the termination of the license. The licensee must identify the location and nature of departures from licensing-basis information within supporting documents for a certified design within the updates to the Safety Analysis Report required by § 53.1545.

(3) Licensees for which the NRC has docketed the certifications required under § 53.1070 need not retain records of departures from the design of the facility associated with SSCs that have been permanently removed from service using an NRC-approved change process.

(c) The holder of an OL or COL that authorizes operation of a manufactured reactor may make changes in the facility as described in the FSAR (as updated) and make changes in the procedures as described in the FSAR (as updated) without obtaining a license amendment pursuant to § 53.1510 if the changes are identical to changes approved by the Commission by amendment to the manufacturing license for the manufactured reactor and upon determining that implementation of the changes will be consistent with the basis for the Commission's approval of the amendment to the manufacturing license and not involve any additional changes that would require an amendment to the OL or COL.

(d)(1) The licensee must maintain records of changes in the facility and procedures made under paragraphs (a) and (c) of this section. These records must include a written evaluation which provides the bases for the determination that the change does not require a license amendment under paragraph (a)(2) or (c) of this section.

(2) The licensee must submit, as specified in § 53.040, a report containing a brief description of any departures and changes, including a summary of the evaluation of each. A report must be submitted at intervals not to exceed 24 months. For COLs, the report must be submitted at intervals not to exceed 6 months during the period from the date of application for a COL to the date the Commission makes its findings under § 53.1452(g).

(3) The records of changes in the facility must be maintained until the termination of an OL or COL issued under this part, or the termination of a renewed license issued under § 53.1595—whichever is later. Records of changes in procedures must be maintained for a period of 5 years.

■ 106. In § 53.1565, in paragraph (d), revise (1)(i) introductory text, add (1)(iii), revise (2), add (3)(i)(E), and revise (3)(ii), (iii), and (vii) to read as follows:

§ 53.1565 Evaluating changes to programs included in licensing-basis information.

* * * * *

(d) * * *

(1) * * *

(i) Each holder under this part of an OL or COL, after the Commission makes the finding under § 53.1452(g), subject to the quality assurance criteria in appendix B of part 50 of this chapter, may make a change to a previously accepted quality assurance program (QAP) description included or referenced in the Safety Analysis Report without prior NRC approval, provided the change does not reduce the commitments in the program description as accepted by the NRC. Changes to the QAP description that do not reduce the commitments must be submitted to the NRC in accordance with the requirements of § 53.1545. In addition to QAP changes involving administrative improvements and clarifications, spelling corrections, punctuation, or editorial items, the following changes are not considered to be reductions in commitment:

* * * * *

(iii) Each holder of an OL or COL after the Commission makes the finding under § 53.1452(g), subject to the quality assurance criteria in appendix T of part 50 of this chapter, must submit changes to the quality management system to the NRC and receive NRC approval prior to implementation as follows:

(A) Changes made to the quality management system as presented in the Safety Analysis Report or in a topical report must be submitted as specified in § 53.040.

(B) The submittal of a change to the Safety Analysis Report quality management system must include all pages affected by that change and must be accompanied by a forwarding letter identifying the change, the reason for the change, and the basis for concluding that the revised quality management system incorporating the change continues to satisfy the criteria of appendix T of part 50 of this chapter and the Safety Analysis Report quality management system commitments previously accepted by the NRC (the letter need not provide the basis for changes that correct spelling, punctuation, or editorial items).

(C) A copy of the forwarding letter identifying the change must be maintained as a facility record for three years.

(D) Changes to the quality management system included or referenced in the Safety Analysis Report shall be regarded as accepted by the Commission upon receipt of a letter to this effect from the appropriate reviewing office of the Commission.

(2) *Quality assurance program—siting, construction, and manufacturing.*

(i) Each holder of an LWA, early site permit, CP, ML, or COL, before the Commission makes the finding under § 53.1452(g), subject to the quality assurance criteria in appendix B to part 50 of this chapter, may make a change to a previously accepted QAP description included or referenced in the Safety Analysis Report without prior NRC approval, provided the change does not reduce the commitments in the program description previously accepted by the NRC. Changes to the QAP description that do not reduce the commitments must be submitted to NRC within 90 days. Changes to the QAP description that reduce the commitments must be submitted to NRC and receive NRC approval before implementation, as follows:

(A) Changes to the Safety Analysis Report must be submitted for review as specified in § 53.040. Changes made to NRC-accepted QA topical report descriptions must be submitted as specified in § 53.040.

(B) The submittal of a change to the Safety Analysis Report QAP description must include all pages affected by that change and must be accompanied by a forwarding letter identifying the change, the reason for the change, and the basis for concluding that the revised program incorporating the change continues to satisfy the criteria of appendix B of part 50 of this chapter and the Safety Analysis Report QAP description commitments previously accepted by the NRC (the letter need not provide the basis for changes that correct spelling, punctuation, or editorial items).

(C) A copy of the forwarding letter identifying the changes must be maintained as a facility record for 3 years.

(D) Changes to the QAP description included or referenced in the Safety Analysis Report shall be regarded as accepted by the Commission upon receipt of a letter to this effect from the appropriate reviewing office of the Commission or 60 days after submittal to the Commission, whichever occurs first.

(ii) Each holder of a CP or COL, before the Commission makes the finding under § 53.1452(g), subject to the quality assurance criteria in appendix T of part 50 of this chapter, must submit changes to the quality management system to the NRC and receive NRC approval prior to implementation as follows:

(A) Changes made to the quality management system as presented in the Safety Analysis Report or in a topical report must be submitted as specified in § 53.040.

(B) The submittal of a change to the Safety Analysis Report quality management system must include all pages affected by that change and must be accompanied by a forwarding letter identifying the change, the reason for the change, and the basis for concluding that the revised quality management system incorporating the change continues to satisfy the criteria of appendix T of part 50 of this chapter and the Safety Analysis Report quality management system commitments previously accepted by the NRC (the letter need not provide the basis for changes that correct spelling, punctuation, or editorial items).

(C) A copy of the forwarding letter identifying the change must be maintained as a facility record for three years.

(D) Changes to the quality management system included or referenced in the Safety Analysis Report shall be regarded as accepted by the Commission upon receipt of a letter to this effect from the appropriate reviewing office of the Commission.

(3) * * *

(i) * * *

(E) *Risk significant planning standard* means the most essential functions of emergency preparedness to ensure adequate protective measures are taken to protect the public in the event of a radiological emergency. For the purposes of this section, the risk significant planning standards are classification, notification, assessment, protective actions, staffing, and facilities.

(ii) A holder of an OL under this part, or a COL under this part after the Commission makes the finding under § 53.1452(g), must follow and maintain the effectiveness of an emergency plan that meets the requirements in appendix E to part 50 of this chapter and the planning standards of § 50.47(b) of this chapter, or an emergency plan that meets the requirements in § 50.160 of this chapter.

(iii) A licensee may make changes to its emergency plan without NRC approval only if the licensee performs and retains an analysis demonstrating that:

(A) For planning standards that are risk significant, the changes do not reduce the effectiveness of the plan and the plan, as changed, continues to meet either the risk-significant requirements of § 50.160 of this chapter or the applicable requirements in appendix E to part 50 of this chapter and the risk significant planning standards of § 50.47(b) of this chapter; and

(B) For planning standards that are not risk-significant, the plan, as changed, continues to meet the applicable requirements.

* * * * *

(vii) The licensee must provide for annual evaluation of the adequacy of the interfaces between the licensee and the applicable State, local, and Tribal governments, including licensee drills, exercises, capabilities, and procedures. The results of the evaluation, along with recommendations for improvements, must be documented, reported to the licensee's corporate and plant management, retained for a period of 5 years, and must be made available to the appropriate State, local, and Tribal governments.

* * * * *

PART 54—REQUIREMENTS FOR RENEWAL OF OPERATING LICENSES FOR NUCLEAR POWER PLANTS

■ 107. The authority citation for part 54 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 102, 103, 104, 161, 181, 182, 183, 186, 189, 223, 234 (42 U.S.C. 2132, 2133, 2134, 2136, 2137, 2201, 2231, 2232, 2233, 2236, 2239, 2273, 2282); Energy Reorganization Act of 1974, secs. 201, 202, 206 (42 U.S.C. 5841, 5842, 5846); 44 U.S.C. 3504 note.

Section 54.17 also issued under E.O. 12829, 58 FR 3479, 3 CFR, 1993 Comp., p. 570; E.O. 13526, 75 FR 707, 3 CFR, 2009 Comp., p. 298; E.O. 12968, 60 FR 40245, 3 CFR, 1995 Comp., p. 391; ADVANCE Act of 2024, sec. 301 (42 U.S.C. 2133 note).

§ 54.9 [Amended]

■ 108. In § 54.9, in paragraph (b), remove the reference ''54.22''.

■ 109. In § 54.17, revise paragraph (c) to read as follows:

§ 54.17 Filing of application.

* * * * *

(c) An application for a renewed license may not be submitted to the Commission earlier than the start of the period of operation that directly precedes the requested renewal period.

* * * * *

■ 110. In § 54.21, add paragraph (a)(4) and remove and reserve paragraph (c)(2) to read as follows:

§ 54.21 Contents of application—technical information.

* * * * *

(a) * * *

(4) An applicant may voluntarily use risk-informed and performance-based alternatives to the requirements in paragraphs (a)(1), (a)(2), and (a)(3) of this section. The application must describe the alternatives, justify their basis, and include a description of the underlying systematic analysis.

* * * * *

(c) * * *

(2) [Reserved]

* * * * *

§ 54.22 [Removed and Reserved]

■ 111. Remove and reserve § 54.22.

■ 112. In § 54.29, revise paragraphs (a) introductory text and (a)(1) to read as follows:

§ 54.29 Standards for issuance of a renewed license.

(a) Appropriate actions have been identified and have been or will be taken with respect to the matters identified in paragraphs (a)(1) and (a)(2) of this section, such that there is reasonable assurance that the activities authorized by the renewed license will continue to be conducted in accordance with the CLB, and that any changes made to the plant's CLB in order to comply with this paragraph are in accord with the Act and the Commission's regulations. These matters are:

(1) managing the effects of aging during the period of extended operation on the functionality of structures and components that have been identified to require review under § 54.21(a)(1) and alternatives authorized by § 54.21(a)(4); and

* * * * *

■ 113. In § 54.31, revise paragraphs (b) and (c) to read as follows:

§ 54.31 Issuance of renewed license.

* * * * *

(b) A renewed license will be issued for a fixed period of time, not to exceed 40 years.

(c) A renewed license will become effective upon expiration of the operating license or combined license previously in effect. Prior to the renewed license becoming effective, the licensee shall take all necessary steps to ensure the renewed license remains up to date, consistent with the CLB.

* * * * *

■ 114. In § 54.37, revise paragraph (b) to read as follows:

§ 54.37 Additional records and recordkeeping requirements.

* * * * *

(b) After the renewed license is in effect, FSAR updates required by 10 CFR 50.71(e) must contain any changes to summary descriptions of how the effects of aging will be managed for any newly identified systems, structures, and components that require aging management or an evaluation of time-limited aging analyses in accordance with § 54.21. Documentation of the related aging management review or evaluation of time-limited aging analyses shall be retained in accordance with § 54.37(a).

§ 54.43 [Amended]

■ 115. In § 54.43, in paragraph (b), remove the reference ''54.22''.

PART 71—PACKAGING AND TRANSPORTATION OF RADIOACTIVE MATERIAL

■ 116. The authority citation for part 71 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 53, 57, 62, 63, 81, 161, 182, 183, 223, 234, 1701 (42 U.S.C. 2073, 2077, 2092, 2093, 2111, 2201, 2232, 2233, 2273, 2282, 2297f); Energy Reorganization Act of 1974, secs. 201, 202, 206, 211 (42 U.S.C. 5841, 5842, 5846, 5851); Nuclear Waste Policy Act of 1982, sec. 180 (42 U.S.C. 10175); 44 U.S.C. 3504 note.

Section 71.97 also issued under Sec. 301, Pub. L. 96–295, 94 Stat. 789 (42 U.S.C. 5841 note).

■ 117. In § 71.55, revise and republish paragraph (g) to read as follows:

§ 71.55 General requirements for fissile material packages.

* * * * *

(g) Packages containing uranium hexafluoride only are excepted from the requirements of paragraph (b) of this section provided that:

(1) Following the tests specified in § 71.73, there is no physical contact between the valve body and any other component of the packaging, other than at its original point of attachment, and the valve remains leak tight;

(2) There is an adequate quality control in the manufacture, maintenance, and repair of packagings;

(3) Each package is tested to demonstrate closure before each shipment;

(4) The uranium is enriched to not more than 10 weight percent uranium-235; and

(5) A design feature is incorporated to protect the valve or other fill device from impact for contents with uranium-235 enriched above 5 weight percent and up to 10 weight percent.

PART 100—REACTOR SITE CRITERIA

■ 118. The authority citation for part 100 continues to read as follows:

Authority: Atomic Energy Act of 1954, secs. 103, 104, 161, 182 (42 U.S.C. 2133, 2134, 2201, 2232); Energy Reorganization Act of 1974, secs. 201, 202 (42 U.S.C. 5841, 5842); 44 U.S.C. 3504 note.

§ 100.1 [Amended]

■ 119. In § 100.1, in paragraphs (a) and (d), remove the word ''stationary''.

§ 100.2 [Amended]

■ 120. In § 100.2, remove the word ''stationary''.

■ 121. In § 100.3, add in alphabetical order the definitions ''*Tier 1 reactor*'' and ''*Tier 2 reactor*'' to read as follows:

§ 100.3 Definitions.

* * * * *

Tier 1 reactor means a *power reactor* having an unmitigated consequence of less than 25 rem (0.25 Sv) TEDE at the site EAB.

Tier 2 reactor means a *power reactor* having an unmitigated consequence of greater than 25 rem (0.25 Sv) TEDE at the site EAB or where the unmitigated consequence is undetermined.

* * * * *

■ 122. In § 100.8, revise paragraph (b) to read as follows:

§ 100.8 Information collection requirements: OMB approval.

* * * * *

(b) The approved information collection requirements contained in this part appear in §§ 100.10, 100.11, 100.20, 100.21, and 100.23.

■ 123. Revise subpart A section heading consisting of § 100.10 through § 100.11 to read as follows:

Subpart A—Evaluation Factors for Tier 1 Power and Testing Reactors

* * * * *

■ 124. Revise § 100.10 to read as follows:

§ 100.10 Factors to be considered when evaluating sites.

This approach to evaluating sites applies to Tier 1 power reactors and testing reactors. The Commission will take the following factors into consideration in determining the acceptability of a site for a Tier 1 power or testing reactor:

(a) Characteristics of reactor design and proposed operation.

(b) Population density and use characteristics of the site environs, including the exclusion area, low population zone, and population center distance (or alternate area assessed by consideration of societal risks and benefits).

(c) Physical characteristics of the site, including seismology, meteorology, geology, and hydrology. Applications to

earthquake engineering criteria are contained in appendix S to part 50 of this chapter.

(d) Where unfavorable physical characteristics of the site exist, the proposed site may nevertheless be found to be acceptable if the design of the facility includes appropriate and adequate compensating engineering safeguards.

(e) For siting criteria described in § 100.11(a)(3)(i)(B), a comparison of societal risks and societal benefits.

■ 125. Revise § 100.11 to read as follows:

§ 100.11 Determination of exclusion area, low population zone, and population considerations.

(a) As an aid in evaluating a proposed site, an applicant should assume a fission product release,[1] the expected demonstrable leak rates from potential flow paths, and the meteorological conditions pertinent to the site to derive an exclusion area, a low population zone, and population center distance. For the purpose of this analysis the applicant should determine the following:

(1) An exclusion area of such size that an individual located at any point on its boundary for any 2-hour period following the onset of the postulated fission product release would not receive a radiation dose in excess of 25 rem [2] TEDE.

(2) A low population zone of such size that an individual located at any point on its outer boundary who is exposed to the radioactive cloud resulting from the postulated fission product release (during the entire period of its passage) would not receive a total radiation dose in excess of 25 rem (0.25 Sv) TEDE.

(3)(i) The reactor site must either:

(A) Provide a population center distance of at least one and one-third times the distance from the reactor to the outer boundary of the low population zone; or

(B) Be found acceptable to the NRC based on assessments of societal risks in comparison to societal benefits for the specific site.

(ii) The boundary of the population center or the alternate area assessed considering societal risks and benefits must be determined upon consideration of population distribution. Political boundaries are not controlling in the calculation of population center distance or the alternate area assessed considering societal risks and benefits.

(b) [Reserved]

[1] The fission product release assumed for these calculations should be based upon a major accident, hypothesized for purposes of site analysis or postulated from considerations of possible accidental events to bound a broad range of design basis accidents.

[2] The use of 25 rem (0.25 Sv) TEDE is not intended to imply that this number constitutes an acceptable limit for an emergency dose to the public under accident conditions. Rather, this dose value has been set forth in this section as a reference value, which can be used in the evaluation of reactor sites with respect to potential reactor accidents of exceedingly low probability of occurrence, and low risk of public exposure to radiation in the event of an accident.

■ 126. Revise subpart B section heading to read as follows:

Subpart B—Evaluation Factors for Tier 2 Power Reactor Site Applications

* * * * *

■ 127. In § 100.20, revise the introductory paragraph to read as follows:

§ 100.20 Factors to be considered when evaluating sites.

This approach to evaluating sites applies to Tier 2 power reactors. The Commission will take the following factors into consideration in determining the acceptability of a site for a Tier 2 power reactor:

* * * * *

■ 128. In § 100.21, redesignate footnote 3 as footnote 1 and revise footnote 1 and paragraphs (b), (g), and (h) to read as follows:

§ 100.21 Non-seismic siting criteria.

* * * * *

(b) (1) The reactor site must either:

(i) Provide a population center distance, as defined in § 100.3, of at least one and one-third times the distance from the reactor to the outer boundary of the low population zone; or

(ii) Be found acceptable to the NRC based on assessments of societal risks in comparison to societal benefits for the specific site;

(2) The boundary of the population center or the alternate area assessed considering societal risks and benefits must be determined upon consideration of population distribution. Political boundaries are not controlling in the calculation of population center distance or the alternate area assessed considering societal risks and benefits;

* * * * *

(g) Physical characteristics unique to the proposed site that could pose a significant impediment to the development of emergency plans must be identified; and

(h) Reactor sites should be located away from very densely populated centers or otherwise be shown to be acceptable by assessments of societal risks in comparison to societal benefits for the specific site. Areas of low population density are, generally, preferred. However, in determining the acceptability of a particular site located away from a very densely populated center but not in an area of low density or when assessing a site considering societal risks and benefits, consideration will be given to safety, environmental, economic, or other factors, which may result in the site being found acceptable [1].

[1] Examples of these factors include, but are not limited to, such factors as the higher population density site having superior seismic characteristics, better access to skilled labor for construction, better rail and highway access, shorter transmission line requirements, the ability to use existing infrastructure for a retired fossil fuel power plant, or less environmental impact on undeveloped areas, wetlands or endangered species, etc. Some of these factors are included in, or impact, the other criteria included in this section.

■ 129. In § 100.23, revise paragraph (a) to read as follows:

§ 100.23 Geologic and seismic siting criteria.

* * * * *

(a) *Applicability.* The requirements in paragraphs (c) and (d) of this section apply to applicants for an early site permit or combined license pursuant to part 52 of this chapter, or a construction permit or operating license for a nuclear power plant pursuant to part 50 of this chapter that do not meet the entry criteria for subpart A of this part.

* * * * *

Appendix A to Part 100 [Removed]

■ 130. Remove appendix A to part 100.

Dated: July 14, 2026.

For the Nuclear Regulatory Commission.

Presidential Documents

Title 3—

The President

Proclamation 11041 of July 9, 2026

Regulatory Relief for Certain Stationary Sources To Promote American Chemical Manufacturing Security

By the President of the United States of America

A Proclamation

1. The United States relies on a strong chemical manufacturing sector to support industries like energy, national defense, agriculture, and health care. These facilities produce essential inputs for critical infrastructure, advanced manufacturing, medical sterilization, semiconductors, and national defense systems. Maintaining a robust domestic chemical industry is vital to safeguarding the supply chains that underpin our economy and to reducing the Nation's dependence on foreign control over materials critical to national resilience. As adversaries expand influence over key inputs, continued domestic production is essential not only to economic resilience but also to military readiness, public health, and national preparedness.

2. On May 16, 2024, the Environmental Protection Agency published a final rule titled *New Source Performance Standards for the Synthetic Organic Chemical Manufacturing Industry and National Emission Standards for Hazardous Air Pollutants for the Synthetic Organic Chemical Manufacturing Industry and Group I & II Polymers and Resins Industry,* 89 FR 42932 (HON Rule). The HON Rule imposes new emissions-control requirements on certain chemical manufacturing facilities, some of which were promulgated pursuant to section 112 of the Clean Air Act, 42 U.S.C. 7412.

3. The HON Rule imposes substantial burdens on chemical manufacturers already operating under stringent regulations. Many of the testing and monitoring requirements outlined in the HON Rule rely on technologies that are not practically available, not demonstrated at the necessary scale, or cannot be implemented safely or consistently under real-world conditions. For many facilities, the timeline for compliance as set forth in the HON Rule at 89 FR 42953–42955 would require shutdowns or massive capital investments before any proven pathway to compliance exists. The HON Rule imposes requirements that assume uniform technological availability across facilities, despite significant variation in site conditions, permitting realities, and equipment configurations. A disruption of this capacity would weaken key supply chains, increase dependence on foreign producers, and impair our ability to respond effectively in a time of crisis. These consequences would ripple across sectors vital to America's growing industrial strength and emergency readiness.

NOW, THEREFORE, I, DONALD J. TRUMP, President of the United States of America, by the authority vested in me by the Constitution and the laws of the United States, including section 112(i)(4) of the Clean Air Act, 42 U.S.C. 7412(i)(4), do hereby proclaim that certain stationary sources subject to the HON Rule, as identified in Annex I of this proclamation, are exempt from compliance with those aspects of the HON Rule that were promulgated under section 112 of the Clean Air Act, 42 U.S.C. 7412, for a period of 2 years beyond the HON Rule's relevant compliance dates (Exemption). This Exemption applies to all compliance deadlines established under the HON Rule applicable to the stationary sources listed in Annex I, with each such deadline extended by 2 years from the date originally required for such deadline. The effect of this Exemption is that, during

each such 2-year period, these stationary sources will be subject to the emissions and compliance obligations that they are currently subject to under the applicable standard as that standard existed prior to the HON Rule. In support of this Exemption, I hereby make the following determinations:

a. The technology to implement the HON Rule is not available. Such technology does not exist in a commercially viable form sufficient to allow implementation of and compliance with the HON Rule by the compliance dates in the HON Rule.

b. It is in the national security interests of the United States to issue this Exemption for the reasons stated in paragraphs 1 and 3 of this proclamation.

IN WITNESS WHEREOF, I have hereunto set my hand this ninth day of July, in the year of our Lord two thousand twenty-six, and of the Independence of the United States of America the two hundred and fifty-first.

Presidential Documents

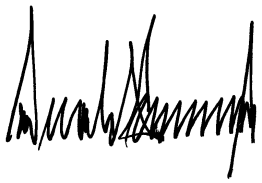
Notice of July 13, 2026

Continuation of the National Emergency With Respect to Hostage-Taking and the Wrongful Detention of United States Nationals Abroad

On July 19, 2022, by Executive Order 14078, the President declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) to deal with the unusual and extraordinary threat to the national security, foreign policy, and economy of the United States constituted by hostage-taking and the wrongful detention of United States nationals abroad.

Hostage-taking and the wrongful detention of United States nationals are heinous acts that undermine the rule of law. Terrorist organizations, criminal groups, and other malicious actors who take hostages for financial, political, or other gain—as well as foreign states that engage in the practice of wrongful detention, including for political leverage or to seek concessions from the United States—threaten the integrity of the international political system and the safety of United States nationals and other persons abroad. Hostage-taking and the wrongful detention of United States nationals abroad continue to pose an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. For this reason, the national emergency declared in Executive Order 14078 of July 19, 2022, must continue in effect beyond July 19, 2026. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency declared in Executive Order 14078 with respect to hostage-taking and the wrongful detention of United States nationals abroad.

This notice shall be published in the *Federal Register* and transmitted to the Congress.



THE WHITE HOUSE,
July 13, 2026.

Presidential Documents

Notice of July 13, 2026

Continuation of the National Emergency With Respect to Significant Transnational Criminal Organizations

On July 24, 2011, by Executive Order 13581, the President declared a national emergency pursuant to the International Emergency Economic Powers Act (50 U.S.C. 1701 *et seq.*) to deal with the unusual and extraordinary threat to the national security, foreign policy, and economy of the United States constituted by significant transnational criminal organizations.

On March 15, 2019, by Executive Order 13863, the President took additional steps to deal with the national emergency with respect to significant transnational criminal organizations in view of the evolution of these organizations as well as the increasing sophistication of their activities, which threaten international political and economic systems and pose a direct threat to the safety and welfare of the United States and its citizens, and given the ability of these organizations to derive revenue through widespread illegal conduct, including acts of violence and abuse that exhibit a wanton disregard for human life as well as many other crimes enriching and empowering these organizations.

Significant transnational criminal organizations continue to pose an unusual and extraordinary threat to the national security, foreign policy, and economy of the United States. For these reasons, the national emergency declared in Executive Order 13581 of July 24, 2011, under which additional steps were taken in Executive Order 13863 of March 15, 2019, must continue in effect beyond July 24, 2026. Therefore, in accordance with section 202(d) of the National Emergencies Act (50 U.S.C. 1622(d)), I am continuing for 1 year the national emergency with respect to significant transnational criminal organizations declared in Executive Order 13581.

This notice shall be published in the *Federal Register* and transmitted to the Congress.

LIST OF PUBLIC LAWS

This is a continuing list of public bills from the current session of Congress which have become Federal laws. This list is also available online at *https://www.archives.gov/federal-register/laws/current.html*.

The text of laws is not published in the **Federal Register** but may be ordered in ''slip law'' (individual pamphlet) form from the Superintendent of Documents, U.S. Government Publishing Office, Washington, DC 20402 (phone, 202–512–1808). The text is available at *https://www.govinfo.gov/app/collection/plaw*. Some laws may not yet be available.

S. 629/P.L. 119–102

Emergency Conservation Program Improvement Act of 2025 (July 12, 2026; 140 Stat. 985)

Note: Upon expiration of the 10-day period prescribed by the Constitution of the United States, S. 629 became law on July 12, 2026, without the President's signature.

Last List July 14, 2026

Public Laws Electronic Notification Service (PENS)

PENS is a free email notification service of newly enacted public laws. To subscribe, go to *https://portalguard.gsa.gov/__layouts/pg/register.aspx*.

Note: This service is strictly for email notification of new laws. The text of laws is not available through this service. **PENS** cannot respond to specific inquiries sent to this address.
